1867

LONDON:
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR CONSTITUENTS.

THE fortieth Volume being closed, the two Editors offer themselves for re-election: and they trust that you will consider their care for your interests during the last twenty years entitles them to a continuance of the confidence you have hitherto reposed in them.

It is needless, after so protracted a service, for them to enter into minute details of their principles: but there are a few points on which it may at this time be considered desirable that they should be explicit.

They will vote for the proposed inquiry whether a Head Gardener should be established in every parish of Ireland at the parish expense; and they seek for your opinion whether a Gardener should be thus established.

They will oppose uncompromisingly the use of the Ballot in Gardeners' Clubs, because every one voting ought to act upon conviction; and only those who are afraid their conviction is erroneous, or who have promised yet wish to be unfaithful, would resort to secret voting.

If the question is brought before them, whether Gardeners should wear particularly coloured Aprons, they will give that question their earnest attention, and endeavour to divest themselves of any preconceived opinion that the Master's appreciation of a Gardener's services can be or cannot be influenced by the colour of his apron.

All other questions brought to the notice of the Editors will receive their candid and unprejudiced consideration; and where they have any doubt, or where they require fuller information, they will, as heretofore, consult and co-operate with the party with whom they have previously acted, and who deservedly have your confidence and approbation. That party, they rejoice to say, remains not only undiminished but strengthened; and thus sustained, they hope for many future years to appear again before you confident of re-election.

INDEX.

ABOTT'S CASTLE. COLLECTION OF PLANTS THERE, 214
 Abutilons—repotting, 486; vexillarium, 44
 Acacias not hardy, 186
 Aconitum virginicum, 128
 Acorns for poultry and pigs, 561
 Acoridocarpus natus, 381
 Advertiser's grievance, 142
 Aegides natus, 207
 Agaveya stamnea, 441
 Agapanthus umbellatus culture, 27, 369
 Agave dasyliroide, 44
 Age, marks of in fowls, 200
 Air-drying in winter, 424
 Aldborough and Broughbridge Poultry Show, 149
 Allerton Poultry Show, 120
 Alternanthera amara—propagation, 175; for bedding, 346
 Altrincham Poultry Show, 255
 Amarantus discolor, 32
 Amygdalus—sowing seed, 48; watering, 13
 Amey? who is an, 96
 American blight, 364
 Acaulium's face, 36
 Andromeda floribunda, calyculata, &c., 77
 Annals—new, 6; for spring flower-
 ing, 271
 Anemones, spring flowers at the, 261
 Anis, 32; destroying, 81, 229, 328
 Aphelandra—Leopoldi leggy, 466;
 nitens, 381
 Apples—Bunyard's seedling, 190; for
 poultry, 200; Gault's tart, 213; for
 an orchard, 231; from Tasmania,
 247; American, 301; best required
 to ripen, 301; dwarf, 302; Paul's
 seedling, 321; list of 315; keeping
 from frost, 401; storing, 410; in an
 orchard house, 411; stocks for, 447;
 forming pyramidal, 466; Early Non-
 pareil, 281, 323; Milton, unfertile,
 328, 485; Rivers's Early Nonpareil,
 284; Small's Admirable, 323; Stir-
 ling Castle, 247, 323
 Apricots, 184; their merits, 57; stewed,
 88; for south wall, 254; Japanese,
 405; casting fruit, 466
 Aquarium troubles, 256
 Aquatics for stove, 326
 Arisaema japonica culture, 288
 Arisaema partly brown, 466
 Arbor-Vita—management of seedling,
 118; propagation, 174, 288; pruning,
 213; from cuttings, 231; seed, 389
 Arctostaphylos uva-ursi, 77
 Ardisia, scale on, 481
 Areca Baccari, 21
 Ardisia and planting shrubs, 277
 Artichoke seed, sowing, 154
 Ashford Poultry Show, 472
 Asparagus—(kissing seedling, 154;
 manure for, 193; culture in England
 and France, 496
 Asplenium trichomanes culture, 501
 Asters for exhibition, 13
 Aucubas, from cuttings, 327; berries,
 487
 August, plants in flower, 184
 Auricula—John Waterston, 44; raising
 from seed, 505
 Australian paroquets, 70; seeds,
 sowing, 425
 Aylesbury Poultry Show, 254
 Azaleas, 77; Sir R. Napier and Lizzie,
 44; list of, 213; scale on, 306; soil
 for, 347; repotting, 388, 425, 417; cul-
 ture, 411; leaves falling, 447; forc-
 ing, 504

Bachelor Household, MY, 217
 Badminton Poultry Show, 139
 Bailey, H., death of, 264
 Balm, variegated, planting, 194
 Bantams—dubbing Game, 35; Japan-
 ese, 67, 83, 124; legs of Game, 124;
 Bantam Game, 218; other than Game,
 232; hatching, 236; grey and tufted,
 236; Game, 331; black and white,
 252; Black and Game, 494
 Barbarea vulgaris variegata, 485; for
 winter, 417; as a decorative plant,
 440
 Barnstable Poultry Show, 24
 Baskets—plants for hanging, 213; in
 windows, plants for, 410
 Bath and West of England and South-
 ern Counties Association, 175
 Battersea Park, 131, 167, 298; subtro-
 pical plants at, 321
 Bedding plants—blue-headed pit for,
 119; frame for potting, 138; propa-
 gating, 230; treatment of cuttings,
 230; temperature for, 327
 Bedding-out plants, cuttings of,
 287
 Bedding without wintering under
 glass, 495
 Bees—in America, 142; Asiatic, 36;
 from Cape of Good Hope, 751, 322;
 Mexican native, 331; Are they can-
 vorous? 197; comb fallen, 142;
 comb broken in bar-bive, 218; in a
 cask, 69; in a house roof, 218; in a
 wall, 250; supposed Christmas phe-
 nomenon, 514; Darnstadt, meeting
 of apianians, 452; decamping, 236;
 destroying, 142; disaster, 17; drone-
 slaughter early, 17; Do they hunt
 by scent or sight? 394; exhibiting,
 236; changing floor-boards, 70;
 glasses, 17, 62; invasions of, 62;
 irregularities, 164, 216; keeping pro-
 fitably, 70; commencing, 276; Kech-
 ler's secret revealed, 141; lecture
 on, 200; Pettitt's gratings, 180; re-
 moving, 121, 352; restless in winter,
 515; robber, 352; Southern on,
 454; not thriving, 352; transferring,
 352, 371; at Woodstock Show, 225;
 at Clonch, 276; in Lanarkshire,
 275; near a manufacturing town,
 514; in a roscery, 276; in Somerset-
 shire, 313; in Wicklow, 276; waxen
 sheets for, 161, 192, 217, 393, 474.
 Dying—88, 106, 124, 162, 198, 292.
 Feeding—256; in winter, 334. Poul-
 try—25, 33, 276, 474, 514; Baron
 von Bercksh on, 86, 344; micro-
 scopical investigation into its nature
 and origin, 311, 373, 494; Schiebler's
 method of curing, 493. Hives—
 two to one super 18; communica-
 tions with supers too small, 124;
 Berkshire, 236, 351, 293; large, 123,
 333, 394, 414, 451, 481; movable comb,
 514; moving, 256; Nutt's, 106; Pet-
 ti-rews, 311; queenless, 372; Stew-
 arton, 314; storified, 215; straw,
 bulging, 36; Woodbury, 161. Honey—
 crystallised, 162; depriving of, 180;
 the German centrifugal honey-ex-
 tracting machine, 36, 123; harvest,
 236, 351; in Hants, 256; in Lanark-
 shire, 294; large, 123; from one
 hive, 293; in the north, 141; im-
 ported, 162; sale of, 70, 162. Ligu-
 rians—53; new mode of propagating,
 141; cheap queens, 180; raising, 255;
 us honey-gatherers, 351; introduc-
 ing queens, 398; Liguarianising an
 apiary, 180, 236. Queens—two in one
 hive, 18; cheap Liguarian, 18; unpro-
 lific, 372; introducing Liguarian, 398.
 Swarms—causing second and third,
 50; not sent forth, 36; uniting se-
 cond, 106; eccentric, 41; from su-
 pered hive, 200; from infected co-
 lonies, 434; fighting, 494. Supers—
 preventing breeding in, 161, 180;
 brood in, 215; their management of,
 434, 474; their uses, 216; communi-
 cations with hives too small, 124;
 glass, 36, 69. Unting—124, 194, 225,
 534; failures in, 216; autumnal, 255.
 Bee-keeping, 106, 161
 Bee, Dull's, as an ornamental plant,
 110; as a beeder, 323, 356, 398; in-
 sects on leaves, 360; storing, 425
 Begonia manicata culture, 368
 Bedford Canary Show, 449
 Beludonna Lilies—culture, 251; not
 flowering, 327
 Benares, red-collared, management,
 163
 Bentley Priory, 133, 186, 361
 Berberis nepalensis, propagating, 410;
 the common, 380, 406
 Beverley Poultry Show, 14
 Bideford Poultry Show, 81
 Bingley Poultry Show, 173; Pigeons
 at, 195
 Birmingham Rose Show, 23
 Birmingham Philopeterston Society's
 Show, 370
 Birmingham Poultry Show, 253, 370,
 427, 434, 450, 451; meeting of poultry
 exhibitors, 507
 Blandford Cunninghamia, 264
 Boiler—cost of heating, &c., 500; heat-
 ing without a, 481

Bones—dissolving, 270; potash for
 dissolving, 328; boiled or unboiled
 for manure, 126
 Borovick, culture of, 175; variegated,
 223
 Boronia serrulata, scale on, 12
 Botanic (Royal) Society's Show, 6, 40
 Bottom heat, 408; how to obtain for
 forwarding and propagating, 113;
 failures in, 283
 Bougainvillea glabra and speciosa,
 culture, 271; lateritia to flower in
 June, 447
 Bowman, Mr. D., 172
 Box edging, 505
 Brachna Postas—culture-hocked, 18,
 218, 363, 432; for exhibition, 70;
 Dark cockerel, 88; points in, twist-
 ed-winged, 106; Light, at Hasling-
 den, 142; for exhibition, 180; self-
 plucking, 200; legs paralysed, 218;
 colour of legs, 218; marking, 256;
 not roosting, 314; light-coloured, 348;
 mounds, &c., 412; trimming culture-
 hocked, 422; characteristics, 434;
 colour of eggs, 491
 Broda fowls, 54
 Brewers' grains for chickens, 236
 Briars, planting, 389
 Brillington Poultry Show, 162
 Brighstone Poultry Show, 83
 Brisbane Botanic Gardens, 321
 Bristol and Clifton Poultry Show, 318,
 510
 British Ferns, prizes for, 175

 Bryanthus erectus, 78
 Buckwheat for fowls, 200
 Bulding, 191; experiments, 92
 Buck Haven Poultry Show, 67
 Bulbous plants, wintering, 288
 Bulbs, top-dressing beds, 410
 Bullfinches, teaching to pipe, 70
 Burnley Poultry Show, 157
 Bush fruit trees, heavy crop from, 281
 Butter in sacks, 353
 Cabbage—SEED SAVING, 66, 91; blight,
 389
 Caladams, wintering, 389
 Calcareous loam, 230
 Calceolarias—seed sowing, 47; seed
 saving, 99; cuttings, 400; cuttings,
 failing, 346; disease, 378; culture,
 484
 Californian Eden, 75
 Callas, wintering, 307
 Camellias—value of, 174 transplant-
 ing and potting, 251; list of, 306;
 buds dropping, 327; repotting, 425,
 447; forcing, 504; for standards,
 505; culture, 466
 Campanula—pyramidalis culture, 368,
 406; isophylla, 441
 Canaries—wintering and breeding, 35;
 queries about, gas in their aviary,
 52, 86; profic, 88; young, dying,
 106; laying soft eggs, 121; plucking
 each other, 142; dying, 142; rearing
 young, 169, 180; marked and vari-
 etated, 160; young and old together,
 200; parasites on, 234; black legged,
 and beaked, 294; grouse for, 294;
 feathers bent, 314; food for exhibi-
 tion, 314; varieties of, 351; disorder-
 ed breathing, 351; asthma in, 371;
 Norwich and Yorkshire, at York,
 571; goldfinch Mule, 392, 493; colour-
 ing; breeding from weak-eyed, 494;
 management, 514
 Canary aviary, gas stove in, 52
 Carbonic acid among plants, 347
 Carnations—seedling, 48; seed-sow-
 ing, 101; pipings failing, 231; layers,
 cutting, 252; tree, for winter, 411
 Cassiope tetragona, 78
 Cauliflowers, protecting, 304
 Cedar, Deodara, 280
 Cedar of Lebanon, 280
 Celery—blanching, 183, 249; culture,
 210, 343; Dwarf White Incom-
 parable, 222; good white, 486; San-
 dringham White, 502
 Celosia aurea pyramidalis culture,
 419
 Centaurea candidissima culture, 366
 Centranthus macrosiphon in a hot
 season, 97
 Cerastium tomentosum, planting, 194
 Chalk, seedling, 199
 Chardonon procumbens, 78
 Charcoal making and using, 401
 Chelmsford Poultry Show, 15, 290
 Cherries—for exhibition, 66; and
 birds, 72; Biscarran not stoning,
 100; Lagarran apparently dying,
 138; miniature trees, 343; as pyra-
 mids, 425; stocks, 447; covering, 505
 Cheshire Poultry Show, 255
 Chester Poultry Show, 559
 Chicken-feeding fold, Crook's, 52
 Chickens—hatched in June, 36; droop-
 ing suddenly, 54; feathering, 70;
 April-hatched, 88; and the weather,
 139; separating different breeds, 142;
 their feathers, 180
 Chievery culture, 344
 Chippinham Poultry Show, 431
 Christchurch Poultry Show (New Zea-
 land), 231
 Christmas, 475
 Chrysanthemums—exhibiting, 347; Ja-
 panese, 368, 428; Salsers, 381; losing
 leaves, 388; Mr. Forsyth's, 401;
 Temple Gardens, 401; gold-dewed, im-
 perfect, 410; propagating, not quite
 hardy, 411; in the orchard house,
 419; notes on, 498
 Cider, sweet, 334
 Cinerarias—leaves curling, 466, 502;
 thrips on, 416
 Clarke's insect-destroying powder,
 359
 Claw, loss of a fowl's, 294
 Cleaning-up, 504
 Clematis—Jackmauni naked, 252; not
 flowering, 252; John Gould Vitch,
 44
 Clerodendron culture, 326
 Clithra arborea, 411
 Clifton Horticultural Show, 326
 Climbers—for a London garden, 137;
 for summer house under trees, 138;
 for W. and N.W. walls, 175
 Clithra Poultry Show, 177
 Cliveden, bedding-out at, 284
 Clumberdy, 411
 Club root, 317; in Cabbages, 327
 Clumps of trees, planting, 446
 Cochins-China—cockerel, weight of,
 314; management of Buff, 352; hen
 not laying, 394; Grouse, 414; vi-
 nate-hocked, 453; cock's comb, 334
 Cockatoo self-plucked, 418
 Cockroaches, destroying, 368
 Cocoa-nut sowing, 486
 Coleuses—the hybrid, 410; Golden
 varieties, 385, 462; wintering, 346,
 466; seed sowing, 505
 Commelina caelestis, wintering, 251
 Conifers for Queensland, 138
 Conservatory—arranging, 231; climb-
 ers for, plants for with Vines, 271;
 heating, 426
 Convolvulus mauritanicus, 146; in a
 hot season, 97
 Cordons—training, 154; tightening
 wires for, 252; vertical p. lateral
 for Apple trees, 340; vertical Plum
 and Pear tree, 457
 "Cottage Gardeners' Dictionary Sup-
 plement," 76
 Cottingham Poultry Show, 179
 Covey trouchna cooking, 314, 374

From observations taken near London during the last forty-one years, the average day temperature of the week is 71.9; and its night temperature 50.5. The greatest heat was 97°, on the 5th, 1852; and the lowest cold 35°, on the 7th, 1861. The greatest fall of rain was 0.78 inch.

PLANTS OF PREY.

UNFORTUNATELY a thread of evil runs through all nature, an inherent love of mischief for its own sake. In some it may be said to constitute the whole warp, while in others it only crops-out here and there among a host of good and noble traits. It shows itself in a thousand forms, many of them harmless, and some criminal in the highest degree. The miss in her teens who tries to break hearts "just for the fun of the thing,"

or the urchin who, reaching his switch through your iron paling, tries to knock off the heads of your Rhododendrons for the same reason, both receive the impulse to do so from the same source as the incendiary or bushranger, who will fire a stackyard or shoot a traveller from no other motive than the gratification of this propensity.

Were it needful, many proofs might also be adduced to evidence that something near akin to this is also inherent in the lower animals; but that plants and flowers, which have for ages been emblems of beauty, purity, and grace, should show traces of this moral perversion is something very hard to believe, yet some species do exhibit traits of character which inevitably lead to this conclusion were there not many reasons for suspecting that there are functions connected with the economy of plants scarcely yet dreamt of in our philosophy.

As instances may be cited the well-known Pitcher-plants, or Nephenthes, found in the tropical swamps of India, China, and elsewhere. N. distillatoria may be taken as the representative plant of the order, although upwards of twenty species have been found and described by botanists. After divesting its history of all those fabulous stories which have gathered around it in bygone days, when travellers' tales were not what they now are, it still remains one of the most curious plants in existence. It is of a half-shrubby character, 4 or 5 feet in height, and the flower is a panicle of greenish yellow florets, about which there is nothing remarkable; but the oblong leaf has attached to its extremity by a gracefully-coiled tendril a pitcher-like vessel of chaste and elegant form, furnished with a close-fitting lid, which opens on a membranous hinge when fully developed. This pitcher contains a quantity of sweetish but wholesome water, and is generally found a little less than half-full. It was once thought that this liquid was an accumulation of dew stored up by the plant during the night, and kept to sustain its flagging energies under the next day's sun, or that it was intended for the use of weary, panting beasts and men, from which supposition comes the name Nephenthes, sorrow-soothing. It is now known, however, to be a secretion from the plant itself, though for what purpose has never been clearly explained; but from the fact of the plant never being found except where there is water, we may infer that it is not a provision of nature for quenching the thirst of animals: indeed, from the shape of the vessel, and from its never being full, very few of these, except man, could avail themselves of its contents even if they required to do so.

But perhaps some may say, Do the pitchers not serve for drinking fountains to moths and butterflies, and all the myriad forms of insect life with which those regions teem? and would it not be more in keeping with the order of things in these lands to see a gaily-painted humming bird sipping from a fairy cup growing on a tree, instead of drinking at a muddy pool? Perhaps it would. At any rate we have ample proofs that the contents of these vessels are highly appreciated by flies, moths, and other insects. Attracted by the slightly saccharine nature of the secretion and by the always-open lid, they descend, but it is only to taste the bitterness of death, for they never return. Their egress is prevented by reversed glands placed round the inside of this treacherous pitcher, which pointing downwards, are no obstruction so long as the victim is going in that direction, but when, from fright or satiety, an ascent is attempted—sad thought to bibulous men and moths—it is all but impossible.

The existence, conformation, and arrangement of these glands put a verdict of accidental death altogether out of the question. It has been said that the dead insect when decayed or during decomposition ministers to the health of the plant; but this is also highly improbable, for some of those in this country which grow most luxuriantly in our stoves produce no pitchers at all, and even those which do have comparatively few opportunities of gratifying their insectivorous appetite, yet live and thrive like other honest plants; so that the case seems to stand thus: These dead flies either are or are not necessary or beneficial to the plant; if it be proved that they are not, then most assuredly the fly is not the benefited object, and the only legitimate inference we can draw is that the death of the insect is all that is sought.

Another plant, a bright tiny thing, with a gladsome name, against which a similar charge might be preferred, is to be found growing plentifully on some of our own bogs and marshes: but as the evidence against it is not so conclusive I will not press for a conviction. Minute flies are said to have been often found within its suspicious-looking little tentacles, but they may have got there by accident, and not being able to release themselves have been the means of bringing down the breath of slander upon the pretty little Sundew. In the case of another member of the same family, however, these reasons do not obtain, consequently it cannot be so gently dealt with. The *Dionaea muscipula* is known in this country only as a very tender greenhouse or cool stove plant, difficult to grow, yet well repaying all the care and attention it may receive by its curious structure and habits. The leaf consists of, or rather the true leaf is terminated by, a toothed apparatus composed of two lobes hinged together in much the same fashion as the shells of the mussel or oyster, and in general appearance resembling nothing so much as a common iron rat-trap. The inner surfaces of these lobes are covered with a gummy substance, and on each are placed three or four bristles in such positions that any fly entering must touch them, which springs the trap; for these hairs being highly irritable, they in some way communicate the touch to the nervous system, if such there

le, of the plant, and the two lobes instantly close up, the bristly teeth interlock like clasped hands, and the unlucky creature is crushed to death. That they have not the power, however, of distinguishing the touch of an insect from that of anything else is evidenced by the lobes grasping with equal avidity the head of a pin when inserted between them; but the same want of judgment may be seen in the case of the Sea Anemone, which, though possessed of animal life, will enfold within its tentacles a small stone with as much eagerness as it does a piece of the daintiest food. When the leaves of the *Dionaea* begin to grow old, they by degrees lose their irritability, and it is curious, almost painful, to watch one that is fast passing into the "sere and yellow leaf," how it will feebly clutch at a fly that has been put within its reach when the power to kill is altogether gone.

We can understand something about the various means of self-defence with which many plants are provided; why the Thistle presents at every point a threatening spear, and why the Rose stands armed to the teeth with hooked spines ready to lacerate the incautious hand which may try to pluck one of her peerless flowers; but when, instead of these, we find plants fitted up with engines of destruction, seemingly for no other end than to destroy, we are naturally not a little surprised. The two described, together with a few more which present somewhat similar characteristics, have often been commented upon by botanists, without any very definite conclusion having been arrived at concerning their spider-like propensities.

Yet why should they not be accepted for what they really seem to be?—instruments provided by Nature for helping to preserve the balance of insect life. Our world is flooded with vitality in innumerable forms, and "the reaper, whose name is Death," uses weapons of different kinds to cut the strings of life in every form which it assumes; and having fluttered through a life-time—the length of a summer's day—is it not better for the little fly or moth to expire in a cup of nectar, or in the arms of a tiny flower, than to die by disease or starvation? No doubt the number thus destroyed must be very small, compared with that of those which die from other causes; but that variety is the watchword of Nature is a truth illustrated as forcibly by the varied means of death as by the myriad forms and modes of existence.—*AYRSHIRE GARDENER.*

ROSES SUITABLE FOR VARIOUS STOCKS.

"CYRIL" wishes to know the names of the best Roses for budding upon the "Dog Rose, some for Manetti stocks, also for Céline stocks."

Before I attempt to answer this, I must make a few observations. The Dog Rose is an excellent stock for unctuous clays. It will do respectably in light, rich land, provided the owner will go to the expense of mulching and watering copiously in summer. It does not like its roots burned. For bad or moderate-growing varieties it is the only suitable stock. For those of strong growth, with the rarest exceptions, Manetti and Céline stocks are adapted. Moreover, the Dog Rose likes strong-growing kinds, and is kept healthy by the strong growth of the Rose. Weak growers will in due time destroy the Briar.

1. Roses that succeed extremely well on a Briar, even in light lands, on their own roots, and on Manetti stocks:—*Gloire de Dijon*, *Céline Forestier*, and *Triomphe de Rennes*. These are yellow Roses of the highest excellence.

2. Roses that I know bloom and grow splendidly on Manetti:—*Brilliant Crimson* or its shades.—*Charles Lefebvre*, *Senateur Vaisse*, *Lord Macanlay*, *Maurice Bernardin*, *Alfred Colomb*, *Duchesse de Caylus*, *Madame Victor Verdier*, *Lady Suffield*, *Baronne Adolphe de Rothschild*, *Madame Boutin*, *Jules Margottin*, *Globosa*, and *Maréchal Vaillant*. *Dark Maroons*.—*Prince Camille de Rohan*, *Souvenir de Dr. Jamain*, and *Empereur de Maroc*. *Dark Crimson*s.—*Duc de Cazes*, *Pierre Notting*, *Vicomte Vigier*, and *Souvenir de Comte Cavour*, superb, but not quite full. *Blush*.—*Caroline de Sansal*, and *Marguerite de St. Amand*. *Rose Colour* or its shades.—*Baronne Prevost*, *Comte de Nanteuil*, *N. Griffiths*, *Comtesse de Chabillant*, *Charles Rouillard*, new and fine, and *Duchesse de Morny*.

The above are here in abundance; they are the *élite* of the Rose kingdom. There are others very good, but I could not recommend them to any but experienced persons. Some are only fit for first-class soils. Some are most splendid under certain conditions—for instance, *Madame Julie Daran* and *Leopold Premier*. The first loses colour under strong sun in the early part of the year, and both open well in a shady place,

where they get heat without the direct rays of the sun. How beautifully are they blooming here under these circumstances now! If "CYRIL" bud these Roses, or any of them, he will be pleased with them. I believe I have here 450 plants of *Charles Lefebvre*, *Senateur Vaisse*, *Prince Camille de Rohan*, *Jules Margottin*, and *W. Griffiths*. One cannot have too many of them. They never go wrong at any time, and charm everybody.—*W. F. RADCLIFFE, (Okeford Fitzpaine.*

A FEW HOURS' OUTING.

UNLESS in particular cases, all visits to gardens at this season should be confined to as short a time as possible, that the time of the gardener visited may not be encroached upon. Dy-and-by, when all is straight sailing, an extra hour will not be of the same consequence as now. The four places I called at have been already described in these pages, and, besides shaking hands with old and new friends, my principal object was to see how the dry weather had affected their gardens. I will not enter into particulars, but chiefly confine myself to that one point of observation.

At STOCKWOOD PARK, standing on elevated ground, there used to be a great want of water in dry summers. Sometime ago a huge brick and cement tank, or rather reservoir, was formed in the park, and part of the park drained into it, and that has never been dry since. Water from this reservoir can be conveyed to other parts of the park by pipes for the service of cattle. I presume this cannot be done in the case of the garden, and I suppose could not be done unless the water was first pumped into an elevated cistern. But for the labour of carting, however, the garden is now well supplied. Except in some cases, in order to apply it to the flower beds in the flower garden, the water is not taken from the cart and used, for in that case there is apt to be either a waste of horse power in keeping the horse standing, or a waste of men's time in coming and going to another job, so as to empty the cart as soon as possible, and when this must be done considerable care must be taken to have other work at hand that the time spent in moving from one piece of work to the other may be as little as possible. In most of the watering at the garden this is avoided at Stockwood by having in the water barrel a large tap which soon runs the water into tanks, and from thence one man may pump and take it away in a small barrel as wanted. This plan also permits of the watering chiefly being done towards the evening, when it has greater effect than when done during the day, when horse power can chiefly be obtained.

Here, considering the season, the flower garden looked remarkably well, and I could not help wondering where the young gardener could manage to keep such multitudes of strong plants. Amongst the many of *Mrs. Pollock Pelargonium* I was struck with fine beds of a bronze-leaved kind called *Topé*. Some of your readers may recollect of a small enclosed flower garden with glass houses on two sides. Here the beds have been greatly enlarged, and well planted, but for want of being able to look down on them, &c., they will seem too much like one bed in *Mr. Robson's* style, without showing the same unity in arrangement. As to looking well, there can be no doubt, only I think there would have been a more distinctive beauty if the beds had occupied only some fourth of their present ground.

The weather, thanks to the watering, had not affected either the Strawberries or the other crops; the houses were very neat, the fruit houses well supplied, and in excellent order; and here I noticed a simple thing worthy of record. In a Peach house the chimney passed through the back wall. Near the chimney fruit was gathered some weeks earlier than from the same tree further from the chimney, but the extra heat almost always induced the presence of the red spider. To counteract this, the wall was faced with wood as a nonconductor, and, in addition, a semicircular wire trellis was brought out a foot or so from the chimney, and thus, though the wood trained over it ripened earlier as before, it was not subject, as previously, to the attacks of red spider.

At LUTON HOO I did not see much of how the weather had treated the flower garden, as this is made less a point than formerly, and more effort is concentrated on the kitchen garden, fruit in-doors and out of doors, and house plants of all kinds, hardy flowers out of doors, and fine shrubs and trees. The park in some places seemed much parched, but there was no sign of such being the case in the garden. The whole of the houses, rich with rare plants, and attractive from the fine show

of Grapes, chiefly the Muscats, Peaches, Melons, &c., had a peculiar charm about them in the humid atmosphere that met you so pleasantly after being nearly parched out of doors. This was more particularly the case in the tropical orchard house, where a large tank in the centre was kept supplied with moving water, heated with pipes when necessary, and almost all the houses were shaded with fine tiffany, &c., which contributed to the pleasant sensation, the same rolls of tiffany coming in for covering the Peach and Apriest walls in the spring. Pines, a new feature here, were also doing well in a narrow house, not the best fitted for them.

But whilst giving all due honour to the energy, and the industry, and the intelligence of the gardener, he would own that one cause of his success was the good supply of excellent water. Naturally he was no better situated than many of us, but a water-ram at a fall in the river Lea sent up a good supply of water for house, garden, and farm. If one ram should be insufficient, a second would only involve a fresh set of pipes for a mile or so. What a pleasure it is to be able to dash water along paths, on stages, over foliage, &c., and not be troubled with the thought that if you act so lavishly to-day, you may have plants starving for what you cannot give them to-morrow.

THE HYDE stands equally high, not quite so far from the Lea, but with no cascade or waterfall so near. Its gem of a little flower garden promises to be as fine as in Mr. Donaldson's time, and would only be more pleasing if the huge raised terrace walk in the middle of it were removed.

The want of plenty of water has always been a drawback; and does not the gardener almost dread to use it in this weather, and plumb his tank every day, fearful that he will quite run out and be dependant on earthing up a steep hill from the river? And yet much has been done to meet the want; a huge pond, puddled and concreted, near the farm has been made, and it holds the water drained into it well, and held a great body of water in its centre on our visit. A deep large tank about 20 feet deep and 15 feet or more in diameter had been sunk at the back of the garden, and as the ground above it shelves all round like the sides of a basin, the bricking and cementing that ground would nearly double its size. It was considered wasteful to have such a large tank bricked and cemented at first, but on our visit there was not more than 2 feet at the narrowed bottom, and well might the gardener look on every drop used as valuable as the finest vintage. This is supplied by drainage from the garden and park, and the overflow of house cisterns, &c., but large as the tank is, and large as the widening shelving basin around it, it soon gets full and water runs away by the waste-pipe every winter. How valuable that wasted water would be now. I had not seen the pretty old place for some years; its kitchen garden, with its trellises for common fruit, was and is an example of how much can be obtained from little room. I have lived to see the realisation of many a musing dream. Some day we may seek for the much-praised old terrace walk and find no trace of it left. The dream of a comfortable cottage home, close to the garden, for the gardener and his helpmate has already been realised, and most likely when I return there some day I shall find a piece of ground outside the walls appropriated to garden purposes and means secured for even more water than now. Neither in plant houses, fruit houses, nor even out of doors among flowers and excellent vegetables had the drought told very injuriously, but that was a fortnight before this will be read.

KIMRON HOO.—Spirits of envy and covetousness, stand aloof! I will nought with you. Surely we may admire the blessings that others have without detracting from the value of our own. The mansion and flower garden, like our own and the places mentioned, stand on the highest ground in the neighbourhood. Turning from the dusty road, and through a wood in which Rhododendrons and some of the best Pinuses are growing luxuriantly, we come on the little flower garden in front of the mansion, and every sense of the oppressive heat and the stifling dust leaves you as by enchantment. You might even fancy you were enjoying all the luxuries of a shower bath, as a man, after watering the roots, was sending a shower of spray water over the flower beds. The water comes on turning a tap from a cistern on the top of the house, supplied by a water ram from the lake. Just think of taking hold of gutta percha tubing, and giving what your plants require, and how they require it, with so little wear and tear even to the physical machine. These flower beds showed the perfection of keeping.

There were three things here that were gratifying to me.

When I described the place the flower garden was on three squares of lawn. Now mark! It is concentrated in one square. I do not say but that all three squares might not have been equally good, but the same hands could not have done for the three what they would have done for the one. Secondly, an elegant conservatory has been built, which will be a great acquisition to the house, and more especially as it is intended to keep the bulk of the floor for promenading purposes, the back wall being set out with Derbyshire ragstone for growing Ferns in the interstices. Thirdly, the ugly sunk ditch and wall close to the principal walk have been removed and the lawn extended, which is a great improvement, as anything would have been which would have prevented the ditch, the ha-ha being such a prominent object.

The kitchen garden is near the river, but as the water here had to be carried some crops were showing the effects of the drought; but what surprised me was a quarter of Peas just swelling and showing no distress, though *never* watered. Dr. Hogg and Premier Strawberries were in fine condition; and the late Eleanor was looking well, even though water had to be carried. It was delightful to see the water at the bottom of the garden and over the outside part of it pretty well all round it. In such a position the subsoil could scarcely ever be very dry. It was not on the low part, however, that the fine Peas stood; no mode of preparing the ground would have enabled me to have had them equally good in such a season without watering.

It is pleasant to see improvements. I called on Mr. Cox when he had only a small vinery and a few frames. Now there is the flower garden and the conservatory at the mansion, almost a new gardener's house, numerous suitable sheds, fruit rooms, &c., and a good supply of glass in the shape of span-roofed houses and brick pits and houses; and, as in most other places, most additions show that some other little addition would be desirable.—R. F.

VIOLA CORNUTA AND ITS FAILURE IN DRY SEASONS.

My experience of *Viola cornuta* is exactly opposite to that of Mr. J. Robson. Last year our summer was wet, and my *Viola* hardly flowered at all. This year (the plant has been out all winter) it has been a mass of bloom for the last six weeks, and looks like continuing for weeks. I am satisfied that, if possible, it does better if not moved after flowering.—H. A. Prestwich, Manchester.

EARTH HEAT.

MUCH was at one time written about the supposed discovery of a natural means for the preservation of plants from frost, and for enabling us to attain greater perfection in the production of early and late crops. Through its agency many plants treated as half-hardy, or requiring protection by fire heat from frost were to be kept unharmed over winter, and in summer we were to grow many plants and fruits which are only obtained in perfection from heated and costly glass structures. The so-called discovery, however, was recognised in this country as a means well known, and extensively utilised for all the purposes it was to aid in, and about which some of our oldest and best horticulturists were able, retrospectively, to say far more than the discoverer. The new name of the discovery I will not employ, but shall content myself with calling the means earth heat, though this seems to me neither more nor less than the absorption and retention by the earth of the sun's rays. It is absurd to consider the earth, so far as vegetation is concerned, in the light of a heat-supplying medium, for the earth so far as it conduces to the growth of plants, is entirely dependant on the sun for its warmth. The sun being the one great centre of light and heat to the earth, it is evident the earth's internal heat has a very insignificant, if any, influence on the temperature of the earth's surface. It is very interesting, and even desirable, to know that the further we descend into the earth the higher the temperature is. Facts, however, in connection with the earth's upper or surfacial temperature are of far greater consequence to the gardener than the knowledge of the earth's internal formation and heat. We know that coal and other mines have a greater mean temperature than the surface of the earth, and that the temperature increases with the depth. Earth heat proper, then, is distinct from the heat derived by the earth from the sun: the former has no essential

effect on the heat at the surface, and it is entirely the latter upon which the horticulturist is dependant.

Taking the sun as the one great and only source of heat we necessarily must arrive at the conclusion, that to make the sun's heat available in cold and dull periods, it is essential that the heat produced in bright weather be retained, and for its retention it must be absorbed. In general terms, the earth is the only absorber of the sun's rays, but as the sun's rays are direct, and the earth does not present its surface to them vertically in our latitudes, a large percentage of them is not absorbed, but reflected; but walls surrounding a garden would give a slight increase of temperature, for there will be a greater absorbing, and, consequently, radiating surface. An enclosed space, whatever the material forming the enclosure, will necessarily have a higher temperature than an open space, because the heat absorbed is retained longer through the check given to the air passing over the enclosed space; there is shelter, a greater absorbing, and, of course, a greater radiating surface, and a sensible increase of temperature is afforded plants in the area enclosed.

It will have been noticed that trees against a wall invariably push their shoots directly towards the point whence they have the greatest light, or opposite the direct rays of the sun; this is commonly termed the shadow of the wall: or rather the growth of the shoots is induced by the shadow being cast in that particular direction. I simply name this, so that solar light and heat may not be confounded; for solar light, however much it may contribute to a plant's growth, is not to be treated as heat, though it is simultaneously transmitted. Solar light is the governing power of a plant's growth; the plant, whatever it is, will push its growth in the direction of the light, but the light being equally diffused the plant will make equal growths in all directions, subject, of course, to the formation of the plant and its natural habit. Solar heat does not, on the contrary, appear to have any great influence on a plant's direction of growth. It is the great natural stimulant to activity of growth, and upon it depends the perfection of vegetable life. Plants live and grow for a time without light, but never thrive, and it is in that point of view that we must look at earth heat resulting from sun heat being absorbed and radiated—absorbed when the surrounding atmosphere is hotter, and radiated when the atmosphere is colder than the earth's surface.

The surface of the earth is the culminating point, so to speak, of the extremes of heat and cold. The temperature is greater there than higher in the air upon an average of annual means, for though a thermometer will read 3° or more lower at the ground than at 4 feet from the ground by night, it will read several degrees higher by day than one at 4 feet. From a careful register of the readings of thermometers at different heights, I find that the temperature progressively decreases with the height, being led to the experiment from noticing some time ago a statement in a contemporary, that at 10 or 12 feet from the ground frosts, and especially spring frosts, are never so severe as at or near the surface, consequently the blossoms of fruit trees would be less liable to destruction if the trees were cultivated as standards than as dwarfs. Assuming this to be the case (and it is incontestible), there is still a dead loss to the tree of several degrees of temperature by day, and though sensibly warmer at night, in cases of sudden frosts, the trees at that height experience a greater loss on account of their not being immediately within the reach of the heat constantly radiated from the earth. The frosts most destructive to fruit-tree blossoms are those which are of long continuance, and in dull periods the blossoms most distant from the earth are those chiefly destroyed, whilst those nearer the earth, from the constant radiation from its surface, enjoy a higher temperature, and are very often preserved. Hence Pear and other fruit trees, as dwarfs, almost invariably produce fruit, whilst the same kinds cultivated as standards do not yield a crop. Indeed, many kinds of Pears that do not succeed as standards, thrive and produce fruit admirably as dwarfs on the Quince, and even on the Pear stock. It is, then, useless grasping at the air for heat; if we desire it, we must look to the earth.

The temperature of the atmosphere decreases proportionately upwards: that of the earth increases downwards. The mean temperature of the earth at 1 foot from the surface is equal to that of the atmosphere at 4 feet. It never in this country, at 1 foot from the surface, is reduced to the freezing point by the cold of winter, at least not in my experience, and if we descend the temperature is higher, so that nothing further is required than to make an excavation deep enough, and we have at length a temperature sufficiently high for the preservation

of plants from frost. We must bear in mind that in penetrating the earth we have not only a source of heat but of damp, and that the heat thus secured, or I ought in this case to say attained, will be speedily lost unless it be prevented from radiating. We must also bear in mind that plants must have light, particularly when growing, and this is one of the greatest obstacles to the employment of earth heat generally; but it may be more employed as an agent in the preservation of plants than it has hitherto been, for we have in the earth sufficient heat to enable us to winter most, if not all, of the plants known or cultivated as half-hardy, and by that heat we may cultivate successfully the Vine and other fruit trees. With half-hardy plants damp must be avoided, and sufficient protecting material provided to prevent the radiation of the earth's heat and to keep out cold; whilst with fruit trees the points are to provide a medium for absorbing the sun's rays, and to give the plant the full benefit of the heat absorbed and being always radiated.

I hope in subsequent papers to show some of the various uses to which earth heat has been applied, and how mishaps may to some extent be obviated.—G. ABBEY.

(To be continued.)

JUDGING AT THE ROYAL HORTICULTURAL SHOW.

How can "P." call zoneless *Pelargoniums* true Variegated Zonals? The gentlemen named in his letter had an undoubted right to exhibit; but that is no reason why they should obtain a prize if they did not exhibit in accordance with the schedule. If the schedule of any society is not to be the guide for both exhibitors and judges, of what use is it? Undoubtedly there is plenty of room for improvement in the arrangement of the schedules of our horticultural societies; but when the schedule remains unaltered up to the day of the exhibition, it is the duty of both exhibitors and judges to abide by it.—J. W.

ROYAL HORTICULTURAL SOCIETY.

ROSE SHOW, June 30th.—This Exhibition, with which is incorporated the National Rose Show, was a success, both as regards the number of the competitors and the quality of the flowers which they produced at a time when, owing to the great heat and drought which have so long prevailed, the beauty of a Rose is gone in an hour. The majority of the flowers had suffered from these causes, and very many of them were quite different in colour from that which they usually present; still there were trusses, for instance those shown by Messrs. Paul & Son, Messrs. Perkins, of Coventry, Mr. Cant, and the Rev. E. Pochin, such as are rarely surpassed; but even these had greatly deteriorated in beauty before the close of the day, notwithstanding the awning employed to keep off the sun. As regards the attendance of visitors, the Show was also very successful, for the gardens, which are just now in high condition and extremely gay with bedding plants, were thronged with a large and fashionable company; and in the afternoon, besides other eminent personages, their Royal Highnesses the Prince and Princess Christian, the Prince and Princess Louis of Hesse, the Princess Louise, and other members of the Royal Family were present.

Class I, was for seventy-two single trusses, and for nurserymen only. In this Mr. Cant, of Colchester, took the first prize with, among others, excellent examples of Fisher Holmes, Mrs. Rivers, Comtesse de Chabillant, Horace Vernet, Madame C. Crapelet, Mathurin Regnier, Marie Baumann, very fine; Anna de Diesbach, President, Vicomtesse de Cazes, Senateur Vaisse, Queen Victoria, Mar-chal Vaillant, Jean Lambert, Lord Macaulay, fine colour; Paul Verdier, La Boule d'Or, Olivier Delhomme, Rubens, Beauty of Waltham, Dr. Andry, Madame Derrenx Donville, Exposition de Brie, Mdle. Bonnaire, Charles Lefebvre, fine, but touched with the sun; Mar-chal Niel, very fine; Alfred Colomb, Madame Bravy, Leopold Premier, Mdle. Marie Rady, Souvenir d'Elise, Niphetos, very fine; Duchesse de Caylus, Xavier Oliho, Madame Victor Verdier, Cloth of Gold, Marguerite de St. Amand, and Souvenir d'un Ami.

Messrs. Paul & Son were second, pressing very closely for the first place, and had Exposition de Brie, very fine; Mdle. Marie Rady, Madame Vidot, Madame Fortado, Camille Bernardin, Prince de Portia, Felix Genero, Xavier Oliho, Mdle. Marguerite Dombain, Alfred Colomb, Horace Vernet, Madame Victor Verdier, Pierre Notting, Black Prince, Maurice Berardin, Monsieur Fortado, and Leopold Premier, the last very fine. Mr. Fraser, of Lea Bridge Road, who was third, had, among others, Madame Belledun Ker, a pretty white; Gloire de Vitry, small but good; Andre Leroy, fine velvety crimson purple, but rather open; Jean Lambert, Dr. Andry, Senateur Vaisse, and Duc de Rohan. Messrs. Francis, of Hertford, were fourth, and Mr. Clarke, Streatham Place, Brixton, also exhibited in this class,

In Class 2, for three trusses of forty-eight varieties, Messrs. Paul and Son were first with trusses which for effect and general excellence constituted the finest exhibition seen on this occasion—indeed, there was hardly a truss which was not fine. The most notable were Duke of Wellington, Comte de Nanteuil, Maréchal Niel, splendit, Alfred Colomb, Jean Lambert, Souvenir d'un Ami, Maurice Bernardin, Comtesse de Chabillant, Victor Verdier, Josephine Beauharnais, Dr. Andry, Madame Caillat, Monsieur Boncenne, fine velvety crimson, John Hopper, Madame Margottin, Xavier Olibo, very fine, Lælia, Madame Moreau, Mlle. Bonnaire, Duke of Edinburgh, rich scarlet, Prince de Portia, Duchesse de Caylus, Sénateur Vaisse, Leopold I., Queen Victoria, Baron Gonella, Gloire de Santenay, Antoine Ducher, Pierre Notting, Marguerite de St. Amand, Mlle. Marie Rady, Triomphe de Rennes, Clement Marot, and Marie Baumann. Mr. Cant, to whom the second prize was awarded, had also a remarkably fine stand, in which were La Brillante, La Boule d'Or, Exposition de Brie, Madame Victor Verdier, Camille Bernardin, Mrs. Rivers, Devoniensis, Maurice Bernardin, Lord Clyde, Mlle. Bonnaire, Jean Lambert, Madame Verschaffelt, President, Marie Baumann, Xavier Olibo, splendit, Maréchal Niel, beautiful in colour, Niphotos, Duchesse de Caylus, Pierre Notting, John Hopper, Alfred Colomb, Thorin, bright rose, Rubens, Fisher Holmes, Souvenir d'Elise, and Monsieur Boncenne. Messrs. Francis, who were third, had very good trusses of Xavier Olibo, Madame Boutin, Alba Mutabilis, Triomphe de Rennes, Mlle. Bonnaire, Charles Lefebvre, Pierre Notting, Louise de Savoie, Madame Victor Verdier, Dr. Andry, Duchesse de Caylus, and some others. The fourth prize went to Mr. William Paul, who had splendid trusses, but owing to the hot weather mostly overblown. Still they were very effective, especially Marie Baumann, Lady Sutfield, Black Prince, a splendid Rose, Abel Grand, Maréchal Vaillant with a brilliant glow of scarlet, Lord Macaulay, Louis XIV., François Louvat, and Madame Victor Verdier.

Class 3 was for twenty-four Hybrid Perpetuals, three trusses of each. In this the first prize went to Messrs. Perkins, of Coventry, who furnished fine trusses in beautiful condition, the kinds being Sœur des Anges, Lord Clyde, Prince de Portia, Lælia, Beauty of Waltham, Camille Bernardin, Madame Victor Verdier, Mlle. Marguerite Dombain, John Hopper, Duc de Rohan, Pierre Notting, Duchesse de Caylus, Baron Gonella, Mlle. Marie Rady, Mlle. Bonnaire, Jean Lambert, Sénateur Vaisse, Marguerite de St. Amand, Alfred Colomb, Madame Moreau, Charles Lefebvre, Victor Verdier, Mathurin Regnier, and Madame Charles Wood. Mr. Cant, who was second, and Messrs. Lee, who were third, had fine flowers of several of the above and other varieties. A fourth prize was awarded to Mr. Clarke.

Class 4 was for single trusses of twenty-four kinds. Here Mr. Cant was first with a stand in which were Charles Lefebvre, Rubens, Mlle. Annie Wood, Madame Rival, Beauty of Waltham, Anna de Diesbach, Maurice Bernardin, Niphotos, Jean Bart, Souvenir d'Elise, Madame Charles Wood, John Hopper, Horace Vernet, Maréchal Niel, splendit, La Brillante, Mlle. Marguerite Dombain, Xavier Olibo, Marie Baumann, Mathurin Regnier, Madame Pulliat, Madame C. Crapet, Maréchal Vaillant, Gloire de Vitry, and Dr. Andry. To Messrs. Perkins, of Coventry, the second prize was awarded for a stand in which were Dr. Spitzer, a showy bright red Rose, Rushton Radclyffe, fine, Mrs. John Berners, Antoine Ducher, Alfred Colomb, Pierre Notting, and good blooms of several other kinds. Mr. Clarke, of Brixton, took the third prize.

The best stands in the amateurs' class for forty-eight single trusses came from the Rev. S. Reynolds, Hote, Cauntun Manor, Newark, and contained John Hopper, Souvenir d'un Ami, Madame Charles Wood, Mathurin Regnier, the best bloom of the kind in the Show, Fisher Holmes, splendit, Madame Moreau, Sénateur Vaisse, Jean, Maréchal Vaillant, Triomphe de Rennes, Gloire de Vitry, Gloire de Santenay, Leopold Premier, very fine, Lord Raglan, Alfred Colomb, Comte de Nanteuil, Prince Camille de Rohan, Antoine Ducher, Maréchal Niel, Madame Victor Verdier, a splendid Duc de Rohan, Charles Lefebvre, Pierre Notting, Lord Clyde, and Louise Magnum. The second-prize stand of Mr. Hedge contained excellent examples of some of the above, Madame Willermoz, Lamarque, Cornelia Koch, Marie Baumann, &c. Mr. Chard, gardener to Sir F. H. Bathurst, Bart., Salisbury, was third; and Mr. Porter, gardener to P. Hughes, Esq., Walthamstow, fourth.

In Class 6, for thirty-six single trusses, Mr. Keen, gardener to J. G. Sheppard, Esq., Campsey Ash, had a magnificent bloom of Duc de Rohan, by far the largest in the Show. Alfred Colomb, Queen Victoria, John Hopper, Madame Victor Verdier, Pierre Notting, Niphotos, and several others were also good. The Rev. S. R. Hote was second with fine examples of Sophie de Coquerelle, Alfred Colomb, and other kinds already named as being exhibited in his stand of forty-eight. Mr. Ingle was third; Mr. Hedge, fourth.

In Class 7, for twenty-four single trusses, the Rev. E. Pochin, Sibley Vicarage, Longborough, gained a well-merited first prize with a stand in which all the trusses were in fine condition. Maurice Bernardin, Alfred Colomb, and Vicome Vigier, among crimson kinds were remarkably good, so was Charles Lefebvre, though showing a little eye. Xavier Olibo was splendit, and of other kinds we noted Pierre Notting, François Lacharme, Felix Genero, François Louvat, Devoniensis, Louise de Savoie, Niphotos, Madame Willermoz, Général Pellissier, very good, but not often so; Baron Gonella, Duc de Rohan, Gloire de Vitry, Maréchal Niel, Madame Boutin, Anna de Diesbach, Louise

Peyronny, and Madame Boll. Mr. Postans, of Brentwood, was second, and had excellent trusses; Mr. Skinner, gardener to Capt. Christie, Westerham Hill, and Mr. Stoddart, Wivenhoe Park, being third and fourth.

For twelve trusses the Rev. E. Pochin was again first, exhibiting beautiful examples of Leopold Premier, Louise Peyronny, Charles Lefebvre, Gloire de Vitry, Duc de Rohan, Maréchal Niel, Pierre Notting, Madame Derronx Donville, M. Boncenne, Madame C. Crapet, Alfred Colomb, and Baron Gonella. Mr. Soder, gardener to O. Hanbury, Esq., Brentwood, took the second prize, the third was withheld, and the fourth went to Mr. Quinell.

The next Class, 9, was for eighteen new Roses of 1865 or 1866. After a continuance of such hot dry weather as we have lately had, very little can with safety be said about them and their colours. Still, as a rule, it may be concluded that varieties which are good under such circumstances will also be good in more favourable seasons. Messrs. Perkins, of Coventry, took the first prize for a stand in which Black Prince, shaded dark crimson, large and full, was conspicuous as one of the finest Roses in the Show. Among others were Gloire de Ducher, bearing, as shown, considerable resemblance to Black Prince, but not so full; Horace Vernet, shaded crimson and scarlet; Jean Lambert, Mlle. Marie Rady, Camille Bernardin, and Prince de Portia, crimson scarlet; Alfred Colomb, cherry red; Thorin, bright rose; Mlle. Marguerite Dombain, Comtesse de Jancourt, Charles Verdier, and Madame Eugène Appert, shades of rose and pink. Mr. Cant, who was second, had besides some of those just named, Madame George Paul, crimson scarlet; Mlle. Annie Wood, fine red; Hippolyte Plantin, salmon rose; Exposition de Brie, Antoine Ducher, Napoleon III., Mrs. Berners, lilac rose with a glow of scarlet in the centre; Mrs. Ward, peach; and others. Messrs. Paul and Son were third; Mr. Coppin, fourth. The first prize in Class 10, for twelve trusses of any new Rose of 1866, was adjudged to Mr. Cant for Antoine Ducher; and extra prizes were awarded to Alfred Colomb, from Messrs. Lee and Mr. Fraser. This Rose from both exhibitors was splendit, and especially the trusses shown by Messrs. Lee, and would have taken the first and second prizes had it not been considered a Rose of 1865.

Of yellow Roses shown in Classes 12 and 13, beautiful trusses came from Messrs. Cant, Fraser, Hedge, and Stoddart. Maréchal Niel from Mr. Cant was remarkable, not only for the size of the trusses, but its rich golden colour. Other kinds well represented were Gloire de Dijon, Céline Forestier, Vicomtesse de Cazes, La Boule d'Or, Cloth of Gold, Solfatère, Madame Faleot, and Narcisse, of which Mr. Hedge had fine trusses. Mr. Cant took first prizes in both classes; Mr. Fraser and Mr. Hedge being second in Classes 12 and 13 respectively.

Of Tea-scented and Noisette Roses the best twelve in the amateurs' class were contributed by Mr. Hedge, and consisted of Souvenir d'un Ami, Triomphe de Rennes, Moiret, Souvenir d'Elise Vardon, Maréchal Niel, Cornelia Koch, Gloire de Bordeaux, Niphotos, Devoniensis, La Boule d'Or, Gloire de Dijon, and Adam. Mr. Stoddart, who was second, had Homer, pale yellow edged with pink, Niphotos, and Adam. In the nurserymen's class for the same Roses Messrs. Paul & Son and Mr. Cant took the first and second prizes, each with very fine examples of varieties just named, Monsieur Furtado, Madame Margottin, Lamarque, Rubens, and Madame Bravy.

The best stand of twelve single blooms, shown in the open Class 16, came from Mr. Cant, and consisted of Charles Lefebvre, Maréchal Niel, Maréchal Vaillant, Anna de Diesbach, Xavier Olibo, Alfred Colomb, Madame Caillat, Madame Moreau, Niphotos, John Hopper, Mad. C. Wood, and Exposition de Brie, all of which were fine. Messrs. Perkins were second, and Mr. Coppin third.

Of vases and baskets of Roses but few were shown. The first prize went to Mr. Chard for a pretty arrangement, along with Ferns, in a March stand, the stem of which was entwined with the young growth of Bignonia argyrea-violescens, presenting a very agreeable change from the Japanese Honey-suckle generally employed. The second prize went to Mr. Soder for a similar stand with Japanese Honey-suckle round the stem, and the third to Messrs. Paul & Son, for a large basket on a wickerwork stand.

Several fine bouquets of five trusses of Roses were exhibited, mostly in Hyacinth glasses, the best being from Messrs. Paul & Son, and consisting of Marie Baumann, Pierre Notting, Triomphe de Rennes, Lælia, Alfred Colomb, and Xavier Olibo. Mr. Cant had in his six fine trusses of Niphotos, Maréchal Niel, and Mlle. Bonnaire. Mr. Hedge was third.

Of miscellaneous subjects but few were exhibited. Messrs. Rollison, of Tooting, sent a collection of Orchids, in which were Cattleya citrina, Calanthe masnea, A. rides Lobbi, with a spike fully 18 inches long, Barkeria species with pretty pale lilac flowers, Dendrobium MacCarthia with four flowers, Cyrtopogon superbiens, Phalenopsis cervicornu with yellow flowers barred with rich cinnamon brown, a fine variety of A. rides odoratum, and a seedling Heath, apparently the result of a cross between the Aristata and Tricolor sections. From Mr. Sherratt, gardener to J. Bateman, Esq., Knypersley, came fruit of a species of Myrica, under the name of Yanguae, and cones of Abies nobilis; Mr. Noble sent out spikes of the beautiful Spiraea palmata, noticed last week; Mr. Perry, new Verbenas; and lastly Mr. Dobson, of St. James' Street, contributed a fine example of dinner-table decoration, in which the centrepieces resemble the March stands, but have gracefully curved twisted glass arms supporting glass pendant

baskets, to be filled with flowers. The effect of these is excellent. Bordering the table were jappanned zinc troughs, of course very shallow, with semicircular projections. Flower glasses being attached to these, both at the outside of the parts farthest advanced, and on the inside elsewhere, a double row of flowers or other ornaments is obtained round the table.

FLORAL COMMITTEE.—The Committee was summoned to meet at Chiswick on the 29th to examine the Fuchsias and annuals, at least those of the latter which have survived the long-continued drought.

Among the Fuchsias, which were fine young healthy specimens, the following received awards. Many of the newer kinds were not in flower, and will be inspected on another occasion. *Elysée d'Amour*, three marks, a rich highly coloured corolla with bright scarlet sepals; *Vainqueur de Puebla*, a fine double white corolla, two marks; *Light Heart*, very dark corolla, fine form, three marks; *Rhoderick Dhu*, fine flower, but rather lax in habit, two marks; *Constellation*, fine dark corolla, three marks; *Bland's Floribunda*, one mark. This is not a pot plant; to judge of its merits it must be planted out; and then for its compact and neat habit, its conspicuous though small flowers, scarlet tube and sepals, with white corolla, it is most useful and ornamental. *Enoch Arden*, with a large, dark, expanded corolla, and bright crimson sepals, is a flower of great merit—three marks were assigned it. *Father Lantius* was not so fine as last year. Two marks were given, but the plants were not in condition. This is one of the best varieties when well grown.

Double *Petunias* were also examined. *Elise de Fontadier*, which received three marks, is a fine rose-coloured variety; *La Coquette*, three marks, a neat but small-flowering plant, with beautifully veined flowers—this is a very desirable variety.

Among the seedling *Petunias* there were many good as seedlings. *Fanty*, one of Mr. Bull's, was superb; a veined grey flower with intensely dark stripes, nearly circular in form, of first-rate habit. It received three marks.

Among the annuals, which have nearly all come to grief from lack of rain, *Tropaeolum Tom Thumb* *Caruleum roseum* received three marks. This is novel in colour, a dull rosy red shade, its chief recommendation being novelty in colour. *Tropaeolum King of Tom Thumbs*, with vivid flowers and dark foliage, received three marks. This plant seemed to be of close and compact habit. Sweet Pea *Invincible* maintains its good character, and is now duly appreciated by the public as a distinct and beautiful variety—three marks. Sweet Pea *Invincible Black* is another distinct and good flower, the darkest yet seen. Three marks were given it. This is worthy of cultivation as the best dark variety. *Gilia laciniata*, a dwarf kind, of a dark leaden blue, was approved of as a useful plant as an annual. Three marks were given it.

The bedding *Lobelias* of the *Erinus* family were examined. Beauty of *Ravensbourne*, a pinkish red variety, very dwarf and compact, received three marks. *Trentham Blue*, which has been sent out by the Messrs. Veitch, was much admired for its freedom of flowering and its robust habit and dark blue flowers: this will prove a most useful plant for bedding or edging purposes. Three marks were given it. Little Gem *Lobelia*, a neat, dwarf, compact, light blue and white variety of the *Paxtonian* strain, was awarded three marks.

The *Pelargoniums* were passed through, but at present are not fit for adjudication. The specimens planted out are in fine condition, showing much flower, and many of the new varieties promise to be of first-rate quality. These will be examined at the end of July, or when in condition.

It is very satisfactory to see what has been done in the Zonal section of *Pelargoniums*. No plant has ever been brought to such a state of perfection, whether we consider the beautiful, highly coloured, and varied foliage, or the perfection of the form, or the truss of flowers. As bedding as well as greenhouse plants, the Zonals have arrived at their meridian; and now it will be well for horticulturists and florists to give a little attention to a plant which is always a pleasing companion to the Zonal *Pelargoniums* in the autumn months—we mean the *Fuchsia*. It is most desirable that attention should be given to this plant, for it is quite as capable of improvement as the Zonal *Pelargonium* was. A simple rule as to perfection is all that is required; old and worthless kinds will then be discarded, and the standard of perfection sought after. We have many *Fuchsia* raisers; perhaps among them Mr. Banks, of Sholden, in Kent, stands pre-eminent. Many of his flowers have been introduced to the public by the Messrs. Henderson, of Wellington Road, but we have not yet seen any well-grown specimens of the newer kinds. We may hope that Mr. G. Smith, of Hornsey, one of the best and most successful raisers of *Fuchsias*, will direct anew his energies to improve this flower; and very much may be expected from Mr. Cannell, of the *Fuchsia* Nursery, Woolwich, in the same direction, Mr. Cannell being at present the largest cultivator of the *Fuchsia*. We hope, then, soon to see the cause of this most graceful and useful flower warmly advocated; when once set in motion, there will be many ardent admirers and cultivators to give an additional impetus. May a *Fuchsia* mania soon show itself among us.

PAXTON MEMORIAL.—A few days since an address was presented to Lord Charles Russell by the Working Men's Mutual

Improvement Society of Leighton Buzzard, sustaining his Lordship's suggestion that a memorial of Sir Joseph Paxton should be erected. We hope to give full particulars next week.

ROYAL BOTANIC SOCIETY'S SHOW.

THE last Show of this Society for the season opened yesterday, and will be continued to-day. In addition to a fine display of flowering stove and greenhouse plants furnished by Mr. Peed, Mr. Williams, Mrs. Cole & Sons, Mrs. Glendinning & Sons, Mr. Tanton, Mr. Donald, and other exhibitors, there are in the collections of ornamental-foliaged plants from Mr. Fairbairn, gardener to the Duke of Northumberland; Mr. Smith, gardener to T. Nixon, Esq.; Mr. Williams, and Mr. Baines, gardener to H. Micholls, Esq., some remarkably fine specimens. The *Sarracenia* from Mr. Baines form masses such as have only been exhibited by himself. Heaths are again numerous shown; and of *Pelargoniums*, Show, *Fancy*, and *Zonal*, excellent collections are furnished by Messrs. Fraser, Ward, Catlin, Weston, Stevens, Watson, and others. Mr. Penny and Mr. Wilson, gardener to W. Marshall, Esq., send fine Orchids, and hardy Ferns are largely exhibited by Messrs. Ivery & Son.

Messrs. Veitch have a very extensive and interesting collection of new and rare plants, one of which, a species of *Puya*, has bluish flowers with a metallic appearance and lustre, and prominent yellow stamens, altogether a very remarkable plant. *Ampelopsis Veitchii*, a very ornamental hardy climber, the new *Coleuses*, *Gloxinias*, and a large number of other novelties are included in this collection. Mr. Williams also sends several new plants in addition to his fine contributions of older plants, and Messrs. E. G. Henderson have a large group of bedding plants beautifully arranged.

The fruit, however, constitutes the great feature of the Show. Among collections, a very fine one comes from Mr. Miller, gardener to Lord Craven, Combe Abbey; in it the Black Hamburgh and Foster's White Seedling Grapes, and the *Violette Hâtive Penches* are especially worthy of remark. Mr. Bannerman, gardener to Lord Bagot, Rogeley, and Mr. Johnson, gardener to the Marquis of Ailesbury, Savernake, have also excellent collections. Of Pines there are several very fine specimens from Mr. Barnes, of Bicton, who has Black Prince, weighing 10½ and 12 lbs., Queens of nearly 6 lbs., Charlotte Rothschild of 5½ lbs. Mr. Young sends remarkably fine heavy Queens and Smooth-leaved Cayenne, and Mr. Davies and Mr. Kemp beautifully ripened Queens, whilst Mr. Hansen, Cyfarthfa, has large fruit of the Providence.

Of Grapes Mr. Hill, Keele Hall, Mr. Meredith, and Mr. Henderson, Coleorton, send baskets of Black Hamburgh; and very fine dishes of the same variety come from Mr. Meredith, Mr. Meads, Mr. Henderson, Mr. Miller, Mr. Johnson, Mr. Squires, and some others. Buckland Sweetwater is shown in fine condition by Mr. Meredith; and of Royal Vineyard very large bunches come from Mr. Kettlewell. Mr. Meads has excellent Black Prince, and Messrs. Standish finely ripened Muscats. Other exhibitors show large bunches of these, but not exhibiting the beautiful golden tinge of perfect ripeness. Messrs. Standish & Co. again exhibit their excellent Royal Ascot Grape, and bunches of Ascot Citronelle, a delightfully flavoured white Grape, which promises also to form good-sized bunches.

Of Peaches Mr. Miller has splendid fruit of Royal George and *Violette Hâtive*; and Mr. Bailey, Shardeloes, has several fine dishes of Strawberries.

Mr. Barnes, of Bicton, has quite a novelty at exhibitions—the immense cone of *Arancaria imbricata* weighing 5 lbs., also male catkins of the same plant, cones of *Picea nobilis* weighing 2 lbs., and those of other Conifers.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE twenty-fifth Anniversary Meeting of this Institution was held at the London Tavern on the 24th of June, M. T. Bass, Esq., M.P. in the chair. The company was more than usually numerous, and the room in which the dinner took place was even gayer than usual with flowers and fruits from Sandringham and other gardens. Behind the Chairman was a fine display of flowering plants, with large tree Ferns on each side, and other parts of the room as well as the staircases leading to it were studded with fine-foliaged plants, the whole being the contributions of Messrs. Veitch, Lee, Williams, Turner, and Fraser.

The usual loyal toasts having been drunk, the Chairman in proposing the toast of the evening, "Success and Prosperity to the Institution" urged its claims to support, and expressed a confidence that that support would not be wanting, for, said he, "show me a man who takes pleasure in his garden, and I will show you a kindly fellow. Show me a lady who is fond of her garden, and she will be found to be possessed of the most elevated tastes and acquisitions. It is the ladies who lead the way in gardening, it is the ladies I wish to enlist in the cause of the Institution, and wherever the ladies lead, the men must follow."

Sir Robert Peel, Bart., M.P. in proposing the health of the Chairman expressed gratification at seeing around many who had supported himself at the last Anniversary, but there was one whom he missed, Mr. Veitch, who, he regretted to learn, was absent from illness. It

was at his (Sir Robert Peel's) recommendation that Mr. Bass had consented to take the chair on the occasion, and there could not have been a better Chairman than one who furnished so bright an example of liberality of conduct, whose purse was ever open, whose hand was never closed.

The next toasts given were the "Houses of Legislature," coupled with the name of T. W. Evans, Esq., M.P.; "The Treasurer," Mr. Wrench; "The Secretary," Mr. Cutler; and The Horticultural and Botanic Societies of London, coupled with the name of Mr. G. F. Wilson.

Mr. Wilson in replying, said that he had once before had the pleasure to respond to the same toast on a similar occasion, but since that time the Royal Horticultural Society had been exerting itself in two very opposite directions, in one of which it had already met with a marked success as exemplified in the new Colonnades, and in the other the new Scientific Committee promised most favourably.

Sir Robert Peel then proposed "The Nursery and Seed Trade," to which Mr. John Lee, Mr. Nash, and Mr. Harry Veitch replied, the last-named remarking that his father's indisposition was brought on by overwork and would probably soon give way to rest.

The donations amounted to nearly £100, and included the following:—M. T. Bass, Esq., £20 5s.; Mrs. Bass, £10 10s.; A. Bass, Esq., £10 10s.; Lord Sondes, £10 10s.; Baron Rothschild, £10 10s.; Sir Robert Peel, Bart., £10 10s.; J. C. Evans, Esq., £21; F. Wigan, Esq., £10 10s.; O. R. Cozier, Esq., £10 10s.; W. Ranbury, Esq., £10 10s.; J. Foster, Esq., £10 10s.; Thomas Moore, Esq., £5 5s.; Dr. Hogg, £5 5s.; Messrs. Veitch & Sons, £10 10s.; Messrs. Lee, £5 5s.

ENTOMOLOGICAL SOCIETY'S MEETING.

THE June Meeting was held at Burlington House, the President W. H. Bates, Esq., in the chair. Amongst the donations to the Society's library received since the last meeting, were the publications of the Zoological and Botanical Society of Vienna, the Entomological Society of Stettin, the work of Herr Thomsen on the Insects of Scandinavia, &c.

The Secretary called the attention of the meeting to the proposed exhibition of economic entomology during the month of August next, the programme of which is of a very extended character, and promises to render the exhibition a very valuable one. It is to be held in the great building in the Champs Elysées.

Mr. McLachlan exhibited the caterpillar of one of the Phryganide, which was taken by Mr. Fletcher crawling about the bark of a Willow tree near Worcester, thus differing from the aquatic habits of the remainder of the tribe. He considered that it was the larva of *Enoyella pusilla*, which has been ascertained on the Continent to be a non-aquatic species, and of which the female is wingless.

Mr. Butler exhibited specimens of *Otiorynchus picipes*, which had proved very injurious by biting off the young shoots of Roses and Horse-chestnuts.

Mr. Jenner called attention to a report of the Proceedings of the Scientific Committee of the Horticultural Society, in which the operations of the larva of *Coleophora Hemicobiella* were detailed, and in which it was erroneously stated that the insect acts in the same manner as a leech, in sucking the leaves, and rolls up the leaves like a cigarette.

Mr. Keays exhibited *Psyche crassirella* from Hornsey Wood; also, Oak leaves, portions of which had been rolled up into egg-cases by *Attelabus Curculionoides*.

The Hon. T. De Grey exhibited larvæ and pupæ of *Hypercallia Christianna*, the former found during the months of April and May, upon *Polygala vulgaris*, near Shoreham. One of the larvæ had changed to the pupa state during the sitting of the meeting.

Mr. H. Burmeister, jun., exhibited drawings of the larvæ and pupæ skins of many species of Brazilian Butterflies. He had determined the true character of the pupæ of the genus *Ageronia*, which Mr. E. Doubleday had from false characters created into a distinct family. The pupa is, however, simply suspended by the tail like those of the ordinary *Nymphalidae*. He had also ascertained that the larvæ of the anomalous genus, *Castnia*, feed on the bulbous swellings at the base of the stems of *Orchidaceae* plants in Brazil.

Mr. Edward Sheppard read a note relative to the formation of small balls of earth by the curious Beetles belonging to the genus *Meloe*, and Professor Westwood gave an account of the manner in which the sacred Beetles form and roll large pellets of dung and earth, which they bury in the sand, as recently observed by himself at Cannes and Pompeii. Mr. De Grey also exhibited specimens of the longicorn Beetle, *Acapanthea Carlini*, which he had bred from the larvæ which reside on the dead stems of Thistles in the Norfolk fens.

EAST SUTTON PARK.

IN travelling from London to Dover by the South-Eastern Railway, it will be found that the line from Tunbridge to Ashford passes in a great measure through a flat country, more especially beyond the Paddock Wood station; but the traveller will perceive a more hilly country two or three miles to the north of the line. This rising ground soon appears to assume the character of a ridge of considerable elevation, which extends

for some miles parallel or nearly so to the railway, and three or four miles from it. The base of the ridge forms the northern boundary of the district called the Weald of Kent, of which geologists speak so much, and which may be described as a rather flat district, though not a dead level, in which the soil has a heavy clayey subsoil, and in most places is highly cultivated. The ridge differs considerably from the valley, although it is not on the chalk formation met with elsewhere, Kentish ragstone cropping out as well as being quarried in many places; while in others the surface is thickly strewn with a hard kind of stone in pieces not much larger than road metal, the soil in the latter case partaking more of an oolitic character, and water is less plentiful in this description of surface than where ragstone predominates. Both soils, however, are favourable to the growth of certain kinds of trees to a degree which their appearance would not indicate, most deciduous trees and hedges thriving remarkably well. The heights have for many years been favourite places to build residences upon—not on the top, which is perhaps too bleak, but on the southern slopes, which overlook the Weald above mentioned for many miles. Among the mansions which adorn these commanding positions one of the most ancient is Sutton Castle, no longer a dwelling house, but an Ivy-clothed ruin. It is said to have been the residence of Aymer de Valance, Earl of Pembroke, soon after the Conquest, and the adjoining village still retains the name of its once-proprietor, being called Sutton Valance. This pleasantly situated village as well as the Castle is built on a steep declivity, there being as much as two storeys difference in the height of the house on the lower and upper sides. Modern improvements aided by the disciples of McAdam have removed many of the romantic features of the place, but its lovely view over acres of orchards and hundreds of acres of Hop gardens remains the same, if, indeed, it is not improved; but as my journey is still further eastward I must dismiss the village and its venerable ruin, and a short and pleasant walk, the greater part of it through the park, brings me to the place I more particularly wish to describe.

East Sutton Place the seat of Sir Edmund Filmer, Bart., is one of those commodious mansions erected in the time of the seventh Henry. The brick house enriched by angles and recesses, windows plentifully furnished with stout mullions, and gables and chimney stalks to match, constitutes a building of large extent, stamped with the marks of antiquity, yet not so much so as to create a feeling that discomfort must exist internally, and improvements judiciously introduced have rendered the interior all that could be wished. The mansion is snugly and delightfully situated in a park, which of itself presents more diversity of surface and features of interest than most enclosures of the kind, and commands a view of a dozen miles or more to the south, east, and west. It is built on the slope of the ridge alluded to, about four miles from the Headcorn station on the South-Eastern Railway, and about the same distance from Staplehurst. The carriage front is on the southern side, which is open to the park, and near to the house this is moderately level, but it soon begins to descend rapidly to the south, and a piece of ornamental water occupies the lowest corner on the south side; while the steep and irregular ground is here and there plentifully furnished with timber trees of great size and age, many of those near the house being Walnuts, whose whitened bark has evidently been blanched by many a winter. Oaks, Chestnuts, Elms, and other trees also abound, and I incidentally measured an Ash tree that promised to do duty yet for a century or more, and found its circumference in the smallest part between the root-claws and the branches to be 27 feet. There possibly might be many larger, but this one happened to be near at hand. A herd of deer reposing in the valley formed an appropriate feature; while the eye had only to extend its research, and thriving orchards, Hop gardens, and the appearance of a highly cultivated country bounded the view far and wide.

Having said that the carriage front is open to the park on the south side, the dressed ground may be said to surround it on all the other sides. A neat geometrical flower garden occupied a position facing the west. The beds were all well filled, and had evidently been very gay at an earlier period in the year; *Stella Pelargonium* retaining the highest position amongst its class here as well as at most places that I have seen it, even when competing with newer kinds. As an ornament to the flower garden it is questionable whether it is more necessary to general effect than *Christine* or a similar variety, of which there were excellent examples; but it was rather painful to witness, amidst the general success of plants so used, that Cal-

ceolaria Aurea floribunda was a failure in some degree, though not to the same extent as at some places, Linton for one. The blanks left by plants partly dying off, or at all events ceasing blooming long before they ought to have done, led Mr. Skinner, the very able and intelligent gardener here, to threaten to do away with it, as another variety of taller growth seemed not to be so affected. Among *Verbenas* Purple King and Crimson King were the greatest favourites; while a seedling *Petunia*, or, rather, plants propagated from a seedling of a former year, seemed to have prospered better than this plant usually does in most places.

A large flower bed in another place now caught my eye, and I left this interesting group and proceeded to the new attraction. I found that it was a circle placed so as to be well seen from an important window facing the north, which, notwithstanding what may be said about looking out in that direction,

is certainly the very best point to view flowers from; for as many of them open to the south only, the brightness they present on that side contrasts strongly with the appearance which they have when viewed in the contrary direction. Of course the bed was far enough from the house not to be shaded by it, and the flowering was all that could be desired. This bed, represented in the accompanying figure, is 45 feet in diameter, and is annually planted with bedding plants arranged to form a pattern, of which that now given is perhaps not the best example, as it is altered each year; a fresh disposition of plants for winter ornament is likewise made. The bed is placed on the lawn, trees and shrubs being at no great distance from it; but it is not bounded by any walks. Its appearance from above must be like a piece of rich embroidery, and with the exception of the *Calceolaria* the plants seemed to have all done well.

FLOWER BED AT EAST SUTTON PLACE.

- | | |
|--|---|
| <p>1. <i>Pelargonium Stella</i>, edged with a tall yellow <i>Calceolaria</i> called <i>Viscosissima</i>, and in the centre of all a group of <i>Flumea elegans</i>.</p> <p>2. <i>Verbena Purple King</i> in eight compartments, edged with the same <i>Calceolaria</i> as that used in No. 1.</p> <p>3. <i>Pelargonium Shottisham Pet</i>, silver-edged, forming the groundwork.</p> | <p>4. <i>Calceolaria Aurea floribunda</i> in a single line or ring, separating the centre from the outer band.</p> <p>5. <i>Verbena Crimson King</i> in thirty-two circles, each edged with <i>Cerastium</i>. <i>Lobelia speciosa</i> forms the groundwork on both sides, as well as an edging next the turf.</p> |
|--|---|

As will be seen by the above, the varieties of plants used were not numerous; nor is it advisable that they should be so, as the most pleasing results are often obtained by a judicious selection of the most simple colours. In the present arrangement I believe an outer edging of *Golden Chain* was contemplated, but abandoned for want of sufficient plants, and it is

questionable whether it would have been any improvement. The single line of *Calceolaria Aurea floribunda* (4), after flowering well in the early part of the season, died off very much, and thus in some degree injured a design which, as those who have such things know, is rarely perfect in all its parts; but, taken as a whole, the bed may be regarded as a great success, the

other plants, including the taller yellow *Calceolaria*, being all that could be desired, and when at its best must have been much admired.

In another part of the grounds I noticed a flower border on a rather steep bank planted very effectively. The border was about 12 feet wide, and was divided into diamond-shaped and triangular compartments by diagonal cross lines of *Cerastium*, making a good-sized diamond shaped compartment in the centre, and triangles of half the size at the outside. The diamond-shaped portions were planted with *Tom Thumb P. largonium*, which still retains a good place in the bedding-out flower gardener's estimation, and the triangles with *Lobelia speciosa*, the whole being edged with *Cerastium*. Consisting of only three kinds of plants of as many colours—namely, red, white, and blue, this arrangement had a very pretty effect. Another border, not so wide, was arranged differently, the lines of demarcation forming a sort of zigzag or serrated pattern; but it was on the whole less effective, a greater number of plants being used; and although all had done well, the simplicity of the design previously noticed was preferable.

Some other beds in the grounds were very attractive, particularly one—a raised bed of three circles united at the edges; the central one, larger than the other two, was very good. The only plant showing symptoms of going off was *Centaurea candidissima*, which, as with me both last year and this, was anything but healthy. In another place was *Centaurea gymnocarpa*, luxuriant enough, but not so much to be depended on as *Cineraria maritima*, to which Mr. Skinner, as well as myself, and I believe Mr. Fish, give the preference: for although the *Centaurea* is of more free growth than the *Cineraria*, the aptitude of the autumn-struck plants to run to seed early in summer, and when in that condition their liability to die off without making foliage, leave a greater number of ugly gaps than is pleasing. *Centaurea candidissima* is certainly not subject to this, and is less prone to flower and seed than any of the three; but with me during the last two years the points of the leaves have become crumpled and dead, and a sickly appearance pervades the whole plant. This is much to be regretted, as we have no plant so white, and its habit and other features are all that can be desired. Mr. Skinner had discarded *le-rine Herbstii*; but *Coleus*, *Amarantus*, *Perilla*, and other plants were introduced with good effect where wanted.

In the grounds I noticed some good specimens of *Coniferae*, particularly one of the best specimens of *Taxodium sempervirens* that I have ever seen, and which was standing out prominently amongst others, while there was no lack of *Roses* and other shrubs.

The kitchen garden, which adjoins the eastern side of the pleasure ground, also contained good examples of ribbon borders by the side of one of its principal walks, and the glass structures excellent *Black Hamburg* and *Muscot* of *Alexandria Grapes*. A new viney devoted to late *Grapes* showed unmistakably that the very popular *Lady Downe's* requires almost the same amount of heat as the *Muscots*, for its condition was less satisfactory than that of the *Hamburgs*, which, as well as the *Muscots* in another house, were all that could be desired. *Peaches* had been gathered early in the year from another house, and in a central one greenhouse plants were grown as extensively as the house would allow. Perhaps the most interesting feature was another kitchen garden separated from the first one by a road passing between. This garden was only formed about four years ago, and yet the walls, 11 feet high, are quite covered with excellent bearing *Peach* and *Apricot* trees on the south and west aspects. The *Apricots* had done remarkably well in 1866, but less favourably in 1867, which was amply made up by the heavy crop of *Peaches*, some continuing in bearing till October; a fine crop of *Late Admirable* was showing well at that time. The central and cross walks of this garden were lined with *Pear trees* trained as pyramids, most of which were in fruit. Of other crops common in kitchen gardens, not the least conspicuous was a fine breadth of *Red Beet*, the tops of which might vie with any of the occupants of the flower beds for depth and richness of colour. *Strawberries* for forcing occupied a sunny corner, and amongst them *Sir Charles Napier* was conspicuous; while in the open ground the same variety was much esteemed for its bearing qualities, as well as that of enduring travelling well—a qualification not sufficiently valued in every case, but an important one in most.

The general good appearance of the garden crops, not less than the trimness of the flower beds, and the abundance of everything required for a large family, showed that the head

as well as the hands of the manager was judiciously and skillfully employed. In looking round it would be difficult to point to anything which indicated what was the gardener's hobby, which is often enough evident, for at Sutton Park all things were equally well cared for.—J. REXSON.

WORK FOR THE WEEK.

KITCHEN GARDEN.

The principal sowings and transplantings will now soon be over for this season, and as the nights lengthen a more vigorous growth will commence. Everything lately planted out ought to be watered occasionally till the plants begin to grow freely. Birds are very troublesome to the early fruits, and must be watched, and although the garden has been kept free from weeds all the season, there are thousands of seeds of weeds now floating on every breeze, and those which fall on good ground will soon become troublesome if not looked after. *Cabbage* and *Cauliflower* plants for autumn use should be transplanted at regular intervals; those last planted out should have the ground well stirred about them, and a little soil drawn round their stems. *Celery*, the main crop might now be planted out, and the rows formerly planted should have a little earth drawn to them, first taking the precaution to stir the soil on each side of the rows which has been battered into a crust with the watering. If the earliest row does not throw up seed stalks, you may assist it very much by a good dose of liquid manure. *Cucumbers* under hand-lights, and *Vegetable Marrows*, should have a little long litter spread over the soil before the shoots are pegged out to their full extent, which will keep the fruit clean, save watering, and bring up the *Mushrooms* quickly where spawn was inserted. *Peas* and *Beans*, few people think of sowing *Peas* after next week, and this is about the time that mildew is so troublesome on *Peas*. A liberal supply of water is the best preventive. *Succession Crops*, these are now reduced to salad plants, which are always sown according to the demand and the state of the last sowing.

FRUIT GARDEN.

Those who thought proper to attend to the stopping of the shoots of *Pear trees*, &c., against walls, will be gratified by perceiving the buds swelling beautifully at the points of the small spurs, and at the bases of the shoots shortened. Allow the young shoots which have started from the foremost bud of the stopped shoot to grow a little longer, or, if becoming long, merely pinch out its point, as any sudden check to the flow of the sap after such genial rain, would be apt to break into shoots those promising buds which you would rather see adorned with blossom and fruit next season. It is a general observation that fine-looking old *Pear trees* against walls produce sparingly, and that chiefly on the points of the branches. This is partly owing to the fact that the other parts of the tree are so smothered with breastwood during the best part of the summer, that the buds finally left cannot be matured by the juice-elaborating influence of light, and to the objection of employers to leave the borders uncropped; the consequence of which is, that the roots are incited to go so deeply that they absorb juices of so rank a character that our longest and best summers are insufficient to ripen the buds on the puny shoots. The remedies for this are raising the roots nearer the surface, timely foreshortening, and slight or no cropping. By taking off the young wood from every alternate branch on old trees, choosing good shoots about a foot apart on the other branches, and, commencing at the top of the tree, tying these shoots in a pendant position to the denuded branches, and taking out these branches in the succeeding year, in a year more, other circumstances being favourable, the tree will be regularly covered with young fruitful wood. The principal work now is to guard fruit from birds, &c., to gather and preserve *Strawberries*, and to procure plants of these for next forcing time. Fill a number of 60-sized pots with rich compost, take a dibber and make a row of holes alongside of a row of *Strawberries*, push a pot into each hole down to the rim, then single out the runners and pinch-off the tops just below the newly-formed plant, double the runner on the other side of the plant, and with the forefinger push the doubling down to the bottom of the pot, and by this means the bottom of the young plant is just brought within the soil, and is firmly pegged down by its own runner or string in half the time you could do it with a peg, or with a stone or lump of soil.

FLOWER GARDEN.

There is little to attend to in this department at the present

time except cleaning and keeping everything and every place as neat and tidy as possible. Attend to the removal of flowers as fast as they decay, as nothing looks so untidy in a well-kept garden as dead flowers. Brompton Stocks must be sown immediately, but Brompton Ten Week Stocks should be sown in the first week in August. This is favourable weather for budding, and where the buds are properly matured, as they are in most places, it must be attended to immediately. Established plants of Roses that make very strong branches which hide the flowers, should have them shortened in below the level of the flowers. Tulips ought now to be safely stored; those which are seeding on the bed must occasionally be examined. When the stalk assumes a yellow tint the roots may be taken up, and the stems with capsules attached may be placed in an airy room till they become perfectly dry. Plant out the first crop of pipings, if proper attention can be given them, such as shading, watering, &c. Take advantage of the first showery weather to plant out young Pansies.

GREENHOUSE AND CONSERVATORY.

If the plants in the greenhouse are all of the true greenhouse kinds, give them as much air as the house will admit; but if, as is generally the case at this time, they are a mixed collection of half stove plants, annuals, &c., they may be kept close at night with a very damp atmosphere, and the house may be allowed to become well heated by the sun before giving air in the morning. Training and staking plants, surfacing pots, and all routine work, must be attended to. Climbers in the conservatory, if they are what they should be, will now require the greatest attention; training, thinning, and arranging them properly occupies much time, and should never be done in a hurry. Formerly it was customary in many places to tie up climbers close to the pillars and rafters, &c., in a stiff formal manner; but now it is thought they can hardly be allowed too much freedom, providing that they do not injure other plants with their shade. Orange trees and many other large specimen plants require less water about this time, but diminish the quantity very gradually. A cool refreshing air loaded with perfumes in this house is always agreeable in summer, and the only way of obtaining this is by large portions of air, by slight shading, and by pouring large quantities of water over all spare places round the house. Stove plants brought in here for flowering do not require half the quantity of water which greenhouse plants do in the same place.

STOVE.

For the next six weeks or two months, according to the weather, stove plants ought to have more air and light than at any other period. After this time shade as little as possible, with the exception of Orchids and young or newly-propagated plants.

COLD PIT.

Are warm enough to allow of the glass or canvas being taken off at night to give the plants the benefit of the night dews, which seem to suit them better than any sort of artificial moistening. When the sun shines strongly—that is, if it continues to do so as of late, throw a slight shade over the Camellias, Azaleas, Rhododendrons, and similar plants.—W. KEANE.

DOINGS OF THE LAST WEEK.

With the exception of a dull day and a shower on the 22nd, the drought has still continued, and on this day, the 27th of June, has been more trying to most things than on any previous day.

KITCHEN GARDEN.

After the shower took the opportunity of planting out strong plants of Brussels Sprouts, Broccoli, and Winter Greens, and sowing Turnips, Lettuces, &c. Those growing freely were surface-hoed to preserve in the soil the little moisture that fell. It was down, however, to such a slight depth that the advantages of the shower were more owing to the cool and shady atmosphere than the quantity of water that fell, though in the space of a quarter of an hour we added a good many gallons, collected from our glass roofs and sheds, to the supply in our tanks.

Lettuces of various kinds have been very good hitherto, chiefly those sown thinly and left to grow, as they have scarcely needed a drop of water, but looked after themselves—a great advantage in such weather over transplanted ones, which could not grow without watering and even shading. Our two first crops of Cauliflower have been excellent owing to the deep mulching, and a bed of a third crop will be fair, but we fear for

our next succession, unless there be a change of weather, as we can scarcely give them enough of water to keep them from becoming blue in the foliage in the hottest days, and in such circumstances they are apt to throw up their heads too soon. Even the next crop, standing between rows of early Peas, we can hardly keep from showing distress, though shaded by the remains of the Peas on each side of them. These Peas we would remove, turn up the ground on which they grew, and plant it with Cauliflower again so as to have two successions on the same piece, but we are unwilling to lose the benefit of the shade of the Peas as yet.

We have sown Turnips, Lettuces, Carrots, &c., but we drew the drills, watered before sowing, and after covering-in spread over the ground a slight layer of litter. In such heat and dryness it would be vain to expect young plants to grow or get above the soil, unless where there was an abundance of water, or an easy mode of applying it where wanted. Our Peas have as yet been very good, but some of the succession crops refused to set the bloom without watering, and we have helped in this way Peas, Dwarf Kidney Beans, and Scarlet Runners, watering at the root and mulching with grass or litter immediately afterwards.

Thinning.—Finally thinned all our crops of Onions, Carrots, Beet, Parsnip, Salsify, &c., as they were more easily moved after the rain on the Monday, but these had all been partially thinned some time ago. Onions were very easily thinned when the ground was hard and dry, as the roots broke when touched, close to the ground, but these thinned later will be more useful, as when laid in rows thickly they will do for salads; and many will just grow enough to give a good supply of buttons, a thing we can scarcely obtain from our strong ground in any other way. All these root and bulb crops look well, though they have never received any watering. By running a Dutch hoe along the surface weeds have been kept from appearing, and a couple of inches beneath the surface the soil is moist enough to keep on growth. In thinning Carrots at this season, the Carrots if from a quarter to half an inch in diameter, if laid in thickly in rows, as stated above for Onions, come in well for soups when the main crop would be much too large. From the middle to the third week in June is a good time to sow a piece of Carrots, as for many purposes such Carrots are sweeter and better than the spring-sown crop, and they are less likely to have a speck on them from the attacks of Carrot enemies. One of our best gardeners always sows a good breadth of Carrots in June, but this year he gumbles that the seedlings will not show above ground. In such weather they would have no chance unless the drills were previously watered and the ground slightly shaded with litter, &c., afterwards. Onions for salading we find come like points of needles without this protection.

Much against our will, we will prick out quantities of Cauliflower and Winter Greens in beds, as there we can attend to them with watering, &c. much more easily, and lift them afterwards when the ground is more suitable to receive them. In trying to dig a piece of ground on which there had been a heavy crop of Spinach, it was too much for the spade, being as hard and dry as if clay had been baked in an oven. We find even our Celery, though strong, must have more shade, as well as more water, or it will stand still, or do what Celery rarely does with us, will run up its flower stalks, which must be prevented, if possible. We have been forced to water Turnips, as we found that otherwise they would be hard and stringy, instead of sweet and succulent, as a young summer Turnip ought to be.

But for the labour in carting and carrying, it will be some time before we are so badly off for water as we were four years ago, though depending entirely on rain and drainage stored up in tanks and ponds; but many farmers in this neighbourhood have already to drive water for their animals from three to four and more miles. This is a serious affair, and shows the importance of having more means of storing up what falls freely from the heavens in the course of the season.

FRUIT GARDEN.

In the open air, Strawberries with us will be too much of a glut, as the crop will not be so continuous, on account of the dryness, and smaller fruit will look nothing after the large fruit of the first few weeks' gathering. Many of ours are drying up from the drought. It is right to state here, that an old favourite of ours, as one of the best of bearers, and from its hardness valuable for preserving, the Black Prince, is one more sensitive to drought than any other we have met with. We generally force a few for their earliness, but in-doors the least dryness injuriously affects them, when Keens' Seedling, Pre-

sident, British Queen, &c., would not show any bad effects under similar circumstances. When we gathered from a heavy crop for preserving, the berries were actually flagging and withering, when other kinds close to them were showing no distress, though treated exactly alike. This Strawberry, therefore, is peculiarly fitted for a damp position. Of course, in our case, the myriads of succession fruit would not come to much, but in a damp season, or where plentifully supplied with water, this kind continues a very long time in bearing. Late kinds, as Elton, Eleanor, &c., will be most useful this season, especially where they could be kept moist. They are not to be compared with others in flavour, but then they are Strawberries, and their comparative acidity may be neutralised by some pounded sugar. A great epicure in Strawberries, even as respects these late ones, was very particular that each berry should be gathered by touching the stalk merely, and be sent in the basket in which it was placed, or merely reversed on a plate, without any attempt being made to give a neat appearance in dish. So particular was he in this respect, that he often gathered his Strawberries himself; and then, seated with a small vessel of cream, and another of pounded sugar, beside the Strawberries, as he dipped the Strawberry by the stalk in the cream, and then in the sugar, before disposing of it, he used to say that the ancients never tasted such a luxury, or they would not have talked such wild romance about ambrosia and nectar as food and drink fit only to be partaken of by their divinities.

Fruit Crops.—Of Gooseberries there is an extraordinary crop, far too thick after thinning for tarts and preserving, and they should be thinned before ripening, to give the wood a chance of growing sufficiently; and Currants would have been equally thick but for the birds that cleared them rather unmercifully when quite green, and in their case we will thin and shorten the shoots as soon as possible. Raspberries only want a thorough watering to make them nice, and without it the fruit will be small. Cherries are ripening sooner than we want them, and all our netting will not prevent our bird visitors from having a few. What makes the stupid things sing out when, inside a net, they see any one approaching? Is it because they have a strong consciousness of wrong-doing, and are crying for mercy? Our Cherries, especially the earliest, as we could not water them, are smaller than usual—much smaller than similar kinds in the orchard house in pots, where they had what watering they needed. Plums and these fruit mentioned have mostly received their summer dressing, and if we cannot attend to all, we will at least shorten the shoots at the top of the trees, and let the lower ones have a little more growth. Apples are dropping their fruit a little, partly owing to the dryness, and thus thinning the superabundance are doing for themselves what should have been done for them.

Most of our dwarf Apple, Pear, and Cherry trees would have been benefited by a good watering, and this is just one of the cases where the amateur with only a few trees may be able to do better for them than a gardener who has much to look after, and affords an evidence why most improvements in all trades and professions are more due to the amateur enthusiast than to the men who engage in the profession as mere workmen in a trade by which they must live.

Went over the most of our Apricots and Peaches out of doors, removing strong shoots, or what would be too strong for fruiting next season, as it is now quite late enough to stop-back such shoots in order to secure two or three of less robust strength, which would ripen their wood for next season. This early stopping of very strong shoots is one of the best means of filling up gaps in trees, and of regulating the strength of growth all over the tree, as every one of these strong shoots, if allowed to grow, not only robs the rest of the tree of its due strength, but proves useless of itself, as such extra growth can rarely be so matured in our climate as to be fruitful in the succeeding year, whilst if stopped early and from one to two or more shoots taken from it, the stopping would divert the strength of growth into other channels, and the one or more shoots that came from the stopping would have the chance of being perfected and ripened, so as to produce in the following year. We have not watered such trees as yet out of doors, but we see we must do so ere long if there be not a change of weather, or there will be a risk of the fruit falling. This is neutralised so far in our case, as the borders, some 5 feet from the wall, have been cropped, and the crops needed a little water.

We would have no objection to deep borders for fruit trees,

may would rather prefer them, provided we could so treat them that we could by mulching and watering entice the roots within a reasonable distance from the surface. In such seasons as this, where the above means cannot be resorted to, the roots will go down in search of moisture, just as we sink a well deeper when the shallow one becomes dry; and the consequence of the roots going deep, where they obtain moisture without much of the oxygen of the atmosphere, and especially in dull seasons, is the production of gross watery wood, which our seasons are not bright and hot enough to mature, and the result is either fruitless wood, or wood so soft, juicy, and immature as to be killed by the frosts of winter. Hence where such care as above cannot be given, the most fruitful borders for trees will be those where the roots cannot go too deep, and where the means for securing due strength can be communicated from the surface. If we plant an Oak or a Pear tree for timber we may treat them nearly alike; but if we plant a Pear tree and wish to eat fruit from it as soon as possible, we must treat it differently from the Oak.

Again, as respects *Peach trees, Apricots, &c., on walls out of doors*, let it not be forgotten that next year's fruitfulness depends on having the bearing wood of next season as much exposed to the sun of the present as possible, and, therefore, that all extra and useless wood should be removed as soon as this can be done. We sometimes offend in this respect, just because among conflicting claims some things cannot be attended to as soon as they ought to be. We have heard of cases where the gardener used to be nonplussed what to send his men to do, everything was in such good order that he actually was troubled to find a job. But we must say that in our own observation and experience we never met with such an instance. The great trouble is to do work in sufficient time so that nothing may suffer from being passed over. Nevertheless, when one sees the shoots of Peaches, &c., against walls hanging in a natural state in July and August, and being fixed up to the wall when the sun is declining in power, we need not wonder that year after year the trees produce less and less, and only want a sharper winter than usual to destroy them altogether.

Such winters as 1860-61 killed or much injured many trees well treated. We saw the other day a wall that was a picture in 1859, and which has never recovered, and never will recover, the injury sustained at the Christmas of another year of the period named, even though treated in summer in the very best manner; but if such was the effect of the frost on trees well treated, what can we expect from the watery wood hanging like a thicket from the wall in July and August? The great secrets for securing wall fruit are—stop strong robber shoots early, get the bearing wood exposed to all the sun possible, and keep the trees clean by clearing off all insects before they establish themselves, and for a rough and ready and effectual means for doing this latter cleaning, though valuing tobacco dusts, grains, and liquids, commend us to a good lashing with soft-soap water from a syringe or engine.

Tobacco Powder, &c.—Here, in passing, let us state, that we had some of the kinds advertised as made up free from duty, and there may be differences in the mixtures sent out by different makers, but for certain things we will use them with great care especially under glass. Not wishing to fumigate, nor yet under the circumstances to syringe overhead, we dusted some fine shows of British Queen Strawberry on which the green fly had presented itself, but for such a purpose we will not use it again. In most cases the dusting killed the fly, but the young fruit on which it chanced to light never grew afterwards but became hard and shrivelled.

Orchard House.—In last week's number we should have stated, that we used the soap water at a temperature ranging from 120° to 130°, and with no bad effects. Yesterday we selected ten leaves near the top of the house most affected with the red spider, and though closely examining these leaves with a magnifying glass, we found only one red spider alive. Though depending something on the daubing the wall with sulphur and soft-soap, we will ere long give the trees another good lashing. It will not do to use soap water after the fruit is swelling to ripening, especially Peaches. The fruit has mostly been gathered from the front of the Peach house, and there, too, the red spider has been making its appearance lately, but we cannot resort to very severe measures there until the ripening fruit is all gathered.

Vineries.—In re-arranging plant houses, &c., we have been able to clear out all plants from the vinery from which we are now cutting. The most tender sorts will not, therefore, be

damped or split, as respects the berries, from the watering necessary to plants beneath them. This house will also be kept drier inside. The stage and every portion of the back wall that could be reached has also been lime-washed, and plenty of air left on night and day, so that the fumes of the lime should not be felt. The white surface thus presented will throw more light to the foliage than if walls or stage had been of a duller, dingy colour. Though these walls are regularly washed every spring, the growing of many plants in the house, Strawberries, &c., renders them anything but bright by this time of the year, and according as opportunity offers we make the walls and stages whiter for the extra light that will thus be reflected.

Proceeded with thinning Grapes in the late houses and orchard houses. In our vineries, to obtain huge bunches we want fresh borders and replanting, meanwhile we have plenty of fruit, for after cutting off bushels of bunches before thinning, we have left still far more than enough. These vineries, contrary to what we would wish, have the roots outside, the stems taken through a hole in the front wall in the old-fashioned way, and the outside borders we have had watered after merely breaking the surface. The first vineries covered with litter, and used with old sashes, for bringing on bedding plants, had no watering, until lately the covering was removed, after the Grapes were colouring. Many early vineries, with the Vine roots out of doors, suffer from removing the covering too early. In some cases it would be better to give no covering except a little dry litter, in preference to clearing all off too early. Some of our best gardeners prefer mulching all the summer, instead of watering much, if any, farther than what the rains supply, and these they exclude from early houses by August and September, by means of tarpaulin, sashes, &c.

ORNAMENTAL DEPARTMENT.

To this we will return with more minuteness next week, meanwhile our flower garden, with a little water at the roots of the most needy plants, for eight or ten days, is looking as well as could be expected, we are assured better than where the plants have been watered well every day. It is so easy to give too much of a good thing.—R. F.

COVENT GARDEN MARKET.—JULY 1.

FALLING prices and a slow demand rule here, and this, coupled with the astonishing quantities of some descriptions of produce, such as Peaches, Nectarines, and Pines, renders it difficult to effect sales for one-half of it. How long this may last we cannot say; but it is very unsatisfactory at present. Kent Shaw Potatoes bring 4s. per bushel, Regents 5s.

TO CORRESPONDENTS.

*. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.

BOOKS (*Pomona*).—"Fruit Gardening," which you can have free by post from our office for five postage stamps, we think would suit you" (*G. E. B.*).—As you do not stipulate as to the price, we recommend McIntosh's "The Book of the Garden," Johnson's "Cottage Gardener's Dictionary," the new edition, with supplement. Smith's "Ferns, British and Foreign."

SUPPLEMENT TO COTTAGE GARDENERS' DICTIONARY (*A Gardener and Others*).—The Supplement will be published by the end of next week.

PEAS.—STRAWBERRIES (*A. E.*).—There are too many varieties of Peas for us to be able to name one from a few pods. The size of your Empress Englemire Strawberries is a full average. The gardener who talked about a Strawberry weighing six ounces must have been joking. He never saw one of half that weight.

BLACK SPOTS ON ROSE LEAVES (*E. F. W.*).—"The black spots on the Rose leaves are said to be caused by some fungus, but I have never yet been able to detect a spore. I never saw them under glass, but I have more than I like on my Roses now. It is not improbable that the cause may be sudden and extreme atmospheric changes. The leaves invariably fall off in course of time. After a Rose has bloomed you may cut back to the first fresh plump eye. If a bud start and look pointed, cut to the next plump eye.—W. F. RADCLIFFE."

LOSSES FOR PEGGING-DOWN ON A LAWN (*Idem*).—"I recommend the following thirteen Roses for pegging-down on a lawn; they are very free bloomers. For this purpose they must be plants with pliable wood. Stiff, erect growers are not so suitable. *Pink*—Jules Margottin; *Maroon*—Camille Bernardin; *Termination*—Maurice Bernardin; *White*—Baronne de Maynard, most beautiful; *Yellow*—Coline Forester, it must not be cut much, and requires great room; *Rose colour*—Comte de Nanteuil; *Red*—Satanstoe Vaissey; *Scarlet Crimson*—Baronne Adolphe de Rothschild (not Baron), beautiful; *Purple Crimson*, dark shaded—Duc de Cazes; *Purplish or Brilliant Crimson*—Marchal Vaillant; *Waxy Flesh*—Mrs. Rosanquet; *Blush*—Marguerite de St. Amand; *Rosy Crimson*—Lady Suffield. From these thirteen Roses selection is safe.—W. F. RADCLIFFE."

SOWING PEAS (*S. B.*).—There is nothing new in the plan you adopted to keep off birds. Thread or string stretched over seed beds may be seen in almost every cottager's garden.

SKELETON LEAVES AND SEAWEEDES (*E. E.*).—It is impossible for us to tell the value, so much depends on the specimens and their condition. Such things, as a rule, are just worth what the buyer pleases to give, unless you fix a price and wait a long time to effect a sale.

BORONIA SERRULATA INFESTED WITH SCALE (*Drina*).—The specimen is much infested with scale. You will find it upon the stems and under sides of the leaves, appearing as a small, brownish, slightly raised long speck, that comes off readily when touched slightly with the point of a knife. The gummy substance is honeydew caused by the scale insect, and the black substance is the honeydew infested with black fungus. We cannot say what is the cause of the attack, but it probably is the plant being kept in too close and warm an atmosphere. The best remedy is to pick off all the insects with the point of a knife, then lay the pot on its side, syringe the plant freely with water at a temperature of 140°, turning it and the pot round so as to thoroughly syringe it on every side. This repeated a few times at intervals will free the plant of the scale. We advise you to keep it in a cold pit or frame during the summer.

MAKING A TAN BED (*A Young Beginner*).—The tan or bark we presume is old and spent, as it ought to have heated before it had lain "some time," which we presume is some weeks. If fresh it would become heated within a fortnight if the heap was large enough. No sprinkling with water would cause it to ferment or heat, nor ought it to be covered—indeed we consider it worthless; but tan may spread out too thinly, and there may be too little of it for fermentation. For the width of bed you name the tan should not be less than 4½ feet in depth, and it should be fresh, putting about a foot of screenings of old tan—that remaining in a half-inch sieve—on the surface for plunging the pots in. Cheilanthes fragrans tolerates a somewhat severe Fern, being rather difficult of cultivation. It is included in the catalogues of our principal nurserymen, and is not high-priced.

IMPREGNATING MELON FLOWERS (*T. W.*).—It is scarcely necessary at this period to impregnate the flowers, but it is well to practise it at all seasons. The process is a very simple one. All that is necessary is to take the male flower, which is that without fruit, and nipping it off the plant, strip it of the corolla, leaving the centre entire. This will be covered with a fine yellow powder. Taking the flower by the stalk, place it in a flower having a fruit beneath it. Twist it gently round a few times, and the pollen or yellow dust will be distributed on the stigma of the flower. The flowers should be impregnated when they are fully open and fresh, and during the early part of a fine day, going over them frequently for the purpose, so as to perform the operation before they shut.

STOPPING VINES (*R. E.*).—It is not desirable to stop the leading shoots until they reach the top of the house or length of rafter; then they ought to be stopped, and not turned back as you seem disposed to do. We invariably pinch out the point of the leading shoot when about 1 foot from the top of the house or rafter, and allow the laterals to grow to some extent before stopping.

STRAWBERRIES FOR LIGHT SOIL (*Ormskirke*).—For preserving we recommend Sir Charles Napier; and for table use, Eclipse, La Constante, and Frogmore Late Pine. Roses cannot be successfully cultivated in a drawing room.

IMPIDOPTERIS PELTATA CULTURE (*S. A. M.*).—It is a very rare Fern from the West Indies, succeeding admirably in a rather close moist atmosphere. Avoid wetting the fronds more than can be helped. A moderate amount of air is necessary, and shade from bright sun. When growing freely water liberally, and always keep the soil moist, but drier in winter than in summer. Keep it near the glass, and afford plenty of room. Give a liberal amount of drainage; and for soil use a compost of brown, sandy, fibrous peat torn in pieces with the hand and made fine, adding silver sand freely. The temperature may be from 55 to 65 or 70 in winter, and from 60 to 65 at night in summer, and from 80 to 85 by day with sun.

PLANTS FOR A ROCKWORK ARCHWAY (*A Twelve-years Subscriber*).—Your rockery archway being in the shade will answer very well for some of the hardy Ferns; but there are no Lycopods that would succeed, except, perhaps, Selaginella denticulata planted in a sheltered cavity or crevice.

The following Ferns would probably succeed, providing the rockery is not subjected to the sun's rays, but shaded from them, and can be kept moist:—*Allosorus crispus*, *Asplenium adnigrum*, *A. ruta-muraria*, *A. trichomanes*, *A. viride*, *Cystopteris fragilis*, *Polypodium alpestre*, *P. vulgare*, *P. dryopteris*, *Blechnum spicant*, *Polystichum aculeatum*, *P. angulare*, and its varieties *proliferum* and *eristatum*, and *Polystichum lonchitis*. The rockwork, on the other hand, being in the full sun, will need plants accordingly, and not Ferns—as *Anthriscus deltoidea*, *Arenaria verna*, *Arabis alba*, *Campanula garganica*, *Cerastium tomentosum*, *Cheilanthes alpinus*, *Draba aizoides*, *Eriurus alpinus* (should be planted liberally), *Linaria cymbalaria*, *Oxalis tropaeoloides*, *Polygala vulgaris*, *Saxifraga alpinus*, *S. aizoon*, *S. cymbalaria*, and *S. juniperina*; *Sedum acre*, *S. anglicum*, *S. Forsterianum*, and *S. kamtschaticum*; and *Sempervivum arachnoides*, *S. globuliferum*, and *S. californicum*. They can be procured through any of the principal nurserymen.

FERN FRONDS MILDEWED (G. A. S.).—We are obliged by the Fern friends. The plants should have thorough and frequent syringings. The mildew or fungus would then disappear.

LADY DOWNE'S GRAPES SETTING BADLY (S. C.).—The Lady Downe's Vine should have a higher temperature to set its fruit well, and the floors and other surfaces should be sprinkled with water twice or three a-day. Requiring a higher temperature than the Black Hb umburgs, Lady Downe's Vine might not be grown in the same house, but the Hamburghs will succeed with the treatment required for the Lady Downe's, only the fruit owing to the temperature may be ripe earlier than desired.

GANSEL'S BERGAMOT PEAR (A Subscriber).—It would not succeed as a standard if you reside in the northern counties. Your planting it in a warm sunny orchard would be successful if your locality is mild and not far north.

CUTTING-IN OLEANDERS (C. M. M.).—Now is a good time to cut-in the old Oleander trees, but we should have preferred doing so a month or six weeks earlier. In pruning leave some young wood if you can, as they do not push freely from such thick stems as you describe. We should prefer putting in cuttings, shoots of the current year that have completed their growth being taken off when the wood is rather firm. Cut them below a joint, take off the lower leaves for about two-thirds the length of the cutting, and insert the cuttings in a compost of equal parts of turfy loam, sandy peat, and silver sand, with an inch in depth of silver sand on the surface. Place the cuttings in a hotbed, and they will be well rooted in about six weeks, and may then be potted-off. The young plants will serve your purpose better than cutting down the old plants.

WATERING AMARYLLIS (Idem).—Watering should be continued until the plants show signs of going to rest, which you will notice by the alteration in the colour of the leaves. The seed will ripen fully without giving water specially on their account. As a rule, watering will be required until September. We fear you have destroyed the seed pods by too liberal supplies of water overhead. Give only enough water to keep the foliage from flagging, and when the leaves turn yellow cease watering altogether, placing the plants near the glass in the full sun.

VALLOTA PURPUREA POTTING (Idem).—For autumn flowering no time should be lost in having the plants repotted; but unless the drainage is bad we would not repot, but leave the bulbs as they are. If the drainage is bad repot, but do not give a large shift, as *Vallotas* and all bulbs never do so well as when the roots are confined and touching the sides of the pot.

IPOMEEA HEDERIFOLIA (L. C. M.).—You have the plant we meant by German Ivy, and when it flowers we will thank you for a specimen. The

true *Ipomoea hederifolia* has pale lilac flowers, and is very like a *Convolvulus*.—G. A.

PANSIES FOR FLOWERING AT THE END OF JUNE (Centurion).—To have Pansies in flower at the end of June cuttings should be put in late in the previous autumn, and planted at the end of March or early in April. These plants should be kept well supplied with water, and shaded from bright sun during hot dry periods, so that they may grow well during May and the early part of June, instead of flowering. To prevent their exhausting themselves pick off the early blooms. Top-dressings of rich compost should be given in April and May.

ASTERS FOR EXHIBITION (R. C.).—They must be grown in good, rich well manured, and deeply-dug ground. The seed should be sown at such a time that they will be in flower at the time required. Sow in gentle heat, keep the seedlings near the glass, prick them off when large enough to handle, and plant them out when of sufficient size. Afterwards attend well to them with water, shade from bright sun, and take every means to encourage free vigorous growth, giving liberal supplies of liquid manure, and a top-dressing of rich compost when the flower buds are formed. The treatment is not different from that for Asters grown in borders, only more pains are taken with them.

TRAINING MELONS (Idem).—It is impossible for us to tell how many shoots ought to be left on a plant. The main branches should be trained about 1 foot apart, and from them you will have lateral or secondary shoots, on which the fruit is produced. The surface of the bed, therefore, should be covered with main branches not nearer than 9 inches, nor exceeding a foot apart, which will be equal to about three main shoots per plant, two plants being planted under a light. One fruit will be sufficient on each branch, but we never leave more than two fruits on a plant, or three at the most when it is exceedingly vigorous, and only one on a main shoot or branch.

OUT-DOOR VINE-GROWING (An Amateur Vine-grower).—"Heare on the Vine" is a good work on out-door Grape-growing. It chiefly refers to the cultivation of Vines on walls. Mr. Hoare's system is practically that of the rod, now so much written about under the title of the "extending system of Vine-growing," as if it were a novelty. The information in Mr. Hoare's book is sound; but with the introduction of cheap glass has come superior and extended culture of all fruits. We shall have an article on the culture of Vines in the open air in an early number.

TEAR PITS (L. J. P.).—We shall publish some notes on these shortly. Your letter we regret having mislaid.

INSECTS (E).—The small snail-like insects on your Jargonelle Pear leaves are the slimy larvae of a black-winged Sawfly, *Tenthredo Ethiops*. Dust the leaves well with powdered lime, or syringe them well with strong lime water. (Centurion).—Your Pear leaves are attacked by the slimy larvae of a small black-winged Sawfly; your Rose leaves by those of another kind of Sawfly; and one of the leaves sent enclosed the empty chrysalis skin of a small Moth (*Tortrix* sp.). Lime water and powdered lime will destroy the former. For the latter, in addition to hand-picking, we would sprinkle or dust the bushes with white hellebore powder, or they may be syringed with a solution of one peck of lime and 2 lbs. of soft-soap to thirty gallons of rain water. The Pear trees may be treated in the same way, syringing them in the evening. The Pear leaf is evidently that of Winter Nellis, but we cannot name fruit trees from leaves.

NAMES OF PLANTS (Unoramus).—We have repeatedly stated that we cannot name plants from leaves, nor florists' varieties.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending June 30th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

HOUDANS.

REDEEMING the promise we made last week, we continue our notice of the French breeds. We do so, repeating we are responsible only for translation, the description still belongs to M. Jacque. Nevertheless, as very old breeders, we will guarantee the truth of the description he gives.

It may be that when we speak of ourselves as very old breeders it will be thought we should say something of our own experience. It is that the Houdan is the hardiest of all the French fowls introduced to us of late years. It is an excellent layer, a fowl easily and cheaply kept, bearing any amount of confinement, but determined to have its own way, and to seek a substitute for anything that is lacking. Thus, we cannot tell whether it was from drought and consequent lack of green food, or that the efforts of our English feeder were unpalatable to the French taste of our imported stock, but they certainly lacked something, spite of grass and lettuces,

and from results it would appear that the nearest approach to a substitute was feathers. The hens have eaten all the cock's feathers, the cock has eaten the hen's. It is lucky the moulting time is at hand, that the damage may be repaired.

There is a peculiarity in the French breeds, which will be understood by all who keep them: the difficulty, almost impossibility, of keeping the cocks healthy. We have given it up with the unfortunate *La Flèche*. The cocks will be well in the morning, moribund in the evening. Who has not read *Sponge's* sporting tour? Who has not noted the difference between *Jawleyford* addressing his tenantry, and the same *Jawleyford* getting himself up to put off that "horrid Mr. Spraggon." The unlimited costume and great flow of spirits in the first place, the downcast face and handkerchief-bound head in the second, are fair representatives of the French cocks. In the morning they are seen gay and cheerful, and you are tempted to believe they are greatly libelled, or (and this is the most pleasing interpretation), that others do not understand the management of them so well as you do. You give your opinion freely during the day to your friends, and offer one of them an unlimited supply of strawberries and cream if he will go

with you and see the birds after office is over. You increase the bribes till he consents. The first visit is to the poultry. Where is the bold bird that cried defiance at you in the morning? You cannot see him; but on close examination you perceive a sort of semicircular bunch of feathers in the corner of the pen. There is the gallant bird of the morning. His tail is on the ground, his head as near it as may be. You can only say, "It is very odd." He will, and does recover; but those who keep them know this is a common case. Now for M. Jacque.

Proportions and general characteristics:—Body slightly rounded, of ordinary proportions, tolerably near to the ground, standing firmly on large feet. Breast high, legs and wings well developed, large head, half top-knot, whiskers and beard, triple transversal comb, five toes on each foot. Plumage splashed or spotted white, black, or straw colour; in chickens, black and white only.

An adult cock should weigh from 6 to 7 lbs., made up principally of flesh, the bones weighing only an eighth. He should be put up to fatten at sixteen, and be killed at eighteen weeks old.

His comb should be triple and transversal to the direction of the beak, composed of two lengthened, rectangular, and flattened spirals, opening from right to left like the leaves of a book; they should be thick and fleshy, and notched or uneven at the sides. The third spiral should grow from the middle of the other two, be about the size of a lengthened nut, and shaped like an irregular strawberry. A fourth, independent of these, and about the size of a tare, grows above the beak and between the nostrils.

Deaf ears small, and hidden by the whiskers; half crest inclining backwards and to the sides.

Beard begins between the wattles under the beak, and should be larger at bottom than at top.

Physiognomy of the head differing from that of other breeds in many remarkable particulars. The head forms with the neck a very close angle, so that the beak takes the appearance of a nose. The square and flattened comb looks like a fleshy forehead, the cheeks are surrounded with curling feathers that look like whiskers, the drooping corners of the beak look like a mouth, the feathery cravat joined to the gills simulates a beard, the top-knot looks like a luxuriant head of hair, and the whole face immediately gives the idea of that of a man.

In the adult the legs should be of a leaden grey, in the chicken bluish grey and white, with rose-coloured spots.

The plumage of both sexes should be entirely composed of black, white, and straw colour; those that show any red should be pitilessly got rid of. The plumage of the Houlan should be either spotted or splashed, irregularly made up of alternate black and white feathers, sometimes of black tipped with white, sometimes of white tipped with black.

The adult hen should weigh from 5 to 6 lbs.

Both sexes must have five toes on each foot. The hen is an abundant and early layer of large eggs.

This is truly a hardy fowl, and is reared more easily than any other French fowl. They are also more domesticated and less destructive to gardens and crops than any other.

NOTES ON HATCHING.

THE necessity of keeping eggs damped previous to hatching is adverted to in page 396. I find doing so very beneficial, and very rarely lose a chicken at hatching time. I sprinkle the eggs at intervals with flowers of sulphur, but not when the eggs are ready to hatch. Just before I expect them to do so I take a bowl of water, and try the eggs, put them all in, and if, after carefully watching them for a few seconds, there is no movement, remove the bad ones; it gives the others more room, and facilitates hatching. I seldom sprinkle the eggs during this hot weather, but pour half a hand-bowl of water over them.

"Nemo," in the same number of the Journal, thinks an easterly wind prejudicial to hatching. I cannot now call to mind the time the east wind prevailed. It is said about this part of Sussex (near Uckfield), that if a Goose sits when the wind is easterly she will require five weeks to hatch. My Geese have hitherto hatched in about thirty or thirty-one days. One of mine laid a second time, and sat on the 11th of May. Of this I am positive, as I put the date on all the eggs. I found she did not hatch at the usual time, and would have taken her eggs away, but she sat in a damp place out of the way near a bed of rushes, and not far from a pond. On

the 15th of June, five weeks from the 11th, the first goslings appeared, and the others came out during the following day.—L. B.

STAVELEY POULTRY SHOW.

HAVING entered a pen of birds for the Staveley Show, which was fixed for June 23rd, I was somewhat surprised on the 22nd by receiving a letter from the Secretary, stating that "owing to the small number of entries the Committee are sorry that they cannot see their way clearly to holding the proposed Show at the present time," and returning the amount of my entry fee. The entries, it appears, closed on June 13th, therefore the Committee must then have been aware of the "small number of entries." Why, then, I ask, did they not immediately signify the abandonment of the Show without waiting eight or nine days, and until almost the day of the Show? Had they done so, I for one should have been less displeased.

I would suggest to the Committee of the Staveley Show, and the same suggestion may apply to some other committees, that in their advertisements they should state more definitely where the place is situated. After ferreting through a gazetteer and Bradshaw's Guide I concluded that this Staveley was either in Westmoreland or Derbyshire. I, however, addressed my application for a prize list simply "Staveley," and in due course received a list, but by which I was not further enlightened. Seeing, however, that the list was printed at Chesterfield, I concluded it must be the Derbyshire Staveley.—LEX.

BEVERLEY POULTRY SHOW.

THE entries at Beverley this season, were scarcely so numerous as in previous years, no doubt from the dates for the Spalding and Staveley Shows being almost simultaneous. The latter meeting was withdrawn by the Committee all but at the last moment, on account of the paucity of entries, and, consequently, many intending competitors were thrown entirely out in their calculations, and from this cause only a large number of excellent fowls that would otherwise have been at Beverley, remained at home. Even with this disadvantage, there were 290 entries, and with the single exception of the Game classes, the birds quite maintained the reputation which this meeting has enjoyed for eleven years.

This year's Show was held in the grounds of W. Crosskill, Esq., of Walker Gate, and certainly a more beautiful spot for such an exhibition could scarcely be imagined. Very extensive tents were provided, the arrangements were complete, and although at repeated intervals a thunder-torn seemed imminent, the weather fortunately proved fine throughout. The Honorary Secretary, Mr. Harry Adams, was as indefatigable as ever, and the most complete order and regularity prevailed.

A very extraordinary effort to surreptitiously obtain possession of a much-coveted premium at this year's Beverley Show deserves a moment's notice at our hands. An exhibitor who, we are informed, holds a very good social position, within a few days of the Show addressed a private letter to the Judge, directing his particular attention to both the class and likewise number of his pen that he purposed to exhibit for a silver cup, and then very modestly requested its appropriation. The letter also contained a post-office order drawn by the exhibitor in the Judge's favour. The sequel will, we trust, teach most expressively, that such conduct will never receive the sanction of any party worthy of the position of a public arbitrator. The course pursued by the Judge was this: The evening before the Show he read aloud the letter to a full meeting of the Committee, signed the post-office order in their presence, and at once handed it over to the funds of the Show, expressing his unalterable determination "to pass over" this particular pen, good or bad, as an empty one, when engaged in his decisions of the morrow. This done, the Committee passed unanimously a resolution, that the exhibitor should not be permitted again to exhibit at any future meeting of the Beverley Poultry Society. It is but justice to the birds themselves to add, they proved a very excellent pen, but from this cause only they were "as foretold," "passed," unheeded by the Arbitrator, though they did not at all lack the especial attention of visitors generally. We pass without comment, for it needs none, from this really unpleasant affair.

Most of the *Game* fowls exhibited were birds of high repute, and again added other laurels to the many they had previously obtained, but the rapid moult that is taking place this season so unusually early, caused the Game classes, to an unpractised eye, to appear of far less interest than on former occasions. Six weeks or even a couple of months must now elapse before the fowls can again recover their usual condition and essential hard feather. The silver cup for *Spanish* fowls was awarded to an extraordinarily good pen belonging to E. Jones, Esq., of Clifton, the competition being at the same time unusually severe for the remaining premiums in this class. Of *Cochins*, the display was excellent, and the emulation for the cup proved that the breeders of *Cochins* were fully aware of the value of its possession, both as to the sale of extra stock, and also as an addition to their

Sideboard. W. A. Taylor, Esq., of 23, Turner Street, Manchester. Proved the winner, with an excellent pen shown in first-rate feather. All the *Hambergh* classes were well filled, Mr. Beldon taking the bulk of the premiums, and the silver cup was awarded to a pen of Golden-pencilled, shown in perfect condition by Mr. J. R. Jessop, of Hull. In the "Variety class," a pen of Ptarmigans were shown of excellent quality. The *Ducks*, with the exception of those in the "Variety class," were not so good as customary at the Beverley Shows, but the *Pigeons* throughout were so unexampled for good quality as to create quite a public interest in this portion of the Exhibition, and a reference to the list of awards will best prove that the competition throughout the whole of these classes was without a precedent at former meetings of this Society. There was also a very good display of *Canaries* and singing birds generally.

GAME (Black-breasted or other Red).—First, W. Boyes, Beverley. Second, S. Matthew, Stowmarket. Commended, H. M. Julian, Hull.

GAME (Any other variety).—First, H. M. Julian. Second, A. K. Briggs, Bradford. Commended, W. Boyes; W. J. Cope, Barnsley; S. Matthew.

GAME.—*Cock*.—First and Cup, S. Matthew. Second, H. M. Julian. Highly Commended, G. Sutton Bootham, York. Commended, W. Boyes. **SPANISH**.—First and Cup E. Jones, Clifton. Second, H. Beldon, Bingley. Highly Commended, J. Walker, Wolverhampton; J. Thresh, Bradford; T. J. Harrison, Singleton Park.

DORKINGS.—First, J. White, Warley. Second, H. Lingwood, Needham Market. Highly Commended, Rev. G. Hustler, Stillingfleet; Miss Milne, Otterburn. Commended, Rev. J. F. Newton, Kirby in Cleveland; H. Pickles, Earby.

COCHINS (Cinnamon or Buff).—First and Cup, W. A. Taylor, Manchester. Second, H. Mapplebeck, Woodfield, Birmingham. Highly Commended, J. H. Dawes, Moseley Hall, Birmingham; W. A. Taylor. Commended, K. White, Sheffield; C. W. Brierley, Middleton, Manchester.

COCHINS (Any other variety).—First, T. Stretch, Ormskirk (Partridge). Second, E. Tudman, Whitechurch, Salop. Commended, C. W. Brierley.

HAMBURGHS (Gold-spangled).—First, H. Beldon, Bingley. Second, G. Holmes, Driffield. Highly Commended, J. White, Whitley, Netherton. Commended, J. Elgar, Newark; W. A. Hyde, Hurst, Ashton-under-Lyne; H. Beldon, Bingley; J. Walker, Haya Park, Knarborough.

HAMBURGHS (Silver-spangled).—First, H. Beldon. Second, J. Walker. Highly Commended, H. Beldon. Commended, J. A. Taylor, Manchester.

HAMBURGHS (Gold-pencilled).—First and Cup, J. R. Jessop, Hull. Second, H. Beldon.

HAMBURGHS (Silver-pencilled).—First, H. Beldon. Second, H. Pickles. **POLISH**.—First, H. Beldon. Second and Highly Commended, Miss Proctor, Hull.

ANY OTHER VARIETY.—First, R. Loft, Woodmansey (Ptarmigan). Second, R. White (Brahmas). Highly Commended, L. Biney, Manchester (Brahmas); H. Beldon (Cochin Bantams). Commended, Rev. G. Hustler (Malays).

GAME BANTAMS.—First and Cup, J. R. Robinson, Sunderland. Second, W. F. Entwistle, Leeds. Commended, T. C. Harrison; E. Toder, Little Carlton.

BANTAMS (Black or White).—First, Messrs. Tonkin & Tuckey, Bristol (Black). Second, J. R. Jessop (White). Highly Commended, W. H. Tomlinson, Newark-on-Trent. Commended, A. Jones, Stapleton, Bristol.

GAME BANTAM COCK.—First, J. Bamber, Accrington. Second, J. Donagis, New Delaval. Highly Commended, L. Biney. Commended, T. C. Harrison.

DUCKS (Aylesbury).—First, Messrs. Bowman & Fearon, Whitehaven. Second, M. Harrison, Warter. Highly Commended, Rev. G. Hustler.

DUCKS (Rouen).—Second, Messrs. Bowman & Fearon.

DUCKS (Any other variety).—First and Second, T. C. Harrison (Pintails and Carolinas).

SELLING CLASS (Any variety).—First, H. M. Julian (Game). Second, J. Walker (Silver-spangled). Highly Commended, G. Holmes; T. C. Harrison (Bantams); J. Walker (Gold-spangled).

PIGEONS.

CARRIER.—*Cock*.—First and Second, R. Fulton, Deptford. Third, H. Beldon. Highly Commended, R. H. Artindale, West Derby, Liverpool. Commended, H. Yardley, Birmingham. *Hen*.—First and Second, R. Fulton. Third, H. Yardley. Highly Commended, P. Graham, Birkenhead.

POUTER.—*Cock*.—First and Second, R. Fulton. Third, H. Beldon. Commended, H. Beldon; H. Yardley. *Hen*.—First, H. Beldon. Second and Third, R. Fulton. Highly Commended, J. Elletson, Thorngumbald, York. Commended, H. Yardley.

ALMONDS.—First, F. Key, Beverley. Second and Third, R. Fulton. Highly Commended, W. Winter, Derby.

TUMBLERS (Any other variety).—First, Cream Jug, and Third, R. Fulton. Second, Jesse Thompson, Bingley.

BARBS.—First and Second, T. H. Frean, Anfield Spere. Third, P. Graham.

OWLS.—First, H. Yardley. Second, T. Newell, Ashton-under-Lyne. Third, R. Mole, Hull. Highly Commended, J. Clark, Thirsk; T. Statters, Hull. Commended, J. Walsh, Halifax.

FANTAILS.—First, H. Yardley. Second, R. Mole. Third, J. T. Lishman, Gillingham.

JACOBS.—First, J. Thompson. Second, T. Newell, Ashton-under-Lyne. Third, R. J. Bell, Hull. Highly Commended, C. Lythe, Cottingham.

TRUMPETERS.—First, J. T. Lishman. Second, Messrs. Beaumont and Stephenson, Beverley. Third, H. Yardley. Commended, J. Campey, Beverley.

TURBITS.—First, H. Yardley. Second, G. J. Pickering, Driffield. Third, J. Thompson. Highly Commended, J. T. Lishman. Commended, K. Wilson, Thirsk; H. Beldon.

NUSS.—First, C. Lythe, Cottingham. Second, H. Yardley. Third, R. Mole. Highly Commended, R. Wilson, Thirsk; J. Thompson.

DRAGONS.—First, F. Graham, Birkenhead. Second, J. Thompson. Third and Highly Commended, H. Yardley.

ANY OTHER VARIETY.—First and Second, J. T. Lishman. Third, H. Beldon. Highly Commended, H. Yardley; J. Clark (Swiss); R. Mole (Black Spots); T. Statters, (Red Swallows); C. Lythe (Blue feather-legged Jackerlins). Commended, R. Wilson; T. Newell.

SELLING CLASS.—First, W. Watson, Beverley. Second, H. Beldon. Third, J. Thomson. Highly Commended, R. Dawson, Beverley.

The Judges were—for *Poultry*, E. Hewitt, Esq., of Birmingham; for *Pigeons*, Dr. Boulton, of Beverley; and for *Canaries, &c.*, Mr. J. Moreton, of Hull.

CHELMSFORD POULTRY SHOW.

THIS Show was held in conjunction with the Essex Agricultural Society's Meeting, on June 25th and 26th.

The following is a list of the prizes awarded:—

DORKINGS (Coloured).—First, Cup, and Second, for best pen of Dorkings, D. C. Campbell, M.D., Brentwood. Third, H. Lingwood, Barking, Needham Market. Highly Commended, F. Parlett, Great Baddow, Chelmsford. Commended, C. Turner, Chelmsford; F. Parlett.

DORKINGS (Any other variety).—First, H. Lingwood (White). Second, D. C. Campbell, M.D. (White). Third, Rev. E. S. Tideman, Childerditch Vicarage, Brentwood (Silver-Grey).

COCHINS (Buff or Cinnamon).—First and Cup for best pen of Cochins, H. Lingwood. Second, H. Mapplebeck, Woodfield, Moseley. Third, Mrs. Christie, Glyndebourne, Lewes. Highly Commended, W. A. Gibbons, Chiddington; J. H. Dawes, Haseley Hall, Birmingham.

COCHINS (Any other variety).—First, H. Lingwood (Partridge). Second, A. O. Worthington, Burton-on-Trent (Partridge). Third, J. K. Fowler, Aylesbury (Partridge).

BRAHMAS (Dark).—First and Cup for best pen of Brahmas, A. F. Hart, Alderwasley, Derby. Second, J. K. Fowler. Third, H. Lingwood. Highly Commended, J. H. Cuff, Metropolitan Cattle Market; F. James, Peckham Rye.

BRAHMAS (Light).—First and Second, H. Dowsett, Pleshey, Chelmsford. Third, A. O. Worthington.

GAME (Black-breasted and other Red).—First and Third, Rev. F. Watson, Messing, Kelvedon (Brown Red). Second, S. Matthews, Stowmarket (Black Red). Highly Commended, H. Lee, Appuldurcombe (Black-breasted Red); W. B. Jeffries, Ipswich.

GAME (Any other variety).—First and Cup for best pen of Game, S. Matthew (Duckwing). Second, Rev. F. Watson (File). Third, T. Dyson, Halifax (Duckwing).

SPANISH.—First, P. H. Jones, Fulham. Second, F. James (Black). Third, R. Ede, Worthing (Black). Highly Commended, H. Lingwood; F. James (Black).

HAMBURGHS (Gold or Silver-pencilled).—First, W. K. Tickner, Ipswich. Second and Third, C. Haver, Ingatestone (Golden and Silver).

HAMBURGHS (Gold or Silver-spangled).—First, Rev. F. Tearle, Gazeley Vicarage, Newmarket (Silver). Second, Mrs. Pattison, Maldon. Third, T. Penfold, Newhaven (Silver).

FRENCH (Any variety).—First, Lady L. Charteris, Attleborough (Black Crève-Cœur). Second, Col. Stuart Wortley, Grove End Road, London (French). Third, J. K. Fowler (Crève-Cœur).

GAME BANTAMS (Any variety).—First, W. Dale, Weston-super-Mare. Second, W. E. Jeffries (Black Red). Third, E. B. Edwards, Brentwood. Highly Commended, Mrs. Sheerman, Chelmsford; Mrs. Holmes, Shepherd's Bush (Brown-breasted Red); J. Parlett (Black Red).

BANTAMS (Any other variety).—First, Rev. F. Tearle (White). Second, T. Burgess, Brighouse. Third, G. Manning (Golden Sebright). Commended, J. Allen, Amptill.

ANY OTHER VARIETY NOT PREVIOUSLY MENTIONED.—First, P. H. Jones (Polish). Second, Mrs. J. Mayhew, Great Baddow (Pea Fowls). Third, D. Mutton, Brighton. Highly Commended, J. Pool, Little Waltham (Pea Fowls); Mrs. Tippler, Dukes, Roxwell (Guinea Fowls); Col. Stuart Wortley (Frizzled Japanese); J. K. Fowler (Silkies); Lady L. Charteris (Buff Polish).

DUCKS (Rouen).—First, Second, and Third, H. Dowsett.

DUCKS (Aylesbury).—First, J. K. Fowler. Second, W. Tippler, Dukes, Roxwell. Third, Withheld.

DUCKS (Any other variety).—Prizes withheld.

TURKEYS.—First, Mrs. Mayhew. Second, H. H. Tippler, Dukes, Roxwell. Third, R. Pigott, South Weald.

GESE.—First, J. K. Fowler. Second, Mrs. Upon, Rivenhall. Third, H. H. Tippler.

SELLING CLASS (Any variety).—First, Miss A. L. Dowsett, Pleshey. Second, D. C. Campbell, M.D. (Coloured Dorkings). Third, G. Simpson, Chelmsford (Coloured Dorkings). Highly Commended, E. Rice, Sandwich (Black-breasted Game); G. Simpson (Coloured Dorkings). Commended, E. Rice (Duckwing); A. Barker, Roxwell (Buff Cochins).

PIGEONS.

CARRIERS.—First, H. Yardley, Birmingham. Second, E. Sheerman.

POUTERS.—First and Second, P. H. Jones, Fulham.

TUMBLERS.—First, P. H. Jones (Almond). Second, H. Yardley.

JACOBS.—First, P. H. Jones. Second, H. Yardley.

TRUMPETERS.—First and Second, E. Sheerman.

FANTAILS.—Prize, H. Yardley.

ANY OTHER VARIETY.—First, P. H. Jones (Burs). Second, H. Yardley. Highly Commended, P. R. Tippler, Dukes, Roxwell (Turtle Doves); H. Yardley. Commended, P. H. Jones (Turbit).

SELLING CLASS.—First and Second, E. Sheerman.

JUDGES.—W. B. Tegetmeier, Esq., Muswell Hill, London, and J. Monsey, Esq., Thorne Lane, Norwich.

STONEHOUSE POULTRY SHOW.

JUNE 26TH AND 27TH.

THE Judges, Mr. Matthew Hedley, of London, and Mr. Wm. Rone, of Bristol, awarded the prizes as follows:—

SPANISH.—First, Third, and Commended, R. Parrett, Stroud. Second, R. Bick, Stonehouse.

DORKING.—First, W. Sims, Stroud. Second, D. Darke, Stonehouse.

COCHINS-CHINA (Light).—First, G. L. N. Rawlinson, Gloucester. Second and Commended, R. Barrett.

COCHINS-CHINA (Dark).—First, R. Bick. Second, J. E. Burghope, Stroud. Highly Commended, T. Gee, Hardwicke.

BRAHMA POOTRA (Light)—Prize, R. H. Tyte, Minchinhampton.
BRAHMA POOTRA (Dark)—First, W. Sims. Second, R. Blick.
GAME (Black-breasted and other Reds)—Prize, R. Blick.
HAMBURGS (Golden-pencilled)—First, J. S. Maggs, Tetbury. Second, R. Blick.
HAMBURGS (Golden-spangled)—First, J. S. Maggs. Second, R. Blick. Commended, R. Blick; C. Webb.
HAMBURGS (Silver-spangled)—First, R. Blick. Second, J. S. Maggs.
POLISH (Silver)—First, Miss K. Barrett, Stroud. Second, R. Blick.
ANY OTHER DISTINCT VARIETY—First, Mrs. Barnes, Eastington (Silkies). Second, R. Blick (Andalusians). Highly Commended, E. W. Winterbotham. Commended, J. Burghope.
SINGLE COCK (Any variety)—First, W. Kneec. Second, R. Blick. Commended, R. Barrett.
BEST CHICKEN—First, R. Barrett. Second, R. Blick. Highly Commended, R. Barrett. Commended, J. Brinkworth.
DUCKS—First and Second, J. Webb, Stroud. Highly Commended, S. S. Dickinson (Muscovy Duck and drake).
PIGEONS—Carriers—Prize, R. Blick. *Trumpeters*—Prize, R. Blick. *Black and White*—First and Second, W. Kneec.
CANARIES—Best Cage of Birds—First and Second, Mrs. Smith, Stonehouse. *Single Cock*—First, G. Cumming, Gloucester. Second, Mrs. Stephens, Stonehouse.
ANY OTHER VARIETY OF FOREIGN BIRD—First, Miss E. Hayward. Second, R. Blick.
BEST CASE OF STUFFED BIRDS—First, R. Blick. Second, Miss Hayward.

SPALDING POULTRY SHOW.

THE second annual meeting of the Spalding Society was held June 25th, and being combined with a Floricultural Exhibition, it was unusually attractive. The weather being most favourable, the attendance was very good. Every effort was made by the acting Committee to promote the comfort of the poultry and the convenience of visitors. Turner's pens were used, and, consequently, the display was effective, whilst an ample tent accommodated all the sightseers, and would have sheltered them had the weather been bad.

For *Dorkings*, Dr. Campbell took the cup with some excellent specimens, and not without a severe competition from his rivals. Mr. J. Fletcher, of Stoneclough near Manchester, sent a collection of *Game* fowls calculated to fully support the high reputation of that gentleman's yard, and they proved to be in wonderful condition, and one of the greatest attractions in the Show. All the principal *Game* prizes were secured by these birds, and it took the Judges a considerable time to determine to which of these particular pens the silver cup for the best pen of *Game* should be awarded, the Judges, of course, little supposing that the whole of those so closely-competing pens belonged to the same individual. We can speak in the same high terms of commendation of the *Cochin* classes, Mr. Taylor, of Manchester, taking the *Cochin* cup in an unusually excellent class. Some very beautiful Cuckoo-coloured *Cochins*, and also some *Black* ones, were shown. *Bedfords* were good, more especially the dark-feathered ones. *Spanish* were excellent as a class, and here Mr. Beldon was the cup-winner. Some first-rate *Cochin Bantams* were shown, and also some of the best *White* ones we have seen for a long time.

The collection of *Fancy Ducks* was a chief feature of the Show, all the prizes being taken by the well-known exhibitor, Mr. Harrison, of Hull, and by another Mr. Harrison, a local resident.

Of *Pigeons*, we cannot speak too highly, as a reference to the names of the winners would lead any lover of *Pigeons* to anticipate, and those persons who missed the opportunity of viewing this division of the Show, where so much was calculated in other portions of the meeting to arrest the attention, lost a treat they little imagine.

The *Rabbits* were especially good, and the entries in this department were numerous.

The Committee were everywhere congratulated on the success of this year's Exhibition, and with similar attention no doubt future meetings will prove equally well supported.

DORKINGS (Coloured)—First and Cup—Dr. Campbell, Brentwood. Second, H. Lingwood, Needham Market, Barking. Third, J. Vorley, Woodhouse, Holbeach. Commended, G. Clarke, Long Sutton.

DORKINGS (Any other variety)—Prize, H. Lingwood (White).

GAME (Black-breasted Reds)—First and Cup, J. Fletcher, Stoneclough, near Manchester. Second, J. Fletcher. Third, J. Laming, Cowburn, Spalding.

GAME (Brown Reds)—First, J. Fletcher. Second, J. Laming. Third, J. Shepherd, Spalding.

GAME (Any other variety)—First, J. Fletcher. Second, J. Laming (Duckwing). Third, S. Matthew, Stowmarket.

COCHINS (Cinnamon & Buff)—First and Cup, W. A. Taylor, Manchester. Second, H. Lingwood. Third, H. Mapplebeck, Woodfield, Moseley, near Birmingham. Highly Commended, J. W. Harrison, Spalding. Commended, J. Vorley (Buff).

COCHINS (Partridge and Brown)—First, Rev. G. Gilbert, Claxton, Nerwich. Second, J. Stephens, Walsall. Third, E. S. Lowndes, Stoney Stratford, Bucks (Partridge).

COCHINS (Any other variety)—First, G. Furness, Acerrington (Cuckoo). Second, H. J. Goffrey, Melton Mowbray (Black). Third, Mrs. Williamson, Leicester (White).

BRAHMAS (Dark)—First, E. Leech, Rochdale. Second, W. Whiteley, Sheffield. Third, G. P. Hobson, Long Sutton. Highly Commended, J. Dring, Gedgey Marsh. Commended, H. C. Woodcock, Kearsby, Leicester; J. W. Harrison.

BRAHMAS (Light)—First, J. Pares, Postford, Guildford. Second, H. Dowsett, Pleshey, near Chelmsford. Third, Miss E. S. Maples, Spalding.
SPANISH (Any variety)—First and Cup, H. Beldon, Bingley. Second, J. Marchant, Halifax. Third, F. James, Peckham Rye (Black). Highly Commended, Messrs. T. C. & E. Newbitt, Epworth, near Bawtry.

HAMBURGS (Gold and Silver-pencilled)—First, J. Laming. Second, G. Dykes, Spalding.

HAMBURGS (Gold and Silver-spangled)—First, Second and Cup, J. Laming. Third, Rev. F. Tearle, Newmarket. Highly Commended, J. F. Loversidge, Newark-on-Trent.

FRENCH FOWLS (Any variety)—First, T. Hardy, Crowland (Creve-Coeur). Second, Col. Stuart Wortley, Grove End Road, London. Third, H. Beldon.

ANY OTHER DISTINCT VARIETY NOT PREVIOUSLY MENTIONED—First, H. Beldon. Second, G. W. Boothby, Louth. Third, S. S. Mossop.
LOCAL CLASS (Any variety)—*Chickens*—First and Third, J. W. Harrison. Second, J. Reynolds, Cowbit.

SELLING CLASS (Any variety)—First, J. Laming (Red Game). Second, E. Vine, Spalding (Black). Third, Miss E. S. Maples (Light).

DUCKS (Rouen)—First, E. Leech. Second, Rev. G. Gilbert. Third, J. J. St. dt, Rochdale.

DUCKS (Aylesbury)—First, J. W. Harrison. Second, E. Leech. Third, Rev. G. Hustler, Stillingfleet.

DUCKS (Any other variety)—First and Third, J. W. Harrison. Second, T. C. Harrison, Hull. Highly Commended, Messrs. S. & R. Ashton, Mottram; J. W. Harrison. Commended, J. W. Harrison.

BANTAMS (Game)—First, W. F. Entwistle, Leeds. Second, J. Parlett, Huntingdon. Third, G. Maples. Highly Commended, W. F. Entwistle; J. Laming (Cup). Commended, J. W. Harrison; A. Storrar, Peterborough.

BANTAMS (Any other variety)—First and Cup, Rev. T. Tearle (White). Second, H. Beldon (Pekin). Third, H. C. Woodcock (Japanese). Highly Commended, T. C. Harrison; H. Draycott, Humberstone, near Leicester (Silver-laced); A. Storrar (Black); Commended, J. W. Harrison (Sebright).

GEES (Any variety)—First, G. Hustler. Second and Third, T. Hardy.

TURKEYS (Any variety)—Prize and Cup, E. Leech.

PHEASANTS, GUINEA FOWLS, AND ANY VARIETY OF ORNAMENTAL, FOREIGN, OR DOMESTICATED POULTRY—Prize, G. G. Maples, Wavertree (Pea Fowls).

SWEETSTAKES FOR SINGLE GAME COCK—Prize, C. Ulyat, Spalding.
SWEETSTAKE FOR GAME BANTAM COCK—Prize, C. Munro, Stamford.

PIGEONS.

CARRIERS (Any colour)—First, F. Crossley, Elland, near Halifax. Second, R. Fulton, Deptford. Highly Commended, R. Fulton; F. Crossley; H. Yardley. Commended, R. Fulton.

POUTERS (Any colour)—First, Cup, and Second, R. Fulton. Highly Commended, H. Snushall (White); F. Crossley; H. Yardley.

TIMBLES (Any variety)—First, R. Fulton (Short-faced). Second, F. Crossley (Almond). Highly Commended, T. Ashburner, Dalton-in-Furness (Black); J. Fielding, jun., Rochdale (Almond); R. Fulton (Short-faced). Commended, J. Hawley; R. Fulton (Short-faced).

GAMES (Any colour)—First, F. Crossley. Second, R. Fulton. Highly Commended, H. Yardley.

JACOBS (Any colour)—First, R. Fulton. Second, Messrs. T. C. & E. Newbitt. Commended, J. Thompson, Bingley; H. Yardley.

FANTAILS (Any colour)—First, J. Hawley. Second, H. Yardley. Highly Commended, Messrs. T. C. & E. Newbitt.

ANY OTHER DISTINCT VARIETY—First, J. Fielding, jun., (Owls). Second, J. Thompson. Highly Commended, Miss F. Easton, Hull (Blue-tailed White African Owls); F. Crossley (Owls); H. Yardley; H. C. Woodcock. Commended, J. Thompson; T. Ashburner.

SELLING CLASS (Any variety)—First, D. Young, Leamington (White Dragons). Second, G. Clarke. Highly Commended, J. Barnes; J. Queenborough, jun., Boston (Sandy Antwerps); H. Yardley; Messrs. T. C. & E. Newbitt. Commended, H. Draycott; H. Snushall; J. Queenborough; J. Thompson.

CAGE BIRDS.

CANARIES (Clear Yellow and Buff)—First and Cup, E. S. Smith, Poston (Yellow Belgian). Second, E. S. Smith (Buff). Highly Commended, G. C. Osborn.

CANARIES (Variegated Yellow and Buff)—First, J. Green, Spalding. Second, W. Cross, Spalding. Highly Commended, E. S. Smith (Buff Belgian, Buff Norwich, and Yellow Norwich). Commended, J. W. Harrison.

LINNET, GOLDFINCH, OR OTHER ENGLISH FINCH—First, W. Ringham, Deeping, St. Nicholas (Hullfinch). Second and Highly Commended, E. S. Smith (Linnet and Goldfinch). Commended, W. Ringham (Linnet); E. S. Smith.

BLACKBIRD, THRUSH, STARLING, LARK, OR OTHER ENGLISH CAGE BIRD—First and Second, E. S. Smith (Thrush and Blackbird). Highly Commended, E. S. Smith (Lark); J. W. Harrison (Thrush, Nightingale, and Blackcap). Commended, J. W. Harrison (Wood Lark).

PARROT, PARAKEET, LORY, OR OTHER FOREIGN BIRD—First, G. E. Storr, Spalding (King Parrot). Second, G. Ecclesfield, Spalding (Parakeet). Highly Commended, C. A. Cartwright (Parrot); E. S. Smith (Parakeet); J. Watson, Spalding (Grey Parrot); J. Earnes, Spalding (Lory).

RABBITS.

HEAVIEST—First, P. Booth, Spalding. Second, J. Taylor, Sheffield. Highly Commended, T. Boor, Wykeham. Commended, A. H. Easton. Bull; E. Warner, Spalding.

LOP-EARED—First and Cup, M. Millington, York (Yellow Buck). Second, A. H. Easton (Yellow and White Buck). Highly Commended, M. Millington (Yellow Buck and Black and White Doe); A. H. Easton (Black and White Doe, Fawn Buck, and Fawn Doe); H. Yardley; J. Taylor; W. Allison, Sheffield.

FANCY VARIETY—First, R. Wise, St. Ives, Hunts (Silver-Grey). Second, W. S. Hornby, Clifton Garth, York (Himalaya). Highly Commended, A. H. Easton (Silver-Grey Cream Shade and Silver-Grey); R. Wise (Silver-Grey); J. Hoekerton. Commended, J. W. Taylor.

Mr. Edward Hewitt, of Sparkbrook, Birmingham; and Mr. Richard Tebbay, of Fulwood, near Preston, were the Judges.

DRAGON AND ANTWERP PIGEONS.

I AM very glad that my remarks upon the above varieties of fancy Pigeons have called forth a few words from two writers, for in this way knowledge is increased. Perhaps it may be thought right for me to add a word or two in reply.

"A FOREIGNER," as a Pigeon-fancier, takes a different view from myself, an English fancier. The fact is, we view the subject from different points of sight, for from all I have read or heard, Pigeon opinions on the continent are very different from ours in England. The old writers called the Pouter the English Pouter, and they might have prefixed the word English to other varieties; the continental Tumbler, for instance, was always different from our English bird.

To mark the differences now-a-days I will quote the description given of "The Hamburg Pigeon Show" in our Journal of August 29th, 1867. There I read, "The Carriers were very poor indeed in quality, but an improvement on the German idea of them a few years since," and "the Pouters, according to German ideas, were all that could be desired. In my eyes the true English Pouter was very badly represented." "The Tumblers, according to English ideas, resolved themselves to two pairs!" "Of Barbs much cannot be said." "Turbits were awfully low in quality," and so throughout. Nations differ in opinion, and it is right they should; national feelings vary, well they may, and may they always; it would, indeed, be a dull world if every nation were exactly like every other nation. Further, at the end of the article I have quoted is an account of forty thousand visitors who met to see two or three hundred Antwerps tossed off; in England the men would not have been nearly as numerous as the birds. Then mark the conclusion, "The attractions of the Pigeons seemed immense, and in many a group of some half dozen staid-looking men one would have imagined that the fate of kingdoms was being discussed, rather than the produce of some particular bird."

All this would not have happened in England. We love in poultry and Pigeons to breed pet birds with fine and remarkable points and properties. We delight to reach a certain difficult standard of merit in marking and colours, and only a small class of fanciers care for plain-looking but sharp-flying birds.

I am sorry I cannot recede in any way from what I have said. I have kept Antwerps, and did not find them as interesting, from my point of view, as other varieties. Two years since I saw the Birmingham Show, and think with "J. I. B." that "some Antwerps were little better than Blue Rocks." I am also happy to agree with the author of "Pigeons," where he says, page 82, "Antwerps often have a class given to them at the poultry and Pigeon shows; a very absurd arrangement, as they have no qualities that can afford any criteria for a judge to decide upon in a show pen." These words are stronger than mine. Again, this writer says, page 83, "Speed and endurance are the objects to be attained, and colour is altogether disregarded, another proof, if any were wanting, of the absurdity of offering a prize for a pair of well-matched Antwerps in a show pen, a prize which is generally given to a pair of birds that would never be seen again if let out fifty miles from home."

The right way would be to exhibit Antwerps that had performed very long journeys, these performances being duly certified and authenticated, not merely the written word of the owner; then, being sure they had done a great feat, they would be regarded with great interest, and would deservedly have much notice. But as a fancy bird I cannot for one moment place the Antwerp on the same level with the very graceful, striking-looking English Dragoon, a bird which merits much care and pains, and without which it cannot be bred to perfection. "A FOREIGNER" is quite entitled to his view, and so also is an English fancier.—WILTSHIRE RECTOR.

P.S.—I see Euton says of Antwerps, "The more ugly they are the better they perform their work—that is, of flying." Ugliness is an unfortunate qualification for a show pen, unless the admirers of Antwerps regard them as a man who had an extraordinarily ugly wife did his spouse, for he said, "I am very proud of her; no man has such an ugly wife, and therefore she is unique. Oh! I am very proud of her."—W. R.

EARLY DRONE SLAUGHTER.

Upon looking at my bees on June 23rd, at noon, I noticed that in one of my hives, a Woodbury nine-bar and frame hive all glass, placed inside a summer house, the bees were killing the drones. The hive has not yet swarmed, but is very strong both in bees and honey. For several days I have seen the queen upon the top of the bars inside, surrounded by her attendants; she will stay about half an hour at a time and then go down again, and perhaps in an hour or two will re-appear. Can you tell me the cause of the drones being killed so early? The queen looks well and lively, not languid or slow in her

movements. The bees hang out in thousands at the front of the hive, but still she does not seem inclined to lead them off. I passed last winter with fifteen stocks and did not lose one. I have had several swarms, but none before May 31st.—A SOUTH LANCASHIRE BEE-KEEPER.

[This somewhat premature massacre of drones arises from the recent break-up of fine weather putting a stop to the honey-harvest, and indicates that however populous the hive may be it is not likely to swarm naturally. Every available cell being, doubtless, filled either with brood, honey, or pollen, the queen's occupation is for the present gone, and she, therefore, idles much of her time at the top of the hive. The true remedy for this unsatisfactory state of things is to make an artificial swarm, which we should do immediately in the manner described by Mr. Woodbury, in page 80 of "The Gardener's Almanack" for 1868. The swarm should, of course, be fed if the weather is unpropitious, in order to enable it to proceed with comb-building.]

A BEE DISASTER.

"By other's faults wise men correct their own." I think I remember this proverb being on my copy slip long, long ago, and it is in the hope that others may profit by my woeful experience that I send you the account of to-day's disaster. I took a pin swarm of Ligurian bees last September, after it had been in the rain all night, hived it in the only hive at hand, a rotten old affair, brought it home, added two or three (I forget which) common swarms to it, fed them to the amount of 25 lbs. of food during the winter, and had the pleasure of seeing them thrive to my heart's content.

When this unlucky day, June 13th, I attempted to drive an artificial swarm—the bees had been hanging out for days, and as I was obliged to go from home, I feared they would swarm, and go off in my absence—so I turned up the rotten old hive, when down fell all the precious combs full to overflowing with honey, brood, and bee bread. The hive was so tender that the pressure I used in attempting to invert it, though I thought I was most careful, was too great, and a confused mass of bees, combs, and honey, was all that remained of my so lately prosperous colony. No words can describe my distress. I have packed up as much as I can, and placed it in a sapper, in the forlorn hope that the bees may rally round it. If you can advise me what to do, I shall be grateful; if not, publish this to warn others against a like disappointment.—AN UNFORTUNATE BEE-KEEPER.

[We fear that this is a hopeless case. The probability is, that the combs had become attached to the floor-board, and that the catastrophe might have been averted by the use of a moveable floor-board which could have been inverted with the hive.]

BEE GLASSES.

My attention has been directed to the very admirable sketch of a glass of honey which was given in your Journal for June 4th. With a little further improvement this glass would prove a great acquisition. First of all, supposing that the hole of communication by which the bees enter from the hive below is at the base of the glass, as it stands in the engraving, and that the upper part is quite open, would it not be better for the top to rest upon, and not within the marginal rim, as it appears to do in the engraving? Methinks, too, it would be better made of wood than of glass, in which case the bees would make their combs adhere to it, and we should not, as now, see the bees constantly obliged to repair their labours, when the comb breaks down from its own weight, and from the difficulty of making it adhere to the glass.

Then, I should like to know how the bottom hole 3 inches in diameter is closed, so as to prevent the honey from oozing out when on the breakfast-table, which without some sort of stopper it will certainly do, as soon as the comb begins to be eaten. A cork would probably suffice, but then some allowance must be made in the stand below for the reception of the projecting part. But for some arrangement of this kind the glass, however beautiful as "a drawing-room ornament," will be practically useless where it is most wanted, "on the breakfast-table."

I have long given up glasses as adjuncts to my apiary, finding practically that those in common use are an extravagance. Often the bees will not work in them, and when they do, the industrious insects are constantly baffled by the difficulties they meet with in constructing and securing their combs,

wasting much time and wax in repairs. If this new glass had only a flat wooden top, and were otherwise improved according to the suggestions I have ventured to offer, many of these difficulties would be removed, and the glass would be all but perfect. Will your correspondent, "A RENFREWSHIRE BEE-KEEPER," kindly state where these glasses can be procured, and at what prices?—B. & W.

WILL TWO HIVES OF BEES WORK IN THE SAME SUPER?

PLACE the hives back to back, with a space of, say, 6 inches between. Place on them a super having holes to communicate with each hive through which the queens cannot pass. Divide the box in the middle with perforated zinc, and have the same over the entrance holes. Then first draw away one slide and allow one lot of bees to pass up, then in a day or so let the other bees come up. There then being free communication between the two hives, divided only by the zinc plate, the smell of the one will mingle with the other. After a short time would the bees know the difference in each other? The zinc plate if stopped up by propolis could easily be exchanged for another, and if the plate were entirely removed, what then? Would they fight? Or is the experiment worth trying or no? The object of this would be, I presume, an immense number of bees at work in the same super. Of course, they would go out of either hive, but always return into their own, I suppose.—X.

[The same idea has occurred to us, but we have been deterred from trying it, by the expectation of a quarrel. There is also the risk of regicidal attacks being occasioned by the intermixture of the bees of two different hives. We know of an instance in which the attempt was made to work a large glazed super by dividing it into four compartments, and admitting into each the bees from the same number of hives. The result was not encouraging, for all would not commence at the same time, so that the work in the different compartments advanced at a very unequal rate, then some of the queens went up, and a large quantity of brood appeared. Finally, one or two colonies swarmed, and declined to continue the work, until in the end the huge super had to be taken off with its contents in a very chaotic condition.]

TWO QUEENS IN ONE HIVE.

THE following instance of two queens in a hive will probably be of interest.

Premising that of nine young queens which I have lately raised from a Ligurian imported by Mr. Woodbury the half are remarkably light and well marked, and the other of a dark mahogany colour, with hardly a vestige of rings, I may state that having formed a nucleus with two combs, I saw on the 30th of May two royal cells sealed, the first of them on the 22nd. On the 2nd of June I found a young queen, which I consider to have been hatched May 31st, and very large, remarkably light-coloured, and with the hind extremity very black. I did not remark the condition of the royal cells, but put the box into the cellar, according to the receipt of "M. J.," for impregnation, and which, I may remark, has in two nuclei on which I have tried it in second-rate weather, proved a failure.

On June 5th I showed the queen to your correspondent "R. S.," when she appeared very large, but her bright yellow a little dimmed by confinement, as was that of the workers. On the 8th I looked at the queen, and was astonished at the change in her appearance; she was now of a dark mahogany colour, and very slight, which change I ascribed to the confinement, which ended three days previously. On the 11th I again saw the queen under the same aspect, and on the 18th observed her entering the hive about noon, the day being calm and cloudless, and remarked that she had quite recovered her pristine looks and condition. In the evening I looked and found her encaased, a great beauty for size and colour, and with the evidences of a recent successful wedding flight. Dispersing the knot of bees, I shut the box up for about a quarter of an hour, when, looking again, I found her, as I supposed, at liberty; but, wonderful metamorphosis! she was now dark, slender, and evidently unimpregnated. Suspecting at last how the matter stood, I examined the other comb, and there was a knot with the yellow queen in the middle of it as before.

It is evident that in this case two queens inhabited the same box for more than a fortnight in harmony, but when one took a flight, she was received on her return as an alien. Is it not

possible that this may happen oftener than is suspected? and that it may account for the manner in which young queens are frequently destroyed on their return from their wedding trips? In this case I should never have suspected anything had it not been for the remarkable dissimilarity of the two queens; when first the yellow, and then, perhaps, the dark queen would have been destroyed; for, as it was, after I had removed the yellow queen, I found the bees very mutinously disposed towards the other, which I eventually removed and then caged the yellow queen; but until dark the regicidal furor remained unabated.

I may remark that I immediately examined all my other young queens, and found them intact, so that the supposition that one of them might have found its way into the hive is excluded; indeed, there was not any young queen within many yards of the spot.

For the information of one of your recent correspondents I will observe that I have fitted an adapting board with gratings three-sixteenths of an inch wide to exclude the queen, and that the super is progressing as well as if the passage were free. As an experiment in hastening fertility, I selected a glass unicombed hive with one common Woodbury frame on which a queen was hatched on the twelfth day of its removal from the parent hive, and I fed the very moderate population day and night from the time of the queen's being hatched. They built much comb, and on the ninth day of her life she was rendered fertile. I have never before had a queen so before the fourteenth day.—ARICOLA.

OUR LETTER BOX.

GAPES IN CHICKENS (G. F.).—If your chickens died from poison they would not be then as you describe. We believe they die of gapes. There is only one cure for them. No ordinary treatment is of any service, as it is a purely local disease, and that only which comes in contact with it can be of any service. You must administer pills of camphor, one at a time, and each pill half the size of a garden pea. These must be given every eight hours till the bird is relieved. In slighter cases a cure is effected by giving the chickens water strongly impregnated with camphor to drink. The disease is caused by small red worms at the end of the windpipe, and these die as soon as the odour of the camphor reaches them. Adult fowls do not suffer from gapes. Chickens are strengthened by having wormwood in their water.

WEIGHT OF SPANISH FOWLS—COMBS TURNING BLACK (H. B. T.).—There is no standard weight for Spanish cocks and hens. They are birds of feather, and should be judged accordingly. It is very likely your birds are approaching the moulting season; that would account for the appearance of the combs. Those of the hens always shrivel up at that time. We look with suspicion when a cock's comb falls over, always fearing lest it should remain so. Feed them well. Let them have their grass run as usual. You must not expect their combs to be as florid as in the spring.

HEN SUFFERING FROM DIARRHOEA (P. A.).—Give your hen Baily's pills if you have not them at hand, mix some pounded chalk with hard old strong beer, and give the pills every two hours till she is better.

WASHING FOWLS FOR EXHIBITION (Idem.).—You may wash the plumage of any fowls with a sponge and cold water, if very dirty add a little soap. Wipe the feathers the right way, as it is only the outside that is dirty. Put them in a basket with hay to dry; in the winter before a fire, now in the sun. You may wash them the day before they leave you.

BRASSIAS VULTURE-HOOKED (Norw.).—It is very vexatious that your birds should come vulture-hooked. You are right; they are valuable only for the cock. This may occur in spite of every precaution on the part of the seller, as his birds may throw back. The birds that won the cups were not vulture-hooked in all probability. The seller of the eggs will, probably, regret the result as much as you do, and be willing to make compensation by sending you some more eggs, especially selected with a view to prevent a similar result.—E.

COCKATOOS SELF-PLUCKED (C. E. S.).—Continue to give your bird a good syringing of water, slightly warmed, two or three times a day with a watering pot through a fine rose. Give it cold supped bread, dry plain biscuits, Indian corn, canary seed, and fruit, a plentiful supply of clean water, and some bread dipped, not soaked, in milk occasionally. If the bird has plucked its feathers any length of time, there is no remedy, we fear, of curing it of the habit of doing so. This answer has been accidentally delayed.

GROUNDED OATS (Ferr.).—Apply to Mr. Agate, Slougham Mills, Crawley, Sussex.

ESTABLISHING A HIVE (D. W.).—It is certainly not too late. A trifling expenditure in sugar will in any event set matters right.

SILK-WORMS' COCOONS (M. L. J.).—Three hundred are too small a quantity for commercial purchasers, and are only worth 2s. or 3s., producing about 1 oz. of silk, but if good they might be useful for production. If you send a sample to Mr. L. Harman, jun., Old Catton, Norwich, perhaps he will buy them.

POULTRY MARKET.—JULY 1.

We are daily getting a larger supply of poultry, and prices are hardly maintained, although, as is usually the case in very hot weather, there is a good demand.

From observations taken near London during the last forty-one years, the average day temperature of the week is 75.2°; and its night temperature 50.5°. The greatest heat was 93½°, on the 14th, 1817; and the lowest cold 33°, on the 9th, 1863. The greatest fall of rain was 1.46 inch.

NOTES FOR AND AGAINST SPRING GARDENING.

IF the present movement in favour of spring gardening be calculated to lessen the amount of summer bedding, as it is called, many hard-working gardeners, whose glass structures of all kinds are overcrowded in the spring months, will hail it with delight, as relieving them and the legitimate occupants of houses and pits from a pressure that has been yearly increasing. It is, however, to be feared that no diminution of the number nor important change in the description of plants wanted in summer will be made; on the contrary, the cultivator's attention to the plants intended for spring display will have to be added to the amount of work which he has at present to perform, but with this difference, that the plants intended for summer display will remain longer on hand before they can be finally planted in their flowering beds, and the spring gardening, if well carried out, will be found to entail, at a time generally the busiest of any during the year, a much greater amount of labour than is often expected. A heavy crop of spring flowering plants cannot be removed from the bed which they have been occupying, without that bed having to undergo some kind of renovation in order to render it capable of supporting immediately afterwards another crop in a healthy and vigorous condition. Besides, many of the so-called spring-flowering plants continue to be ornamental until the beginning, or even the middle, of June. Possibly, too, the weather at the time the bed is ready may not be the most suitable for planting out subjects which have not each a separate pot, and loss or delay must take place; and even under favourable circumstances they cannot be so early as others planted out at the proper time, unless they have been specially prepared at the same trouble and cost that as many ordinary greenhouse plants would involve. Hence those persons who are taxed with as much work as they can possibly do with advantage to the plants under their care, ought to pause ere they commit themselves too hastily to an extensive system of spring bedding, if an early summer display be wanted also.

The example of the past winter ought not to be too hastily quoted as showing what can be done towards producing a display in spring, for it has been one of the best for the purpose that I ever remember. Some Primroses made an excellent show early in February, and were never injured by frost, but we can hardly expect this to occur often; beds, likewise, may endure one winter's crop without showing that exhaustion which they would do if winter planting were repeated year after year. That good results will not follow every season I have myself witnessed this spring. Nevertheless, I by no means wish to disparage a system that has attracted attention at intervals during the last thirty years, but has been abandoned by all but those who have the means of carrying it out well.

A short time ago I had an opportunity of witnessing a good example of spring gardening, combined with summer

bedding-out. In this case the early-flowering plants had been removed, the soil of the beds in a great measure exchanged for fresh compost, and Pelargoniums, Verbenas, and other plants, each growing in an 8-inch pot, were employed to fill the beds again, the plants being large enough to place on the stage of a greenhouse. The effect was complete at once, but few have the means of practising such a system on a large scale, and every one must do the best he can with the conveniences at his disposal. Some modification of this system will be attempted by many who cannot adopt it in its integrity, but those who have not had much experience should not embark too extensively in spring gardening unless they are in a position to carry it out well; and I would especially guard them against pursuing a plan practised in some places—that of mixing the summer bedding plants in the same bed as the spring ones, in the expectation that the former will out-grow the latter. Such mixtures rarely answer well, and are often a source of much disappointment; the bedding plants being late and irregular, and the season in a great measure gone before they cover the space allotted to them.

The present year, as I have already remarked, must not be taken as furnishing a fair example of the results which will be achieved in spring gardening in ordinary seasons, for the weather was unusually mild from the middle of January up to May, and annuals attained a robustness of character which they would not have done had the frost been more intense. The winter was so mild that here and at other places in the neighbourhood several rows of the single white Primrose commenced flowering by the end of January, and the frost was never sharp enough to injure the flowers, though it often is so late as April. This variety blooms earlier than the wild Primrose, and during the past season it also flowered more profusely where both were growing together. I regard it as one of the best, if not the very best, of early spring-flowering plants; but I only mention it here to show that the mildness of the season enabled it to continue for more than two months one of the most ornamental plants we had; but such would not have been the case had frosts of an ordinary kind occurred while it was in flower. Forget-me-not, Silenes, and other plants were equally favoured by the mild weather.

I advise those desirous of attempting spring gardening, and who wish to have their beds at liberty by the middle of May, to grow only the earliest of all spring-flowering plants, and to avoid as far as possible all which do not begin to flower by the beginning of April, or at latest by the middle of that month. The number of such plants is, of course, limited, but they afford a good variety of colour, and it is better to reject the later-flowering ones than have to perform the unpleasant duty of destroying them when, perhaps, just at their best, in order to clear the ground for the next crop. Of course I am now advocating the cause of early spring-flowering plants only; those which bloom about Whitsuntide or later, beautiful and showy though they are, may be more properly considered as belonging to summer. Assuming, therefore, that only early flowers are wanted, the following short list may form a nucleus for

others to add to. All the plants named in it are very hardy, and easily transplanted, except in cases where it is stated that they are otherwise.

AUBRIETIA RUPPURA, a dwarf, spreading, herbaceous plant, likes dry ground, and is raised either from seeds or cuttings, the former being preferable. As a permanent edging it deserves a place almost everywhere, but it bears transplanting well; being densely covered with pale purple flowers, it is a great favourite in spring. A striped-leaved variety is still more pretty as a plant, although its flowers are less ornamental. *A. Campbelli* has darker-coloured flowers. All are good.

ARABIS ALBIDA is one of the earliest and most easily cultivated of all our spring-flowering plants, but it is often neglected at the time when its propagation ought to be attended to. Being of a free-growing habit, it speedily becomes too large for removal with ease, and it is preferable to pull a few plants to pieces in June, and insert the cuttings, or rather slips, for they may be 6 or 8 inches long, in a piece of nursery ground, using the spade for the purpose much the same as in planting Box edging. They will form useful plants to take up in autumn, when they may be removed to their flowering quarters. The perfect hardness of this plant, and the profusion of flowers which it produces, entitle it to more attention than it receives, and its propagation is on the whole less troublesome than that of some annuals which require twice transplanting.

ARABIS ALBIDA VARIEGATA.—Of less robust habit than the preceding, its flowers are not less beautiful, while as a plant for winter decoration it has few equals. I mention merely the plant, not its flowers, for winter decoration, because the character and appearance of the plant are of more importance at that season than the flower, and it will be admitted by all that out-door flowers present only a sorry appearance in the dead winter months when this plant is so neat and interesting.

ARABIS LUCIDA AUREO-VARIEGATA.—I have never been able to make much of this plant, which seems to require a soil in which lime does not predominate to such an extent as with us. Its leaves rather than its flowers are its chief merit.

PRIMROSES.—The great variety of colour and compact habit presented by this family render it a favourite with everyone, nevertheless it does not succeed alike in all places, and with us dry summers affect it most, more especially the *Polyanthus* section. In general the single varieties make a better display than the double ones, and are more readily propagated. The single white and single pink are my greatest favourites, but the common wild Primrose is a desirable addition to these. Taken up and transplanted in some shady, rather moist soil, Primroses generally do very well; but where such north borders are wanted for summer Lettuces and similar crops and the plants have to be placed in some dry corner, the drought of summer affects them very injuriously. In general the best specimens of Primroses are those which have remained two years or so in the same place without having been disturbed; when longer in one place they very often become unsightly.

ALYSSEUM SAXATILE.—I know of no plant which in dry soils is equal to this in intensity of colour at the period when it flowers; it is also hardy and readily adapts itself to transplantation twice a-year. We have grown it extensively at Linton Park for many years, and we have two varieties of it, one much dwarfer than the other, the flowers of both being of a vivid golden colour. A variety with variegated foliage does not flower so freely, but it looks well as a plant, and being very hardy is well adapted for winter work. It must be propagated by cuttings, but the ordinary form of *Alyssum saxatile* is easily raised from seed, which it produces freely. A dry soil appears to suit this plant best, as it clings to a dry corner with a tenacity not met with in every plant. I consider it amongst the best and most useful of spring-flowering plants; its gay appearance gives it an importance even when viewed from a distance, and the sturdy character of the plant when not in flower is also in its favour.

HEPATICA.—I mention this more on account of what I have seen elsewhere than as being successful with it myself, for I have never been able to manage it satisfactorily; either it did not transplant well or did not flower freely, so that I have not tried it for many years. In some places, however, it has been fine, and the neat character of the plant and its other qualities are great recommendations, if it can be made to endure transplanting twice a-year and will yet bloom well.

IBERIS GIBBALTARICA.—This is somewhat later than the *Alyssum*, but is a compact plant, which preserves a good ap-

pearance all winter. As an edging it also looks well, and after flowering bears cutting-in better than most plants of its kind. I have used it more as a permanent edging than for spring bedding. An improved sort has lately been introduced called, I believe, *I. ternata*. The flowers are of a clearer white, and, instead of forming an umbel, are collected in a sort of short spike or head, the habit of the plant being about the same as that of *I. gibraltarica*.

DAISIES.—I have not planted these much, but where I have seen them the double white was of most service. Much, however, depends on the distance a plant is from the observer. If it is 50 yards off or more, usually pale-coloured flowers, as contrasting most strongly with the ground, look best, and those of a dull red colour are but little seen, but when close under the eye both look well.

BULBS.—Although last on the list these ought to have been first. The Snowdrop, which is noticed the least of all by bulb-vendors, is the most useful, as it transplants well in all stages of its growth, flowers the earliest, and has the important recommendation that when planted near woods and similar places it is not liable to be attacked by mice like the *Crocus* and *Narcissus*. Bulbs, however, are too well known and appreciated to require more than a passing notice.

To the above may be added many other beautiful and serviceable plants, and the Winter Aconite for one; but although it thrives remarkably well here when not removed, its success is not so satisfactory when it is taken up twice in the season, and the same remark holds true with regard to the Christmas Rose. There are so few annuals that meet our requirements of what may be called a winter plant that my list of them is a very meagre one. Many years ago I used to plant the Virginian Stock for early flowering, and I am not aware yet of any annual that blooms before it, but as a plant to look at and handle it is poor, although it is quite hardy and only resembles many other annuals. The Forget-me-not, which is very sturdy, also flowers tolerably early during a mild season, and nothing could well excel two large beds of it which I had this spring; but then every winter may not be like the last, and when I say that plants of *Tritoma uvaria* were in full bloom in March, it need hardly be wondered that other plants were in a like manner unhurt by the cold. I fear, therefore, that the Forget-me-not must not be classed with the very early-flowering ones, while a variety called *Impératrice Elizabeth* is very much later, in fact, it did not flower till June, when the hot weather decreased both the size of its flowers and the duration of their beauty.

There are no doubt other early flowers besides those which I have mentioned; but many say that the Pansies do not do well in dry summers and on dry soils, and *Viola cornuta* does not meet our requirements of the class of plants I am referring to, as old-established plants do not flower early enough, while the very pretty family of *Mimulus* requires a greater amount of moisture than is generally given. Wallflowers will do better, but they require somewhat more attention during the summer than they often receive; and the same may be said of several other plants equally beautiful. The really early-flowering plants are not so numerous as might be supposed, and those which present a good floral display in April after a hard winter are the kind wanted. Later-flowering subjects are plentiful enough.

Having gone thus far without lauding the prevailing rage for spring gardening so much as many have done, but without at the same time wishing to disparage the system (my purpose being to confine it to the class of plants flowering early enough to allow of the beds being cleared and prepared for the summer bedding plants at the proper time), I would particularly urge all whose beds are objects of daily inspection to try to make them as ornamental as possible during the winter months. In general it is hopeless to look for many out-door flowers from the middle of November to the middle of February, and sometimes even during a longer interval; but there is no reason why ornamental plants should not occupy such beds during this period, and the plants available for the purpose are quite as numerous as those flowering in April. The winter decoration of the flower garden is not of less importance than the spring display, while it has the advantage of not interfering in the least with the summer bedding, which in most places is after all of the greatest consequence.—J. ROBSON.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION OF GARDENERS.—The next examination of candidates for certificates will take place at Kensington on the 14th of this month, and for

associateships on the 15th. Those requiring information on the subject may obtain it by applying to Mr. James Richards, Assistant Secretary, Royal Horticultural Society, South Kensington.

INSECTS AND WEEDS.

Few have been used to country life who have not often heard something like the following—"It's a sharpish morning!" the farmer says, rubbing his hands in the vain endeavour to turn his fingers any other colour but blue; "but it's very healthy, and it will kill all the grubs and weeds." Now, the ideas meant to be conveyed by such observations as these are so generally entertained that one has, perhaps, never heard a dissentient remark about them; and it is hence concluded by everybody that a hard winter is destructive to insects and weeds, and, indeed, that "King Frost" destroys more grubs than hosts of swallows, whilst he is duly honoured as "Winter the Weeder." But widely spread as are these ideas, I take upon myself to dissent from them, in the belief that my opinion will be shared by others upon due observation.

With regard to both insects and weeds, we must take into consideration that those here named are indigenous, and that they are among our wild native plants just because they are endowed with powers to resist the cold and frost to which in winter they are liable to be subjected. Look at the snug retreats of insects in the bark of trees, in the moss of the wall, or the leafy bank; see how they are further protected by swathings of cottony material, by thick varnished cases, or nicely constructed houses; and above all, inquire into the immense fecundity of most species, and we shall be aware that this vast superabundance is made for the due continuance of the species, in spite of atmospheric action, which with insects, as with humanity, exerts a decided influence. Yet the world would soon be overstocked with insect life, were it not that insects are kept in check by insectivorous creatures of various kinds, amongst which none will be found such active insect-destroyers as birds. A few weeks of frost may aid in the destruction of some insects, and especially in the larva state; but then, though so tightly bound up in the frozen earth, it must be borne in mind that they are wonderfully well prepared for the event; and it must be recollected that birds during all this time must starve, or, what is as bad for our crops, they must attack the buds, roots, and softer parts of our cultivated plants for the means of a scanty subsistence. Under these conditions it is no wonder after all that even those farmer friends who have been so pleased with a hard winter "for killing the grubs," should wonder in the following summer "how there can be so many insects after the cold winter we had." For myself, I view this as a natural consequence; and observation has seemed to me to verify the conclusion that severe winters are succeeded by summers prolific in both insects and weeds.

A very little inquiry will be sufficient to show that the same evidence is afforded by the growth of plants, and more especially of those we term weeds. These for the present purpose may be very conveniently divided as follows:—

1. Perennials, or those in which the stem or rootstock is permanent.
2. Biennials, or those in which the plant is prepared in one year, and the seed grown in the following.
3. Annuals, in which the seed is sown in autumn, but its germination and the re-seeding occupy the following year.

On reviewing the Perennials, we shall see that we ought to have but few weeds belonging to this division, if we except the shrubs of various kinds which find their way into hedgerows to the detriment of the Quicks, such as—

<i>Sambucus nigra</i> , Elder	<i>Viburnum opulus</i> , Guelder Rose
<i>Viburnum lantana</i> , Wayfaring Tree	Rosa and Rubus, all species growing in hedges.

Of weeds with perennial rootstocks we have such as—

<i>Triticum repens</i> , Couch Grass	<i>Convolvulus sepium</i> , Hedge Bind-weed
<i>Convolvulus arvensis</i> , Corn Bind-weed	<i>Carduus arvensis</i> , Corn Thistle

These form a good example of a class of weeds, the rootstocks of which are all the better protected from being beneath the surface, for frost, instead of being injurious to them, forms a pellicle above them, and thus provides for their greater safety.

As regards the second set of weeds, it may be said of them, as of insects—they live in our climate by virtue of their adaptation to it; and if we duly study the plants in the list which I give in the next column, we shall see that a hard winter is more favourable to their full second year's development.

Plants of this kind are either developed from seeds which,

falling in the autumn, remain until spring without germinating, and so occupy one season in developing a plant from which the seed is produced in the following year; or the seed when sown in autumn may at once germinate, and the plant and seed development each occupy a year afterwards; whilst some may in the year the seed is sown make sufficient progress to form the seeds the next year. This, however, depends to a great extent upon the season, as biennials, which occasionally take parts of three years for growth and re-seeding when the weather is severe in winter, produce seed the first year after sowing if the weather is mild.

<i>Ranunculus repens</i> , Creeping Crowfoot	<i>Leontodon taraxacum</i> , Dandelion
<i>Papaver hybridum</i> , Smooth-headed Poppy	<i>Carduus nutans</i> , Musk and other Thistles
<i>Papaver rhoeas</i> , red Poppy	<i>Centaurea nigra</i> , Black Knap-weed
<i>Coincya maculata</i> , Hemlock, and others of the same family	<i>Centaurea scabiosa</i> , Great Knap-weed
<i>Kuanta arvensis</i> , Field Scabious	<i>Plantago media</i> , Plantain
<i>Soechus arvensis</i> , Corn Sowthistle	<i>Rumex pratensis</i> , Meadow and other Dock
<i>Soechus oleraceus</i> , common Sow thistle	

On examining these plants we shall find them all so well prepared for winter, that unless they have severe weather to arrest their growth and make them strong and hardy, they will grow up weakly and attenuated, and produce as little seed as would non-transplanted Cabbages and Lettuces in garden culture. Hardiness and consequent after-size are induced by the autumn sowing, and the retarding process is further aided by transplantation. No fact, then, is better established than this—that supposing a few weeds of biennial growth to be destroyed by winter, yet the effect of cold and frost is to harden the rest, and thus to make them far more productive of seed than they would be after milder weather; so that in reality, when we see in midwinter examples of Sowthistles and Docks with just a small living central bud hidden in a mass of dead leaves, and cringing to the very ground as though afraid of the biting blast, we must not conclude that these have been destroyed by frost; on the contrary, their very stunted growth is an evidence of their well-being, and such specimens will assuredly produce well at seed time.

Annual weeds are by far the most troublesome, as they grow up so quickly, and frequently so abundantly with every crop, that they usually smother the young plants unless soon removed. Who has not seen this in the case of roots, where it is an evidence of the farmer having allowed their parents to seed in the soil with a previous crop? Many of this section of weeds do not take the whole of the year for the production of their seed, but seed more than once; others, again, require but a few weeks for their development, and so come up with an early-sown spring or summer crop indifferently. Of course, seeing the large production of seeds in most of the annual species of weeds, we shall be prepared for many of them being destroyed; but cold or frost should not be considered as destructive to them, except to a limited extent, as annual weeds are, if possible, better adapted than any other for withstanding the widest vicissitudes which our soil and climate can offer; and though it is true that different soils possess different species of annual weeds, yet there are some that are common throughout the country, from John o' Groat's to the Land's End. Amongst the causes, however, which tend to lessen weeds I may mention the following:—

Their seeds may be scattered by high winds to places uncongenial for them. Numberless seeds are destroyed by insects, many species of which partly live upon them.

By far the greatest destruction of the seeds of weeds that takes place is due to such birds as the finches. We all know what large quantities of seeds are eaten by some of our bird pets, and as with them the seed is almost reduced to powder by their active little mandibles, birds of this kind really destroy the seeds of weeds in the most perfect manner. Many of us have been before now amused in watching a piping bullfinch enjoying his cruciferous seeds, and when I say that he does these his daily allowance of Grouse! has about a hundred heads of flowers, each of which may perfect as many as fifty seeds, we have 100 × 50 = 5000 seeds of a pernicious weed daily destroyed by a single bird, and this by no means represents all his weed food, still less does it give us more than a faint idea of the numbers of weeds destroyed by birds of this kind in the wild state.

This amount of good—and I maintain that our small birds are amongst the farmer's foremost weeders and best friends—is interfered with by winter. Frost binds up the scattered

seeds of autumn, snow covers those not scattered, and all this time the birds are starving. The appearance of the bare earth in winter is very different from that which it presents in summer when clothed with verdure; the difference is known to be caused by cold, and so we hastily conclude that winter is a weeder to whom we may safely trust; but the very green of summer is only preparatory to the growth of plant seed, and if we waste that season by allowing this consummation to go unchecked, we may be quite sure that Nature has thus amply provided for the continuance of species.—GEORGE NEWLYN.

ROYAL HORTICULTURAL SOCIETY.

JULY 7TH.

FRUIT COMMITTEE.—George F. Wilson, Esq., F.R.S., in the chair. Messrs. Carter & Co. and Messrs. Hurst & Son exhibited a dish of Laxton's Supreme Peas, a fine, large, and very distinct early Pea of the Green Marrow race. It was awarded a first-class certificate. Messrs. Wood & Son, of Maresfield, sent a dish of a seedling Potato, which was submitted for trial in the collection of Potatoes at Chiswick. Mr. Carver, gardener to J. Walker, Esq., Southgate, sent fine fruit of the Camellia.

Three splendid bunches of the Golden Champion Grape were exhibited by Mr. William Thomson, of Dalkeith Park. This is the first time it has been submitted to the judgment of the Committee, and it fully realised all that has already been said of it. The bunches are large, and the berries are enormous; the latter are oval, with an amber tinge when quite ripe, a solid, tender flesh, and a flavour differing little, if at all, from the Black Hamburg. In size and appearance it far surpasses any white Grape, and in flavour it is excelled by none except the Muscats. It received a first-class certificate.

Mr. Tiltley of Welbeck, sent dishes of very fine fruit of Galande Peach and Violetta Hitive Nectarine, both of which were handsome. Mr. Westcott, gardener to the Duke of Cleveland, at Raby Castle, sent a large oblong ribbed Melon, a hybrid between Scarlet Gem and Scarlet Rock. It was a handsome fruit, but the flavour was very deficient. Mr. Jack, gardener to the Duke of Cleveland, at Battle Abbey, sent a green-fleshed Melon, called Battle Abbey, the flavour of which, though good, was not of sufficient merit to warrant the award of a certificate. A collection of Gooseberries came from the Society's garden at Chiswick. Legerdmain, a large green Lancashire variety, was very richly flavoured. Beeston Castle was also good, but not so rich. Old Ship, a yellow variety, was rather more acid. Teazor, also a hairy yellow, was of good flavour. Early Amber and Pitmaston Green Gage were very rich, and Red Champagne, though not quite ripe, was very good.

The Committee had previously met on June 29th at Chiswick, and proceeded with its examination of Peas growing in the gardens. If the early varieties have suffered in this excessively dry season, later kinds—the large foliaged dwarf Marrow sorts—are still more affected, it being well known that these varieties succeed best in rather a rainy season; and the present being just the reverse of that, they are consequently considerably under the usual average, both in quantity and quality. One or two exceptions to this state of things have, however, been observed; or, rather, some varieties seem to succeed in this dry season and to withstand the summer drought better than others. The following decisions were arrived at:—

McLean's Princess Royal is a first class second-early white Marrow, distinct, with large, well-filled pods; it withstood the summer drought well.

Peabody is a very prolific dwarf white Pea.

Somersetshire Early Prolific is very much in the way of the old white Prussian.

Dillstone's Early Prolific Green Marrow is the same as Prize-taker.

Heale's Matchless Marrow is the old Matchless Marrow—a large and very good green Marrow.

Blue Excelsior (Knight) is a very good and prolific green Marrow Pea, in appearance while growing like Champion of England; the dried seeds of a light blue. Blue Emperor is a dwarf-growing and inferior variety of this.

Carter's Surprise is very much in the style of Scimitar—a prolific variety.

Grotto is a tall growing late green Marrow, of pretty good quality, distinct.

Laxton's Supreme is a grand Pea, a green Marrow of excellent quality, with very long, well filled, curved pods. It is a hybrid between Prolific and Little Gem. The stock of this variety is very true this season, entirely free from that mixed character which was its great drawback last season. Laxton's Quality is very similar to this, but partaking more of the wrinkled character of Little Gem, a very excellent variety.

Laxton's Leader is in the style of Veitch's Perfection.

Cooper Wyton is a very good dwarf wrinkled Marrow, with large, well-filled pods.

Dwarf Incomparable is a very dwarf and prolific late wrinkled Marrow, with small, well-filled pods, of good quality.

Forty-fold is a very excellent Pea; an improved form of Champion

of England, with larger and more curved pods. It stands the dry weather well.

Premier is the finest and best form of the dwarf wrinkled green Marrow class.

Paterson's Matchless Marrow, a variety which has been grown by Mr. Whiting, of the Deepdene, for many years, is the same as Veitch's Perfection.

New Tall Wrinkled (Hurst), is very much in the way of British Queen.

A tall Marrow (Bradley) is, tall white Mammoth.

Spider Pea is a dwarf white wrinkled, much-branching variety, with small, well-filled pods.

Hybrid Pea (B. Sandiland), is a hybrid between the Sugar Pea and Knight's Marrow. It is of a very distinct character, remarkable for the shining glossy colour of the leaves and pods, resembling the old Glass Pea in that respect. It is a large white wrinkled Marrow, of very excellent quality; its appearance, however, militates against it.

The Committee then proceeded to examine the collection of early Potatoes, which in this dry season is remarkably fine—large in size, and of fine appearance and good quality, without the slightest trace of disease amongst them. The following were the most remarkable varieties noticed:—

Lemon Kidney (an old variety), quite ripe. Large, full-eyed, clean, and handsome. Prolific.

Rivers's Ashleaf is a very prolific variety, handsome, but not so early as others.

Birmingham Prize-taker is a very handsome variety, of medium size, oblong, flattened, early.

Mona's Pride (quite ripe), is a first-class early kidney; large, full, regular, and handsome; excellent cropper.

Gloucester Kidney is a very excellent early Potato, of fine size, good quality, and very prolific.

Milky White is a very distinct variety, the whitest of all, of excellent quality, and a good cropper.

Giant King is a very handsome variety, large and regular, of oblong shape, with a fine clear skin. A splendid Potato for early market use.

Red Ashleaf Kidney is a very large and fine variety, of a dark purple colour, fit for use as early as the White Ashleaf; a heavy cropper.

Smith's Early, which is the same as the Coldstream, is the earliest round Potato.

Myatt's Ashleaf (quite ripe), is a very fine, large, and excellent stock.

Old Ashleaf (quite ripe), large and very handsome.

Paterson's Red Kidney (quite ripe), is a very fine Potato, of handsome appearance, recommendable for field culture.

FLORAL COMMITTEE.—A greater number of certificates than usual were awarded this day; and a more interesting exhibition could not be seen, whether we consider the beauty of some of the plants, or the botanical interest of others. The Society may well be satisfied at the continued interest of these fortnightly meetings.

The silver Flora medal was offered for the best twenty-four Carnations, also for twenty-four Picotees. These medals were awarded to Mr. Hooper, of Bath, there being no other competitor. A special certificate was also given to Mr. Hooper for his general collection of Cloves, &c. There were some very fine varieties among the Cloves, and we hope Mr. Hooper and others will give their attention to the improvement of this most welcome and favourite flower. There is much to be done, and easily done, with this flower; bold and smooth outline and guard leaves of substance being the principal points. Perfection in form and colour must also be studied. From what we have seen we may hope this flower will prove a favourite of the ladies.

Messrs. E. G. Henderson, of the Wellington Road, St. John's Wood, exhibited several new Lobelias, but not in a condition to judge of their merits. These plants in pots are apt to be deceptive: the only sure way of judging of their merits is from plants planted out. Lobelia pumila Distinction, much resembling Beauty of Ravensbourne, received a first-class certificate for its robust habit. Viola cornuta alba, from the same firm, received a second-class certificate. Pelargonium Flower Queen, exquisitely white in its margin, but with foliage of rather slimy texture, had also a second-class certificate. Lass o' Gowrie, a silver-edged Zonal Pelargonium, received a first-class certificate.

Messrs. Rollison sent a collection of Orchids, which received a special certificate. From Messrs. Downie, Laird, & Laing came a hybrid Nosegay Pelargonium, with bright scarlet flowers in a large compact truss; it was named Robert Bowley, and received a first-class certificate. Red King, a bronze Zonal from the same firm, had also a first-class certificate.

Mr. Williams, of Holloway, exhibited several interesting plants, and among them Trichomanes fimbriatum and Trichomanes maximum received first-class certificates. He likewise sent some others. Mr. Whithead, gardener to Mr. Dodgson, contributed a cut spike of Oncidium luridum of unusual size, and a special certificate was awarded it. Messrs. Veitch had first-class certificates for Lindsea sp., to be determined by Mr. Moore; Ampelopsis Veitchii, a hardy climber with small foliage, but of rapid growth; Adiantum sp., name to be determined hereafter; Nepenthes Hookeri, a most beautiful plant; Nepenthes rubra, equally interesting; Phormium Cookii, a beautiful form of the New Zealand Flax; Dracena nigra rubra, a very fine

variety; *Puya* or *Dyckia* species, with a curious and unusual tint of colour in its flowers, an interesting plant; *Croton tricolor* and *Croton Hillii*, both fine varieties, especially the latter. *Mesospidium sanguineum*, a delicate cherry-rose-coloured *Orchis*, received a second-class certificate, and a fine specimen of *Dendrobium MacCarthiae*, a special certificate.

Mr. C. Turner, Slough, sent *Zonal Pelargonium* May Queen, Silver-edged, and which would be designated as a bicolor *Pelargonium*. A first-class certificate was awarded it. Mr. G. Smith, Hornsey Road, exhibited a fine double *Zonal Pelargonium*, with a good truss and large flowers of a bright scarlet colour. It received a first-class certificate, and is the best yet exhibited among English seedlings. *Nosagay Pelargonium* Lizzie, very peculiar in colour, probably a new tone of colour, also from Mr. G. Smith, was likewise awarded a first-class certificate.

Mr. Parker, Tooting, exhibited a curious form of *Cypripedium Veitchii*, with an apparent double lip; also a very beautiful seedling *Ixora*, called *amabilis*, larger in the truss of flowers than *javanicum*, and of the same colour. A first-class certificate was awarded to this desirable plant. Mr. Patey, Milton, near Stevenage, introduced a most exquisite and beautiful form of *Polystichum angulare*, called *Pateyi*, for which a first-class certificate was awarded. This is very distinct and fine, and was a seedling picked up in a ramble in Devonshire. The discovery of this beautiful form of *Polystichum* may well encourage those members of the Society who are about to migrate into green fields and shady lanes; such a prize is well worth seeking.

Mr. Ley, nurseryman, Croydon, exhibited *Coleus Carteri*, which was awarded a second-class certificate. This so much resembled a plant brought by Mr. Green, gardener to W. W. Saunders, Esq., that it could hardly be distinguished from it. Mr. Green's plant was a sport from *Coleus Verschaffelti*. Messrs. Lee, of Hammersmith, sent *Zonal Pelargonium* Mrs. John Clutton, a Silver-edged variety, which received a first-class certificate; also *Quercus Concordia*, a golden-leaved Oak, and very handsome, to which a similar award was made. *Eoonymus aureus elegantissimus*, from the same firm, a well-marked variegated form, likewise received a first-class certificate.

Messrs. Jackman, of Woking, exhibited some good specimens of their *Clematises*, which were awarded a special certificate; also some cut flowers of seedling *Clematis* Sir Robert Napier, a dark purple—first-class certificate; *Beauty of Surrey*, a greyish blue, a very fine flower—first-class certificate; and *Clematis viticella rubra grandiflora*, a new tint of dark brownish red; the flowers were small, but very distinct. A first-class certificate was awarded.

Mr. Green, gardener to W. Wilson Saunders, Esq., sent a small collection of interesting plants, among them several beautifully-marked terrestrial *Orchids*, for which a special certificate was given. Mr. Robert Thompson, of the South Kensington Museum, exhibited a most interesting collection of British Ferns, well grown, and good varieties. Among them was a variety of *Asplenium adiantum nigrum*, to which the name of *flabellatum* was provisionally given. This received a first-class certificate.

Messrs. Carter & Co. sent fine groups of their Variegated *Zonal Pelargoniums*. These are, doubtless, among the very best of the first-rate varieties. Little Beale, with finely-coloured brilliant foliage, received a first-class certificate. Sir Robert Napier, very dark, fine, and distinct, a first-class certificate, and Black Prince, a bronze *Zonal*, first-rate in quality, a first-class certificate. A special certificate was also awarded this firm for a basket of well-grown specimens of *Trichinium Manglesi*.

Mr. Davis, gardener to W. Stride, Esq., sent cut specimens of *Bignonia cherere*, very fine in colour, but we hear rampant in growth. Numerous other plants were sent; some of them had received previous awards. Mr. G. Maw sent specimens of a new garden label, made of their peculiar earth at the Braseley Works. These were approved of by the Committee, and recommended for pot labels. Those of the size exhibited were a shilling per hundred. They are made in various colours, and can be used for the pencil, or a prepared enamel ink. They will be found very durable, but, like all materials made of clay or earth, fragile. With fair usage they may be considered a boon to the amateur.

GENERAL MEETING.—W. Wilson Saunders, Esq., F.R.S., in the chair. After a vote of thanks for numerous donations of plants, seeds, &c., and the election of seven new Fellows, the usual announcement of awards was made.

The Rev. M. J. Berkeley then offered the following remarks:—It was some time since there had been more than a formal General Meeting, but those who were present at that held on May 19th, would probably recollect an *Orchid* shown as the *Arachnanthe moschifera*, of Blume, but doubts were expressed whether its name was correct or not, and on examining a figure of the *Arachnanthe*, he had found that the plant exhibited was totally different. The opinion had been mooted at the Floral Committee that it was one of the *Angraecums*, but on looking over the specimens of these in the herbarium at Kew, he found nothing like it. A few meetings ago Mr. Wilson Saunders had referred to the subject of raising *Orchids* from seed, and he himself had recommended all who might try experiments in this direction to sow the seeds on branches covered with moss, an idea which he (Mr. Berkeley), had taken from the late Mr. Joseph Henderson, who was gardener to Earl Fitzwilliam, at Wentworth. Mr. Berkeley said he

had afterwards visited, along with the Scientific Committee, Messrs. Veitch's establishment in pursuit of an inquiry into *Orchid* seed, and he there met with Mr. Doring who had been so successful in raising hybrid *Orchids*, and who confirmed all that he (Mr. Berkeley) had said, stating that no success whatever had been met with except when the seeds were sown on moss. Mr. Berkeley then pointed out a flower of a *Cypripedium*, the singularity of which consisted in the lip being apparently double, but in reality there was but one lip which had become split in two, the case being analogous to what anatomists call *spina bifida*.

Mr. Bateman had last year given some interesting information relative to an insect called *Sirex juvenus*, which proves very injurious to Pine trees, and Mr. Berkeley said, that in a village near him, observing this insect abundant, he looked about for the cause, and found that the rector was making a new parsonage. In all probability, therefore, it came from the deal which was used; but not only was there *Sirex juvenus*, but a much finer species, most likely *S. gigas*, which was also met with near Market Harborough. It was desirable that those who had large plantations should pay attention to these insects.

The magnificent specimens of Golden Champion Grape sent by Mr. Thomson were next noticed, and Mr. Berkeley remarked that fine as they were, all the berries were not healthy, for on cutting them open in some cases he found that the seeds were affected by a disease which often attacks Muscat and Black Hamburg Grapes, and which also deteriorates the pulp. His opinion as to the origin of the disease was, that either the roots get in a bad condition and carry up some putrescent matter from the soil, or that the Vines are unable by evaporation to get rid of a superabundance of moisture. He did not believe that the disease originated from any fungus, but afterwards fermentation took place, followed by mouldiness.

Some specimens of labels from Messrs. Maw, of Broseley, and which can be had at 1s. per 100, were then pointed out as being an improvement on the ordinary wooden labels, after which Mr. Berkeley observed, in reference to the *Puya* shown by Messrs. Veitch, and of which the flowers have a singular metallic appearance, that he was uncertain whether the plant was a *Puya* or a *Dyckia*, or, indeed, one of a distinct genus. The only instance he knew of a plant so singular as the *Puya* in colour, was *Agaricus eruginosus* (*Peziza eruginosa*), which gives its tint to the green Oak used at Tunbridge for a variety of ornamental purposes.

After a brief reference to *Oxalis megalorrhiza* which forms the first plant in Mr. Wilson Saunders's "Refugium Botanicum," and the sport of *Coleus Verschaffelti* from the same gentleman, Mr. Berkeley announced that the two prizes for Fungi, spoken of on a previous occasion, would be offered at the first meeting in October. That would be the best time, for it often happens when the autumn rains come, that Fungi spring up abundantly. He hoped to see exhibited both useful and reputed poisonous species; and, in connection with the latter, remarked that Dr. Badham stated that an *Agaric* which was nearly fatal to his schoolmaster, he had again and again eaten without evil results. In conclusion the *Yang-mae*, the fruit of a species of *Myrica* commonly cultivated in China, was referred to as being really very palatable.

Mr. Wilson Saunders said Mr. Berkeley had well observed that the colour of the *Dyckia* or *Puya* was very remarkable, and except in the other instance which Mr. Berkeley had mentioned, he (Mr. Saunders) did not know any case of so peculiar a colour among plants. Some of the *Dyckias*, although related to the Pine Apple, could be grown out of doors, and they would flower in a cool greenhouse. Some of them, too, produced long flower spikes which hung down, and such should be grown on pedestals. The flowers were of various colours, and altogether these plants were well worthy of attention. With reference to the *Coleus* sport which was produced by *Coleus Verschaffelti*, and was permanent, he had exhibited it less on its own account than for direct attention to the fact, that the present dry season is very productive of sports. When such remarkable alterations in the dryness of the atmosphere occur sports are set up, and we should be on the alert to detect them. As regards *Sirex juvenus* it was a pest in Laroh forests, and very destructive on the continent. Here it was yearly becoming more common, and though at one time it was difficult for entomologists to obtain a specimen, now wherever Pine trees were growing there was a good chance of finding it.

Mr. Wilson Saunders then announced that the next meeting, which was to have been held on the 21st of July, would be postponed to the 4th of August, in consequence of the Leicester Show, which, he was glad to say, promised to be a very successful one.

BIRMINGHAM ROSE SHOW.

TAKING rank among the most important annual floral exhibitions, this requires special notice, not only for the excellence of the flowers and specimens exhibited, but also as it affords an occasion of bringing into comparison the productions of growers who, on account of distance or other causes, do not compete at the metropolitan shows. It is not always that the stands of amateurs generally, excepting those of Mr. Hedge, Rev. E. N. Pochin, Rev. S. R. Hole, and a few others, who exhibit at the Crystal Palace and Kensington, will bear the test of comparison with those of the professional growers. At Birmingham the classes for amateurs were well filled, and the flowers submitted for competition showed ample proofs of the pains that had

been bestowed upon their culture, and enhanced in no small degree the excellence of the Exhibition.

The Show was held in the Town Hall, on Thursday and Friday, July 2nd and 3rd. Though so good on the whole, indications of the severity of the drought were not wanting. For example, the nurserymen's classes were not filled up, and Mr. Cranston, who brought eight stands of twenty-four each, affixed a notice that they were not offered for competition on this account.

It is useful to append lists of the best flowers in winning collections, for the numerous Rose admirers there find which are the most deserving kinds to cultivate, though to others the repetition may seem tedious and unnecessary. Thus in the following lists giving the very *élite* of the blooms shown, Alfred Colomb, Charles Lefebvre, *Maréchal Niel*, Céline Forestier, *Senateur Vaisse*, *Marguerite de St. Amand*, *Madame Charles Wood*, *Madame Victor Verdier*, John Hopper, Charles Ronillard, and Antoine Ducher figure in almost every first-prize collection, and these are really, with a few others which Mr. Radclyffe has pointed out in last week's Journal, the best Roses known.

Notwithstanding that Mr. Cranston's collection was not for competition, it must claim a priority of notice on account of the wonderful size of the blooms, combined with freshness of colour and perfection of form, which we must necessarily ascribe to the best Roses. Extra fine were Charles Lefebvre, *Madame Charles Wood*, Alfred Colomb, *Madame Moreau*, *Marguerite de St. Amand*, Dr. Andry, Antoine Ducher, Victor Verdier, *Devoniensis*, *Triomphe de Rennes*, *Maréchal Niel*, *Senateur Vaisse*, *Madame Fartado*, Antoine Ducher, *Joséphine Guyet*, and *Felix Genere* (new).

In Section A (Nurserymen), Class 1, for seventy-two varieties, Mr. Keynes was first with magnificent flowers of Alfred Colomb, *Maréchal Vaillant*, *Madeleine Nonin* (new), John Hopper, *Hippolyte Flandria*, new, of remarkable size and fullness, *La Ville de St. Denis*, Pierre Notting, *Leopold Premier*, Mlle. Marie Rady, new and good, Charles Ronillard, *Madame Cuillat*, Mrs. John Berners, *Triomphe de Rennes*, *Senateur Vaisse*, *Souvenir d'un Ami*, *Souvenir d'Elise*, Xavier Olibo, Charles Lefebvre, *Marguerite de St. Amand*, *Madame Margottin*, *Maréchal Niel*, *Devoniensis*, &c.

Messrs. Paul & Son were second. In their stands were fine blooms of Charles Lefebvre, *Comte de Nanteuil*, *Leopold Premier*, *Lélie*, Jean Lambert, *Gloire de Santenay*, *Maréchal Niel*, Charles Ronillard, *Souvenir de Monsieur Boll*, *Senateur Vaisse*, *Queen Victoria*, Alfred Colomb, &c.

The third place was taken by Mr. Durbin, of Bath. There were in his stands good blooms of *Marguerite de St. Amand*, *Madame Moreau*, *Madame Fillion*, *Gloire de Vitry*, Pierre Notting, *Acidalie*, *Souvenir de la Malmaison*.

In Class 2, for forty-eight varieties, three trusses of each, Mr. Keynes was again first with a collection grand as a whole, varied in colour as far as yet attainable, with such perfect flowers as the following:—Alfred Colomb, *Marguerite de St. Amand*, Mlle. Marie Rady, *Devoniensis*, *Souvenir d'un Ami*, *Senateur Vaisse*, *Madeleine Nonin*, *Madame Moreau*, *Comte de Nanteuil*, *Madame Bontia*, *Gloire de Dijon*, *Madame Willermoz*, Mlle. *Marguerite Dombtrain*, Victor Verdier, Pierre Notting, Mrs. John Berners, *Maréchal Niel*, Sophie Coquerel, *Triomphe de Rennes*, *Duc de Rohan*, &c.

Messrs. Paul & Son were second with a magnificent display. Among the very best may be noticed Alfred Colomb, *Leopold 1.*, *Madame Charles Wood*, *Vicomte Vigier*, *Duc de Rohan*, *Madame Cuillat*, Xavier Olibo, Camille Bernardin, Victor Verdier, *Princess Mary of Cambridge*, *Joséphine Beaubarnais*, Maurice Bernardin, Mlle. Marie Rady, *Gloire de Santenay*, Sophie Coquerel, John Hopper, Céline Forestier, *Maréchal Vaillant*, *Comte de Nanteuil*, *Madame Victor Verdier*.

In Class 3, for twenty-four varieties, three trusses of each, Mr. Keynes again carried off the chief honour with a superb collection. Among the very best were *Maréchal Niel* of course, and Alfred Colomb; *Hippolyte Flandrin*, very large, and Sophie Coquerel, a pretty light rose, on petals white, or nearly so. Messrs. Perkins & Son, of Coventry, gained the second place. Their stands were of great merit, the following blooms especially—*Madame Victor Verdier*, Pierre Notting, Charles Lefebvre, *Madame Fillion*, John Hopper, *Senateur Vaisse*, *Marguerite de St. Amand*, Alfred Colomb, Mlle. Marie Rady. Messrs. Paul & Son were third with Mlle. Marie Rady, *Joséphine Beaubarnais*, *Marguerite de St. Amand*, *Madame Bontia*, Pierre Notting, *Comtesse de Chabillant*, *Gloire de Santenay*, and others. Mr. Charles Kimberley was fourth. There were in his stands fine blooms of *François Treyve*, Alfred Colomb, *Louise de Savoie*, and *Madame Moreau*.

Classes 4 and 5 were restricted to residents in the counties of Warwick, Stafford, and Worcester. The stands were invariably good, and contained many well-grown flowers.

In Section B (Amateurs), Class 6 was for forty-eight varieties. The first prize was awarded to Rev. P. M. Smythe, whose collection was not only free from blemish generally, but contained some very remarkable flowers, especially a truss of *Maréchal Niel*, the best in the Show. Among the others were *Senateur Vaisse*, Pierre Notting, John Hopper, *Comtesse de Chabillant*, Charles Lefebvre, Lord Macanlay, and *Souvenir de Comte Caven*, beautiful. Mr. C. J. Perry was second with Dr. Andry, Charles Lefebvre, *Duchesse de Cayula*, *Gloire de Vitry*, *Madame Derrenx Donville*, very pretty. Alfred Colomb,

Madame C. Wood, &c. Mr. Evans, gardener to C. N. Newdegate, Esq., was third. He had excellent blooms of *Madame C. Crapet*, Alfred Colomb, Pierre Notting, *Senateur Vaisse*, *La Ville de St. Denis*, and *Duchesse de Cayula*.

In Class 7, twenty-four varieties, single trusses, there was a strong competition, and, as in the preceding class, the stands contained many fine specimens of the same kinds. The first place was taken by Thomas Lloyd, Esq., of Warwick, the second by the Rev. P. M. Smythe, the third by Mr. Hunt, of Leicester.

Class 8, eighteen varieties, three trusses of each, was a trial of strength for the amateurs of the midland counties. Here Mr. Evans was first. He had excellent trebles of *Maréchal Niel*, *Duc de Rohan*, *Niphotos*, Charles Lawsen, *Madame C. Wood*. Close upon him, in the second place, followed Mr. Hunt, of Leicester, who had Charles Lefebvre, *Senateur Vaisse*, and *Madame Charles Crapet*. The third place was taken by Mr. C. J. Perry.

In Class 9, for twelve varieties, the contest was again between Rev. P. M. Smythe, Mr. C. J. Perry, and Mr. T. Lloyd, who took the first, second, and third places respectively.

The various classes from 10 to 14 inclusive, were restricted to residents within a radius of a certain distance from Birmingham, with a view of affording encouraging Rose-culture in the neighbourhood of the town.

In Section C, Class 15 was for a collection of new Roses sent out by English nurserymen in the springs of 1866, 1867, and 1868, twenty-four varieties. The first prize went to Mr. Keynes. In his stand were *Hippolyte Flandrin*, *Horat*, *Vernet*, *Madeleine Nonin*, Antoine Ducher, Mlle. Marie Rady, Mlle. *Marguerite Dombtrain*, Jean Cherpin, and others. Messrs. Perkins & Son, of Coventry, were second with nearly the same kinds. It will be better to defer a critique on the new Roses till later in the season.

In Class 16, for the best new Rose sent out in the spring of 1866-7, six trusses, the first prize was won by Messrs. Paul & Son with Alfred Colomb, Mr. Keynes being second with the same variety, and third with Mlle. *Marguerite Dombtrain*.

Class 18 was for Teas and Noisettes. These were not in condition. The competition was also confined to the takers of the first, second, and third prizes—viz., Mr. Keynes, Messrs. Paul & Son, and Mr. Durbin, of Bath.

In Class 21, for the best bouquet for the hand, Miss Anne Twigg was first; Mr. W. Brown, second.

Class 22, for ladies only, was for the best design for dinner table, Roses the only flower to be used, combined with foliage of any kind. In this Miss Cole took the first prize. Prizes were also awarded to Messrs. Felton & Holiday and Mr. R. H. Vertegans for designs of Roses and Rose foliage, arranged suitably for room decoration.

Among the miscellaneous contributions, Messrs. Downie, Laird, and Laing sent *Pelargoniums* Mrs. Lewis Lloyd, Charming, *Sailor Prince*, *Magnificent*, *Harrison Weir*, and another, all of them new kinds, with some peculiarity or distinctive feature. The merits of these must be decided by the Floral Committee of the Royal Horticultural Society, or by connoisseurs of these popular plants. The same firm also had some stands of *Pansies*; so beautiful and varied, surely such lovely flowers must be deserving of more attention than they now receive, especially in the south of England.

Above the stage on which these were placed, together with the dinner-table devices, were Tea Roses and ornamental designs for holding flowers, of which there was a good display. The whole of the decorative plants occupying the gallery opposite the orchestra and great organ were supplied by Messrs. Felton & Holiday, of Birmingham. They consisted of Ferns, hardy and exotic, a fine plant of *Cyathea dealbata*, *Selaginellas*, *Lilium auratum*, variegated *Yuccas*, and the pretty *Acer negundo variegata*, in pots, in large numbers. The introduction of these plants into a Rose show suggests a very simple but striking improvement of exhibitions. Particularly noticeable were the Variegated Maize (*Zea*) and Colons placed alternately between the rows of stands in the body of the hall. Messrs. Felton & Holiday had *Pelargoniums*, *Fuchsias*, *Petunias*, &c., tastefully arranged as a miniature flower garden. They also exhibited their new *Tricolor Pelargonium* *Princess Teck*, and Silver-edged variety, *Lady Calthorpe*. Other flowers and plants were exhibited by Mr. R. H. Vertegans.—A. H. K.

THE PROPOSED PAXTON MEMORIAL.

On the 24th of June the members of the Leighton Buzzard Working Men's Mutual Improvement Society assembled at The Cedars, the residence of J. D. Bassett, Esq., for the purpose of presenting an address to Lord Charles J. F. Russell, advocating his lordship's suggestion, made at the inauguration of the recent industrial exhibition, to establish an educational and popular institute, to be associated with the name of the late Sir Joseph Paxton, who was born at Milton Bryan, in the vicinity.

The President of the Working Men's Institute introduced the deputation with the Society's memorial address, from which the following are extracts:—

"We rejoice in the hope that in this our memorial your lordship will perceive a promise of fruitfulness from the grain which you planted; and we proceed to call to your recollection that portion of your address on New Year's-day, when you did us the kindness to

preside over the opening of our Industrial Exhibition, in which you advocated the foundation in this town of a memorial institution in honour of Sir Joseph Paxton, to be devoted to the advantage of the industrial classes of this locality.

"On that occasion your lordship spoke as follows:—'There remains yet another part of your Exhibition of so peculiar a character as to demand a special notice. An article manufactured at a distance from a raw material found in this neighbourhood—glass, made at Birmingham from our Heath—I might almost say our Leighton sand. We have reason to be proud of our contribution to the most perfect of the products of English industry. In china and earthenware we are excelled; in glass pre-eminent. The Paris Exhibition settled that point; and in this climate how greatly should we appreciate that beautiful fabric which can afford us shelter without intercepting the cheering rays of light—the fabric without which the industries of all nations concentrated here in 1851 would have been set at naught and viewless, but for the palace of glass and iron which rose to receive them. But what is the material without the man? The man who overcame that great industrial difficulty by his creative genius was, like the glass itself, found in this neighbourhood, though trained at a distance. Sir Joseph Paxton was the man; and I ask, with surprise and shame, Where is the fountain-head monument to him from whom the Crystal Palace sprang? Mentmore on one side of you, Battlesden on the other, confront each other telling of his fame. Your town between the two seems made for his memorial site. I knew the man well, and am intimate with the family that knew him best; and I can safely say, that while it is impossible to conceive anything that could exceed the enthusiastic gratitude, affection, and respect with which he regarded the noble patron of his fortunes, yet there was one feeling in him paramount to all, and that was loyalty to the class from which he sprang, embodied by a deep desire to afford them the advantages of a cultured education; and I say it, not for the purpose of creating excitement, but on my honour, and with a certain conviction of the truth of what I utter, that if the man could now speak to us he would say that of all the testimonials that might be given to his worth, that which would be most grateful to him would be something in the nature of advantage to free education of the artisans in the neighbourhood of the place of his birth. Then what I say is, that out of this educational movement there should spring a Paxton Museum, in honour of the man and for the advantage of the working classes of the town. If you are of my opinion, say, Aye.' [Replies of 'Aye.'] The ayes have it, and the work is done; for I cannot for a moment think that any man can deny to the appropriateness of the movement, nor that it will be left to this neighbourhood to carry it out.'

"Our Society has thoughtfully weighed your suggestion, and has endeavoured to give it form. It has embodied its conclusions in resolutions."

The resolutions were read, and LORD CHARLES RUSSELL, in reply, said, It happened that Sir Joseph Paxton, in honour of whose memory they were that day met, had what he might consider the singular good fortune of adding one link to the chain of friendly connection that had existed between two of the oldest and highest families in this country for the last two centuries. Some two hundred years ago William III. conferred the honour of a dukedom on the house of Cavendish and on the house of Russell. The families were connected at one time by an act of grateful patriotism; they were afterwards more closely connected by marriage. From that time to this there had been between them uninterrupted harmony and friendship. Well, it so happened that the first shilling Joseph Paxton earned was earned as a garden boy in the service of the Duke of Bedford, and the last days of his life were passed in the firm friendship of the Duke of Devonshire. What Sir Joseph Paxton was as a link between these two noble families, this address was between himself and them. They were there to accept from the late Sir Joseph Paxton the legacy of that good name which he had bequeathed to the townsmen nearest to the place of his birth, and to devote that legacy to the preservation of his fame by erecting a monument which should be strictly in accordance with the work and with the life of that man. There were some who told him that the Crystal Palace was the noblest and the fittest monument to the worth of Sir Joseph Paxton. He accepted the Crystal Palace as a national monument, but he claimed something nearer home as a local memorial, and one thing which especially made him desire it was this—that though Sir Joseph Paxton raised himself from the very humblest grade, that of an agricultural labourer, to a position in which he associated with most of the great and noble of the land, yet—his lordship spoke from his own experience—he was always loyal to the ranks from which he sprang; and the more he respected the aristocracy of the land, the more did he look to the working classes of the country—an educated, a contented, a prosperous working class—as the firmest foundation on which the aristocratic institutions of this land could rest (cheers). He (Lord Russell) remembered Paxton once telling him that he had been all over Europe, and had seen nothing more beautiful than the site on which Battlesden House now stood. Now, without at all disparaging the landscape about Battlesden, he might say that they in the midland counties held a middle position in landscape, somewhat higher than the fens of the lower countries, but considerably lower than the breezy uplands of the northern counties. But when he told them that Sir Joseph Paxton was so blinded by his love for his locality as to prefer it to anything he had seen in Europe, the meeting would agree with

him that some local memorial was due to the memory of that man. Now, what they proposed to do was to raise a monument, which should be first of all for the benefit of the working men of the district in which he was so largely interested. Mr. Bazley, the member for Manchester, told him that not long ago he went with a foreigner to the Free Library at Manchester. A boy, about thirteen years of age, clad in fastidiously taking a book home to read, as he was entitled to do; it was "The Lives of Eminent Men." Sir Joseph Paxton had added another chapter to those lives, and one thing they desired was that those lives might be read by every poor boy. The memorial by which they proposed to perpetuate the memory of Sir Joseph Paxton, was to consist first of all of an architectural building, then a museum, a library, and the means for periodical addresses. Now, he would not have those present to understand by a museum an old fossil collection. That they might have in due time, but their first object would be to have a museum of staple manufactures and of the present industry of this land, expanding the idea which they had already seen so well suggested. With regard to the library, their first object would be a good library of reference; there must be numbers even of clergymen and gentlemen, every one indeed who had not the advantage of a first-class library, who would find the benefit of being able to refer to it. And to this library they proposed to add a reading room, where the periodicals might circulate, and where those in the neighbourhood might read during the day, and the working classes when their work was done. Such an institution would be a proper tribute to a man who had done much for the first-class recreation, both of the educated classes of society and the toiling masses in this great workshop of a world. The meeting would ask him—and a very proper question—"How do you mean to do this?" He was told that they must look at a cost of some thousands; at a venture he might put it at £5000. He was not the least appalled at that. There was nothing worth having that they could get without a little toil and trouble. He could not get it alone, but he meant to get it from a sense of what was due to the memory of Sir Joseph Paxton.

A conference was then held.

Ultimately it was resolved, "That this conference, held under the presidency of Lord Charles J. F. Russell, having before it the memorial address of the Leighton Buzzard Working Men's Mutual Improvement Society, presented to his lordship at the previous meeting held this day, advocating his lordship's suggestion for the establishment in Leighton Buzzard of a memorial institution in honour of Sir Joseph Paxton, and having received the resolution unanimously adopted by the aforesaid meeting approving the proposal, resolves that the proposed memorial shall be called 'The Paxton Institute,' and shall be devoted to the advantage of the working classes and the inhabitants of the locality generally."

"That this conference is of the opinion that the proposed institution, to be permanently successful, must be founded upon a broad and comprehensive basis: and, whilst it is desirable that it should meet the requirements of the more educated portions of the community, it is essential that its primary object of affording easily accessible educational advantages for the industrial classes of the locality must be steadily kept in view. And this conference is of opinion that a building should be erected and fitted to contain—1, A museum; 2, a library; 3, a public reading and news room; 4, rooms suitable for lectures and classes."

"THE BUILDING should be in a central part of the town; should present some decided architectural features, and it is suggested that ornamental ironwork might be usefully and effectively employed in its construction; its general character might thus be such as to accord with the ideas by which the genius of Paxton has been illustrated."

"THE MUSEUM.—It is not intended to gather in this department a general and miscellaneous collection, but one which would represent, in the main, the products, the industry, and the natural history of the district."

"THE LIBRARY.—A room should be specially fitted and devoted to this purpose; the library should consist of standard books for reference—viz., works on biblical literature, science and art, history and biography, accepted text books on agriculture, commerce, trades and handicrafts, local history and maps."

"PUBLIC READING AND NEWS ROOM.—The requirements of this department are so generally understood, that it seems only needful to say that it should be made as attractive and popular as possible."

"LECTURES.—It is believed that benefit might arise from the frequent delivery of lectures on scientific and technical subjects by qualified persons, even though the audiences might be limited. For such purposes a large class room or fair-sized room fitted as a lecture theatre would be necessary."

"CLASSES.—It would be advisable to encourage as far as practicable the holding of science and art classes, in conformity with the regulations of the Science and Art Department of the Committee of Council on Education. Both the museum and library should be kept *en rapport* with the class subjects. For these purposes one or two moderate-sized class rooms would be necessary."—(Leighton Buzzard Observer.)

VIOLA CORNUTA FAILURES.

I SHOULD like to hear from some of your correspondents how *Viola cornuta* is doing this season; with me, I am sorry to say, it is quite a failure, much worse than last year. I then

only grow the variety known as Purple Queen. This year, on the strong recommendation of Mr. Wills, who was kind enough to send me a lot of Mauve Queen, I have tried it, but with little better result. It succeeds a little better than Purple Queen, but the plants of both varieties have nearly all gone off after I have taken every possible care that I could think of. The beds were filled with fresh rather heavy loam, together with plenty of leaf mould, and some of them were covered with cocoa-nut fibre refuse, but all to no purpose. Purple Queen I have planted in different situations, including shady ones, but in all it is much alike. Such being my experience of this *Viola* for the last two seasons, it is wholly condemned here.—JOHN BRYAN, *Audley End Gardens, Saffron Walden.*

LADDER FOR FRUIT-GATHERING.

I SEND you a slight sketch of a contrivance (*fig. 1*), which I have found very convenient for pruning and gathering fruit from some pyramid Apple and Pear trees from 12 to 16 feet in height, and which are too high for the tops to be reached from the kitchen steps, and not strong enough to bear a ladder with me upon it.

Having a light ladder 12 feet long, I had two deal props made of the same length, with slits at the tops, and pointed at the feet like clothes-line props. They are of deal, $1\frac{1}{2}$ inch thick by $2\frac{1}{2}$ or $2\frac{3}{4}$ inches wide at the foot, tapering towards the top, and the corners are taken off. About 12 inches from the top of the ladder two T-shaped pieces of iron are inserted, projecting $1\frac{1}{2}$ inch. These

Fig. 2.

pins are made to screw into pieces of iron let into the wood of the sides of the ladder so as not to project, and to allow of their being removed when the ladder is wanted for other purposes than fruit-gathering. See *fig. 2*.

In using the ladder it is first set up against the tree, the props are then adjusted one after the other, so as to form a triangle. The whole is easily removed; and the props, being loose, can be inserted between the branches of the tree.—AMATEUR.

GRAPES SETTING IMPERFECTLY.

I PLANTED three years ago a Royal Vineyard Vine, which has grown vigorously. Last year I allowed one bunch to remain and ripen. On one part of the bunch the berries were large, but on the other only about the size of Red Currants. It hung, and the berries continued plump until about Christmas. This year I have sixteen good bunches, but out of them only two have set properly. Unlike the other shy-setting Grapes, the berries adhere and ripen. Of course I did not intend to leave more than six bunches if they had set properly.

My Muscats set well by simply drawing a dry hand over them when in flower. I had four bunches of Muscat of Alexandria 15 inches long. Only four years since I put in the eye of this Vine. When I grew the Muscat Hamburg on its

own roots it sometimes set like the Royal Vineyard.—C. M. McC.

[We think you left far too many bunches of the Royal Vineyard on the Vine. One-fourth the number would have had a better chance to set well. We can do nothing to help you, as you are so successful in setting Grapes that are generally shy setters.]

THE ROYAL HORTICULTURAL SOCIETY'S CHISWICK GARDEN.

As a member of the Fruit Committee, it has struck me for some years that the great want of the Royal Horticultural Society is a good orchard house; not a little paltry place like the one shown at Chiswick as an orchard house, but a really good large house, where trees could be grown in a satisfactory manner.

To prove and give a really reliable opinion on the new fruit not generally known is, I think, one of the first duties of the Society; but before such an opinion can be formed at Chiswick, a fruit may be elsewhere well known for years. Take the new

Cherries, for instance. I have had a house 100 feet long by 30 feet wide full of fruit this season. If such a collection had been planted out in the open air at Chiswick spring frosts might have prevented the trees fruiting for years, insects might have rendered them unhealthy, and even if they had borne fruit, birds would have consumed the crop before the Committee could have described the varieties. Then, again, a new Pear or Plum might be fruited almost to a certainty if it were kept in a pot till the danger of frost were over, when it might be turned out into a well-prepared border to ripen its fruit, or, if preferred, the pot might be merely plunged in a suitable situation.

It must be nearly twenty years since I built my first orchard house, and in that time I have had only one really bad crop, though my houses have no artificial heat. Trees which have been bearing for the teens of years are this season looking better than ever. Difficulties of cultivation experienced at first have all disappeared, and I am more than ever convinced that all tender fruit ought to be

grown under glass. Whether fruit trees are to be planted out or kept in pots, grown as standards or as dwarfs, trained or grown more naturally, is a mere matter of taste and convenience. Whether the building should be heated or unheated must be determined by climate and the time the fruit are required to be ripe. All I would insist upon is, that they can only be produced with certainty, and of uniform and good quality, by being grown in glass houses. I have received Peach trees, for instance, with the highest characters, and in one or two years have proved them to be worthless. Now, if these had been largely propagated and sold, what an injury it would have been to my customers, and eventually to me. If these trees had been trained to a wall it might have been years before they would have shown a fruit.

I believe no Society in the country is better served than the Royal Horticultural Society is by Mr. Barron; but he ought to have a proper structure in which to grow new fruits in perfection, not a crowded low place of which he must be ashamed.

Then, again, the young gardeners ought to have the advan-

Fig. 1.

tage of seeing good orchard-house cultivation, because such knowledge is increasingly in demand. In advocating the erection of a good house of this kind at Chiswick, I would most earnestly caution the Directors against spending money uselessly in a grand showy building, and, on the other hand, against

putting up a shabby structure on wooden posts, which cannot possibly last long, and would not in the end be cheap. I have seen no houses equal to my own when the cost is taken into consideration, and I shall be glad to show them to any one who will pay me a visit.—J. PEARSON, *Chiswell*.

EXHIBITIONS OF WINDOW-GARDENED PLANTS.

We were among the first to advocate these shows for the promotion of flower-culture under difficulties, for we knew the beneficial results likely to arise from an occupation that renders the humblest room brighter, and which adds to the number of pure pleasures. These exhibitions are yielding a large measure of good, and are annually increasing in number. We have received the following particulars relative to three of them. And we accompany the details with a correct representation of a southern window garden devoted to the cultivation of *Cactuses*.

SOCIETY FOR PROMOTING WINDOW GARDENING IN WESTMINSTER.

—The third annual flower Show of this Society took place on Tuesday last, the 7th inst., in Dean's Yard. The exhibitors were working men or women, domestic servants, and children in parochial, national, infant, Sunday, or ragged schools. About six hundred potted plants were shown. This excellent Society was founded by the Rev. Canons Conway and Jennings, Rectors of St. Margaret's and St. John's, Westminster, and has been warmly supported by the Dean of Westminster (who, with Lady Augusta Stanley, takes great interest in its success), Lord Justice Wood, and many other influential residents in the united parishes of St. Margaret's and St. John, including Jeremiah Long, Esq., the present churchwarden. The competition amongst the working classes, both old and young, has been very animated, and there cannot be a more pleasing sight than the distribution of prizes, enlivened as it is by the presence of the patrons of the Society, the exhibitors themselves (about a hundred in number), and the performances of a band of music. The *Fuchsias*, *Pelargoniums*, and other plants cultivated under most discouraging circumstances in the crowded streets and courts of Westminster, would do credit to a show of far greater pretensions, and it is impossible to overestimate the diffusion of light and air, the habits of cleanliness, and the general refinement which the operations of this Society have introduced amongst the poor of the locality. Prizes were given to *Fuchsias* grown in the workhouse windows.

ST. CLEMENT'S AND ST. ANDREW'S HORTICULTURAL SOCIETY.—

The first Show of the season will take place at the St. Clement's Schools, Lancaster Road West, Notting Hill, on Wednesday and Thursday, July 15th and 16th. This Society, established last year for the encouragement of cottage and window gardening amongst the poorer inhabitants of the districts of St. Clement's and St. Andrew's, has, at the request of residents in the vicinity, recently extended its provisions to the whole neighbourhood of Notting Hill. The success of the Show held last autumn in the infancy of the Society was very encouraging, and the interest displayed by the cottagers has far surpassed anticipation. Whole rows of untidy plots of ground now converted into tasteful gardens, and numberless windows filled with plants, testify to the eager readiness of the poor to enter into the friendly competition which this Society invites.

EDINBURGH WORKING MEN'S FLOWER SHOW.—In the most crowded districts of Edinburgh there are many who, having few opportunities of so innocent enjoyment, regard the "Working Men's Flower Show" as one of the most important occasions of the year; and the testimony of "visitors" in these districts strengthens the belief that the attention required for the culture of the plants for exhibition, and the interest they awaken, exert a very salutary influence.

The show of 1867 was held on the 3rd of August in the Corn Exchange, Grassmarket. Like the two former shows, it proved a complete success, the plants being considerably better on the whole than those previously exhibited, and the Committee were gratified to find that striking evidence was afforded of increasing interest on the part of the working classes. It is estimated that upwards of six thousand persons visited the Exchange in the course of the day, five thousand having paid one penny each for admission after two o'clock, competitors with their families being admitted free. This is a thousand more than in the preceding year. There were fully three hundred competitors, upwards of one hundred of whom were juveniles under fifteen years of age, and their entries of plants, &c., for competition numbered 830. In 1865 there were only 160 competitors, and in 1866, 245, with 481 entries for competition.

dence was afforded of increasing interest on the part of the working classes. It is estimated that upwards of six thousand persons visited the Exchange in the course of the day, five thousand having paid one penny each for admission after two o'clock, competitors with their families being admitted free. This is a thousand more than in the preceding year. There were fully three hundred competitors, upwards of one hundred of whom were juveniles under fifteen years of age, and their entries of plants, &c., for competition numbered 830. In 1865 there were only 160 competitors, and in 1866, 245, with 481 entries for competition.

AGAPANTHUS UMBELLATUS.

This old species of Lily contributes a very imposing effect to a conservatory in August and September. The lovely umbels of bright blue, standing boldly erect among other plants, contrast well, and at the same time make them strikingly conspicuous; indeed, their presence never fails to draw greetings and flattering remarks, especially from the ladies, though the construction of the heads debars them from entering largely into the hand-bouquet, unless in single flowers plucked from the crown.

Propagation.—This is accomplished by seed, division of the roots, and offsets. From seeds, by sowing in a pot any time between March and June, so that the seedlings may acquire sufficient strength to resist the changes in winter. Plunge the pot to the rim in gentle bottom heat, and keep the soil constantly moist, both before and after the plants appear above ground. Pot-off as soon as the seedlings can be conveniently

handled, and attend afterwards to watering, shading, &c., as is usually done with such seedlings. Division of the roots and offsets are a ready means of extending the stock. For a compost, a light loamy mixture, with sand incorporated to the extent of one-third of the bulk, will do.

General Culture.—Little need be added to the attention generally demanded by free-growing plants. They all delight in high living. A rich heavy loam, with a third of well-reduced cow manure and sharp river sand thrown together without riddling, will make them grow strongly and well. Admit air abundantly, administer water copiously in the growing season, adding a stimulant in the shape of a little guano to the water, when the flowers are in the process of formation; and wherever situated, air plentifully supplied ought never to be neglected when the flowers are expanding, else the flowers will be deficient of their bright blue, so much appreciated, as well as in

good substance. When the flowers have dropped, cut down the stems half-way and prevent seeding, unless particularly wanted, when one crown will be enough to leave; and it ought to be remembered that a stance in a vinery for a month in autumn is of material consequence to the maturing of the plants, as well as securing an advanced state of condition for the following year. They may then be allowed to go quietly to rest, by withholding water to a considerable extent, permitting the soil to get almost dry in their pots. The plants will then be quite indifferent whether they are placed above, below, or behind the stage of the greenhouse throughout the winter; only, if below, they must be turned on their sides towards the sun, that they may enjoy any blinks that penetrate through the openings.—(*The Gardener*.)

LILIUM AURATUM RUBRUM VITTATUM.

Would any of the readers of this Journal inform me if they or any one else had flowered the above-named Liliun in this country before the 5th of last month? With me one flower opened on the above date, and magnificent it was. It far surpasses the Liliun auratum in the beauty of its markings. I should have sent it to one of the London horticultural meetings, but the distance deterred me.—WILLIAM OWEN, *Gardener to H. Neumann, Esq., Winnington, Northwich.*

A FEW WORDS ON MR. RIVERS'S NEW PEACHES.

LIVING in a cold district as I do, my experience with regard to Mr. Rivers's new early Peaches is of some importance to the public.

This season Early Rivers was dead ripe on the 4th of June, and had I been at home it would have been gathered two or three days before. Early Louise and Early Beatrice followed so closely that all three were ripe in the first week in June. Early Beatrice would no doubt have been ripe first, had not the tree occupied a position close to the ventilators, and which were always open from the beginning of May; the other two were side by side, 3 or 4 feet further from the front of the house. These trees and a Dr. Hogg grafted on the *Pamius padus* are at the cool end of the compartment of a house heated by two 4-inch pipes above the surface, and by two under a slate-bottomed bed. No attempt has been made to force early, a large amount of air being always admitted; and the condition of the other trees proves that these new early Peaches are at least what Mr. Rivers professes them to be. *Grosse Mignonne* at the warm end of the same compartment is just beginning to colour, as is also the Dr. Hogg referred to, and these will be ripe, I should think, in about ten days' time.

This Dr. Hogg was grafted in March, 1867, and is now a starchy pyramid 6 feet high, with the lower branches 2 feet long, and I have left it one dozen Peaches to mature; the tree from which the scion was taken is at the warm end, and the fruit has not yet begun to swell since stoning. I mention this, as it must be due to the stock that it has become an early Peach. It flowered and set its fruit several days before any other tree in the house; but it was overtaken during the stoning by the Early Rivers, Early Louise, and Early Beatrice. I may add that the flavour of these three early Peaches was first-rate, Early Rivers retaining most decidedly the White Nectarine bouquet.—W. KINGSLEY, *South Kiltrington, Thirsk.*

NOTES AND GLEANINGS.

WE are pleased to hear that H.R.H. the Commander-in-chief has accepted the very liberal offer of Mr. Rivers, of Sawbridgeworth, to supply to the camp at Aldershot a quantity of miniature orchard trees for the use of the soldiers' gardens.

MARVELLOUS EARLINESS OF THE PEACH.—On the 4th of this month the new Peach, Early Beatrice, raised by Mr. Rivers, was gathered from pot trees in the orchard house at Sawbridgeworth, every other variety being perfectly hard and green, and exhibiting no signs of maturity.

WORK FOR THE WEEK.

KITCHEN GARDEN.

THE market gardeners about London have now large beds of early Cabbages sown for winter and spring Coleworts, and

an early sowing of these for the same purpose or for early Cabbages in spring should now be made. In private gardens another sowing might be made a fortnight or three weeks hence. Sowings of Salads, &c., for autumn use must now be made oftener to guard against the uncertainty of our climate. Broccoli, after the main crops are in if you have a spare piece of good ground, you may try some of the small plants left, and these you may plant till the end of the month or even later, planting them more thickly in the ground, and if they grow too strongly they can be thinned out when there is more ground to spare in the autumn. This will afford the chance of a longer succession next spring. These late plantings sometimes withstand the winter better than the main crops. Cauli-flowers, a good breadth of these may now be put in, as they neither button nor run to seed late in the autumn. Spinach will not run much to seed in autumn, and the sowings made now may be twice as large as those made earlier in the season. Spinach will grow best on a dunghill, and the ground cannot be over-matured for this sowing, as it is not to stand over the winter, and the weather late in autumn is against it. Turnips, except for the earliest crops the kitchen garden is too rich for producing good-flavoured Turnips, and unless you have a poor light piece of ground upon which to sow a large breadth of these it is better to sow in a field.

FRUIT GARDEN.

Have hutting or mats ready to put over Currants, Gooseberries, and Cherries that you wish to keep late. Bud all the stone fruit of which you want an increase. Proceed with thinning the shoots of Peach trees where they are too thick, taking off the laterals and exposing to the sun and air all the wood which is to be retained for next season. On old trees of Plums and Cherries lay in a succession of young wood in all parts of the tree; such being kept close to the wall, will in a few years furnish finer fruit and produce more plentifully than old unsightly spurs. Shorten the side shoots of Currant and Gooseberry trees if not already done. On plants previously shortened, the points of the leading shoots may be taken off with advantage. The late sorts of Strawberries, such as the Elton, should be well mulched with grass or straw to keep the fruit clean. Beds that were covered early with grass now wants covering again. Look after the runners of Keens' Seedling and other early sorts. Sprinkle a few barrowful of leaf mould, old tan, or rotten dung and soil on the outside of your Strawberry beds to encourage a stock of young plants to root for making a new plantation by-and-by; when these are ready to plant out, take 3 or 4 inches of the runners with each plant, and make these pieces of the runners firm in the soil with the dibber, which is better than planting the young half-formed plants deeply in the soil.

FLOWER GARDEN.

Edgings of Alyssum, Virginian Stocks, or *Sanvitalia procumbens* are apt to overrun their space after this time, but they stand clipping as well as Box, and by a little attention to this they may be kept neat till frost come. All the *Petunias* and *Verbenas* must also be clipped as soon as they begin to extend beyond the sides of the beds. The *Dahlias* should be pruned regularly through the season, likewise all kinds of plants which straggle or are liable to grow out of bounds. Look over the beds of Scarlet *Pelargoniums* and stop the leading branches wherever a flower bud is perceptible. This will tend to keep the plant dwarf, and the flower buds will be much increased in size by the concentration of the sap. Still attend to the cleanliness of *Auriculas*, keeping them free from decayed leaves, weeds, and the green fly. Continue to part *Polyanthuses* in favourable weather, also plant out seedlings. Of *Tulips*, little can be said just now. The bed, however, must not be neglected, dig it over and ridge it up so that the soil may be sweetened by the action of sun and air. Great attention must be directed to the roots of *Ranunculus*; as they arrive at maturity, which is indicated by the leaves becoming yellow, they should be carefully taken up, as it usually happens that some are ready to remove before others, and should the roots which have become dormant remain in too long, they are apt to start, or commence throwing out fresh fibres, which is attended with ruinous consequences. The blooming season for *Carnations* has now fairly begun, and these favourite flowers will continue to attract admiration during the present and succeeding month. As seedlings flower pull up all with single or semi-double flowers, as well as all selfs, unless the variety has some striking characteristic, when it may be worth while to propagate it as a border flower. Commence layering the shoots,

taking those varieties first which are most forward. Still tie-up the buds as they advance, and do not let the plants in pots lack moisture.

GREENHOUSE AND CONSERVATORY.

All the regular greenhouse plants are, or ought to be, out of the house by this time. Even Heaths and the finer specimen plants of the more delicate sorts ought now to be in cold frames, where they are far better than in the best constructed greenhouse. The treatment of the greenhouse must, therefore, be very different in many places according to the kind of plants with which it is now filled. If for *Pelargoniums* or other florists' flowers in bloom, ward off the sun by blinds, and if for the hardier stove plants keep the house more close and warm. All *Pelargoniums*, including the common *Scutlets*, that are to be forced before next March, should not be stopped or cut-in after this time, and all the early-struck cuttings should now or soon be planted out in beds in the reserve garden for a month or two; but as soon as they become too strong or succulent pot them. Another rule to be observed with forcing *Pelargoniums* is, that the pots should be full of roots, or the plants pot-bound, before they are brought into heat. As soon as they show for flowering, however, they may be shifted into larger pots or be well supplied with liquid manure. Any one can supply heat and moisture to flowers in winter, but much judgment and forethought are required to prepare the plants.

STOVE.

There being so much sunshine this season, house plants, and more especially stove plants, are in a more forward state than they usually are at this time; their management must, therefore, be a little varied for the next six weeks, giving them more water and keeping the house rather moist. Give air freely, especially on very hot days; this will prolong their growth and allow them sufficient time to ripen their wood.

PITS AND FRAMES.

Cuttings and plants divided for increase now find their way into these very useful structures. Seeds of *Calceolarias*, *Pelargoniums*, and many other families now come up readily in close pits without artificial heat. Grafted *Camellias*, *Azaleas*, *Rhododendrons*, *Daphnes*, &c., now do very well in close pits of this kind, taking care to shade them well from the sun. In short, all the houses may be relieved by thinning out the plants in summer; but plant pits and frames should never be empty at any time. Prepare a slight hotbed for a frame, and begin to increase such plants as you require a large stock of next season. *Mangles's*, *Mrs. Pollock*, and other Variegated and Zonal *Pelargoniums* are generally tardy strikers if left till late in the season; therefore, begin in time. Very little watering will, however, suit them until they make roots.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

On this, the 4th of July, we have had cloudy mornings and a falling barometer, but still no rain, and for several nights no dew, so that do what we will matters look not so bright as we would wish them to do. Our work has been chiefly a repetition of that of last week, and getting every bit of ground hoed, and what was cleared of early crops well dug, ready to be planted as soon as a change in the weather shall come. The extreme heat is causing some of the *Camelliflowers* to be greenish and deformed, instead of firm and white as snow as we like to see the curd. Gave sewage water to Peas and other crops, and mulched as much as possible; but even then if a good row of Peas be allowed twenty pailsful of such water, saturating the ground well, it is astonishing how soon in such days as the 2nd and 3rd the foliage would throw so much of it again into the atmosphere.

Watering.—Except in some cases for merely refreshing the foliage, we are no advocates for frequent watering out of doors; if each watering is heavy enough to reach all the roots, and these waterings are frequent, the ground becomes chilled and the roots paralysed by the very abundance of the water that surrounds them, and also by the absence of the air which cannot well penetrate the eaked surface if that is not broken after each watering. In the case even of crops requiring as much moisture as Peas, we prefer in such seasons as this to water well and then let well alone until the service of the pail is again required, and that the plants will soon indicate if we study their appearances.

Very frequent waterings that scarcely go beyond the surface, do more harm than no watering at all. Just look at established

plants in a field, say a field of Wheat, and note how for a very long time the plants hold up their heads rejoicingly to the sun, and never show that they do not receive a refreshing shower every other day. Such plants obtain their supply of moisture from beneath, and the greater the moisture thrown off by evaporation, the greater the quantity absorbed by the roots from great distances below the surface.

The chief evils of surface-dribbling are, that first the line of absorption from beneath is broken; evaporation, it is true, goes on rapidly from the surface, and the moist vapour does good to the foliage as it passes it, but until the applied water is exhaled the roots in the dry soil deeper down receive no benefit from the exhaustless moisture farther beneath them, but are in much the same condition as the roots of a plant in a pot would be where the water applied only penetrated to about one-third of the depth of the soil, leaving the lower two-thirds, as respects roots and soil, much as if they stood for some time in an oven. The second evil is, that the frequent surface-waterings encourage the plant in self defence to make rootlets near the surface, whilst the lower roots are rendered inactive; and then, as the sun exhales the surface moisture, these surface roots are parched up before they can do much for the plant, and thus our extra care has a tendency to promote a sickly condition of growth. The true rule to apply in all kinds of watering is, to give enough to reach to and a little beyond every fibre of the plant, and that done to give no more watering until it is absolutely required, and this rule applies equally to a plant in the open ground and to plant in a pot.

When plants are grown in small pots there is little danger of over-watering, though it is worse than useless to water them when the soil is already moist enough. An animal will scarcely drink unless it be thirsty, and even man will seldom take a drop more water than he absolutely requires. Most plants are equally sensitive, though we are slow to learn their modes and habits. Often, instead of being pleased, they would shrink if they could from the jug that visits the favourites in the window every day. In such weather as we had lately a plant in a small pot might need refreshing twice a-day. In dull cloudy weather it might benefit by being let alone for three days or a week. When a small plant is growing in a rather large pot the frequent and heavy waterings are much more disastrous than to a plant in the open ground. The soil unoccupied and kept drenched, even with fair drainage, becomes sour like the mud at the sides and bottom of a sluggish stream. To secure health in such a case, and yet from a good body of earth to avoid the trouble of frequent shifting, the rule should be in watering to give as much as will reach every fibre, but not more than will keep the outside of the ball generally moist, but not wet to saturation. The outside soil in such a case should only be somewhat moist until the roots begin to permeate the whole of it. Watering so as to reach every fibre is, therefore, the right rule. In a pot filled with roots, water all over so that every root shall have its allowance. In giving a large pot to a small plant, water chiefly at the centre, increasing the circumference of the direct moistening as the roots extend. Thus out of doors, if we had not been forced to allow some large favourite evergreens to cater for themselves by bringing up moisture from beneath to compensate for the evaporation from the foliage, we would have given them a dozen pailsful of water each—much as we once saw given to the beautiful specimens at the Dean of Winchester's, one of the secrets of their beauty in a rather light soil; but in the case of a newly-planted *Pelargonium* or *Verbena* we are equally convinced that deluging the soil much farther than the roots extended would rather impede than accelerate growth. The rule in the latter case should be, Give enough to extend a little beyond the roots, and stop patiently until your services are again required.

We have lately observed some beds that were watered regularly every day, and chiefly overhead with the rose of a watering-pot, but though treated in other respects alike, they were far from equal to others that only had help once in a week or ten days, and that applied rather close to the stems with the spent of a watering-pot, so that the liquid might reach the roots without greatly wetting the surrounding soil. So far as moisture to the roots is concerned, and we have made up our mind to water, we may sum up in the following directions:—Do not water so frequently as to puddle the roots; do not water so plentifully as to deluge the ground beyond the roots; do not resort too much to mere surface-watering either in the open ground or in a pot, and see that the water so given extends to all the roots, which you may easily know in the case of a pot by ringing it, and noticing whether the sound emitted

is dull or clear. Bear in mind that watering by dribblets and often, out-doors or in-doors, is the most fruitful source of ruin to plants. Give enough to reach every fibre when you give any.

To be consistent when, in accordance with the above, we speak of refreshing plants with the syringe, or even watering overhead with the rose of a watering-pot, we say we have no objection to that being frequently done, when the object chiefly aimed at is the mere refreshing of the foliage, or, as in the case of newly-turned-out or newly-potted plants, it is to diminish evaporation from the foliage until in their new position the balance between roots, and stems and leaves be again restored. Just as a good wash or a bath refreshes us when travel-stained and tired, so the water, however communicated, does refresh the foliage of plants, and we would use the syringe, garden engine, and rose watering-pot much more in this way if we could, only we must not suppose that this surface-refreshing will serve long as a substitute for a due amount of moisture at the roots. In watering the roots in some cases, even out of doors, it is useful to use the rose of a watering-pot, as thus more air is conveyed by the water-drops into the soil, and if all the roots are reached, it is of less consequence how the moisture gets there, provided that the caked surface which would result from such frequent rose-waterings is guarded against by frequent surface-stirring. We prefer for general waterings the pail or the spout of the watering-pot, as thus we send the water intended for the roots at once where it is wanted, and with the least caking at the surface. Even in thus watering a flower bed we generally stir the surface soon afterwards, to prevent anything like a caked surface. Plants in a bed out of doors, or in-doors in a pot, will thrive all the better and be more benefited by the watering if the surface soil is loose instead of hard or caked. The natural tendency of much rose-watering is to make a hard surface. In this dry weather, though we knew our flower plants in beds wanted no more water at the roots, we knew they would have thriven better—that is, grown upwards faster if we could have moistened their foliage every afternoon or evening, but that mere refreshing would have been different from an attempted watering, which would have wet the soil for one-eighth or even one-fourth of an inch deep. It is such waterings we wish to guard people against, as in general they are worse than useless, so far as the roots are concerned.

For merely refreshing the foliage or lessening evaporation, we prefer the syringe or the engine to the rose of a watering-pot, as the water can then be thrown on much more lightly, but a practised workman can use the rose also lightly. When it is attempted to reach the roots by rose-waterings, it is important to keep the rose low, as then the water, having less force, will not cake the surface so much. In watering with the spout of a pot, the same mode is also of importance, and if not looked after common labourers will quite disregard it, as they stand nearly erect, hold the pot well up, and send out the jet with force enough to tear the soil from small plants. The end of the spout should be close to the ground, and the water be poured gently out, and if the surface is too dry to receive it it is best to come over the ground several times instead of having the water running to waste, or in rivulets to one place near the edge where least wanted. One man will thus water as if he thought of a gentle shower-bath for himself; another will water as if he thought, if thinking formed any item in the case, that if a jet of water were to be poured on his head, the more feet of descent the jet had, and, consequently, the greater its momentum and force the more refreshing it would be. After all such waterings stir the surface as soon as dryish, to keep moisture in and to admit air.

FRUIT GARDEN.

Much the same as last week. Gathered most of the Black Currants, Red and White for preserving, also Raspberries, knowing that owing to the flocks of blackbirds we should soon have few to gather. Netted the Currants and Gooseberries left, but even that will only be a partial protection. For a few weeks our winged visitors were comparatively few, and thrushes, especially, we picked up dead and dying from the drought; but now blackbirds have come to us in myriads. What fruit we cannot keep without protection, even though green, seems to be safe enough in neighbouring villages, even when entirely unprotected, but that, we believe, is partly owing to the want of shrubs in which to shelter, and still more to the presence of many children, from whom birds instinctively keep aloof. We shall commence directly to prick-out and layer Strawberries for next season's forcing, and we have planted-out the greater

portion of those forced last season. It is important where birds are very numerous to plant Strawberries in beds or quarters so as to be easily netted.

We shall be obliged to water Peach and Apricot trees out of doors to keep the fruit from falling. Apricots need more moisture at the roots than the Peach, and so much is this the case that in some places where the Apricots were a comparative failure, they succeeded after the borders were watered in summer and autumn. The moisture at the roots seems almost as indispensable as dry air when in bloom. All fruit houses wanted extra watering. The Peach house where the fruit is now becoming thin has had plenty of air night and day, but the front air-openings had all to be netted, as the blackbirds had attacked the fruit, which we never knew them do before. They are more shy of going in at the slid sashes at the top of the house. In our orchard houses we have had such birds, pheasants, and even peacocks nibbling the Cherries, getting in by the front openings, but as yet none have gone in at the top ventilators. The weather has been everything for securing good-flavoured Melons. A little shade is serviceable to most things in such weather, and it renders frequent waterings less necessary. All fruit plants in pots will be benefited by rich mulchings of rotten dung, &c.

ORNAMENTAL DEPARTMENT.

Our lawn at length is becoming brown, even in our heavy loamy soil, and until it turn green again the beauty of the flower garden will be greatly marred. With little watering, given chiefly to the roots, and the most part of the surface left loose and dry, the quantity of bloom is greater than we could have expected. A good watering to a long row of scarlet Gladioli acted almost like magic. As we knew the bulbs were strong and rather deep we had left them to themselves, with the exception of a little mulching of rotten dung. We noticed, however, that the points of a number of leaves were becoming brownish, and only a very few flower spikes were showing. After stirring the surface we gave a good soaking of sewage, and the very next morning there were hundreds of spikes peeping from their sheaths, and every vestige of distress in the foliage was gone. If this weather continue we must give another watering eight days hence. Without it we are sure that the spikes would have been poor.

Twigged and otherwise secured plants in flower beds unsafe in our windy place. Hollyhocks and Dahlias will require more attention than they have yet received. One part of our Roses we have been obliged to leave to themselves, and they have given more cut flowers than we could have expected. Our best flowers have come from where the plants have several times been watered with sewage, &c. For first-rate Roses these things are almost essential—the best sorts, a loamy soil, plenty of rotten manure incorporated with the soil, a mulching in dry seasons, and plenty of manure water after the buds are fairly formed. Under these conditions we can smile at Rose enemies. The watering with us this season has been mostly out of the question. Now is a good time to insert buds on Briar or other stocks, and every young gardener, even for his own advantage, ought to practise budding even in his own time, that he may be expert at such pleasing work. For gentlemen, however, it is generally cheapest to purchase budded plants, just as a man whose sole work is to propagate young Heaths, will turn them out at a price which no gentleman's gardener could imitate, with hundreds of other matters demanding his daily attention.

It is now a good time to sow thinly Brompton and Queen Stocks, to receive a little protection in winter. As soon as we can we shall begin putting in cuttings of Verbenas, as now they are mostly free from their usual enemies, the worst of which is thrips, and it will be almost sure to come if this dry weather continue, and we have but little water to counteract it. As yet we have not lost a plant, and even the thirsty Calceolaria is still not affected. We would like to prune a number of Lantanas if we could. It is best to use the knife, as thus the cutting may be almost concealed.

In plant houses the chief object has been to keep them moist by syringing the stages, floors, &c., and yet waste as little water as possible. Plants set out of doors have been kept rather shady. When placed full in the sun the pots should be protected from the fierce rays. After the plants are kept a little shaded for a few days they will mostly stand the sun uninjured, but the roots close to the sides of the pot, when equally exposed, will be more or less injured, water how you may.

Picked-off numbers of Cinerarias and Primulas, and potted

the first lots, placing the latter behind a south wall to be shaded, where they are thriving beautifully. Old cut-down plants of Cinerarias we shall plant in a shady bed, so as to take what good strong suckers we want from them. These two tribes alone help to make houses gay and lively in winter. Those who have favourite kinds of herbaceous Calceolarias which they wish to keep, should turn them out in a shady place after cutting them down, and depend on growing on again from the suckers or shoots that push from the roots. Florists' Pelargoniums are now chiefly standing in the full sun on the ground out of doors, and, except in extreme cases, we prefer watering the ground instead of the pots, so that the wood shall be well hardened before pruning. The moisture at the bottom is generally sufficient to prevent the plants flagging injuriously.—R. F.

COVENT GARDEN MARKET.—JULY 8.

The supplies are quite as heavy as last week, and most of the hothouse produce is of a very inferior description. A considerable quantity of foreign Apricots, Peaches, and Nectarines are also among the dealers, and the first instalment of 20,000 West Indian Pine Apples was offered for sale to-day in very good condition, at from 1s. to 2s. each.

FRUIT.

	s. d.	s. d.		s. d.	s. d.
Apples $\frac{1}{2}$ sieve	1	6 to 0	Melons..... each	3	0 to 6

TO CORRESPONDENTS.

.. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Books (Notice).—There is no single work devoted to forcing Vines, Strawberries, and Cucumbers, but all of them are included in the "Cottage Gardener's Dictionary," a new edition of which with a supplement will be published this week. They are also included in Thompson's "Gardener's Assistant."

FASCIATED MELON STEM (J. F.).—Fasciation only occurs in very luxuriant plants. We have seen examples of it in Ananas, Ash, Holly, Daylily, and Antirrhinum, but never before in the Melon. It is the formation of an excess of woody fibre in the fasciated part, but the cause is unexplained.

GRAPES NOT SWELLING-OFF (J. Bryan).—The few large berries in the bunches sent had been set (contain fertile seeds), but the multitude of small berries contain no seeds. You should assist the setting as was recently recommended in our columns. The bunches you enclosed were not thinned. They should have had three-fourths of the berries removed.

METEOROLOGY (Observer).—There is no doubt that a knowledge of meteorology is useful to the gardener, though not so much so as a know-

ledge of botany and chemistry. We recommend you to purchase Buchan's "Handy Book of Meteorology." A second edition has just been issued, and is really a new book, so much has been added since the first edition appeared, although that was published no longer since than last year. It is an excellent work. Its author is Secretary of the Scottish Meteorological Society.

GRASS OR GRAVEL (Emily).—Do not allow your lawn supplanted by gravel. The grass may be "very brown" during this tropical dry heat, and it may be "very weedy" sometime, but these are temporary defects, and easily prevented by watering, and using the spade to uproot the weeds. Nothing would compensate for the loss of the lawn in front of your drawing-room windows. Read the following, and repent that you ever contemplated destroying your lawn:—

"The grass, the grass, the beautiful grass,
That brightens this land of ours,
Oh, why do we rudely let it pass,
And only praise the flowers?
The blossoms of spring small joys would bring,
And the summer bloom but ead,
Were the earth not green, and the distant scene
In its general robe not clad.
Then sing the grass, the beautiful grass,
That brightens this land of ours;
For there is not a blade by Nature made
Less perfect than the flowers.

"The grass, the grass, the feathery grass,
That waves in the summer wind,
That stays when the flower, all faded and past,
Like a dear old friend, behind;
That clothes the valleys and the valley fills,
When the trees are stripped and bare;
Oh, the land would be like a wintry sea,
Did the grass not linger there.
Then sing the grass, the bonny green grass,
That to all such a charm can lend,
For 'tis staunch as I true the whole year through,
And to all a faithful friend.

"The grass, the grass, the beautiful grass,
Oh, well may the gift endure,
That never was meant for creed or class,
But grows for both rich and poor.
Long may the land be rich and grand
Where the emerald turf is spread;
May the bright green grass, when from earth we pass,
Lie lightly over each head.
Then sing the grass, the beautiful grass,
That stays like a dear old friend;
For whatever our fate, it kindly waits,
And it serves us to the end."

SHADING BY WHITENING THE GLASS (An Irish Subscriber).—The details you refer to are probably these:—We have found a more simple than skim milk, with a little powdered whiteness mixed with it—say as much whiteness as the size of a walnut—reduced to a fine powder, and thoroughly mixed with two or three quarts of milk. We would advise those trying the scheme to do a piece of glass first, let it dry, and add to the milk or whiteness as they require less or more shading. If it be put on quickly and thinly by one man with a brush, and another follow with a dry duster brush, merely dusting it quickly with the points of the dry brush, the shading will have the appearance of shaded ground glass, and look neat. The least quantity of whiteness in the milk will give as much shade as Hartley's rough glass."

CHERRY (Centurion).—Your doubt was well grounded; it is not the Black Tartarian, but the Early Purple Gem.

CLASS 35 AT THE LEICESTER SHOW (An Intending Competitor).—As "hardy fruits" are specified, we consider that any grown under glass would be inadmissible. You had better write to Mr. Cox, the local Secretary, and ask him if Grapes and Peaches may be exhibited in that class. His address is 37, Market Place, Leicester.

GLOW-WORMS (C. P.).—The female Glowworm lays her eggs in the earth, or upon the moss and low damp plants, to which they are affixed by a viscid secretion. The larvæ feed upon various kinds of snails. If you have the means of providing the larvæ with these animals, the earth in which they live must be kept moistened. You will find a summary of the history of the insect in "Westwood's Introduction," vol. i., page 250.—W.

RIPENESS OF PELARGONIUM SEED (An Inquirer).—The seeds are ripe as soon as they become brown, when they usually separate, and are suspended in a kind of whorl and ultimately fall, having a sort of horn to them. The seed when quite hard and brown is quite ripe, and should be gathered and sown forthwith. We cannot say much for its germination; indeed, we think it abortive, but we trust we are wrong.

STONE CLIMBER (J. K.).—It is hard to say which is the best stone climber, but our choice would be *Stephanotis floribunda*.

TEA PLANT MANAGEMENT (C. P.).—It succeeds admirably in a cool greenhouse, and does well in a compost of two-thirds sandy fibrous loam, and one-third turfy sandy peat, adding sand liberally. The drainage should be good, and a light airy situation should be afforded. When growing a good supply of water should be given, and when at rest it will be enough if the soil be kept moist. Its treatment does not essentially differ from that of hardwooded greenhouse plants. We fear it would not succeed out of doors in winter, unless it were planted against a south wall, and protection given during severe frosty periods.

CLEANING MELON SEED (J. P.).—Melon seed should be separated from the pulp by washing well in a saucer or basin containing water. This should be done effectually without injury to the seed, and when complete the light and bad seeds will swim, and these should be skimmed off, and the heavy good seeds will sink. Run off the water, place the seeds on a shelf to dry, and when dry put them away in paper.

CONDENSED STEAM IN VINERY (J. Nipper).—We are at a loss to account for the condensed moisture on the grapes, especially as you leave air on day and night. We can only suppose you have not given up sprinkling the floors, or by watering plants have caused too much moisture in the house. Leave off fires at night, give a little air at top at night, and allow no more water to be taken into the house. It is not possible to remove the stems on the berries. Do not attempt it.

ICE PLANT TREATMENT (A Subscriber).—Your plant being strong we would make a bed for it by digging out a pit about 18 inches square, in a warm sunny situation, and deep enough to hold a barrowful of hot dung; cover

this with 9 inches thick of a compost consisting of sandy loam two-thirds and leaf mould one-third, well mixed, placing the soil taken out of the pit around the sides. In the centre put out the plant, turning it out of the pot with the ball entire, and give a good watering. If convenient cover the plant with a hand-glass, and if this has a moveable top place the top crosswise during the day so as to admit air, otherwise tilt it on one side. This may remain until the plant requires room, then remove it. The hand glass is not a necessity; the plant will do well without it. Water copiously overhead in dry weather. It will in that way be much larger and finer than if grown in a greenhouse.

GROWING MUSHROOMS AFTER CUCUMBERS (W. M.).—In such a case without removing the manure of the hotbed, the best mode is to take away the soil, insert spawn in the manure after breaking it up a little, and then replace with 2 inches of soil. If we had to do all this we would not only move the surface of the manure, but we would add a few fresh droppings if we could.

ANTS IN THE SOIL OF A POTTED APRICOT (W. B.).—Water your pot with guano water, or even with lime and soft water, made by mixing quicklime and soot in the water, and the ants will leave you. If you were to place tar on the wadding round the stem they will not pass. Syringe the head with clear soot and lime water, and that will clear it for the time.

HYACINTHS (Sligo).—We cannot search florists' catalogues for prices. You had better write to two or more florists, tell them what you require, and ask for prices, &c.

ORANGE TREE—POTTED MUSCAT VINE (Salterton).—We would remove the fruit from the Orange tree, wash it well, and place it under glass where it can have the greatest heat and a free supply of air. The heavy crop last year was too much for it. You had better fruit the Muscat in the pot under glass. Even at your place, we do not think it would do much out of doors. Do not cut down now.

AMARANTHUS INSCOLOR (P. J. Neill).—*Amaranthus "discolor"* is not known to Mr. Gibson, of Battersea Park. He has beds of *Amaranthus biolor*, tricolor, and melanochloicus ruber.

PEACHES MILDEW (Dorset).—The fruit is affected with mildew. The only remedy is dusting with flowers of sulphur as soon as a speck shows itself, and taking care that the roots are not suffering from dryness. Dryness at the roots and a moist atmosphere is a fruitful source of mildew. It will also be promoted by too dry an atmosphere with too much moisture at the roots, especially if the weather be dull.

TOBACCO POWDER (E. H.).—We are doubtful if the tobacco powder will banish thrip from Vines and red spider from Melons, but you should try on a small scale. "R. E." stated the other week, that though it destroyed fly it also injured the green fruit of British Queen Strawberry. Smoke and syringe.

OLD STRAWBERRY BEDS (Sligo).—In thinning old Strawberry rows or beds, the weakest shoots, and the shoots or crowns having the smallest beds, are cut out. This is done without interfering with the roots, consequently the slips removed would be of no value for planting when compared with runners having roots. It is only in good heavy soils that such a practice is at all desirable, but many are in alarm about making a fresh bed; and treated as above and fresh mulched every winter, we have known Strawberry beds bear well many years.

LOAM (Idem).—A heavy soil is generally understood, is synonymous with a good garden soil. If rather stiff from having a portion of clay, it is called a clayey loam, and in that the Strawberry flourishes. In a lighter soil, a sandy loam, the Strawberry grows freely, but does not last so long.

WINTER CUCUMBER (Hortensis).—The best, hardiest, and most prolific winter Cucumbers are the old Lord Kenyon, or Lion House, and an improved larger variety called Volunteer. These are smooth-skinned, with little or no spine, and are not so well liked as the darker Cucumbers by many; but they are very good from September to May, but in summer are sometimes apt to be bitter. To have them at Christmas they should be sown by the middle of July.

PACKING GRAPES (Idem).—There are many modes of packing Grapes to go by railway. One of the best is to fix the bunches on cotton wadding or tissue paper on a board, tie them there, and then fix the board in a box, so that however moved the Grapes will remain the same. Another good plan is to fill a box full so that they cannot move, and place it inside another box.

PEAS IN DRY HOT SEASONS (S. S.).—"R. E." recommends syringing in such weather, chiefly to newly-planted subjects in flower beds. It would be of little use syringing rows of Peas, though they would be benefited by such a syringing in an evening after being watered at the roots.

From one-eighth to one-quarter of an ounce of the materials you mention to a gallon of water would be very useful in a watering at the bottom. The nitrate of soda would give the best growth, but we would prefer the guano for fruitfulness. Hence the propriety of changing the fertiliser. The watering will help to dislodge the moles. Placing tar in the runs will cause them to move, but to destroy them you must trap.

ENVIRONMENT.—Fig 12, for "Maroon," Camille Bernardin, read Prince Camille de Roban.

CATERPILLARS ON A PEAR TREE (R. W.).—They are the larva of *Tenthrinia clypeata*.

DAHLIAS (1 Subscriber).—A Self is a flower with petals all of one colour; a Fancy has petals of two or more colours.

PEA (H. Cullen).—It is a well-known variety of the common garden Pea, and is known botanically as *Pisum sativum macrocarpum*—that is, the large-podded cultivated Pea. It is much cultivated in France, where it is called *Pois mange-tout*, or All-entable Pea, because the shell is boiled and eaten with the peas in them.

HYBRID LATHYRUS (S. & M.).—I am doing a profuse bearer is a merit, but the colours are too dull and confused to demand public patronage.

PLANTS TO FLOWER IN A GREENHOUSE FROM OCTOBER TO MAY (A. A. T.).

In October *Chrysanthemums* will be coming on, and they are well supplied by *Primulas*; in addition to which, bulbs such as *Hyacinths*, *Tulips*, *Narcissus*, and *Crocuses*, will tend to make the house gay. In March and April *Cinerarias* will be in fine bloom, followed by *Calceolarias* in May, and then by *Pelargoniums*. These are indispensable for greenhouse decoration. You should also have a plant or two of *Deutzia gracilis* and *Dieltia spectabilis*, which, though hairy, are very handsome. Of greenhouse plants proper we may name *Camellia Alba plena* and *Pimelia*, both white; *Mrs. Abbey Willet*, white, striped carmine; *La Pace*, white, striped and shaded scarlet; *Story*, rosy pink; and *Perfection*, red. *Azalea*—*Étoile de Gand*, light salmon, white margin; *Flower of the Day*, white, striped rose; *Gem*, crimson scarlet; *Mary*, orange scarlet; *Extrane*, violet rose; and *Gleditsia formosa*, white, striped and blotched with scarlet. *Epanthis The Bride*, white; and *Hyacinthiflora*, rosy scarlet. Also *Correa Brilliant*, scarlet; *Acanth Drummondii*, *A. armata*, *A. oleifolia elegans*, and *A. longiflora magnifica*, all yellow; *Boronia Drummondii*, pink; *Chorizanthe cordatum*, splensens, orange and brown; *Cyclamen persicum*, white, rose, and red varieties; *Cypripedium insignis*, green, tipped with white; *Cytisus racemosus*, yellow; *Eriostemon intermedium*, blue; *Imatophyllum minimum*, orange scarlet; *Lechenanthe formosa*, orange scarlet; *Linolia gratesima*, blue; *Monochetum ensiferum*, rosy purple; *Rhododendron jasmindorum*, waxy white; and *Valerita purpurea*, scarlet.

WEEP ON LAWN (Spring).—The weed enclosed is Plantain. It is best removed with a knife in showery weather, cutting the root a few inches below the surface. This is troublesome, but is the only effectual means of eradicating Plantain and other weeds.

GRAPES IN GREENHOUSE (Idem).—We can only coincide that the leaves turning yellow at this season are affected by red spider or mildew. The latter may be destroyed by dusting the bunches, leaves, and shoots with flowers of sulphur. The Grapes may not ripen from a deficiency of heat, but they do so admirably with us in a cool house without any fire heat whatever. Give air early, and reduce it to a minimum early in the afternoon. The kinds you have may not be suited for a cool house.

PROPAGATING IVY (Idem).—Ivy is propagated from seed sown as soon as it is ripe in a bed of light soil in a rather shady situation. Cuttings put in now, or from now to the end of August, in sandy soil in a shady border, and kept moist and shaded, will be well rooted by autumn. Ivy is also easily propagated by pegging down a branch, and covering it with soil to the depth of 2 inches for a length of 3 or 4 inches, watering in dry weather.

INSECTS (W. B.).—The patch of eggs and newly-hatched caterpillars on your Rose leaves appear to be those of *Bombyx ariflua*, the Gold-tailed moth; but the injury which the leaves have chiefly suffered appears to be owing to their having been gnawed by the larva of a small Sawfly. We know no better remedy for the former than careful hand-picking.

NAMES OF PLANTS (T. E. W.). 1, *Astilbe japonica*; 2, *Lychnis chalcidica*; 3, *Nepeta italica*. (T. E. W. C. D.).—*Cornus florida*, var. *scabra* (E. E.); *Lonicera scrutella*, *Aspidium angulare*, *Adiantum bispalmatum*, *Campyloclis spatulata*, *Nierembergia gracilis*. (J. C. H.).—Probably *Hieracium giganteum*, but cannot be certain without a specimen. (A Lady, Cheshire).—*Epimedium macrorrhizon*. (E. E.).—*Stachys heticaria*. (J. W. Dick).—1, *Orchis mascula*; 2, *Cherophyllum cerasifolium*; 3, *Hypochaeris radicata*; 4, *Rumex acetosella*; 5, *Lotus major*; 6, *Misotis repens*; 7, *Rumex acetosa*; 8, *Gaium axillare*. We must defer giving the names of some of the Ferns sent till next week.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending July 7th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

PROFITABLE POULTRY.

I BELIEVE the majority of farmers think that to make a profit of poultry is next to impossible; that if there is no

great loss from keeping them, and they can be kept out of mischief, the wife or sister may have her fowls for pin money, or to indulge her fancy for pets, but that as to profit it is all nonsense.

Some amateurs on the contrary think that they if had but room to keep half a dozen large yards of fowls, with grass land

for them to run over, it would insure them a little fortune. The truth lies, I think, between these two opinions. Fowls ought to pay well for what they eat, but not much for management. Of course, I do not allude to shew fowls at £50 a pen, but fowls and their eggs sold at the ordinary market prices.

Having cottages in my orchards which are laid down in grass, I can keep almost any number of fowls, so have five lots, of from one dozen to thirty in each place. The labourers' wives receive 1*d.* a-score for looking-up the eggs, which is all the money paid for labour. The fowls have as much good barley as they can eat without waste, once a-day in summer and twice a-day in winter. Chickens are all reared at home. The result is, that the eggs and fowls sold pay for the corn consumed, and leave a balance of from £5 to £10 a-year, whilst a large household is well supplied with poultry and eggs costing nothing. This has always appeared to me quite satisfactory. Some of your readers might, perhaps, like to know how this is managed, whilst others will think the result poor in the extreme.

Having made poultry a hobby for more than thirty years, I should be happy to know how to manage better, and will gladly take a lesson from those who obtain a better result. Having touched upon a good many subjects in "our Journal," I thought—Suppose I give my ideas on poultry management!

First, eggs pay well; chickens at a common market price do not pay at all. If you intend to sell eggs, Silver-pencilled Hamburgs will lay mere eggs, particularly in winter, than any other fowls, and Gold-pencilled the next. No others are so profitable, and none prettier, but they will not bear confinement. As I do not believe fowls are profitable or long healthy in confinement, this is to me no objection; but though none pay like Silver-pencilled, I neither like to cat them nor their eggs, they are small and inferior in flavour. The Gold-pencilled laying nearly as well in winter, and their eggs being a little larger, will be preferred by many. Those who have several good grass runs will do well to keep both. As they seldom sit, being what are called everlasting layers, some other fowls must be employed to rear chickens. I have a cross between the Cochins and Dorking for this purpose. But suppose you have one farmyard or grass field only; in this case, I say, Do not on any account keep any pure breed if the supply of your own household and profit be your object. Are your fowls too much inclined to sit? Procure for next year's breeding a couple of well-bred Hamburg cocks of any colour you prefer. Are they too small? Get two Dorkings, change your cocks every year, and let them be well-bred birds, not mongrels. You can in this way have any kind of fowl as to size, &c., because the chickens will resemble their well-bred sire almost always. You will find the chickens much more easy to rear than those of a pure breed, and the fowls are generally more vigorous and healthy.

Having made up your mind as to what fowls to keep, remember that young fowls lay more than old ones, so never kill a pullet or keep a fowl two years old, unless an especial favourite. Kill off all the young cocks as soon as they are fit to roost; they are generally kept too long. In corn harvest commence to kill off the hens if in good condition, and they ought never to be poor.

At this time of the year eggs are cheap; if you keep the hens till they have given over laying, they will be moulting, and are then unfit to kill, and will for many weeks yield no return for their food. The chickens will do much better when part of the hens are killed, as the yards will not be so crowded, and the young pullets will have a quieter time of it when most or all of the young cocks have followed the hens. Some will say, "What are we to do with the hens? We cannot eat them, and they will sell for a mere nothing." If your cook cannot make an old hen in good condition better as boiled fowl than any young chicken, she has not learnt her business. To my taste nothing is so utterly flavourless as a young chicken boiled. I never tasted a white kid glove boiled in milk, but if boiled tender I think it would be nearly as good. A fat fowl boiled gently for two hours and a half is better than any chicken that was ever cooked. Now, do not go and kill some poor skinny creature of a Cochins or Brahma that has never had a full meal for a month, and whose breastbone is as prominent as the back fin of a perch, and then say, "It is just as I thought, catch me eating old hens again." But if the hen is of a respectable breed and fat, and does not come to table as tender as a chicken and a great deal better, be sure it has not boiled two hours and a half or more; if boiled to rags, that it has not boiled gently.

I have been thus explicit, because to be able to kill old fowls without loss is the only way to make fowls profitable; in other words, keep nothing but pullets, rear early chickens, always feed well, kill off every year, and you will find poultry profitable.—J. R. PEARSON, *Chilwell*.

NEWMARKET POULTRY SHOW.

The classes most conspicuous for excellence were those for *Grey Dorkings*, which were throughout well shown, the chickens being a first-rate feature of the meeting. The *Game* classes were not less excellent, and to a pen of Duckwings the silver cup for the best pen of poultry shown was awarded. They were the property of Mr. Mathews, of Stowmarket; but by some mistake being, with several pens sent by the same exhibitor, entered in the wrong class, a protest against their competing was given in to the Committee, but afterwards abandoned, as the Honorary Secretary had, by letter to the exhibitor, engaged to correct the error; consequently this somewhat unusual engagement could not, under such circumstances, be otherwise than fulfilled. We cannot refrain from again advising exhibitors to be more careful in stating correctly at the time of making their entries the number of the class they purpose showing in; as very little care at that moment not only prevents trouble to the managers of shows, but the certainty, where rules are rigidly adhered to, of disqualification. *Cochins-Chinas*, with the exception of the first and second-prize pens, were so indifferent that the third premium was withheld. Some very superior *Game Bantams* were shown, among them being a pen of unusually good coloured Duckwings. There was not a single entry of *Sabrights*, although prizes of the value of £2 5*s.* were offered. *Japanese*, *White-booted*, and *Silky Bantams* were better than usual. The *Black Spanish* class was the worst in the Show, and consequently no first prize was awarded. *Brahma-Pootras* were good, but the dark-feathered were most perfect: each variety of feather, however, enjoyed a separate competition. Some very good well-grown *Houdan* chickens were shown in the Extra class, also *Brahmas*; but the *Sale* class unexpectedly proved an entire failure, and no second prize was therefore given. *Turkeys* had two classes, the first being exclusively for the Cambridge variety, and these were unquestionably good; but in the other class for any other variety of Turkey there was not a single entry. *Aylesbury Ducks* were very good; and in the "Variety" Duck class some *Buenos Ayren* of high quality were entered. The *Geese* were as good as could be desired.

A very excellent collection of *Pigeons* was entered, Mr. Falton taking a large portion of the prizes, likewise the silver cup for the best pen of Pigeons exhibited. A very large amount of money was taken at the gate, and the weather left the visitors to the full enjoyment of a protracted inspection.

DORKINGS (Coloured).—First, Rev. C. H. Crosce, Cambridge. Second, H. Savile, Rufford Abbey, near Ollerton. Highly Commended, H. Lingwood, Needham Market; Dr. Campbell, Brentwood; F. Parlett, Great Eddow. Commended, W. Tippler, Roxwell, near Chelmsford.

DORKINGS (Any variety except Coloured).—First, H. Lingwood, Second, Dr. Campbell. *Chickens.*—First, Rev. E. S. Tiddeman, Childerfitch Vicarage, Brentwood. Second, H. Savile. Highly Commended, H. Pickles. Commended, Lady L. Charteris, Attleborough.

GAME (Black-breasted or other Red).—First, Cup, and Second, for best pen of Poultry in Show, S. Matthew, Chilton Farm, Stowmarket. Highly Commended, H. Loe, Godshill, Isle of Wight. Commended, W. B. Jeffries, Ipswich; F. R. Hall, Cambridge (Black Red).

GAME (Any other variety).—First and Second, S. Matthew (Duckwing and Piles).

COCHIN-CHINA (Buff).—First, H. Lingwood. Second, Mrs. Christie, Glyndebourne, near Lewes. Third, Witheld.

CRANE-GEES.—First, Col. Stuart Wortley, Grove End Road, London. Second, Lady L. Charteris. Commended, Mrs. M. Seamons, Aylesbury.

HOUDANS.—First, H. M. Maynard, Holmewood, Ryde, Isle of Wight. Second, W. Tippler. Commended, Col. Stuart Wortley.

GAME BANTAMS (Any variety).—First, W. B. Jeffries, Ipswich. Second, F. Pittis, jun., Newport, Isle of Wight. Highly Commended, Rev. C. H. Crosce, Cambridge. Commended, J. Parlett, Huntingdon (Piles).

BANTAMS (White).—First, Rev. F. Tearle, Gazeley Vicarage. Second, J. K. Jessop, Hull. Highly Commended, Rev. F. Tearle.

BANTAMS (Black).—First, H. M. Maynard. Second, Messrs. S. & R. Ashton.

BANTAMS (Any other variety).—First, C. Ramford, Impington Hall, near Cambridge (Japanese). Second, J. S. Sharp, Chippingham Park (White Japanese). Highly Commended, J. R. Jessop, Beverley Road (Booted Bantams).

HAMBURGHS (Golden-spangled).—First, H. Pickles, jun. Second, Messrs. S. & R. Ashton. Highly Commended, H. Pickles, jun.; H. Loe.

HAMBURGHS (Silver-spangled).—First and Commended, H. Pickles, jun. Second, J. Robinson, Tailsworth, near Manchester.

HAMBURGHS (Golden-pencilled).—First, F. Pittis, jun. Second, H. Pickles, jun. Highly Commended, C. Havers. Commended, W. M. Mann.

HAMBURGHS (Silver-pencilled).—First, W. M. Mann, Keudal. Second, C. Havers.

SPANISH.—First, Witheld. Second, C. Ramford, Impington Hall, near Cambridge. Third, G. S. Hall, Ely.

BRAMA-POOTRA (Dark).—First and Second, H. P. Leech, Woolpit, Suffolk.

BRAMA-POOTRA (Light).—First, H. Dowsett, Ploshby, near Chelmsford. Second and Commended, H. M. Maynard.

ANY OTHER VARIETY NOT BEFORE MENTIONED.—First, A. S. Rae, Ely (Silver-spangled Polish). Second, Lady L. Charteris (Buff Poland). Highly Commended, T. Jolly, Newmarket (Grey Malaya). Commended, W. Turner, jun., Ipswich (Partridge Cochins).

CHICKENS (Any variety except Dorkings).—First, Lady L. Charteris. (White Crève-Cœur). Second, Rev. F. Tearle (Silver-sprigged Hamburgs). Third, H. Pickles, jun. Highly Commended, H. Loe. Commended, H. Savile (Dark Brahma Pouter); F. R. Hall, Cambridge (Game).
SELLING CLASS.—First, Rev. C. H. Crose. Second, Withfield.
TURKEYS (Cambridge).—First, C. Wright, Fulbourn. Second, C. Bamford. Highly Commended, R. W. King, near Newmarket.
GUINEA FOWLS (Any variety).—First, C. Bamford. Second, W. Peddar, Kennett.

DUCKS (Rouen).—First, H. Dowsett. Second, J. F. Upsher, Salton.
DUCKS (Aylesbury).—First and Second, Mrs. M. Seamons, Aylesbury.
DUCKS (Any other variety).—First, Messrs. S. & R. Ashton (Carolina). Second and Highly Commended, F. Pittis, jun. (Black East Indian).
GESE (Any variety).—First, Mrs. M. Seamons. Second, C. Bamford (Toulouse). Highly Commended, C. Bamford (White); H. Savile (Sebastopol).

PIGEONS.

CARRIERS.—First and Second, R. Fulton, Deptford. Highly Commended, H. Yardley, Birmingham.

TUMBLERS.—First, Second, and Highly Commended, R. Fulton.
OWLS.—First, H. Yardley. Second, Miss F. Eastern, Hull. Highly Commended, G. S. Hall.

POUTERS.—First and Cup for best pen of Pigeons, R. Fulton. Second, H. Yardley.

BARBS.—First, H. M. Maynard. Second, W. B. Jeffries. Highly Commended, R. Fulton.

FANTAILS.—First and Second, H. Yardley. Highly Commended, H. M. Maynard; G. S. Hall.

JACOINS.—First, J. Thompson. Second, H. M. Maynard. Highly Commended, H. Yardley. Commended, R. Fulton.

TORBITS.—First and Highly Commended, J. Thompson. Second, H. Yardley.

ARCHANGELS.—First, H. M. Maynard. Second, H. Yardley.

RUOTS.—First and Highly Commended, T. D. Green, Saffron Walden. Second and Commended, H. Yardley.

NUNS.—First, H. Yardley. Second, E. Cockledge, Little Bradley, Newmarket.

ANY OTHER VARIETY NOT BEFORE MENTIONED.—First, J. Thompson. Second, Highly Commended, and Commended, H. Yardley.

SELLING CLASS.—First, H. Yardley. Second, Miss F. Eastern (Tumblers). Highly Commended, H. M. Maynard (Swallows).

Mr. Edward Hewitt, of Birmingham, was the Judge.

OUNDLE POULTRY SHOW.

THE Northamptonshire Agricultural Society has for many years added both poultry and Pigeons to the many attractions of its annual meetings, and the collection this year was certainly considerably in advance of those previously brought together. This division of the Show when ready for public inspection proved exceedingly well arranged, and the attendance of visitors all the time the Show was open proved how interesting it was to the company generally. Much trouble and inconvenience was caused by the pens, which were supplied by Messrs. Turner, of Sheffield, not arriving in due time, though the stands were fixed and ready a long while previously. The man expected to fix the pens never appeared, and a few men had to make the attempt at the last moment, as best they could, with string. After a delay of at least twenty-four hours from the time originally contemplated, the Show was such as to compensate a large company for the annoyance thus caused.

The Grey Dorkings were one of the chief features of the Show, and of this variety Mr. Longland exhibited a collection such as is rarely surpassed. The chickens shown by this gentleman were undoubtedly the most matured of any we have seen this season, and in first-rate condition. In the classes for *Spanish* the competition of adult birds was small though good, the chickens being, however, generally good throughout the class. Many excellent *Guinea* fowls were shown, and Mr. S. Deacon took a great portion of the premiums. *Cockins* were numerous and good, and here again several pens of finely grown chickens were exhibited; and of *Brahma Pouter*s as early chickens the same statement holds good. The *Aylesbury Ducks* and *Geese* were remarkably good.

We noticed in the *Bantam* class (here open alike to every variety of Bantams), birds of very novel character, being evidently a cross between the Japanese Bantam and the Silky Fowl. They were so extraordinary as to attract the special attention of most poultry-breeders; and a pen of Frizzled Bantams in the same class was scarcely less worthy of attention.

In *Pigeons* the Society's rule was to exhibit pens of three different varieties from each subscriber. The competition was very restricted as to entries, but the birds were unusually good. The Show was most successful, and the weather all that could be wished for.

DORKINGS (Any colour).—First, J. Longland, Grendon. Second, T. Tatham, Kingsthorpe. Third, R. Wood, Clapton, Thrapstone. Commended, J. Carter, Farret Fen, Peterborough; Mrs. M. Seamons, Hartwell, Aylesbury. *Hens*.—First, J. Longland. Second, B. Wood. Highly Commended, W. Prentice, Aldwinckle, Thrapstone; Marchioness of Exeter, Stamford. *Chickens*.—First and Second, J. Longland. Highly Commended, Mrs. M. Seamons. Commended, E. Sykes, Geddington. *Pullets*.—First and Second, B. Wood. Highly Commended, R. Sykes; J. Longland. Commended, Mrs. M. Seamons. *Cock*.—First, J. Longland. Second, J. Beasley, Chapel Brampton. Third, T. Tatham.

SPANISH.—First, Burch & Boulter, Sheffield. Second, J. Stephens, Walsall. Third, W. R. Bull, Newport Pagnell. Commended, C. Wright, Northampton. *Chickens*.—First and Second, Burch & Boulter. Highly Commended, W. R. Bull. Commended, J. W. Smith, Oundle. *Cock*.—First, W. R. Bull. Second, C. Wright.

GAME (Any colour).—First and Third, S. Deacon, Polebrook Hall.

Second, Capt. Wetherall, Loddington. Highly Commended, S. Deacon. Commended, Capt. Wetherall. *Cock*.—First, Capt. Wetherall. Second, S. Deacon. Third, H. Lotan, Oundle. Highly Commended, Capt. Wetherall. *Hens*.—First, S. Deacon. Second, H. Lotan.

COCHIN-CHINAS (Any colour).—First, J. N. Beasley, Chapel Brampton. Second and Third, W. A. Taylor, Manchester. Highly Commended, J. H. Dawes, Mosely Hall, Birmingham; C. Wright; J. K. Fowler, Aylesbury. Commended, J. Stephens, Walsall. *Chickens*.—First and Second, W. A. Taylor. Highly Commended, J. N. Beasley. Commended, J. Longland. *Cock*.—First and Second, W. A. Taylor. Highly Commended, Marchioness of Exeter.

HAMBERGHS (Any variety).—First, W. A. Taylor. Second, Burch and Boulter. Highly Commended, T. Pinfold, Newhaven (Spangled). Commended, W. Barford, Aylesbury (Golden).

BANTAMS (Any colour).—First, W. A. Taylor (Game). Second, Capt. Wetherall (Black-Red Game). Highly Commended, S. Deacon (Game); J. N. Beasley (Japanese); W. A. Taylor (Game). Commended, S. Deacon (Game); J. K. Fowler (Game).

ANY OTHER DISTINCT BREED.—First, J. K. Fowler (Brahma). Second, J. K. Fowler (Crève-Cœur). Third, T. Pinfold, Newhaven (Black Bred). Highly Commended, W. F. Marshall, Branton (Hondan); Capt. Wetherall (Crève-Cœur). Commended, G. Turner, Uppingham (Dark Brahma).

GESE (Any colour).—First, Mrs. M. Seamons. Second, Ladies Fitzwilliam, Harrowden House. Highly Commended, S. Deacon.

DUCKS (Aylesbury).—First, Mrs. M. Seamons. Second, J. K. Fowler. Highly Commended, Mrs. M. Seamons; J. K. Fowler.

DUCKS (Rouen).—First, H. Wood. Second, J. K. Fowler. Commended, R. Wood; T. Burnaby, Pipewell.

DUCKS (Any other variety).—First, J. N. Beasley. Second, S. Deacon (East Indian).

TURKEYS (Any colour).—First, J. N. Beasley. Second, J. A. W. Underwood, Warrington.

SELLING CLASS.—First and Second, W. A. Taylor (Spanish and Buff Cochins). Third, C. Wright (Partridge). Highly Commended, J. K. Fowler (Aylesbury Ducks). Commended, J. Stephens, Walsall (Black Spanish); J. Longland (Dorking and Cochins-China).

PIGEONS.—First, H. Yardley, Birmingham (Fairies, Owls, and Ise). Second, H. Yardley (Carriers, Pouters, and Ruots).

The Judge was Edward Hewitt, Esq., of Eden Cottage, Sparkbrook, Birmingham.

SNAITH POULTRY SHOW.

THE fourteenth annual Show of the Snaith Agricultural Society took place on the 2nd inst. There were ninety-four entries of poultry, Pigeons, Rabbits, and cage birds. The quality of the fowls shown in the classes for the best cock and hen of any variety, and in those for *Game* and *Bantams*, was very good. The *Guinea Fowls* and *Rabbits* were also very good, likewise *Tumbler Pigeons*, and those shown in the class for any breed. The following is the list of awards:—

ANY BREED.—First, J. Senior, Dewsbury. Second, E. Akroyd, Bradford. Highly Commended, W. A. Taylor, Manchester; J. Thresh, Bradford. Commended, W. & F. Pickard. *Cocks*.—Second, E. Akroyd. Highly Commended, J. Senior; Messrs. Gamble & Woodward; Messrs. W. & F. Pickard. Commended, J. Thresh.

GAME.—First, E. Akroyd. Second, J. C. Coupe.

PHEASANTS (Golden).—First, W. A. Taylor. Second, J. Senior. Highly Commended, Messrs. Newbitt; G. Holmes.

PHEASANTS (Silver).—Prize, G. Holmes.

SPANISH (Black).—First, Messrs. Newbitt. Second, J. Thresh. Highly Commended, J. Elwood, Goole; G. Holmes. Commended, Messrs. W. and F. Pickard.

COCHIN-CHINA.—Prize, W. A. Taylor.

BANTAMS.—First, J. Senior. Second, T. C. Harrison, Hull. Highly Commended, G. Holmes; C. Gravill, Thorne.

GUINEA FOWLS.—First, C. Harrison, Hull. Second, G. Holmes. Highly Commended, F. T. Carr, Baloe Lodge. Commended, Mrs. Bradley, Pollicott.

RABBITS.—*Duck*.—First and Second, C. Gravill. *Doe*.—First, C. Gravill. Second, W. S. Hornby. Highly Commended, C. Gravill. Commended, W. S. Hornby. *Extra Stock*.—Prize, W. S. Hornby.

PIGEONS.

CARRIERS.—First, Dr. Thompson. Second, C. Strickland.

CROPPERS.—Prize, Messrs. Newbitt.

TUMBLERS.—First, Messrs. Newbitt. Second, C. Strickland.

JACOINS.—First, Messrs. Newbitt. Second, Dr. Thompson, Snaith. Highly Commended, G. W. Bullace, Sykehouse. Commended, G. W. Bullace; J. Robinson.

FANTAILS.—First and Second, Messrs. Newbitt. Highly Commended, D. Townsley.

ANY BREED.—First, D. Townsley. Second, J. Thresh. *Extra Second*, C. Strickland; Messrs. Newbitt; Dr. Thompson. Highly Commended, D. Townsley. Commended, C. Strickland.

CANARIES.—First, M. Holmes. Second, A. Jennings. Highly Commended and Commended, T. Hutchinson.

RED CAPS.—First, Waterworth. Second, W. Fenton. Highly Commended, M. Brain; Messrs. Newbitt.

Mr. E. Hutton, Pudsey, Leeds, officiated as Judge.

BARNSTABLE POULTRY SHOW.

THIS was held in conjunction with a Horticultural Exhibition, in the Market House, Barnstable, on the 1st and 2nd inst. There were 200 entries of Poultry, Pigeons, and Cage Birds. The following is the prize list:—

COCHIN-CHINA.—First, Col. Stuart Wortley, Grove End Road, London (Buff). Second, L. Patton, Taunton (Buff). Commended, S. R. Higham, Morcham Bishop.

BRAMMAS.—First, Miss C. Boyle, Barnstable. Second, G. Pagsley, Barnstable.
DORKINGS.—First and Second, L. Patton.
FRENCH (Any variety).—First, Col. Stuart Wortley (Crève-Cœur). Second, E. Leworthy, Newport, Barnstable.
SPANISH.—First, J. Juce. Second, H. Bright. Commended, W. Boyle, Barnstable.
MINORCA.—First, H. L. Trowin, Kolkhampton. Second, H. Leworthy, Newport, Barnstable. Commended, S. Northote, Upton Pine.
ANCOSAS.—First and Second, H. Leworthy (Black-tipped White).
ANDALUSIAN (Blue).—First, R. Stone, Newport, Barnstable. Second, R. H. Nicholls, Newport, Mon.
GAME.—First and Second, Rev. G. S. Cruwys, Cruwys Morehard, Tiverton. Commended, E. Maunder, Northmolton (Black-breasted).
POLANDS.—First, J. Hinton, Hinton, near Bath. Second, R. Andrews, Barnstable.
HAMBURGHS (Gold or Silver-peacilled).—First, W. Clement, Barnstable (Gold). Second, R. H. Nicholls (Gold).
HAMBURGHS (Gold or Silver-spangled).—First, A. Snell, Bishop's Tawton (Silver). Second, J. Delmar, Poughill (Gold).
ANY BREED NOT PREVIOUSLY MENTIONED.—First, R. Newcombs, Hanton, Panchardoo (India). Second, E. Mannder, juo., (Malay).
BANTAMS (Any variety).—First, G. F. Hodson, North Petheron. Second, H. R. Higham (Gold-laced). Commended, J. R. Higham (Black-breasted); W. Dale, Weston-super-Mare.
TURKEYS.—First, L. Patton. Second and Third, J. Keal, Ilfracomb.
GERSE.—First, L. Patton. Second and Third, J. Keal. Commended, F. Brayley, Irish Borough.
DUCKS.—First and Third, L. Patton (Rouen). Second, A. W. Jones (White). Commended, R. Pethebridge (American).

PIGEONS.

CARRIERS.—First, C. Eulpin, Bridgewater. Second, E. S. Keall.
POUTERS.—First and Second, C. Eulpin.
JACOBINS.—First, W. Westacott, Barnstable. Second, C. Eulpin.
TUMBLERS.—First, W. Westacott. Second, C. Eulpin.
FANTAILS.—First and Second, C. Eulpin.
BARBS.—First, T. C. Smith. Second, A. D. Smith.
TRUMPETERS.—First, J. G. Gilbert. Second, C. Eulpin.
ANY OTHER VARIETY.—First, C. Eulpin. Second, W. Cooke, Barnstable. (Runs).

BRITISH AND FOREIGN CAGE AND OTHER BIRDS.

CANARIES.—First, Mrs. Boyle. Second, Mrs. E. Palmer.
GOLDFINCHES.—Prize, J. Sellick, Barnstable.
PARROTS.—First, G. T. Gaydon (African). Second, J. Clement (African Grey).
DOVES.—Prize, G. Dowdle (Ring).

Dr. Scott, and the Rev. J. P. Sydenham, officiated as Judges.

PROGRESS OF GROWTH.

I SEND you an account of the increase in weight of a grey Dorking cockerel hatched on the 18th of February.

	1 lb.	7½ ozs.	June 4	4 lbs.	1½ ozs.
April 13	1 lb.	7½ ozs.	June 4	4 lbs.	1½ ozs.
May 5	2 "	6 "	" 7	4 "	6 "
" 11	2 "	11½ "	" 10	4 "	9 "
" 16	3 "	2 "	" 14	4 "	12 "
" 18	3 "	4½ "	" 18	5 "	1½ "
" 25	3 "	14½ "			

Will breeders of grey Dorkings oblige by giving similar statements of the progress of their early birds?—H. S.

NORTH BRITISH COLUMBIAN SOCIETY.—The prize list has just been issued, and is very rich. There are three prizes—20s., 10s., and 5s. in each class, besides twenty-three silver medals valued at two guineas each. There must be a large Exhibition, and a prize gained there ought to be considered a columbian blue ribbon.

WINTERING AND BREEDING CANARIES.

I SHALL feel obliged if you can inform me whether Canaries will live through the winter in cages in a room without fire, and whether they are better in a large flight cage against the wall, or in a large, open, wire aviary cage in the window during our northern winter weather?

I should also like to know if a patent gas stove with a pipe up the chimney would sufficiently warm a room 14 feet by 12 feet, and whether so burning the gas would injure Canaries and other small foreign birds?

I also need directions as to the safest and best method of wintering Canaries, and the dimensions and particulars of the best style of cage for breeding purposes.—W. D. SKELTON, JUN.

[Canaries in health will withstand almost any amount of cold, and it is nothing unusual in a severe winter to have to break the ice in their drinking-vessels twice or thrice a-day. I know several instances in which they are kept in conservatories with no protection and no artificial heat all through the winter. It is quite immaterial whether they are kept in a large aviary cage in a window, or in a flight cage against the wall—that is, as far as regards health; but birds kept in an open aviary cage

will be much more likely to become dirty. They require no special treatment which might be classed under the head of wintering them. In any ordinary winter they will suffer no inconvenience from the low temperature.

I have in my bird-room a small gas stove which I used with great success in the early part of this breeding season. Owing to the unusually fine weather we experienced, I was induced to begin much earlier than usual, and I made a practice of lighting-up my stove in the evening to keep up the temperature during the night. My stove is of the simplest construction and cost only a few shillings including the man's time in fixing, and would do well for "W. D. S.'s" room. It is simply an upright cylinder of common thin sheet iron, about 6 or 7 inches in diameter, and about 2 feet high, covered at the top, and having a pipe to convey away the hot vitiated air. I use simply an ordinary bat's-wing burner, and when the gas is turned full on it will generate sufficient heat in two or three minutes to render the room uncomfortably hot. A very small flame is sufficient to keep up a comfortable temperature. The main point to be observed in its use is the finding a suitable place for the outlet of the pipe. This should be in a place entirely free from draughts, for the down draught will extinguish the light, besides returning to the room the noxious vapour which it is the object of the pipe to convey away. My pipe finds its outlet immediately under the roof of my house, not through it. I question whether communication with a chimney would do. I have known it fail.

There is an apparatus for heating small rooms which I have seen in an office in this town (Sunderland), which is simpler than my own. In it a single jet of gas is introduced into the mouth of an iron pipe (an ordinary rain-water pipe being used), which traverses the side of the office under the desks against the wall, rising from a few inches above the floor at one end, to about 3 feet at the other, where a small escape-pipe up the corner of the room conveys the hot air to a vacant space above the ceiling. The principle is the same in both cases, the iron pipe in the one serving as the sheet-iron cylinder in the other. The cost of the gas is next to nothing, and not the slightest injury to the birds results from its combustion.

"W. D. S." will see my remarks on breeding cages in No. 364 of the Journal. I shall be most happy to answer any queries from the uninitiated, and shall at all times esteem it a pleasure to do so.—W. A. BLAISTON.]

FOUL BROOD.

DURING the spring of the present year I paid a visit to a brother bee-keeper who resides within a few miles of London. His apiary was apparently a flourishing one, consisting of about a dozen stocks in various kinds of hives all well stored with honey, and for the most part working vigorously. There was, however, one weak colony, which happening to be domiciled in a Woodbury frame hive, I lost no time in examining. Much to my own astonishment, and to the discomfiture of its owner, I found it far gone in foul brood. This discovery prompted an examination of two other colonies in moveable-comb hives, and both proved to be infected with the same terrible disease. One was of moderate strength, and in this foul brood was decidedly manifested, although not nearly to so great an extent as the one first examined; whilst in the third, which was a wonderfully strong and apparently prosperous stock, only a few tainted cells could be discovered, scattered here and there amongst immense masses of healthy brood. My hospitable entertainer seemed scarcely able to realise the fact that his seemingly flourishing apiary could in reality be smitten by so fearful a malady, and declared that if this were foul brood he had been familiar with it for the last eighteen years. His experience was that he considered the natural life of a stock of bees was limited to five or six years, at the end of which period it was bound to die out, leaving the combs filled with what he had always called "abortive brood," but which was in point of fact identical with that for which I had testified so much abhorrence, and which I had stigmatised as "foul brood."

This state of things opens up the question whether there may not be what may be termed a chronic form or phase of foul brood, which, although ultimately fatal in its results, is yet of such comparatively slow growth as to admit of a certain degree of prosperity in the infected apiary; the stocks of which flourish, and throw off swarms in the usual way for two or three years, only succumbing when the disease has run its course in five or six years.

It seems difficult to over-estimate the importance of the subject. My own experience of the pest during the year 1863 was fully detailed at the time, and I now purpose, if the Editors will afford me space, laying before the readers of "our Journal" an exhaustive paper on foul brood from the pen of that distinguished German apiarian the Baron von Berlepsch.—A DEVONSHIRE BEE-KEEPER.

CAUSING SECOND AND THIRD SWARMS.

This is an age of progress; but so far as I am aware, the expedient adopted by Mr. Lowe, of Edinburgh, for causing second and third casts to make their exodus at an early hour of the day has not yet been reported. The process, however, does not apply to top swarms—at least it failed with me on several occasions last summer.

As most apiarians know, the fact of giving food to the inmates of a hive, and especially food of a particular quality, such as pure honey, has a maturing influence, and causes great commotion and activity. It is also well known that when "piping" in the evening is strong and long-continued, a swarm may be expected on the following day. It is, however, impossible to predict with certainty when the expected colony will take wing. The exodus, however, may not only be hastened, but may be occasioned almost at the desired hour by giving the hive a little stimulating food. To gentlemen engaged in business, who permit natural swarming, and wish to have their aftercasts lodged as early in the day as possible, this hint will, I presume, be acceptable.—R. S.

ASIATIC BEES.

I AM indebted to the kindness of the Rev. Henry de Romestin, English chaplain at Baden-Baden, for the following interesting notes of Mr. Cori's experience of Asiatic bees. This gentleman, who resides near Teplitz, in Bohemia, received these bees from Smyrna, and appears to consider them a distinct race from the Egyptian bee (*Apis fasciata*). In this opinion, however, I cannot but believe him to be mistaken. It is well known that *Apis fasciata* is indigenous in Syria, and it would appear more than probable that it extends also to Smyrna, whilst any one who is at all familiar with the Egyptian bee can scarcely fail to recognise it in the description which Mr. Cori gives of his "Asiatic Bees."—A DEVONSHIRE BEE-KEEPER.

"May, 1867, was a bad month for bees in Bohemia. The honey season began with the 26th. In June there were seventeen good days. The neighbourhood is not particularly good.

"In the spring the only Asiatic bees were one hive under medium strength. On the 20th of May, a small artificial swarm was made, and the original stock divided into two before the new queens were hatched, making two 'miniature swarms.' The artificial swarm of May 20th sent out a strong swarm after five weeks; then an equally good second swarm, a third swarm good enough to keep, and last of all a fourth.

"The second and third swarms had each two queens, and were, therefore, divided. So the one weak stock became nine, of which six were by July 28th in a state to give no anxiety for the winter. In the same season and neighbourhood the black bee scarcely swarmed at all.

"The Asiatic bee has two yellow rings, and whitish hairs, in shape longer and more wasp-like. The drones have the first ring reddish yellow, the stomach decidedly yellowish, with one or two almost imperceptible black spots, and are larger than the black drones. The queen has the first three segments dark reddish yellow, the rest dark brown. She begins to lay before the black, the Hungarian, and Dalmatian queens.

"A bastard stock sent out six swarms the same year.

"Some original comb had somewhat smaller cells than the black bees; but this difference was not noticed in comb built afterwards. They worked earlier in the morning, and later in the evening than any other bees. They are quieter than the black bee, unless excited, when they are worse, and their sting is more painful than that of the black bee."

OUR LETTER BOX.

RESULTS OF HATCHING (*H. L.*).—The time is passed when the insertion of the results you have sent were interesting.

STAVELEY POULTRY SHOW (*Far West*).—It is quite certain that the Secretary neglected to do what he ought to have done, but it is useless occupying more space with a detail of his mistakes.

DUBBING GAME BANTAMS (*Subscriber*).—Dub your Game Bantams as soon as they have done growing. It must not be done while they are soft-feathered. They should be snake-headed, hard-feathered, and have the wings carried up and close to the body. The cock should not have too much tail, and should not carry it upright or over the back.

CHICKENS HATCHED IN JUNE (*Old Subscriber*).—You may go on setting your eggs safely. We do not know why, but country people are all opposed to June chickens. There is a Hampshire saying—

"Chicks that are hatched, when there's making of hay,
Will never grow up, but fade away."

We have, however, many good June chickens now, and are still setting eggs. We believe the cause may be traced to the eggs being kept too dry during the great heat. We are glad you are successful with your poultry. Ireland does not sell a fifth of the poultry and eggs she can produce without effort.

HOODS CHICKENS (*Bessie*).—We greatly prefer the chickens that are nearly black. They become lighter as they grow older, but for that reason they should, when young, be dark. From what you say, we should not think you had been deceived in any way. The eggs have hatched well, and the chickens have the principal points of the breed. We should not get rid of them, but would wait and see how they turn out.

WHITE CREVE-COEURS (*H. M. B.*).—White Crève-Coeurs are scarce, but like White Spanish, they are little considered, and are not valuable.

FACE OF AN ANDALUSIAN (*J. B. Jew.*).—The rules of Andalusian fowls are but little cared for, as the birds are seldom shown. The best specimens we have seen have always had the lower part of the face and the deaf ear white, the upper part of the face red.

PREVENTING SOFT EGGS (*J. M. S.*).—As your fowls have all the appliances necessary for the formation of egg-shell, the fact of laying soft eggs can only be attributed to want of condition. Your feeding is not good, and lacks nourishment, with the exception of the barley. Tail wheat is a good plying for small chickens. Fowls do not like back-wheat, and pollard does not nourish and help them sufficiently. Give them barley or oatmeal twice every day, and let the mid-day meal be barley, or Indian corn for a change. If you wish for good table poultry all the year round, you should set hens every month so as to have a constant supply of young poultry. The sister to the nice juicy pullet you ate in October, is an old hen in the following February. It is cruelty to try anything to prevent hens from being broody. It is their nature, and they must be so.

SILVER PHEASANTS (*Idem*).—We have kept Silver Pheasants for many years. They are amongst the boldest and most cheerful of that family, and if yours are moping about they are out of health.

RETARDING LAYING (*Lemon Fuff*).—We know of no food that will retard the laying of Cochins-China pullets. Keeping them short of food will do it; but as your object is, doubtless, to encourage growth, you will find that low condition will injure them far more than early laying. We know no law of nature that can be altered or set aside without paying the penalty. We believe the smell of putrefied meat is not injurious to chickens. We have been told it is beneficial rather than otherwise to chickens and their owners. It is therein the reverse of vegetable matter.

PIGION JUDGING (*R. Fulton*).—It would be invidious to insert the list you have sent. Many you name we know would not act as judges.

OLD STRAW HIVE BULGING (*H.*).—If, as we imagine, the combs are very old as well as the hive, no time should now be lost in driving the bees into a new hive and establishing them as an artificial swarm on the old stance. Three weeks after the issue of the first swarm is the best time for this operation, but a few days later will do very well. The best mode of driving bees was fully described by Mr. Woodbury, in page 105 of our last volume. If, on the other hand, the combs are not too old, the bees should be driven and the combs transferred to a frame hive in the manner described in page 39 of our twelfth volume.

BEES NOT SWARMING (*H. Wade*).—We should make an artificial swarm in the manner often recommended in these pages, and last described by "B. & W." in page 179 of our last volume. We cannot tell why the stock is not swarmed naturally, but there seems to be something peculiar in the season in this respect, for the scarcity of swarms is a very general complaint.

GERMAN CENTRIFUGAL HONEY-EXTRACTING MACHINE (*G. J.*).—The square platform is of such a size as just to revolve freely within the exterior box. The four combs stand in their natural position on the four sides inside of, and in close contact with the strained fishing line. The best mode of Lignifying your stocks was fully detailed by Mr. Woodbury in No. 315 of our New Series.

GLASS SUPPERS (*John H.*).—The Avington honey glasses are made by Messrs. James Couper & Sons, at the City Flint Glass Works, Glasgow. The beauty of finish of those manufactured there, both for Mr. Mitchell and himself, is testified by "A DEVONSHIRE BEE-KEEPER."

DYING MOSS GREEN (*Verdant*).—We should try soaking the moss first in a solution of Prussian blue, and then in a solution of gamboge. If any of our readers will give information on the subject we shall be obliged.

POULTRY MARKET.—JULY 8.

THERE is a slight falling off in the demand, and the supply decreases, but owing to the heat prices are maintained for lots of first-rate poultry.

From observations taken near London during the last forty-one years, the average day temperature of the week is 74.2°; and its night temperature 50.3°. The greatest heat was 91°, on the 17th, 1831; and the lowest cold 37°, on the 19th, 1866. The greatest fall of rain was 1.60 inch.

THE STRAWBERRY, AND ITS CULTURE.

NEVER was there a drier or more trying season for the Strawberry, and, it might be added with equal truthfulness, never were Strawberries better in growth, flavour, and abundant produce. The vigorous appearance of the foliage and the splendid crop of berries, convey to us a most useful lesson as to the great importance of deep culture for the successful production of fine crops of this the most delicious of hardy fruits, and as most

decidedly necessary to enable them to withstand so dry a season as the present. What a season it is for the full development of flavour! Surely if a variety fails to "tickle the palate" this year it is high time it were discarded, or, if not discarded altogether, only grown in a more suitable climate; for I am well aware that in discussing the individual merits of fruits, as well as of flowers, it is wrong to make sweeping assertions, and to say, "Well, I have tried such a variety under different aspects, and have bestowed the most skilful treatment on it, and yet it fails in approaching sufficiently to the degree of merit which would entitle it to be kept; it must, therefore, be condemned," when, very likely, the same kind may be met with elsewhere good in every respect.

To cultivate Strawberries successfully is not by any means a difficult matter, nor does it require any great amount of skill, yet there are a few points which must be closely attended to, otherwise but poor results will follow. No plant will bear a greater amount of ill-treatment, hence the miserable samples of fruit which are so frequently to be met with; and, again, no plant will better repay the cultivator for the small amount of care and labour which is requisite to produce healthy vigorous plants, and, consequently, fine fruit. Sometime ago I remember being amused, as I strolled along a certain grass walk overshadowed by the boughs of fruit trees, by the person who accompanied me exclaiming, as he pointed to a Strawberry border on either side of the walk, of which the plants presented a most diminutive appearance, "These are our Strawberry beds." "Ah!" said I; "and how old may they be?" "Why," said he, "Master says they are thirty years old." And as I afterwards discovered, the owner of the place was very fond of and most enthusiastic concerning his Pines, Grapes, and orchard-house fruit, but he did not care for Strawberries; and certainly I thought if he never tasted any but the fruit produced by his own venerable beds, it is not unlikely he might continue of the same opinion.

The mode of culture which is followed here differs but slightly from others which have been advocated in the pages of this Journal, yet as the results attained are all that can be wished, it may be worth while to give the particulars.

The beds are prepared by trenching the soil 18 inches deep, and properly incorporating a good layer of well-rotted dung and charcoal, or coal ashes, with the upper portion of the soil. Early planting is of the greatest im-

portance; the young runners are therefore encouraged to emit roots by stirring a trowelful of leaf mould among the soil for each plant, into which the offset will quickly root. Early in July, or at the latest in the beginning of August, as soon as the plants are ready for removal, they are separated from the parents, and planted in the prepared beds. The rows are 2 feet apart, and the plants 1 foot apart in the rows. I have seen it advised to have the rows but 1 foot apart, and to remove each alternate row after the first year's fruiting; but this is a mistake, because it is found that young plants in rows 2 feet apart ripen their fruit very much earlier than those more thickly planted; and this is a great advantage, as then the two and three-year-old plants which have the fruit overshadowed by their more vigorous foliage form a nice succession to the yearling plants.

Immediately after the fruit is all gathered, a line is stretched on each side of the rows, so as to just touch the tips of the leaves; the runners are then separated with a spade, and the alleys only are cleared. If any young plants have taken root between the parent plants, as will most likely be the case, they are permitted to remain. As much dung as can be covered is then forked in, and the plants at once commence to grow vigorously, the fresh young roots greedily feeding on the manure, so that by the autumn the rows are one mass of green healthy foliage. This treatment is continued in the following season, and after the third crop of fruit is taken, the plants are hoed-up, as they are found to decline in vigour after the third year.

Two waterings of liquid manure are given in the year, the first soon after the plants exhibit signs of activity in the spring, and the second as the fruit commences to swell. These are no mere surface-wettings, but thorough root-waterings. If the plants are growing in a well-manured loamy soil of a sufficient depth, no further waterings are necessary; but to plants on a shallow soil, or one of a very sandy nature, additional waterings are not only highly beneficial, but are absolutely necessary to success in dry seasons, if fruit of good quality and of fair size is required. From experience I should say it is very advisable only to use liquid manure at every second or third watering, clear water to be used at all other times; for although the constant application of a liquid manure may cause the fruit to gain something in size, yet any addition to the size of fruit which is attained in this way is decidedly at the expense of flavour, and in this opinion I believe I am borne out by the decision of the judges at the late metropolitan exhibitions in the case of fruit, in the production of which sewage had been freely used.

In the selection of materials for preventing the fruit from coming in contact with the soil, pebbles, or any rank grass or rushes which may be obtainable, answer very well; but where nothing of the kind is to be had, common draining tiles, of about 2 inches in diameter and 1 foot long, placed side by side, do admirably, and are much better than flat tiles or slates, as they admit the rain freely to the soil. Roberts's patent Strawberry tiles are also very useful, but they are best adapted to support the fruit of single plants. Whatever material be used, it ought certainly to quite

cover the soil, otherwise the fruit will be splashed by the first thunder-shower which may occur.

In packing Strawberries for travelling, flat tin boxes are frequently used, but I very much prefer wooden boxes stout enough to resist any pressure to which they are likely to be subjected in their transit. Boxes 13 inches long by 6 inches wide, and 2½ inches deep, inside measurement, will hold six dozen fine fruit in two layers of three dozen each. The boxes are made of half-inch board, with the exception of the ends, which are three-quarters of an inch thick. A leaf is placed under each fruit and between every two fruits, and the top layer is covered with leaves three or four deep; on these the lid is firmly closed, and the fruit is pressed with just sufficient firmness to keep it in its place without bruising.

Although in most classes of fruits good standard kinds have had the advantage of being tried for a respectable number of years, yet it is not so with the best kinds of Strawberries, despite the eloquent assertions of a certain gardening Rip Van Winkle, who, after a thirty-years sleep, awoke a few weeks back, as I saw in the report of a Gardener's Society, and strongly advocated the merits of Wilmot's Superb!

In the selection of sorts, size, quality, and time of ripening, combined with fruitfulness, vigour of growth, and hardness of constitution, are the principal points to be kept in view. Out of a rather large collection I have selected a few kinds which not only possess most of these good qualities, but which also give a most satisfactory succession of such fine fruit as a gardener may well feel proud to have placed on his employer's table.

Amongst the earlier-ripening kinds *Le Breton's Marguerite* most worthily holds the first place, for, unlike most early sorts, its fruit is very large, having a fine flavour, and the plant is a most abundant bearer. Next to this may be named *Oscar*, of good flavour, and very prolific; and then comes *Trollope's Victoria*, the hardest and most abundant bearer of all Strawberries. For giving a good supply for cooking and preserving purposes, and also for affording some fine fruit for the dessert, this kind with me has no equal.

Dr. Hogg is a first-class sort in every respect, quite superseding *British Queen*: the fruit is very large, and of the finest flavour. *Duc de Malakoff* is a unique variety, worthy of general cultivation; its enormous size, peculiar shape, and dark colour causing a dish of it to form a novel feature in the dessert. I had the curiosity to weigh twelve fruit of this kind, gathered from plants planted in July, 1867; the combined weight was just 1 lb., and occasionally a berry may be found to weigh 2 ozs. *Sir Charles Napier* is a most excellent sort, of handsome shape, fine flavour, and a good bearer; it also travels well. *John Powell* is a splendid kind, having a pleasing acidity just brisk enough to be most palatable and refreshing. *Bieton Pine* is a good white kind; it is also useful for variety. *Rivers's Eliza* is one of the best late Strawberries in cultivation—good in every respect.

Black Prince, although small, is useful for its earliness, ripening, as it does, some days before any other kind.

If all that has been said concerning the good qualities of *The Lady* is correct, I can only say that after two years of unceasing devotion, she has not deigned to reward my attention with one charm which I could appreciate, and, therefore, I conclude "she's as fickle as she's fair."—*Edward Lockhurst, Egerton House Gardens, Kent.*

PANSIES.

Most thoroughly do I echo the sentiment of your reporter when, in speaking of Messrs. Downie, Laird, & Laing's Pansies at Birmingham, he says, "Surely such lovely flowers must be deserving of more attention than they now receive, especially in the south of England." They are deserving of it; but in the general discredit that now unfortunately attends most florists' flowers, I fear the Pansy is so involved, that it will require much perseverance to enable us to re-establish it in the position it so well deserves, and which it once held. My earliest recollections of Mr. Turner, of Slough, are connected with the Pansy, when, in his garden at Upton, he grew it as well as he loved it. His change to Slough brought other matters under his notice and care, and I fancy the situation was not so suitable; but be that as it may, the Pansy no longer forms one of the attractions of his garden. It is omitted from his catalogues, a sure sign of its declining popularity. The eminent firm above mentioned, however, have done their best to introduce its culture, and from their having their northern establishment at Edinburgh and their southern one at Stanstead Park, are enabled to have

a much more lengthened bloom than if they were dependant on either one or the other alone.

There are many persons who can see no difference between one Pansy and another in the same class, yet who can go off into ecstasies over the smallest imaginable difference in a Fern, and think nothing of the absurdities of an *Athyrium Filix-femina multo-difflso-coronatum*, or who can see marvellous differences between *Tricolor Pelargonium Tweedledum* and *Tricolor Tweedledee*, but who have an infinity of sharp words and extraordinarily funny sayings about florists' microscopic eyes. Well, well, a reaction will come some day, and we poor old conservatives will be found to have some followers. Already the grand chromatic of red, yellow, and blue is giving way, foliage is needed to relieve the vulgarity; and ere long, perhaps, my lady will confess to a weakness for Carnations, and *made-moiselle*, who goes into raptures over her *Stellas*, *Lobelias*, &c., may perhaps own that she cultivates a few *Auriculas* on the sly, unfashionable though it may be; and the venerable doctor, who talks so eloquently of his *Cannas* and sub-tropicals, may own that *Pansies* are worthy of cultivation. Indeed the tables may be turned, and these things accounted "weeds, sir, weeds." I live in hope of a return to the good old times, when florists' flowers were the pleasure and glory of many a garden which now is given up to chaos for nine months in the year, and is like a Turkey carpet for the remaining three; not that we can do without the bedding-out system, but I want to have room for all, and so for our Pansies.

Last autumn I received from Messrs. Downie, Laird, & Laing a collection of the two divisions into which Pansies are now arranged, the Show and the Fancy kinds. They were planted in my garden at Deal, and looked very promising at the end of February; then a change came over the spirit of my dream, and I had to remove to Westwell. My Pansies were amongst the first of my removals, but any one who knows what such things are and require, will not be surprised to hear that I had not the bloom from them that I hoped to have had; besides, not knowing the position or the quality of the soil of my garden here, I placed them on a sunny bank instead of in some more shady portion of the ground. The exceedingly dry time that we have had has been most unfavourable to them; and yet, with all that, I was greatly charmed with them, giving me their beauty as they did in the first days of my sojourn here, when all was strange and new, and one had hard work to get reconciled to the breaking-away of ties of so many years' standing. During their time of blooming (in the open ground, I should say), I have taken the opportunity of marking some of the best, and now give the result of my notes.

SHOW PANSIES.

Yellow Grounds.

Gem.—Dark yellow, edged with rich purple; a bold dense eye and blotch. Very fine.

Alexander Whamond.—Rich golden yellow, bronze purple belting. A very striking flower.

Emily Lytle.—Golden yellow, with rich bronze purple belt, large solid eye and blotch. A flower of remarkably fine properties.

J. B. Downie.—Bright yellow, bronze belt. An excellent flower.

Prince of Wales.—Very clear yellow ground, with dark purple belting, good dense blotch and eye.

William Austin.—Bright golden yellow, deep rich belt; very round and smooth.

White Grounds.

Mary Russell.—White, broad purple belting. Very pure and good.

Cupid.—Pure white ground, dark purple belting. An excellent flower.

Larcinia.—White ground, light purple belting.

Lady Lucy Dundas.—Clear white, deep purplish maroon belting. A very fine flower.

Princess of Wales.—Pure white, belted with rich purplish maroon; dense blotch. Very fine.

Selfs.

Alexander McNab.—Dark self, beautifully shaded.

Ladyhurn Beauty.—Intensely dark. Very fine.

Miss Ramsay.—Pure white. Very fine form.

Mr. J. Graham.—Dark plum colour. Very fine.

Rev. H. Dombrain.—Very dark, and fine form.

Yellow Queen.—Deep rich yellow self.

FANCY PANSIES.

Miss J. Kay.—Light purple faced with mauve, with pure blotch of dark bluish purple.

Ninian Niven.—Belted with light rosy carmine, dark blotch. Very large and distinct.

Earl of Rosslyn.—Pale crimson, large dark blotch. Very curious and distinct.

John McNab.—Light yellow faced with purple; large dark bronze blotch. Quite distinct.

Pigaro.—Deep violet purple; side and lower petals edged with white.

Lady Montgomery.—White, belted with violet; dark dense blotch. Of fine form and quality.

Oriana.—French white, shaded with rose; large purple blotch.

Queen Mab.—Pure white, clouded and blotched in each of the petals.

I have no doubt there are many others quite as good as these, but, as usual in such cases, I only give those which I have been enabled to bloom under my own eye. Some others not quite up to the mark I have omitted.—D., *Deal*.

WHAT IS A ZONAL PELARGONIUM?

Will you say in your next Journal what is a Zonal Pelargonium, and thus settle some dispute which has taken place in this quarter?—J. McD.

[The whole of the Pelargoniums known as "Scarlets," though their flowers are of en pink, and even white, owe their production to three species—*P. zonale*, *P. inquinans*, and *P. Fothergillii*; and inasmuch as the earliest of them were the progeny of *P. zonale* they have been comprehensively termed Zonals, though no zone is on the leaves of some of them; and though the name is misleading, it is no more so than calling those "Scarlets" which include plants with flowers of other colours. In short, the term "Zonal" is intended to include a section of Pelargoniums well known as bedders, without any reference to their being zone-leaved. Wishing to know if our opinion coincided with that of a well-known authority, but not a cultivator of these flowers, we wrote to him to ask his opinion. This is his reply:—"I regret that this zonal question has been again mooted. I believe it arose from the disappointment received by an exhibitor, who would not allow that his competitor's plants were all Zonals, he taking it for granted that a Zonal must have a zone fully defined in the several leaves of the plant. The term Zonal has been taken from the original plant, Pelargonium zonale, the old Horseshoe, from which the present race are all descendants. This is one view of the question. But when some of the seedlings produce plain leaves without any sign of a zone, we are told these are not Zonals. In one sense of the word they certainly are not so; but these plain-leaved plants vary in no other way from those in whose leaves the zone is fixed—habit, colour, growth, are all the same. But the florist chooses to subdivide these varieties into Golden-edged, Variegated, Silver-edged, Golden-leaved, Bronze and Gold Zonals, Bedders, or simply green leaves margined with white. It was one of these latter plants that caused this question to arise.

"I think myself it is absurd to quibble on this point. They are all doubtless in character true Zonals, but some varieties are minus the zone, at least it is not developed. Whether the colouring matter of the zone is absent, or why it is not visible, I think no man can venture to say. I can but feel that all are truly Zonals, though not developing a defined zone."

We are thus sustained in our opinion, as we also are by the facts, that some of the Zonals which usually have no zone on their leaves will, under a change of culture, develop a zone on them; whilst, on the other hand, those usually with zoned leaves will, under different treatment, produce leaves not zoned.—Eds.]

THE HOT WEATHER, AND ABSENCE OF RAIN.

Common as the expression is, that "we never knew such dry (or such wet) weather before," there are many who at the present time, the beginning of July, believe that the last few weeks have exceeded all similar periods for heat and the small quantity of rain that has fallen, and in some cases it is asserted there has been no rain for six weeks or more. Now, a certain amount of deduction must always be made from mere casual assertions or grumbings, but it would be well to correct all false notions that may exist in the matter of long-continued drought or rain. On close examination it will be found that neither the one nor the other continues unchecked for so long a period as is often asserted. I find in looking over a register

of rainfall kept here, that only on three occasions during the last fourteen years has there been a period of twenty consecutive days without rain, and one of these was in winter, when the want of it was not felt. Dry periods have been frequent enough, and the driest of them, lasting thirty-four days, was between August 21st and October 9th, 1865. During that time there was only 0.08 inch of rain, but that falling on two occasions reduced the number of consecutive days actually without rain to a less number than might be supposed. Between the 7th and 30th of June, 1858, no rain was registered; in 1863 there was no rain from the 27th of June to the 21st of July, while during the past month (June), a little rain fell on the 2nd, 1th, and 22nd, but it barely amounted to half an inch, most of it falling on the 22nd. June being also preceded by four unusually dry months, it is not surprising that vegetation is suffering much, and that great alarm exists in many places as to the water supply for domestic purposes, more especially as the dry weather has set in so early in the season, and wells and streams are either drying up or getting low. Even deep-rooted plants, as trees and shrubs, have made less growth than usual, and many of them will grow no more this season, while the progress made by such as commence growth late has been small indeed: for instance, Rhododendrons in dry situations have scarcely made any progress. Although the foliage of most deciduous trees and shrubs pushed vigorously, and the growth has been robust, it has been short, and must be so, as in many cases ripening at the points has commenced. I do not think that in this there is anything to complain of; but in the case of evergreens, such as the Rhododendron, a continued dry season may be fatal to many of them. Three or four years ago some established plants which had been planted many years, were pointed out to me at Bury Hill, near Dorking, as having been killed by the dry autumn, and possibly this year the same result may be experienced at other places.

As regards dry periods, we must not forget that a drier one than even the present has occurred before, as the following record of the rainfall in five consecutive months will show.

RAIN.			
1857-58.	Inches.	1864.	Inches.
December	0.49	February	1.35
January	0.79	March	1.29
February	0.77	April	1.21
March	0.80	May	1.92
April	1.03	June	0.61
	4.78		6.28

From the above it will be seen that the winter and spring months of 1858 were even drier than those of the present year, at the same time the rainfall of May and June, 1853, exceeded that of the same months this year; but 1858 was very dry.

This season, however, in addition to being dry, has been early as well, most plants having been in a more forward state by the end of May than they have been for many years; but I am not certain that they are relatively so forward at the end of June, notwithstanding its dryness. Having for many years noted the first appearance of Wheat ears in quantity, and in the same locality, I have to record seeing them one day earlier this season than I have observed in any previous year; the next earliest being 1859, while 1860 was the latest. There was a difference of just fifteen days between the earliest and latest year. Hot dry weather also urges many plants on prematurely, but the above examples will show that the date of the Wheat harvest is less influenced by variations in the atmosphere than is often supposed. The ripening of fruits is more influenced by the condition of the atmosphere at the time, and the growth of plants whose roots only penetrate a short depth into the soil is still more affected. The long-continued absence of rain, however, affects all.

With regard to temperature, the past month has been much less remarkable for heat than dryness, and September, 1865, shows both a higher night and day temperature. I find the mean night temperature of that September to have been 53°, and that of the day 78°, as against 49° and 74° in the past month, a marked difference when the much shorter days which we have in September are taken into consideration. June, 1857, was also a hotter month than the June of the present year, and portions of other months have been still warmer. Whilst the weather up to the present time has been very dry, dew has been almost as scarce as rain, and, perhaps, nothing affects vegetation more than dry withering winds at night from the north-east, and such have often occurred. Thunder has rarely been heard, and the hot days which in former years frequently ended in a thunderstorm, have this season often given place to

a greater fall of temperature at night than was expected; but still no rain. The heat, so great in the second week in June, has decreased so much that at the time I write, July 6th, the temperature is below the average of ordinary seasons. Extreme heat is, therefore, not the cause of the dryness, for although it has been very warm, the thermometer in the shade has never risen higher than it did on the 14th of August last year, and not quite so high as it did during some of the hottest days in the summers of 1850, 1855, 1857, 1858, 1859, and 1865. The heat, instead of increasing after the longest day, has diminished; and the hottest days which occurred in former years being after that period, it is not unlikely that we may experience the same this season.

As heat is not one of the characteristics of the season, to what are we to attribute the scarcity of rain? Perhaps the most likely theory is, that having had considerably more than the average amount of rain in the last three years, a dry season was necessary to restore the balance; and if cycles of ten years or more to a considerable extent resemble each other, the present year may be expected to be unusually dry, if it has to do little more than make up a quantity equivalent to the rainfall of the preceding four years; for I find the total rainfall for the years 1861, 1862, 1863, and 1864, was 94.95 inches, while the amount in the next three years—viz., 1865, 1866, and 1867, was 92.71 inches, nearly equalling that of the previous four. Although the first six months have been remarkably dry, there does not seem to be any certainty of the drought continuing. The autumn of 1859 was an exceedingly wet one, although the early part of the season was so dry.

As to the effects of the dry weather on vegetation, there are few cultivators in the southern and eastern districts of England who have not for weeks looked on their various crops with great anxiety and alarm. Strawberries came in, one kind after another, with a rapidity that shortened the season. Lettuces ready for use one day had run to seed by the next, while the anxious cultivator poured almost in vain canful after canful of water on his next crop to prevent it following the example of the first. Cabbages changed their hue from a pale crisp green to a sickly blue, and later in the season became the prey of caterpillars. Potatoes, promising well at one time so far as crop went, are threatening to arrive at a very small size, and in many cases are too far advanced to benefit much by rain without injury to their quality or danger of disease. Peas, alas! will soon be over, the pods not filling, although I have seen the haulm more infested with mildew. Against this list of evils we have the counterbalancing benefits of Scarlet Runners and Dwarf Kidney Beans doing well; and Ridge Cucumbers, Tomatoes, and Onions are also enjoying the near approach to the heat of their native climes. Although the growth of fruit trees and shrubs may have been shorter than usual, the wood will probably ripen well.

Of hardy fruits, as already stated the season for Strawberries was short, and Raspberries, which promised well, have suffered by continued drought, but Currants and Gooseberries have been plentiful. Pears are rather a thin crop, but Plums are abundant, and Apples a full average. The greatest drawbacks, however, of a dry summer are the lack of herbage for cattle, and the very slight hay crop, which has in many places not been worth cutting. Many pasture fields have passed from the green to the brown condition, and may now be said to be white, the few remaining blades or stems being bleached to that colour. The dry atmosphere seems to have even reached the roots of plants which usually penetrate deep, as Yarrow, Plantain, and Clover, and they are fast passing into the condition of the grasses.

In the flower-garden most plants have been arrested in their growth where they could not be watered, or rather those planted in May have made but little progress, but they have flowered well and in many cases prematurely, Calceolarias especially. On the whole the occupants of the flower garden have benefited rather than otherwise by the dry weather, and many of them are in a condition of fair promise if rain fall soon. In beds, however, containing trees, shrubs, and other robust subjects, which rob the bedding plants of their proper support, these, except where they have been assisted with water or otherwise, are in anything but a happy condition. In beds well prepared before being planted with fair-sized bedding Pelargoniums, Verbenas, Lobelias, and Gazanias, these, after having been once watered, have made satisfactory progress. Nierembergias have not done so well, and Viola cornuta, as I calculated on a few weeks ago, has ceased blooming much earlier than it ought to have done. Possibly watering might

have saved the beauty of this plant as well as secured the more robust growth of others, but where water cannot be had many plants must take their chance, and probably a large proportion of them will do as well without as with unlimited quantities of cold spring water. Here we have not watered anything excepting plants in pots, or in raised artificial mounds or beds; all those on the level ground have only received a slight watering at the time of planting, and none since. The progress of the more tender subjects as Coleus, Castor-oil plants, Tobacco, ornamental Maize, and some others has not been so rapid as I expected, and excepting Calceolarias, which I fear will flower out, nothing as yet has arrived at the condition which can be called good. One of the plants at present in its best condition is the Golden Feverfew, which is really a useful plant. I wish I could say as much of *Dactylis glomerata variegata*, a much older acquaintance. *Centaurea candidissima* threatens to be more green than before, while *Cerastium* is evidently suffering much from the drought, which on the whole seems to favour *Petunias*, *Tagetes signata*, *Tropaeolums*, and that very pretty annual *Portulaca Thellusoni*; but the beginning of July is too soon to pass an opinion on the merits of flower garden plants. I may state, however, in respect to the important family of *Pelargonium*, that the dry season has proved the superiority of the robust varieties over those of more limited growth, and with me two old kinds of no great merit, Punch and Magenta, are about the best of their class at the present time, none of them having had any water, excepting naturally, since they were planted.

Those who keep registers of the weather may be interested to know, that from the 21st of April to the 22nd of May we had only 0.11 inch of rain, but that fell on four days. A little rain also fell on May 22nd, 23rd, 24th, and 25th, and a very heavy thunderstorm occurred on the 29th. In June there were slight showers on the 2nd and 4th, followed by hot dry weather, with a little more rain on the 22nd, making only 0.51 inch in all. The hottest days during June were the 13th, 14th, 16th, 17th, 20th, 21st, and 27th, the maximum temperature being 90° on the 20th, and the same degree of heat was registered on the 14th of August last year. The winds have changed frequently without any change in temperature. The barometer has generally been high, the extreme maximum reading during the month being 30.07 inch, on the 26th at noon, and the lowest 29.43 on the 22nd, at the same time of day. Greater extremes, doubtless, have been attained, but these are the highest and lowest of my readings, which are always taken at noon. Thunder has scarcely been heard since the 29th of May, and little or no lightning has been seen.—J. Robson.

NOTES ON THE ROYAL BOTANIC SOCIETY'S JULY SHOW.

THIS, like the Society's preceding two Shows, was a great success in every point of view; but one circumstance diminished the extent, variety, and beauty of this as has done of other exhibitions—namely, the practice, now becoming too general, of continuing the show longer than one day. This prevents many horticulturists from exhibiting, because the second day entails an expense upon them which the prizes are not sufficiently large to cover, and in many instances employers do not like their plant houses denuded for a longer period than one day. Another serious objection is, that when the exhibitor comes from a long distance his employer's plants are spoilt by the time they are brought back again; for a whole week is occupied in taking them to and from the show, and by the time they are placed in their former quarters most of their beauty and freshness will have gone. Nothing destroys the beauty of a plant so soon as keeping it in an exhibition tent two or three days; and the case of fruits is still worse, for to keep a dish of Peaches, Strawberries, Figs, and many other fruits longer than one day after they have been gathered, is to spoil them entirely, and render them perfectly useless. Add to this the great expense which has chiefly to be borne by the exhibitor, and there is, I think, enough to deter many from bringing their productions to an exhibition which is to be continued beyond one day. I therefore think that the Royal Botanic and other societies would do well to discontinue the two or more days' show, unless it be once now and then on any special occasion like the great International Horticultural Exhibition of 1860, or the Manchester National Exhibition, when a very large expenditure is incurred, and when the funds will admit of the exhibitor being properly remunerated for his trouble.

The plants exhibited were generally well grown, and in very good condition, considering the very hot and trying season we have had. Amongst the new and rare plants a very curious Bromeliaceous plant from the South Sea Islands, said to be a *Puya*, was exhibited by Messrs. J. Veitch & Sons. It has hard spiny leaves, and a strong branching habit, and bears a stout upright flower stem, which was

covered with green blossoms, having a bright metallic lustre, and large yellowish orange anthers. It is certainly a most singular-looking plant, and a great curiosity. From the same firm also came fine plants of *Dracena Cheloni*, *Croton Veitchii*, and *Alocasia Cheloni*. These are all fine additions to our collections of stove plants, and were deservedly awarded first-class certificates.

Mr. Fraser again exhibited Show and Fancy Polargoniums in fine condition. It was a matter of much surprise to many how these plants could be made to retain their beauty under such trying weather as we have had. All, I am sure, will join me in according him unqualified praise for the way in which he has shown his plants at the different exhibitions this season.

Cape Heaths were shown in good condition, and formed a very effective portion of the display. Those exhibited by Messrs. Williams, Jackson, Rhodes, and Peed were especially good. Fine groups of *Oreohs* were also shown in good condition by Messrs. Burnett, Young, and Mr. Wheeler.

Some splendidly-grown Lycopods were exhibited by Mr. Parsons, gardener to R. Attenborough, Esq., Turnham Green, and the large collections of fine-foliaged plants were especially attractive. Mr. Baines, from Bowden, near Manchester, staged his collections of stove, greenhouse, and other plants in his usual excellent style. They were greatly admired, and formed one of the finest features of the Show. His *Ixora javanica* and *Clerodendron Thomsonae* Balfourii were wonderfully fine. Mr. Peed's plants were also in good condition; his *Allamanda grandiflora*, *Ixora coccinea*, and *Pteroma elegans* were exceedingly well grown.

The fruit, perhaps, formed one of the finest attractions of the Show. Mr. Barnes, of Bicton, had numerous Pine Apples, and amongst them were magnificent Queens beautifully finished; Black Prince, weighing 12½ lbs., and measuring 22 inches in circumference; the copper-coloured Montserrat, and a Brown Sugarloaf, weighing 6½ lbs. Mr. Carnichael, gardener to His Royal Highness the Prince of Wales, also exhibited some fine Pines. His Queens were especially good.

For collections of fruit there were seven competitors, all of whom had good collections, but the gold medal was very justly awarded to Mr. Miller, gardener to Earl Craven. His was a magnificent collection, and consisted of two fine Queen Pines, three bunches of Foster's White Seedling Grape, hardly ripe, but exceedingly fine bunches; three bunches of Black Hamburgh, perhaps as fine as any ever exhibited, the only weak point in them appearing to be want of colour; they were in every other respect excellent examples of good Grape-growing. The other fruits in this collection were two finely-formed and well-ripened Trencham Hybrid Melons, Waterloo Cherries, Elruge Nectarines, and Violette Hative Peaches, both of which were well coloured, and a fine dish of British Queen Strawberry. Mr. Clarke, gardener to Earl Cowper, and Mr. Bannerman, gardener to Lord Bagot, also exhibited fine collections. Mr. Bannerman likewise had some fine Black Hamburgh Grapes, as also Mr. Hill, Mr. Wallis, and Mr. Kettlewell. Bunches of Royal Vineyard were also exhibited in fine condition. These were large and handsome.

Mr. Standish's Royal Ascot Grape was exhibited in good condition, both at this and the previous exhibition. This I think likely to prove a most valuable Grape, and one that will hang on the Vine in good condition quite as long as Lady Downe's. It seems to be an everlasting-fruited variety, and the flavour I considered excellent.

Mr. Meredith sent up a splendid basket of Grapes, beautifully ripened, and exhibited in a style not yet surpassed by any one, and equalled by a few only. Mr. Hill and Mr. Osborne also exhibited fine baskets. The Muscats were badly ripened, showing that it is not always a bright hot summer that is required to bring this fine Grape to perfection, and amply demonstrating the fact that this and many, if not all, other kinds of Grapes, do not require so much light to ripen them perfectly as is generally supposed. As a rule I have generally grown finer Grapes in a dull season than in a very hot sunny one. This again proves that any aspect will suit the Vine, and that all which is required is a moderate amount of skill and foresight in its cultivation, and the proper appliances for heat and ventilation, and lastly a properly-made Vine border.

Tolerable examples of Black Prince were exhibited by Mr. Meads, but I have seen this variety shown in much better condition both by him and Mr. Hill.

Peaches and Nectarines were shown in quantity, and were good, and Mr. Osman's Figs were generally admired; they were a very even dish, and beautifully ripened. There were only two exhibitions of Plums, and the best of these was from Mr. Thomas. Fine Black Cherries came from Messrs. Miller, Young, and Cross, and Melons were numerous and generally very good. A few good dishes of Strawberries only were exhibited; among these were wonderfully fine Bicton Pine, Frogmore Late Pine, Empress Eugenie, La Constante, and British Queen.—J. WILLS.

SPECIAL GLADIOLUS EXHIBITION.

I AM glad to say that some progress has been made in this matter. Since my last communication I have been to Paris, and my kind and valued friend M. Souhet has promised to be a competitor, as have also M. Eugène Verdier and M. Loise. At home I have received assurances of support from Messrs. Carter & Co., Holborn; Mr. Charles Turner, of Slough; Mr.

Bunyard, of Ashford, and others; so that it only requires a vigorous effort to carry the matter out effectually. The Crystal Palace Company will, I have every reason to believe, act in their usual liberal manner. My desire is to have three classes of exhibitors—nurserymen, amateurs, and foreign growers, so as to make the competition as wide as we can. I hope all who prize this fine flower will let me hear at once.—D., Deal.

PLANTS IN FLOWER DURING JUNE.

June 1st. <i>Deutzia crenata</i> <i>gracilis</i> <i>scabra</i> <i>Euonymus latifolius</i> <i>Cotoneaster Simmondsii</i> <i>Buddleia globosa</i> <i>Lonicera sempervirens</i> <i>Pernettya angustifolia</i> <i>Phillyrea media</i> <i>Pyrus aria</i> <i>internodia</i>	June 15th. <i>Amorpha fruticosa</i> <i>Andromeda lucida</i> <i>Astragalus trisacantha</i> <i>Aucuba japonica</i> <i>Cornus sanguinea</i> <i>Cytisus biflorus</i> <i>Genista florida</i> <i>Lavender</i> <i>Lathyrus magellanicus</i> <i>Plumonia Russelliana</i> <i>Aconcha italica</i> <i>Lupinus luteus</i> <i>Acerolium rosenm</i> <i>Sphenocoryne speciosa</i> <i>Lychnis dioica plena</i> <i>Gypsophila elegans</i> <i>Whitlavia grandiflora</i> <i>Pyrethrum parthenium</i> <i>Paeonies</i>
„ 5th. <i>Rhamnus catharticus</i> <i>alnifolius</i> <i>Eschscholtzia</i> <i>Phalaris canariensis</i> <i>Robinia pseud-acacia</i> <i>hispidia</i> <i>Spiraea canefolia</i> <i>sericea</i> <i>ulmaria</i> <i>filipendula</i> <i>japonica</i> <i>Meconopsis cambrica</i> <i>Tilia europaea</i> <i>Vaccinium huxifolium</i> <i>Dictamnus fraxinella alba</i> <i>Onobrychis sativa</i> <i>Rhododendron hirsutum</i> <i>buxifolium</i>	„ 22nd. <i>Campanula grandis</i> <i>Verbascum thapsus</i> <i>Collinsia bicolor</i> <i>Asphodelus luteus</i> <i>Gilia tricolor</i> <i>achillifolia</i> <i>capitata</i> <i>Erigeron canadensis</i> <i>Thalictrum aquilegi-</i> <i>folium</i> <i>Campanula carpatica</i> <i>Tradescantia virginica</i> <i>Epilobium angustifolium</i> <i>Ligustrum vulgare</i> <i>Cineraria maritima</i> <i>Dianthus cæsius</i> <i>Lilium tigrinum</i> <i>Calceolarias</i> <i>Koniga maritima</i> <i>Phlox Drummondii</i> <i>Heliotropes</i> <i>Viburnum opulus sterilis</i> <i>Spiraea aruncus</i> <i>tridentata</i> <i>Erigeron Villarsii</i> <i>Mimulus moschatns</i> <i>Polemonium Richard-</i> <i>sonii</i> <i>Tropæolums</i> <i>Mimulus cardinalis</i> <i>Convolvulus minor</i> <i>Petasias</i> <i>Delphinium ajacis</i> <i>Bartonia aurea</i> <i>Linaria bipartita</i> <i>cymbalaria</i> <i>Hemerocallis fulva</i> <i>Lathyrus odoratus</i>
„ 10th. <i>Philadelphus coronarius</i> <i>Achillea millefolium</i> <i>millefolium roseum</i> <i>tomentosa</i> <i>Alchemilla alpina</i> <i>Amsonia latifolia</i> <i>Anemone rivularis</i> <i>Sedum acre</i> <i>sexangulare</i> <i>Forsterianum</i> <i>rupestre</i> <i>purpureum</i> <i>album</i> <i>Orchis maculata</i> <i>Arcuaria cespitosa</i> <i>Catananche cærulea</i> <i>Kalmia latifolia</i>	„ 26th. <i>Eryngium Bourgaui</i> <i>Lupinus angustifolius</i> <i>Chelidonia Pongel, double</i> <i>Fuchsias</i> <i>Lilium martagon</i> <i>Hedychium coronarium</i> <i>Lupinus hirsutus</i> <i>Weigela rosea</i> <i>Aster alpinus</i> <i>Platystemon californi-</i> <i>cum</i> <i>Statice armeria rosen</i> <i>Lilium Thunbergianum</i> <i>Eutoca viscidia</i> <i>Chrysanthemum carina-</i> <i>tum</i> <i>Morina persica</i> <i>Nymphæa lutea</i> <i>Nymphæa alba</i> <i>Hottonia palustris</i>

—M. H., Achlam Hall, Middlesbrough-on-Tees.

STOCKS.

Stocks! What need to say anything about Stocks? Every-body grows and knows about their culture perfectly well. Such,

or something like it, may be the exclamation of some readers when their eye catches the heading of this paper. But the hundred questions which have reached me of late about the culture of Stocks make out a very different case. Indeed, I am inclined to think that to popularise and instruct in the fine varieties of Stocks is very far from being a work of supererogation. The decorative capabilities of the finest varieties of the Intermediate Stock are not so well known or acted upon as they deserve. The effects which can be produced by the purple, white, and scarlet varieties, both for spring and autumnal gardening, are scarcely equalled by any of the now popular plants. In saying this, the practice and experience of many gardeners is the only corroboration that I would appeal to.

For instance, in the end of March, 1867, I sowed in a cold frame a quantity of the East Lothian Scarlet, White, and Purple Intermediates. In May these were transplanted to where they were intended to bloom for the season, and up to November the amount of double bloom which they produced is known to many who saw them here (Archerfield), and at other places in the Lothians. In November nearly the whole of the doubles were lifted and potted. They continued to bloom more or less the whole winter and spring, and were planted out in March with a good crop of bloom on them. Since then they have made fresh growth, and are now, notwithstanding that great quantities of bloom have been cut from them, literally a cloud of bloom; and it is hard to convince any one who has seen them that they have been in bloom for twelve months. For spring and early summer flower gardening these Stocks are unapproachable, and cannot be too strongly recommended.

The way to have the finest bloom early in summer and all through the season is to sow in June in the open border thinly, and when 2 inches high, and before they become drawn, transplant them into beds in rows 6 inches apart each way. Till they get fresh hold of the soil and begin to grow, they require shading, and watering should the weather be dry. By the early part of October they will have formed bloom-buds, and it can be seen which are double. They should then be potted up into 6-inch pots. For this purpose use light rich soil, such as equal proportions of loam and leaf mould, with about a fifth of the whole of sand. When potted set them in a shady sheltered place, or better still, where it can be afforded, in cold pits or frames. Here they soon establish themselves; and if cut bloom through the winter is not an object, the bloom-buds may be pinched off them. A moderately dry place where they can be protected from severe frost will suffice for their winter quarters. If they can be afforded space in cold frames under glass or in vineries or Peach houses at rest, they will grow more or less all winter, and can be had in pretty full bloom by the middle of March, when, if spring display be the object, they can be planted with immediate effect; but for coming into bloom in May and the three following months they are best not allowed to bloom till after being planted. Those who have not seen rows or beds of these, entirely of double-flowering plants, can have little idea of how splendid they are.

To sow in spring for late summer and autumn blooming they are well worthy of being more carefully treated than is general in the case of Stocks. I would advise their being sown in heat early in March, and when they form the rough leaf to be pricked off in boxes 2 inches apart each way; and before they become crowded to be potted singly into 2 or 3-inch pots, and kept in cold frames till well established, but not pot-bound, when they should be planted out about the first or second week of May where they are required to bloom. Managed thus they are prevented from making tap-roots, and receive no check when planted, but come much earlier into bloom than when allowed to remain in the seedling bed or rows till finally planted out. It matters very little about their blooming a month earlier as far as their late blooming is concerned, for their blooming powers are so great that if they begin to flower in the end of June they will bloom into winter. To do this, however, they must have deep rich ground. When plants are plentiful it is a good plan to pot up a quantity into 6-inch pots and keep them in reserve, so that the singles can be lifted out of the beds or lines and be replaced with doubles. In dry sheltered situations where the winters are not severe, the mid-summer-sown plants can be planted after the summer bedding plants are removed in October; but in this case it is best to keep a reserve that can be protected to meet contingencies.

For pot-culture the value of the ordinary Intermediate Stock has been long recognised, in some localities especially, and for the London market they are grown by the thousand. To have

fine plants for the greenhouse or conservatory in March, April, and May, June-sown plants lifted in October and potted in 6 or 8-inch pots will bloom magnificently, and when large specimens are required it is only a question of room, shifting into larger pots, and tying them out. I have seen Mr. Lees at Tynninghame have them, I should say, nearly 3 feet in diameter and one cloud of bloom. Certainly these have but few rivals for this purpose, taking their sweetness, purity of colour, and immense show of bloom into consideration; and as they require but very ordinary means or accommodation for their culture, they are emphatically the plants of the million.—D. THOMSON (in *The Gardener*.)

IMPROVEMENTS IN LIVERPOOL.

SEFTON PARK.

Of all the towns in Great Britain, Liverpool stands first, not only as regards its commercial importance, but the number of its public buildings and places of resort for recreation after the toils of everyday life. At present the Corporation of this vast town, second only in importance to London, are busily engaged in forming new streets through blocks of property, where the buildings are found to be too close together to be healthy to live in, and where streets are desirable for the opening-up of the town. They are also widening several of the narrow streets, and pulling down whole blocks of court property, which are found by the Medical Officer of Health, Dr. Trench, to be unfit for human habitations. They are likewise building a large block of buildings to be used as dwellings for working men, at moderate rents; and last, but not least, in this sanitary reform, they are constructing three large parks on the outskirts, but, at the same time, of easy access even from the centre of the town. These parks form an almost complete cordon round the town, and will when complete be of immense benefit in keeping down the high death rate which has heretofore been such a slur upon the town, as they will form places of easy access where the people can get a breath of fresh air, and healthy and vigorous exercise, which is denied them in the middle of the town, and at the same time see and admire all the beauties of Nature which are thus brought home, as it were, to their very doors.

These parks are called Stanley, Newsham, and Sefton Parks, and lie respectively—Stanley on the north side of the town; Newsham on the east; and Sefton on the south, the river Mersey being on the west.

Newsham Park is nearly finished; Stanley and Sefton Parks have only been commenced a short time, but will both be completed in the course of two or three years. The two first mentioned are of a rather restricted area as regards the ornamental portion, but the latter, of which we propose giving our readers a short account, will, when finished, be the largest public park in Great Britain, including even Hyde and Regent's Parks.

This extensive piece of ground, consisting of about four hundred acres of land, purchased from the Earl of Sefton for the sum of £275,000, lies at the south end of the town, in the district of Toxteth Park, and between the fashionable suburbs of Wavertree, Mossley Hill, and Aigburth. The land strikes one as having been made especially for a park, being composed of large table lands, gently sloping and undulating towards the centre of the park, where there is a small stream running down to the Mersey, the whole being beautifully adapted for landscape effect. It is also situated so as to be entirely removed from the smoke and the business portion of the town, and being surrounded by residences of wealthy merchants, &c., is at once framed, as it were, with an outside border of well-grown trees and wooded hillocks, which will go far in improving its appearance when finished. A portion of the park outside the circular drive is to be devoted to the building of villas, &c., by the sale of which the Corporation expect to be reimbursed to some extent for their large outlay.

Considered in an artistic and landscape-gardening point of view, we may say that the new park will present, when finished, a feature quite novel in this country. The works are being carried out by, and from the designs of Mr. Edouard André, principal gardener to the city of Paris, and Mr. Lewis Hornblower, the well-known architect of Liverpool. These gentlemen defeated twenty-seven competitors, and received the first prize of 300 guineas, in the competition invited by the Corporation in the early part of last year. Since that time there has been considerable delay occasioned by the differences of opinion which have arisen in the Council as to the carrying out of the design; but now that the contract for the roads,

sewers, lakes, &c., has been given to Mr. S. Campbell, the contractor, of Liverpool, it is hoped that the work will progress quickly and favourably.

The whole of the roads, drives, lakes, plantations, &c., have been staked out, and the good soil taken off and stored in heaps for future use in forming the plantations.

One great and pleasing feature will be the rockwork, of which it has been decided to employ a large quantity in the shape of grottoes, waterfalls, &c., in the two streams which run down the valleys towards the great lake. These works are being carried out with great spirit by M. Combaz, of Paris, who, as an artist in his particular branch, is well known in all parts of the Continent. He has executed the rockwork in the Bois de Boulogne, Bois de Vincennes, and new park of the Bateau-Chaumont, in Paris, and other works at Brussels, for the King of the Belgians, Ghent, Lille, and Cologne. From what we have seen of the work already executed by him in the Sefton Park, we are certain he will please the public of Liverpool as well as he has done the Parisians.

The main attraction, we have no doubt, will be that portion immediately contiguous to the lake and streams. The longer of these streams rises in a large grotto at the head of the valley, and after running over several small falls and rapids, and encircling small islands, flows into the main lake, twelve acres in extent, at the junction of the smaller stream, which also rises in a waterfall about 15 feet high, and runs over several small falls into the main lake.

On the banks of both rivulets, which will be broken here and there with rough pieces of rock, summer houses and kiosks will be erected at various points, where good views can be obtained, and on the islands huts will be built for the waterfowl to breed in, &c. These objects, together with the meanderings of the rivulets and falls, will have, we doubt not, a charming effect, as the visitor will have at every turn of the winding walks a fresh scene with which to feast his eyes. Boat-sailing and rowing will be allowed on the large lake, and will prove a great boon to the inhabitants of the district, as, with the exception of the Mersey, which is extremely dangerous on account of the numerous eddies and strong tides, there is no place in the neighbourhood where this healthy exercise can be indulged in. Amongst other features which this park will possess, there will be a large piece of land of a circular form, well sheltered, nearly forty-eight acres in extent, set apart for the reviews of the Volunteers of Liverpool. There will be ample space for 10,000 men to be manoeuvred.

Another portion is set apart for a cricket ground. It will be oval in form, and well wooded all round in order to shelter it from the cold winds that often blow in this part of the country. There is also to be a cricket pavilion, and two smaller pavilions flanking it, one on either side, one for the scorers, and the other for printing the cards.

Among other architectural objects which will adorn the park, will be a grand entrance, and two smaller ones, with lodges flanked on either side by handsome iron gates, Curator's and head gardeners' houses, two restaurants, several boathouses, sheep cot, deer house in rustic wood, several rustic shelters for horsemen, a large aviary, a band pavilion surrounded by three rows of large trees, numerous kiosks, &c., and stone, iron, rustic, wooden, and rocky bridges.

Such a multiplicity of architectural ornamentation might seem exaggerated, if one did not think of the immense area of the park, and the large number of points of sight naturally afforded by the undulations of the ground.

The various plantations and clumps of trees which are, with the lawns, the main adornment of a public park have been well cared for, and will occupy large spaces. On the sides most remote from the town they form complete woods, only cut here and there by the lines of sight. It was necessary to give great care and attention to the position of the planting, on account of the barrenness of ground, which was formerly exclusively cultivated fields, and they have been arranged so that the plantations may shelter from the sea breezes, which blow there throughout the greater portion of the year. With the help of such shelter it will be quite possible to cultivate in the undulations of the glades of Sefton Park, collections of numerous ornamental plants, and even some of those beautiful-foliated plants which have for some years back formed the chief attraction in the Parisian parks and gardens, and in Battersea Park, where Mr. Gibson uses them so tastefully. The use of foliage for the decoration of gardens has been too much neglected in this country, and we hope that trials in that direction will end in giving to such plants the position they deserve. In

this line Sefton Park will have a powerful auxiliary in the new Botanical Garden.

The Corporation propose making a new Botanical Garden to replace the old one, which is badly situated, and daily being destroyed by the smoke of the town, and which is, together with the conservatories, unworthy of a town like Liverpool. Messrs. André and Hornblower have reserved in their design a piece of ground, nineteen acres in extent, centrally situated in the best part of the park, and with a southern aspect, for this purpose. In the centre of this garden there will be a grand conservatory 300 feet long, from the raised terrace of which views of the whole of the park are commanded. We shall give a more detailed description of the Botanical Garden, if the scheme is, as it is hoped, to be carried out without delay.

In the meantime the walks of the park are being actively proceeded with, and we have no doubt that it will be completed in the time specified.

EARTH HEAT.

(Continued from page 4.)

Turf pits.—I will not say that our continental neighbours did not first direct attention to earth heat, but previously the horticulturists of this country had this agent actively at work, and by it a great impetus has been given to horticulture. At the time when earth heat was first brought prominently into notice abroad, we had already the nucleus formed from which have sprung greater results than from any other system. I allude to the introduction of orchard houses by Mr. Rivers, and his subsequent invention of the Curator's or Ground Vinery, and other economical structures for the cultivation of fruit trees. It is tolerably plain that these structures are all dependant for any heat they may possess beyond that of the open air on the absorption of the sun's heat, and their retention of it, thus enabling the cultivator to secure several degrees more warmth not only by day, but at night, and at other times when the sun's rays are obscured, as they often are in our cloudy and fickle climate, for the earth within the structure has then a greater heat, which is being constantly radiated. Of these structures, however, I shall have occasion to write hereafter, and I only now allude to them to establish the facts:—1st, That our horticulturists have been long conversant with earth heat; 2nd, That they have made as good a use of it as those of other countries; and, 3rd, That they liberally diffused throughout the world the knowledge resulting from a life of careful observation and experience.

Turf pits are not now so common as they formerly were, but they still do good service in the temporary protection of plants. I find them very useful, and that in two ways—namely, as a means of protection, and for furnishing fibrous loam for potting. The situation for them should be sheltered from the north, and it is well if the east and west winds are broken by a fence of some kind at a little distance off, so as to deprive the site of the sun's rays for as short a time as possible; and if there is a dry and sandy or gravelly soil give that the preference; in short, select a dry sheltered situation. Some take out the soil and form a sort of pit, but this I consider a great waste of time, and altogether needless, for it is only seeking damp, which is as destructive to plants as frost. Except for large plants, I would not make a pit, but would have all above ground. Mark out the size of the lights or other covering, forming the pit so that the internal face shall be a few inches within the outside of the lights or coverings, for it is necessary that they should rest on the turf walls; to throw off the wet the lights must slope from north to south, and this inclination of the roof will cause the bed to be narrower than their length. For 7 feet lights the bed will need to be made 6 feet 3 inches wide within the turf walls. The back wall, too, will be higher than the front, and the end walls will slope from back to front. The back should be 1 foot 6 inches higher than the front.

Having marked out the size, and square, so as to fit the lights or covering, the turf should be cut as thick as the fibres will allow, but for potting purposes not thicker than 3 inches. The pieces may be of any length and width, but are most convenient when not too large. I like them 18 inches by 9 inches, but size is quite immaterial. In forming the walls commence by placing a layer of turf all round, the same as bricks in building a wall, putting all headers, and then stretchers in the next course, so as to cross the joints and bond the work, making the inner face perpendicular to the ground, but sloping the

external face inwards, which will give stability. All the sods should be placed grass side downwards, and to keep the lights or covering from the turf it is well to have a frame of wood for the lights to rest on, or for securing the covering to. Nothing answers so well as a frame of red deal, and it need not exceed an inch in thickness. The frame will make all secure. The front wall, as already stated, will be less in height than the back, and both will be thicker at the base than at top; but the back wall will need to have a wider base than the front one, as it has to be carried higher. Eighteen inches in thickness for the base of the back, and 15 inches for the front wall, both reduced to 9 inches at top, will form a very good pit, nearly if not quite frost-proof. Turf pits thus made will last two seasons, but I do not keep them beyond the autumn following that in which they were made, for it is impossible not to covet the fine material which these turf walls are after they have stood for a time. The walls may be of any height and thickness, but the above heights are quite enough for the majority of plants needing protection in winter.

It would be difficult to name all the plants that may be wintered in turf pits, as they are very numerous, but I will endeavour to give an idea. In the first place these pits are far better than any heated house for growing Cinerarias, Calceolarias, Humeas, and similar plants for spring-flowering, and which are impatient of a dry, fluctuating atmosphere. With a single covering of mats over the lights, and 6 inches of straw put on so as to overhang the sides and ends about 1 foot, no frost that we have in our climate will penetrate to the interior; indeed, in the memorable winter of 1860-61, frost did not pass through the sides of some turf pits that were at the time filled with these plants. It does not matter how long the plants are kept in the dark, if the frost continues, but do not uncover too hastily upon a thaw, and expose too suddenly to day-light, but shade for a few days from bright sun, and admit air freely. When the Cinerarias are advancing for flowering, they must, of course, be removed to more snitable quarters, as they will need more light, but even they will do better in turf pits than elsewhere, being freer from insects, and making stronger growth. Calceolarias and Humeas may be safely wintered in turf pits, and a considerable saving of fuel thus effected, at the same time that the vigour and beauty of the plants will be increased. The pit will be available for other plants when those named are cleared out, and may be used with or without lights for Pelargoniums and similar plants that need protection in spring. When these are cleared out the pit may be filled quite to the top of the walls with hot sweet dung, a frame placed on it, and soil put in; a good crop of Melons or Cucumbers may thus be obtained, and with a great saving of dung. By afterwards mixing the dung with the turf a most excellent compost is formed, especially for top-dressing fruit trees.

In addition to the plants above named, there are many others now kept in heated houses which may be more healthily wintered in turf pits. Such are Heaths, Azaleas, Camellias, and most New Holland plants. These when young are best kept cool, and having air in mild weather no great disaster comes through damp and mildew; all that is necessary is to give a covering of dry litter sufficient to keep out frost, and even a small degree of that is not half so injurious as fire heat. For these plants the soil at the bottom of the pit should be taken out to the depth of about a foot below the ground level, and a good bottom formed of rough cinders, and then over these some finer ashes; but it is well to wash them, using those remaining in a sieve with quarter-inch meshes. Six inches in thickness will be enough. The pots need not be plunged in the ashes, but should be set on them. The pits if made as described will answer for good-sized plants.

Probably the greatest use made of turf pits in this country is that of protecting hardy plants, of which in most gardens there are great numbers needing protection by reason of their being only recently propagated, and therefore not of a size safe to plant out. Among these are the best kinds of evergreen and deciduous shrubs and climbers, especially such as are used for covering walls and planting in sheltered situations, also many of those neglected herbaceous plants which are now deservedly receiving a share of attention. For Roses in pots, also, and especially the Tea-scented varieties, no better place could be found. All the pots should be plunged to the rim in ashes or sawdust, and if no sashes are at command wood shutters will do in their stead. They need not be heavy and large, but light and of moderate width, so as to be convenient for putting on and for removal; and over them in severe weather a covering of dry litter will be needed, always giving the plants

the full benefit of any mild period for exposing them fully. Next to wood, straw shutters are excellent for protection. They should be made in a kind of frame, and may be of any convenient size, but ought not to be too thick. I have seen them made of thatching straw, 1 inch or from that to 1½ inch thick, so as to be impervious or nearly so to wet, and such will be sufficient for all the plants needing slight protection in winter, or which are nearly hardy. These shutters have done excellent service with Mr. Fish, who was the first to tell us how to winter bedding Calceolarias in cold frames, depending on earth heat for their preservation. Frigi domo is another good protecting material. A light wood frame should be made, and the material tightly tacked to it, also to cross pieces from the back to the front of the framework, so as to keep the frigi domo from bagging and holding the wet. Bast mats are also good for covering turf pits, having pieces of timber laid across the pit to keep the mats from the plants.

Turf pits are very good for sheltering Calceolarias, Verbenas, Gazanias, Ageratum, Cupheas, Fuchsias, Lobelias, Variegated Alyssum, and all the nearly hardy bedding plants; but it is desirable to keep these in frames in order to have them strong for planting out and for spring propagation. Cuttings of the plants named should be put in in August and be well rooted and hardened-off before winter, taking care not to allow the soil to become saturated with rain, but to keep it dry. Calceolaria cuttings, of course, should not be put in until October. Glazed lights will be necessary for protecting bedding plants, and there should be sufficient covering to keep out frost.—G. ABBEY.

(To be continued.)

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

AGAVE DASYLIRIOIDES (Dasylyrion-like Agave). *Nat. ord.*, Amaryllidaceae. *Lim.*, Hexandria Monogynia.—Native of Mexico. Flowers green and brown.—(*Bot. Mag.*, t. 5716.)

ABUTILON VEXILLARIUM (Standard-flowered Abutilon). *Nat. ord.*, Malvaceae. *Lim.*, Monadelphia Polyandria.—Native probably of South America. Flowers scarlet and yellow. Requires a warm greenhouse.—(*Ibid.*, t. 5717.)

NASONIA PUNCTATA (Dotted (cinnabar red) Nasonia). *Nat. ord.*, Orchidaceae. *Lim.*, Gynandria Monandria.—Native of the El Sisme mountains in Peru. It is synonymous with *N. cinnabarina*, which is a much more characteristic name.—(*Ibid.*, t. 5718.)

PÆONIA EMODI (Himalayan Pæony). *Nat. ord.*, Ranunculaceae. *Lim.*, Polyandria Polygynia.—Native of Himalayan mountains. Flowers white.—(*Ibid.*, t. 5719.)

PHARBITIS NIL, *var.* LIMBATA (White-margined Pharbitis). *Nat. ord.*, Convolvulaceae. *Lim.*, Pentandria Monogynia.—Native of North Australia. Flowers purple, with a white margin.—(*Ibid.*, t. 5720.)

SACCOLABIUM AMPULLACEUM ROSEUM.—Native of Moulmein. Introduced by Messrs. Rolleston.—(*Floral Mag.*, pl. 393.)

CLEMATIS John Gould Veitch.—Imported from Japan by Messrs. Veitch & Sons. Flowers pale blue, double.—(*Ibid.*, pl. 394.)

AZALEA Sir Robert Napier.—Flowers bright crimson. Raised by Messrs. F. & A. Smith, Dulwich.—(*Ibid.*, pl. 395.)

AURICULA John Water-ton.—Grey-edged variety, very fine. Raised by Mr. Cunningham, Kilbrahan, near Johnstone, Scotland.—(*Ibid.*, pl. 396.)

AZALEA Lizzie.—This fine Azalea has twice passed the ordeal of the Floral Committee, on one occasion receiving a first-class certificate, and on the other a certification that its high character had been well maintained. Its chief peculiarities are its smooth surface, which gives it a perfect outline, its distinct markings, which take the form of stripes of bright carmine on a pure white ground, varying in breadth and disposition, and its great substance, which results in the long endurance of the flowers. We learn from Mr. Kinghorn, by whom it was raised, that this latter quality is very noticeable, the plants standing much longer in flower than those of any other variety. The flower opens with a greenish tinge, and blanches as it expands, so that the fully developed flowers have a pure white ground, which is well set off by the well-defined and elegant markings. Like most of the varieties Mr. Kinghorn has sent out, this new striped Azalea is one which may be recommended with the highest confidence. We learn that the constitution and habit of the plant are all that can be desired.

"The improved varieties of greenhouse or Indian Azaleas

are certainly not surpassed, if equalled, either for exhibition or conservatory decoration, as by a selection of the earliest, the medium, and the very late sorts they can be had in bloom from Christmas till the end of June. The earliest and most forward plants may be introduced to the forcing house from about the middle of October, at intervals, to keep up a succession of bloom. All the varieties, observes Mr. Kinghorn, at whatever season they bloom, are much improved in quality by being kept in rather a close warm temperature while expanding their blossoms."—(*Florist and Pomologist*, 3 series, i., 115.)

NOTES AND GLEANINGS.

The following competitors (those marked with an asterisk (*) being Chiswick students) had certificates awarded at the GARDENERS' EXAMINATIONS in April, at the Society of Arts:—

	Age.	Floriculture.	Fruit and Vegetable Culture.
A. Bradley, Greenwich	25	2	2
F. W. Burbidge,* Richmond	20	1	—
D. Cargill, Liverpool	26	2	1
C. Fryer, Lambeth	27	2	—
J. C. Higgs, Southampton	27	2	—
R. Inglis, Richmond	23	2	2
W. Jones, Richmond	20	2	2
R. L. Keenan, Richmond	25	1	1
R. C. Kingston, Royal Polytechnic Inst.	21	—	1
C. Lawton, Hull	24	—	2
J. Macpherson, Southampton	22	2	—
J. McArdle,* Richmond	21	2	2
M. Middleton,* Richmond	21	2	2
A. Parsous, Edinburgh	24	2	2
J. R. Pocock, Bromley	32	3	3
F. C. A. Thomson, Liverpool	23	3	2
B. Wynne,* Richmond	23	1	1

The prizes offered in these subjects by the Society of Arts and the Royal Horticultural Society, were awarded to the following competitors:—

	Floriculture.	Fruit and Vegetable Culture.
R. C. Kingston	—	S.A. first prize, £5 R.H.S. first prize, £5
R. L. Keenan	S.A. first prize, £5 R.H.S. first prize, £5	—
B. Wynne	—	S.A. second prize, £3 R.H.S. second prize, £3
F. W. Burbidge	S.A. second prize, £3 R.H.S. second prize, £3	—

The *Gardeners' Chronicle* prize of £3, offered for the above subjects, was awarded to Mr. Kingston, who has also gained the first prize in chemistry (£5) and the Prince Consort's prize of 25 guineas; and Mr. Keenan has won the Society of Arts' first prize in botany (£5) and the Royal Horticultural Society's first prize in botany (£5).

— At the Tuesday Meeting of the Royal Horticultural Society, August 18th, Three Prizes will be offered for Twelve GLADIOLUSES, the first prize being £3, the second £2, and the third £1.

A TIME FOR ALL THINGS, EVEN FOR CUTTING DOWN THISTLES.

DR. ADAM CLARK has made this curious calculation: Suppose that each Thistle bears 80 heads, each containing only 300 seeds: the first crop is 24,000; the second, 576,000,000; the third, 13,824,000,000,000; the fourth, 31,776,000,000,000,000; the fifth, 7,962,624,000,000,000,000,000, a progeny more than sufficient to cover not only the surface of the whole world, but of all the planets of the solar system, so that no other plant or vegetable could possibly grow, allowing but 1 square foot for each plant. This wonderful power of reproduction should teach every man to regard the Thistle a common enemy—to be attacked and destroyed wherever found.

And here it may be well to introduce the substance of a communication to the *Journal of the New York State Agricultural Society*. A farmer had a field, about thirty-five years ago, completely covered with Canada Thistles; he cut them, and not one ever revived. This curious fact led him to a long series of experiments to discern if the particular date at which they were cut might not explain the phenomenon. For many years, therefore, he has cut the Thistles, marking dates, and watching the results. He practised this cutting every day in the season

except Sundays. For four years past he has cut them on August 15th, 17th, 20th, and 24th, and not one has lived. His reasoning as to their destruction is, that at this period the pith is not full in the stalk; that rain and moisture settle in the stalk, and they rot to the root.

This is certainly worth a fair trial. If by the simple observation of certain dates the roots of the Canada Thistle will die, and thus prevent numbers of plants from springing up, the world has gained an invaluable blessing. It is an experiment that will cost nothing, and in any event the Thistle will be cut off.—(*Prairie Farmer*.)

WORK FOR THE WEEK.

KITCHEN GARDEN.

Celery.—This is a thirsty plant, and, like the Asparagus, delights in the richest liquid manure after it has fairly begun to grow. Never put off earthing-up the earlier rows too long, but earth-up a little at a time—indeed, those who prefer earthing-up their main crops in succession instead of all at once, should also bear this in mind. *Cabbages*, if the first sowing for early spring use is not yet in the ground, there is no time to spare. *Peas*, a last sowing may now be made of some of the earlier sorts. A sowing of dwarf varieties may be made towards the end of the month where the situation is very favourable and means of protection can be resorted to. *Potatoes*, those who are partial to young Potatoes may now plant some tubers saved from the earliest crops. If previously greened in the sun they will grow more vigorously. The rows may either be covered with litter on the approach of frost, or they may be dug up and the produce kept in dry sand. *Tomatoes*, keep these fastened to the wall or fence, thin out the shoots and leaves, and pinch out the points before the clusters of blossoms, where early fruit is desirable. Without the assistance of a wall they will not do much good north of London, except in favourable situations. For their culture, for that of Capsicums, &c., and for the forwarding of early crops, dwarf walls with sloping borders ought to exist in every garden. When a gardener crops rather closely his fruit-tree borders, in nine cases out of ten it is the result not of choice but of necessity, for he is aware that the somewhat inferior condition of his fruit trees will not be such an unpardonable evil as being behindhand with a good early supply of the best vegetables. The succession crops are now mostly confined to salad plants, such as *Endive*, which should be planted out in succession about once every three weeks. Continue to sow *Lettuces* and small salads, only as the Lettuces do not run to seed in the autumn, you may now sow more of them at a time than could be done for summer supply without waste.

FRUIT GARDEN.

Take advantage of the first showery weather for budding the stocks of stone-fruit trees, and for inserting buds of esteemed kinds upon the branches of established trees. Propagation by budding, though generally confined to stone fruits, may also be resorted to with advantage with scarce varieties of Apples and Pears. The principal work here is to guard the crops from birds and insects, and to keep the trees clean and free of superfluous wood.

FLOWER GARDEN.

The summer climbing Roses, such as the Ayrshire, Boursault, Banksian, and many of the Evergreen and Multiflora divisions are now fading off for the season, leaving blanks in the rosery, along the arcades, and on pillars, walls, banks, and other positions, which will not be filled up again in many places till next June. Twenty years ago this would have been thought of little consequence; but in these days we are so accustomed to a rich display of autumnal Roses, that from May to November the rosery is expected to exhibit a perpetual succession of bloom. We cannot possibly do away with our beautiful summer gardens without losing the best feature of our flower gardens; we must, therefore, endeavour to clothe our summer climbers by budding on them autumnal-flowering Roses, using those only that are of a rather dwarf, compact habit, so that they may not interfere with the free habit of their foster-parents. Hybrid Perpetuals and Chinas are best suited for this work, unless, indeed, the climbing Roses are against walls with favourable aspects, when the dwarf Bourbons and a few of the Tea-scented kinds may be employed instead of the China Roses. The prevailing tint in summer climbers is whitish, and as some of the sorts to be budded on them may be expected to flower occasionally at the same time with them, it may be as well to make

use of high-coloured varieties, but individual taste will determine this. A few white varieties would relieve the other colours in the autumn. Among China Roses, perhaps, the best whites for this purpose are Clara Sylvain and Infidélité de Lisette, to which you may add any other white sort you may already possess. Among the higher colours in the China section, there is great room for choice. As China Roses are not so particular about the kind of stock they are on as many of the Perpetuals, they had better be worked on the Ayrshire varieties, while the Hybrid Perpetuals should be budded on the Boursault and Banksian Roses. The dwarf Bourbons should also be worked on the freer kinds, and being more tender than the Chinas and Perpetuals, should have the more favourable situations. Any one having a large Banksian Rose against a house or south wall, may easily establish a selection of Bourbon and Tea-scented Roses on it, and in severe winters these could be saved by covering them with mats. None of the Tea-scented varieties, and but few of the dwarf Bourbons do well on their own roots in our climate. There are few good white Roses among the Bourbons, perhaps Acidalie is the best of this colour, while there is no want of good sorts with rose, red, and crimson flowers. Among the old Perpetuals the Crimson, or La Perpetuelle, and William Jesse are, perhaps, the best; but in this class the difficulty is to pick out a bad variety. The work in the flower garden at the present time is in a great measure routine. Attend to the regulating of all plants and beds, and keep everything as clean and neat as possible. Remove dead leaves and flowers, and keep a sharp eye to insects. If we be favoured with rain some of the biennials will be fit to thin out a little, and the young plants may, if required, be pricked-out in nursery beds for transplanting. Hoe the ground amongst the plants frequently, not only to destroy weeds, but also to promote the growth of the plants.

GREENHOUSE AND CONSERVATORY.

If you see well to the watering and staking of the plants in the open air, and that they are not crowded together, nor too much shaded by trees or buildings, it is all that can be done for them, presuming all the best specimens and delicate plants that are not in flower in the conservatory to be luxuriating under the cool refreshing shelter of cold pits, where not a leaf or bud is seen out of place, and where the slight sprinklings from the hand syringe in the evenings supply the place of the absent night dews, and the thin calico frames ward off the sun when powerful. Now when many begin to cut down their Pelargoniums, let me guard the inexperienced against two extremes. Formerly we used to cut our plants to mere stumps, and now some leave the shoots by far too long for the sake of making large specimens next year, and with care this may be effected; but the safest way for beginners is to cut the lower side shoots of this season's growth to three or four eyes, and if the plants are tall to cut in the centre shoot to one or two eyes. Three-years-old plants make the finest specimens for ordinary use, providing the roots are healthy. Very old plants of Pelargoniums that are to be discarded had better be planted in the open ground, and they will furnish in September good cuttings, which may be kept in store pots through the winter, and they will come in useful for succession next summer.

STOVE.

Few stove plants will require potting after this time, except newly-propagated ones, which must be hastened through their nursery stages with all possible speed. Any little plants that are difficult to preserve through the winter should be kept rather dry from this time to harden their growth, and also, if practicable, cuttings of them should be put in. There are many plants that will stand over the winter if crammed in the cutting pots and placed near the glass on shelves, when the old plants can hardly be kept by the greatest care. Give more air and less water to stove plants in general after this time; this will harden and prepare them for another long winter. Before advancing further let us ascertain if those stove plants which we have lost or found difficult to keep in former winters are in good condition; examine the pots, and if the soil is not in a proper state, shake it from the roots and repot them in light soil. Sandy loam is better for wintering delicate stove plants in than composts containing either peat or leaf mould; peat is very apt to become sour in a close stove in winter, but in frames and greenhouses nothing suits them better. In the beginning of the growing season all kinds of stimulants were in requisition to insure a rapid growth; but from this time all safe modes of retarding vegetation should be resorted to in order

that the season's growth may be ripened as much as possible. These general rules may be of more use than minute details.—W. KEANE.

DOINGS OF THE LAST WEEK.

Watering.—In addition to what was stated last week, we must remark, that in using sewage water from manurens, &c., let it be proved that it is not too strong before employing it freely. In our case, and as the matter resolved itself simply into using it or giving no water at all, though the sewage consisted of all that comes from a general establishment, as stableyard, laundry, kitchen, &c., and rain water on yards, if there had been any rain, yet owing to the absence of rain, although the sewage would have done admirably for Cabbages, Cauliflowers, and similar crops of that kind, it would have been too strong to have applied to pot plants at all tender without being diluted with clear water. Sometimes when the sewage is pumped up in barrels this mixing is not very easily done, and in such a case we compromise the matter by half watering with the sewage, and then coming over the plants again with clean water. On the same principle we find that such sewage communicated to Peach trees in pots, might be a little over-strong for them, whilst it would answer well for trees planted out in the soil, whether in the open air or under glass. For most purposes we have used this sewage just as we took it, and even on flower beds it did no harm when sparingly applied at the roots, care being taken that the liquid was not spurted over the leaves. In our case, except under some circumstances, we know that owing to the body of water used the liquid will seldom be too strong for general purposes. Pure water must be obtained for manurens, even if it should have to be carted as in such a season as this, and when it has served its purpose it may be brought in as a useful aid to the garden, instead of being allowed to run to waste as is generally the case. We never thought of using the house sewage merely as a substitute for watering until four years ago, when we were even worse off for water than now. The main drain here terminates in a rather large reservoir, and as that filled the liquid found its way where it could, leaving its mark in a rank vegetation which nothing would eat. An iron pump was placed over the reservoir, so that we can easily fill a large barrel to be moved by a horse, and for watering at the roots we shall not be quite run out so long as this supply lasts, and it will so far last as long as there is a laundry in use, dishes to wash, and carriages to clean.

The great thing for the inexperienced to bear in mind is simply this, that the less the clean water used, the stronger will be the sewage, and the more dangerous its application in its unweakened state. Thus we have used the liquid as it came from all parts of a stableyard without any addition. We have seen liquid that came from another yard that had no rain water, and little of clean water of any sort mingled with it, and that we would not have used without six times its bulk of clean water added to it. We can give no test in this matter, but experience and observation, and the experience is soon gained by trying the liquid on a few plants at first, and remarking its effects before using it freely. For general purposes of watering we prefer our sewage to pure water, but as no rain has yet reached us on this the 11th, we foresee that if it do not come soon all efforts to refresh foliage with water will be with us out of the question.

Some of our correspondents have been amused at the small quantities of strong manure, as guano, we recommend to be mixed in water; and some of them have told us that when they used double and triple the quantity they had too much reason to rue it, and go back to the smaller quantity. In fact, all manure water should be given weak, there is then no danger; and after the first trial or two there need be no difficulty with sewage water, as the safe strength may be easily determined. Satisfy yourself by practice before using it largely.

Recently we used sewage water rather freely at the roots, not only of Cauliflowers, when it just suits, but also to Verbenas, Coleolarias, Scarlet Pelargoniums, &c., and a day or two after the foliage looked blacker and healthier in consequence. This sewage was strong enough to leave its scent on the ground for an hour or two, but the earth soon takes away all scent of that kind. On this account, however, unless suitably prepared, such sewage should not be used near living-rooms. We are thus particular, in the hope that others' source of water may have this supply to go to.

KITCHEN GARDEN.

We were obliged to water Cauliflowers, Lettuces, Turnips, &c.,

as the latter were becoming quite hard. Sowed Cabbages for the early spring crop; a few Cauliflowers, Turnips, Lettuces, Endive, and the last row of Peas, watering the ground in every case before sowing, and then covering with mats, litter, &c., to keep the moisture in a little before the plants appeared. We have been able to keep young crops alive without watering by shading with dry litter, evergreen boughs, &c. Sowed an earth pit of *Dwarf Kidney Beans*, soaking the drills first, and these if necessary we can protect in the autumn. Here we may state that, against our wish, we have sown more this year of the small black Kidney Bean, which produces long clear pods. We do not know how it may hold out for continuous bearing, but as yet it has been the most fertile variety we have ever met with, producing a vast number more flowers and pods than leaves. From a small border we have gathered large quantities for use both fresh and pickled. At one time we held this little black Bean in but small estimation, and always had an idea it produced speckled instead of clear green pods; but now, if it hold out, we shall assign it a first place, as being superior for out-door cropping to China or Robin's Egg, Duns, Yellows, Fulmer's, and all the rest of them. The Robin's Egg in such a season would be apt to produce many dumpy pods, with a seed swelling at the end before the pod had attained its full length. From plants of this little black Bean we have gathered a dozen pods, straight and clean, fully 5½ inches long, and no mark of a seed in them. From its dwarfness we shall give it a trial for forcing next season. Succession crops, though young, have been attacked with the black fly that is frequently so troublesome on Broad Beans, and these have been syringed with lime water and soap water, and they are now nearly free from such enemies.

We have several times mentioned that that fine Pea, Veitch's Perfection, did not produce enough to please us; but this season, dry though it has been, it has been with us more prolific than any other of the large Peas.

FRUIT GARDEN.

Strawberry runners will be very scarce with us this season, and the crop of fruit has almost dried up. Trees in orchard houses have had extra watering, and merely to save watering we have shaded the glass with whitened water. Some nice Figs have been gathered from the most forward orchard house, also some good Plums, the house having been made more forward by shutting up earlier and giving air later. We are at a loss for clean water for syringing, and have used with good effect sewage for root-watering. Used also sewage water for watering the Vine borders, which are out of doors, as, after the covering had been removed, they were becoming dry, and as the soil, from the sun striking freely on it and being out slightly touched on the surface, became as warm as we wished it to be. After the watering, we covered the borders slightly with horse droppings and a little litter, which will protect them from the fierce sun a little, and if a good shower should come some of the virtues of the covering will be washed into the soil.

Nearly finished thinning late Grapes. This could only be done in the morning and evening, owing to the heat. Cleared out all the plants from the second viney, and washed all the stages, &c., then covered them with a paint of lime and sulphur, and daubed all the pipes with sulphur and soft-soap, also doing the same on the wall where there was any chance of the sun's rays falling on it. This was done by way of precaution to keep the red spider at a distance. The floors and stages were also damped in the hottest part of the day, as we do not care to syringe over the foliage. We never think that plants do much harm in such houses until the fruit begins to ripen, then the less watering in the house the better; but in very hot weather the dryness may be carried too far, and a little sprinkling of water will help to keep the bunches plump and full. Figs have also needed extra watering, but nothing repays the trouble better. Provided the water is not stagnant, it is scarcely possible to over-water a Fig tree after it has fairly taken to growth. Plants in pots run a risk of throwing off their fruit every time the soil becomes dry. In pits and frames where Melons and Cucumbers were growing, ran a brush, with a paint made of lime, soot, and sulphur, near the top inside, to moderate the reflection of light, and yet emit some sulphurous fumes when the sun shines strongly. These fumes are the greatest annoyance to the red spider. As to the mere sulphur itself in its natural state, the red spider will walk in it as unconcerned as among dust or earthy particles. The fumes should never be too hot; when they are given off from flues or pipes the heating material should never be warmer than 160°. When the fumes

are caused by the sun's rays striking on a wall, they will rarely be so warm as that. In such bright weather when good Melons cannot have the shade of foliage, they will be all the better of a thin piece of paper being suspended over them.

ORNAMENTAL DEPARTMENT.

Very much the same as last week. Hoed and forked beds of shrubs, &c., to fill up cracks. Some Rhododendrons are suffering from the drought. Proceeded with securing Hollyhocks and Dahlias. As we could not water, the spikes of the former will be shorter than usual. We prefer Dahlias to have only one stout stake, which is hidden as the plant attains maturity, and to this stake all the side shoots are retained arch over the top, which keeps them secure and yet does not give the plant an artificial appearance. Secured Carnations with twisted wires instead of stakes, and proceeded with laying them and making cuttings as we could. The lawn was becoming a little patchy with green vigorous spots here and there, and, therefore, first switched it over with the daisy knife, and then very lightly with the mowing machine, so as not to dip where there was nothing to cut. Plants in beds we watered at the roots chiefly with sewage water. Could we have the grass brightly green again the flowers would look much better.

Shifted for the conservatory into larger pots, strong plants of Feathered Cockscombs and Fuchsias. Shifted Balsams into larger pots for succession. Gave more shade and water to Ferns. Begonias and Caladiums come in well in shady parts of corridors, greenhouses, &c. The former are very impatient of any flowers or leaves falling on their foliage. All plant houses are benefited by keeping the floors and stages moist, instead of drenching the plants too much at the roots. See last week as to Pelargoniums, Chinese Primroses, Cinerarias, &c.

All greenhouse plants out of doors and in pits and frames might be exposed at night fully were we sure of no thunder storm occurring. When there is any danger the sashes may be raised back and front so as to give a free current of air. In such weather we reduce the air to many plants during the day that they may require less water, and give it freely at night. We are not much afraid of a high temperature during the day, provided there is enough of air to prevent the accumulation of condensed vapour.

Now is the best time for sowing *Calceolarias* to flower early next spring. The following is an excellent plan:—Fix on a shady place and there put a hand-light half filled with rough ashes. Fill a 6 inch pot to within 1 inch of the rim, half with drainage, the other half with, first rough soil, then finer, and then very fine sandy loam with a little leaf mould or peat. Press, water well, and in six to ten hours sow on the surface, give a dusting of silver sand over the seed, and press lightly. Place a square of glass over the pot, plunge the pot nearly to the rim in the ashes, and until the seedlings appear give an inch of moisture by watering the ashes and not the surface of the pot. When the seedlings appear raise the square of glass a little, then in a short time remove it at night, replacing it during the day; give air by the top of the hand-light, and as soon as the seedlings will bear it expose them fully; prick out and keep in a cool shady place, and they will be healthy and strong.—R. F.

COVENT GARDEN MARKET.—July 15.

THERE is in the market a vast accumulation of fruit both English and foreign, the latter comprising Pines, Grapes, Peaches, Nectarines, Apricots, and Melons. The vegetable market is not so well supplied.

TO CORRESPONDENTS.

*. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

Books (R. Miller).—Stephens's "Book of the Farm."

SUPPLEMENT OF "COTTAGE GARDENERS' DICTIONARY" (H. S. H.).—The Supplement contains all necessary additions down to the end of last year.

CATALOGUE OF BRITISH PLANTS (M. H. A.).—We know of no such catalogue as you mention.

GASOMETER NEAR VINERY (G. Brown).—It will not be at all injurious to the plants either in a vinery or in the open air.

SEEDLINGS (N.).—There are very many better varieties of Pelargoniums and Fuchsias than those you enclosed. If the only merit of the Petunia is the yellow in its leaves it would not be valued. If the seedling Pelargonium with tricoloured leaves, not two of which are alike, proves permanent in this peculiarity, it may be a desirable acquisition.

SEEDLING VERBENAS (G. Mason).—They were so shrivelled that we can only say that the trusses are good and the colour (crimson) very rich. You had better send them to the Floral Committee as you propose.

RATING NURSERYMEN'S GROUNDS (An Old Correspondent).—If overseers rate them improperly, the remedy is to appeal. It is useless to complain unless the remedy has failed in procuring redress.

ROLLISSON'S CUCUMBER (H. S.).—Your notes refer to statements you made in a contemporary Journal, and our readers would not know to what you refer.

VEITCH'S EARLY ASHLEAF POTATO (J. R. P.).—The sample sent is very good of this very good early variety. As the tubers are quite ripe we have no doubt that you will succeed in raising a second crop this year, for it is a quickly-growing and quickly-maturing variety. We shall be glad to hear the results of your experiments, and at the same time to know when you planted, and when you took up each crop.

EXHIBITING GRAPES (James Murray).—We cannot advise, not knowing the terms of the exhibition. If the prize is merely for the best Grapes, attention need only be paid to the weight, ripeness, colour, and bloom. If to artistic arrangement, then it must be left to the exhibitor's taste and opportunities.

STRAWBERRIES FOR SUCCESSIONAL BEARING IN A STIFF SOIL (A Subscriber).—Taken all in all, you cannot have three better than Keen's Seedling, British Queen, and Eleanor, but as you do not like Keen's, you might substitute President or Premier, and as the British Queen does not bear well, you might have Dr. Hogg, or the fine-flavoured and rather free-fruited Myatt's Eliza, an old sort but good.

FIGS (G. S.).—The cause of your first crop of Lee's Perpetual being firm and "like solid meat," is because the flowers have not been fertilised, or only partially so. This is very apt to be the case with the first crop.

FROGMORE LATE PINE STRAWBERRY (H. H. M.).—The following is the description given in Hogg's "Fruit Manual":—"Fruit very large, conical, and cockscomb-shaped, with a glossy neck like the Old Pine. Seeds not deeply imbedded. Skin glossy, bright red, becoming dark red, and almost black when ripe. Flesh tender and very juicy, red throughout, richly flavoured, and a good deal of the Pine aroma when well ripened."

ROSES (Idem).—If you know what constitutes a good Rose, then the requisite number of such good Roses would constitute a good stand of them. Each variety ought to be shown accompanied by leaves of that variety.

BUDDING AND CUTTINGS OF MANETTI ROSES (Ballinacree).—"You may bud Manetti stocks as soon as, and as long as the bark will run. When you bud very late the bud should be ripe. Early in the year a little eye will take as well as a ripe one; the slice being sappier it will often take better. If the weather is not stormy but hot, as now, put either a Dock or other leaf over the newly-inserted bud. Always water the stocks a day or so before budding, and also afterwards. Watering causes a greater dew of sap. With a trowel scoop away the ground, and remove the suckers, cutting them clean from the stocks. Bud as low as you can do on the main stock. You may bud, if you like, on the wood of the current year, and also on the brood, but it is best to bud on the main stock if the bark will separate or run. After you have budded the stocks let the wood remain on, and in September you may remove a portion of it for propagation purposes. It strikes very easily. Tread in the shoots, 10 inches

long, firmly; and in winter shake amongst them herse litter or straw. Bury the stocks 5 or 6 inches deep, and leave a leaf or two on the shoot above ground. Give them a little water occasionally in the hot autumnal weather. Roses generally, I hear, are at this time in a sad state from excessive heat and fungoid diseases. I have three men employed in mulching and watering my Roses. I scrape away an inch of ground over the roots, put on three shovelful of black decayed horse and pig manure, water copiously, and then return the removed earth over the dung. Finally, buy Alfred Colomb, it runs Charles Lefebvre closely. It is the best Rose that has been out for years, and is first-rate in its bloom and also in its foliage, growth, and habit. The best light-coloured Rose of late date is Princess Mary of Cambridge. It only wants more intensity and fixedness of colour.—W. F. RANCLYFFE."

COMPOST FOR POTTED ROSES (Rose).—"The best compost for pot Roses is one-third of each of rich stiff clay, sand or fine ashes, and decayed black dung. Let me add that Pelargoniums, Fuchsias, Roses, Strawberries, Hollyhocks, and Dahlias all like cow dung. For the last two it is, perhaps, the best of manures. It contains more potash than any other animal manure; hence, as potash is the grand constituent of a Strawberry, it is also excellent for that delicious fruit; in a word, I believe it to be one of the best of manures. The same may be said of soot, which contains nitrogen and carbon. For pot Roses use a skewer to make holes in the soil to let in the water.—W. F. RANCLYFFE." "The Garden Manual" will suit you. It will be sent free by post from our office if you enclose twenty postage stamps with your address.

LIST OF SUPERIOR ROSES (Henry Worrall).—"I presume good growers, hardy Roses, free bloomers, and constant bloomers are desired. *Yellow*—Gloire de Dijon, Céline Forestier, and Triomphe de Reims. These Roses should have plenty of room, and do not require to be cut much. *Blue*—Marguerite de St. Amand, La France (new), Caroline de Sansal, Mlle. Emilie Boyan, Madame Knorr; and for the autumn, Souvenir de Malmaison. *Brilliant Crimson*—Charles Lefebvre, Alfred Colomb, the two best; Sémaphore Vaissé, Lord Macanlay, Lady Suffield, Maurice Bernardin, Duchesse de Caylus, Madame Victor Verdier, Lord Clyde, Madame Boutin, Marechal Vaillant, Mlle. Annie Wood, fine, but shows an eye; Madame Julie Daran, Leopold Premier, George Prince, Gabriel de Perigny, and Dr. Spitzer. *Tule Dove Pink*—Baron Gonsella. *Rosy Pink*—Julius Margottin. *White*—Baronne de Maynard, Madame Freeman, Marguerite Bonnet (fleshy white), Madame Alfred de Rougemont. *Dark Crimson*—Pierre Notting (a grand Rose), Vicomte Vigier, Duc de Cazès, Souvenir de Comte Cavour, Eugène Verdier, Baronne Pelletan de Kinkelin. *Maroon*—Prince Camille de Rohan, Souvenir de Dr. Jaumin, Empereur de Maroc. *Rose Colours*—Baronne Prevost, Comte de Nanteuil, Thorin (new), La Duchesse de Morny, Charles Bonillard, John Hopper, the best, one of the finest Roses in England. Its colour is crimson rose. *Pink*—Contesse Ceille de Chabillant. *Waxy Flesh*—Mrs. Bosanquet. I conclude with a few words on new Roses. Alfred Colomb is the finest by far. Horace Vernet and Antoine Ducher are excellent growers with fine foliage; they are large and fine, with deep petals, but they have not yet been full enough. Fisher Holmes is a nice red Rose. Charles Verdier is distinct, and I think it will be good. Mlle. Marguerite Dornbrin when not tucked in the side is extra fine. Princess Mary of Cambridge is an improved Anguste Mir, and taken at all points is the best Rose of light colour, as Alfred Colomb is the best of the rich colours that has come out lately.—W. F. RANCLYFFE."

VINES CUT BACK NOT STARTING (Thistle).—Cutting down Vines six years old to within 2 inches of the ground was a bold proceeding. The reason of their not starting is, that no eyes were left below the cut, but it is not unlikely that the Vines will yet start. More length of stem should have been left, cutting down to the lowest young wood on the stem from which the Vines would have pushed fresh canes freely. Vines will in most cases push from the old wood, as there are many embryonic buds or eyes which remain dormant for a number of years. We have had them push vigorously on stems of twenty years' growth.

SEEDLING CARNATIONS (L'Amour).—The seedlings are seldom so good at the first flowering as at the second and afterwards, but you will be able to form an opinion in the first year of flowering as to whether they promise anything good in form and colouring. If you have room for them in the border by all means retain them, for if not good in a florist's eye the flowers may be valuable for bouquets.

ANNUAL SEED SOWING (Amateur).—The seed should be gathered when ripe, and we prefer to sow it at once in pots well drained, and filled to within an inch of the rim with a compost of two-thirds rich yellow loam, and one-third sandy peat. We then put on a little of the same kind of soil, but finer and drier, make the surface even by patting it with the bottom of a flower-pot, scatter the seed over it rather thinly, and cover with a quarter of an inch of fine soil, the least possible depth being left to hold water. The pot is then placed on a shelf in the stove, and it is not watered until the beginning of February, when the soil is moistened by a gentle watering. We then plunge the pots in a hotbed and encourage growth, keeping the soil moist. The pot remains in the hotbed as long as there is any heat, and the soil is preserved in a moist condition, and a good heat is given so as to keep the young plants in a growing state as long as possible, but giving a short rest by diminishing the supply of water in November, December, and January. In February they are again placed in a hotbed, and forwarded in a brisk heat with plenty of moisture, and when they have made a growth, which they will do by June, we pot them off singly in pots about four times the diameter of the bulbs, and so that the bulbs are buried to the neck. They are again returned to the hotbed, giving water abundantly and atmospheric moisture, keeping them well supplied with moisture up to October, when the supply is diminished, but so long as there is foliage give enough water to keep it from flagging. The pots are top-dressed in January, removing the old soil down to the roots, and it is replaced with rich rather strong loam from rotting turves. Do not disturb the roots or interfere with the bulb, but if the drainage be defective rectify it. Plunge the pots in a hotbed, encourage growth with water as required and atmospheric moisture, and in May shift the plants into a larger size of pot, not disturbing the roots or ball beyond removing the crocks and any soil not adhering to the roots. Return the plants to the hotbed and keep them growing as long as they appear disposed to do so, giving a good supply of water, and when growth ceases remove them from the hotbed by degrees and set them on a shelf in the full sun in the stove, giving water so as to prevent the leaves flagging, diminishing it, however, when these show signs of going off, and keep the soil rather dry during the

winter. These plants by the third year will have strong bulbs for flowering, and the treatment is then the same as for old plants. It is convenient to sow the seed when ripe, it may be kept in a dry place and sown early in February. We have kept it in silver sand in a flower-pot in a stove until February, and we cannot say which is the better plan; both proved good.

STATICE HOLFORDI PROPAGATION (Idem).—It is propagated by cuttings, the side crowns being taken off close to the stem and with a sort of heel. The base of the cutting is pared smooth with a sharp knife, and a few of the leaves are trimmed off to admit of its being placed in the soil. The cutting-pot should be well drained, filled to within an inch of the rim with sandy peat, and then to the rim with sand, and the cutting should be inserted in the centre. It is well to place the cutting pot in one of a larger size, and to fill the interval between the two with small crocks to near the top, and the remainder of the space with silver sand. The rims of both pots should be level. That will allow of a bell-glass being placed over the cutting and resting on the sand between the pots. Give a gentle watering, and plunge in a bottom heat of from 75° to 80° and a corresponding top heat, being careful not to make the soil very wet but yet to keep it moist. Shade from bright sun, take off the bell-glass occasionally, and, after wiping it dry, replace it. When the cutting begins to grow tilt the glass a little on one side, and by degrees remove it. The best plants of *Statice* are obtained from seed, such being more free in growth and less liable to die off than plants from cuttings.

TREATMENT OF OLEANDER AFTER FLOWERING (Idem).—Your plant with two stems coming from near the soil and 3 feet 6 inches in height, is leggy. We would cut both shoots and branches down to 6 inches, and take two or three shoots from each, rubbing off the others. The plant will not, however, flower next year, but we would take off the points of the shoots again in April next year, at 6 inches above the points where they were last cut, and you will obtain plenty of shoots for a good head in the following year. The shoots coming from the flowering stem will be the flowering shoots of next year, and the prominent buds at their apex are flower buds which will not open this season. If you wish the plant to bloom next year these shoots must not be cut off; but we would put them in as cuttings, cut down the old plant, and obtain a specimen. No plant is worse grown than this, and few equal it in its fine heads of bloom and general usefulness for decorative purposes.

CUTTING-BACK LARGE OLEANDERS (Old Subscriber).—We would not now cut back your trees to the old branches but defer it until next March. If you cut them now they will probably not push until late and will make a weak growth, as the eyes upon such strong wood will not start so freely as those from younger and smaller shoots. After being cut back the plants should have a moist atmosphere, and be kept rather warm and close until they break. We think they will break freely and strongly if cut back in next spring. We were under the impression that you intended to cut back the very thick stem, and that prompted our former reply.

CYPERUS ALTERNIFOLIUS VARIEGATUS (Charlton).—We would pot the plant now in very poor sandy soil, and encourage it with a moist growing heat and an abundant supply of water. Your plant has had quite enough rest. It requires to be kept well supplied with water when growing, and rather dry in winter. It succeeds admirably in a stove, and is of easy culture.

RAISING LAPAGERIA ROSEA FROM SEED (J. G.).—The pod of seed will

no doubt ripen this season. The seeds should be kept until the beginning of March, and then sown in small pots. We take a rather large and deep seed-pan, and drain it to the depth of about an inch, the pan being 1 inches deep. We then half fill a number of 21 inch pots with a compost of fibrous sandy loam broken and made fine, but use the rougher portion for the bottom of the pot, just placing one crock over the hole; we then fill to the rim with the finer portion of the peat. The pots are then set on the crocks in the pan and as closely together as possible, filling the intervals between them with cocoanut refuse, and making it level with the rim of the pot. In case of no peat being at hand, a little moss may be placed over the crocks, the pots set on it, and the intervals between the pots filled up with silver sand. A hole is then made in the centre of each pot, and so deep that the seed when put in shall be covered with its own depth of fine soil. A thin layer of moss is then placed all over the surface, but not so deeply as to hide it entirely, and a gentle watering is given. The pan is then placed in a hotbed and kept constantly moist, and wet after the seeds have germinated. Not having a heated house you may employ a hotbed; if not, we think the warmed part of the cold pit would prove suitable. Being in pots the plants can be transferred into larger pots when they attain a size fit for repotting. If the pots be placed in a hotbed, gradually harden off the plants before removing them to a cooler place. You will find particulars of the after-management in our last Volume, page 90.

HARDY EXOTIC ORCHIDS (W. R. H.).—The following we know to be in cultivation in this country. We cannot say whether they are grown in Ghent:—*Cypripedium acule* (humile), *C. guttatum*, *C. pubescens*, *C. spectabile*; *Goodyera pubescens*; *Ophrys lutea*, *O. fusca*, *O. speculum*, *O. tenthredinifera*, *O. quadripunctata*; *Orchis foliosa*, *O. laxiflora*, *O. longicornis*, *O. papilionacea*, *O. Robertiana* (longibracteata), *O. nigra*, *O. sambucina*; *Platanthera flava*; and *Serapias cordigera*.

COCKCHAFFERS (E. C.).—It is impossible to banish these insects when in their winged state.

INSECTS (A. Roe).—The insects found in your dwelling are weevils, and we believe their scientific name is *Curculio cupreus*.

NAMES OF PLANTS (A Subscriber from the Commencement).—We cannot undertake to name plants unless we see their flowers. (*E. E. Jarrett*).—*Orobancha minor*, or Smaller Broom Rape. It is neither an *Orchis* nor a *Fungus*. (*C. Hall*).—We cannot identify your plant unless you send us one of its flowers, and if a leaf accompanied it all the better. (*Four-year Subscriber*).—We cannot name plants from their leaves only. (*A Subscriber*).—1, *Pteris argentea*; 2, *Aspidistra elatior*; 3, *Polypodium aureum*; 4, *Adiantum hispidulum*; 5, *Pteris serrulata*; 6, *Pteris sp.* (barren); 7, *Croton pictum* var.; 8, *Croton discolor*; 9 and 11, Specimens too small; 12, *Croton pictum*. (*J. G.*).—1 and 2, *Pteris aquilina*, common Brake. (*W. F. P.*).—1, *Lathyrus pratensis*; 2, *Linaria cymbalaria*;

3, *Lotus major*; 4, *Euphorbia latyrus*; 5, *Potentilla reptans*; 6, *Prunella vulgaris*. (*G. M.*).—3, *Pon trivialis*; 5, *Gaultheria Phellos*; 6, *Stipa pennata*. (*Ceres*).—1, *Juncus bufonius*; 2, *Isoplexis setacea*; 3, *Holcus lanatus*; 4, *Lolium perenne*; 5, *Lolium italicum*; 6, *Triticum caninum*; 7, *Bromus secalinus*; 8, *Avena flavescens*; 10, *Dactylis glomerata*. (*J. M. W.*).—1, *Spiraea Douglasii*; 2, *S. Noldiana*; 3, *S. sorbifolia*; 4, *Thujopsis dolabrata*; 5, *Abies Menziesii*; 6, *Cupressus sempervirens*. (*J. C.*).—1, *Origanum vulgare*; 2, *Goodenia ovata*; 3, *Polygonum vacinifolium*; 4, *Swainsonia galegitolia*; 6, *Fernetya* (*Arbutus*) *macronata*.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending July 11th.

DATE.	BAROMETER.		THERMOMETER.				Wind.	Rain in inches.	GENERAL REMARKS.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

FACTS CONNECTED WITH POULTRY CULTURE.

Our correspondent Mr. George Manning, whose remarks before the Food Committee of the Society of Arts we published, suggested the examination of Mr. Brooke, of Newgate Market, and the following are some extracts from his evidence:—

Mr. Brooke: Messrs. Broome & Co., are large poultry, butter, meat, and provision salesmen, at Nos. 10 and 11, Newgate Street, Newgate Market. I am the manager of the poultry business. I have been all my lifetime in the poultry trade; my father was a dealer in poultry in Norfolk, and I have been a salesman from the age of eighteen. I have been in Leadenhall Market thirty years, and in Newgate Market eight years, and the whole class of trade has come under my notice. I have also given evidence on the Game laws in 1846, and have been consulted by the Government in reference to the markets. I was sent by Messrs. Broome to France to examine for myself the markets of Paris, as well as to go through the different parts of the country which supplied poultry to the Paris markets, which markets in the country are so well regulated by the local authorities as

to be worthy of the consideration by those who take an interest in the growth and value of our home-grown farm produce. The time of sale is regulated—tolls are paid—no sales take place outside the markets, and all is order and open trading—besides which all the goods are sold—none are taken home. (The Paris wholesale markets cast into the shade any we have in London; the system of order is complete, but the exaction of *octroi* is odious). This takes place at Houdan, Dreux, La Fleche, Le Mans, Nogent Le Roy, and a great many other parts, where poultry is sold largely. These markets are held weekly, and very large quantities, to the extent of from 3000 to 6000 fowls and Turkeys, are brought, besides other articles of farm produce. I was induced, in consequence of seeing this, to try if I could introduce something of this small farmer system into England and Ireland, because I find that in Ireland large quantities of poultry, which I may call the raw material, are produced cheaply, but they do not fetch the breeders anything at all equal to what they might if properly fattened. In some parts of Ireland the fowls are very inferior, and yet if it were not for the quantity of poultry which comes regularly from Ireland, fowls would be worth in London at the present season half a guinea each. I need not say that the mode of procuring poultry is one well worthy of attention, because we find that fowls weighing 1 lbs. might be produced just as easily and as cheaply as fowls weighing only 2 lbs. each, if attention were paid to having good breeds, such as the Dorking, Cochins, and the best French breeds, with the Malay, crossed with the Essex or Lincolnshire fowls. I find that the fowls which have been sent into

Lincolnshire and Yorkshire, from whence we get large supplies, have completely changed the breeds—thirty years ago they were quite small, and now they are large and fine. This was all brought about by Mr. Charles Clarke, of Boston, who bought the best stock and gave away the eggs to the farmers and cottagers.

The Chairman: The size depends upon better breeding and better feeding?

Mr. Brooke: Exactly. In Essex, likewise, the quantity of poultry is kept up, whilst in Norfolk, some parts of Cambridgeshire, Suffolk, and other counties, poultry has gone completely out of cultivation, in consequence of the absorption of commons and waste lands, as well as that small cottagers are not allowed to produce poultry; while the English farmers' wives and daughters have forgotten the habits of their ancestors, in sad contrast to the French farmers' wives, whose greatest pride is their dairy and their poultry. The suggestion I would make would be simply this—that where there are cottagers and small farmers, the gentlemen in the immediate neighbourhood should find a supply of good stock, and then distribute the eggs for breeding purposes, the cost of which would not be more than 5s. or 10s., and by that means the recipients would do as they have done in Sussex, where a very large quantity of chickens are raised all the year round in the district of Haverhill, in a radius of about twenty miles; during the next three months we shall have sent to London from that part of the country £1000 worth per week, which will show what can be done by industry and method. The supply for London is of very great importance, because we must not only consider that there are 3,000,000 of people to supply food to here, but we also supply a radius of fifty or sixty miles round London when our supplies are above the demand for home consumption, in consequence of the railways being so accessible. That is not the case in France; the poultry nearly all goes to Paris, and there is hardly any demand in other towns. In this country the supplies are required constantly. At Ditchford and all round the south coast, at Oxford and Cambridge, as well as at other large towns, it is not likely the price will decrease, as a more general use would, I am persuaded, lead to an unlimited consumption. The advantages of increasing the food supplies of a people so numerous as ourselves must be apparent; if it would be considered a boon that where one blade of grass grew anyone should produce two, how much more so at the present time, when meats of all kinds are found to be deficient in quantity, to enable every one to have a mouthful, that some one should step forward, and by the simple introduction of a cheap process which is hourly in operation in France, should induce the great landed aristocracy and gentlemen of England and Ireland, as well as the large farmers, to determine that on their own estates a better system of breeding and fattening poultry should commence now. I have recently paid a visit to South Wales, and I find that in some parts the cottagers and small farmers are increasingly producing poultry, and this ought to be extended through the length and breadth of Ireland. I have suggested to Messrs. Browne that I should go to the different markets of England and Ireland, and call together the farmers' wives and cottagers, and market people, on market days, and tell them exactly what they might do, and show them how to do it.

The Chairman: Do you happen to know the French mode of feeding? I think that is very important.

Mr. Brooke: Yes; I have written that down, in order to make it thoroughly known. By the plan I propose I think we could introduce a new mode of breeding and feeding poultry. Thus, chickens two or three months old will fatten in seven, fourteen, or twenty-one days, at a cost of 4d. or 6d. per week. I do not think there is a possibility of raising any kind of vegetable so quickly as that, so as to produce an article out of a bean one in about seven or fourteen days. The French seem to me to have acted very wisely in one respect—they never as a rule, send a very small, young, or half-fattened market. Now, in our markets we have large quantities of bean seeds, not only poultry, but meat, which I consider to be intended to the community at large. The French actually fat the old hens as well as old Turkeys; they are sold in France for the purpose of being made into soup, *brochette*, and other kinds of food, which, according to the French system of cooking, are very nice. Generally farmers, directly they have done with an old hen, sell her for a trifle. The Essex people are wiser; they have managed in the same way as the French; they get the eggs out of the fowls and then they fatten them, and sell them for 2s. 6d. or 3s. each. They shut them up and feed them twelve or fourteen days. The way in which the people round Haverhill, Chesham, Uxbridge, and other parts of Sussex have improved within the last ten years, is marvellous, and they now make from 3s. 6d. to 5s. 6d. for chickens not more than three months old. The chief point is the labour; the only expense there can be is rearing until they get about two months old, which should be by the side of a hedge, or where there is grass, which cannot cost more than 1s. to 1s. 6d.; strong, healthy, well-fed chickens are very soon fattened. I think that is a power of manufacture which is worthy the consideration of the country, as the profit must be at least from 50 to 75 per cent. The means of feeding are simply these:—Barley or oatmeal ground fine, given in fat, or just mixed with it; new milk, or, if not procurable, meat broth, mixed with it to the consistency of thick soup, and administered twice or thrice daily for seven, fourteen, or twenty-one days. Fowls from four to six and nine months old should be fed on this food with the funnel, and kept in the dark on clean straw. All kinds of animals kept in the dark, and quiet, always fatten more quickly than when they

have too much room or light; that is a very important part of the French system, to keep them in the dark. But what I would wish to point out is this—the French fowls which are fed with a funnel are a particular breed—the Crève-Cœur, La Flèche, Le Mans, and Houdan; a small chicken would not bear the funnel to go down its throat. This class of fowls is now selling wholesale, in Paris, at from 6s. 6d. to 15s. each.

The Chairman: I have been much struck with seeing the plan of cramming Geese at Strasbourg; the Geese seem to like the first few months very much, but they afterwards get much disgusted. It was a most extraordinary sight.

Mr. Brooke: The French fowls seem to get quite fond of it, and are quiet; they struggle very much at first, but they soon get used to it. I think it would be rather difficult to introduce this system of feeding by funnel at first amongst the farmers, as it is a process which requires some dexterity and patience; but it is very simple. To make a coop for twenty-four fowls, with a small trough, to be kept clean, to feed the chickens (as they do in Sussex) for seven or fourteen days, is what any one could undertake. The chickens must only have food enough to feed themselves full, then they must be kept in the dark and quiet. The food must be made into a consistency similar to soup; boiled eggs are sometimes given to them during the last two or three days; and as fowls will fatten fetch such a price, it is worth while to bring them to the highest perfection. I have never seen such fowls in England as I saw in the Paris market and the Palais Royal, each weighing 10 lbs. or 14 lbs., which fowls were eight and ten months old. They must be large to be fed with the funnel; while chickens from ten weeks to four months old must have this special food in coops (holding twelve or twenty-four each), provided with troughs, which must be daily cleared. There is a difference, of course, between a chicken fattened in this way and fowls fattened for an especial purpose, as is done with a funnel. Fowls require to be very healthy before you can fatten them at all, and for that reason I think none of these poultry companies will ever be successful, because the fowls do not do well huddled together. Our own supply of poultry can be only increased by giving plots of land to farm labourers, stimulating the cottagers and small farmers to breed and fatten poultry, for, wherever it is mixed and crowded together, disease is sure to follow, and it is impossible to produce them to advantage. We did think at one time it would be well to have a depot at Holyhead or Milford Haven, where the poultry might be brought over from Ireland and fattened; but even with that short passage of ten or twelve hours there is a danger of the poultry getting into a kind of fever, which would prevent them fattening properly. We therefore consider it is much better to import the poultry dead than alive. If we could only get the gentry in Ireland to adopt the simple plan of getting a stock of the very best poultry, and giving away a clutch or two of eggs to the small cottagers around them, and taking care to remove all inferior breeds (and this could be done at a very small expense), in twelve months the whole country might be covered with a fine breed of poultry, to the advantage of all concerned.

The Chairman: Can you suggest any mode by which these country gentlemen can be stimulated to assist the farmers and cottagers in this way, and to insure to the producers a good market for the poultry when they are reared? I understand that in Wales poultry do not fetch more than 8s. a couple, whilst here I give about 7s. and 8s. a piece for fine fowls.

Mr. Jenkins: The price has been very much raised of late in South Wales.

Mr. Brooke: I may say that I have just returned from South Wales, where I have established this system. We have one man there who is carrying it out to some extent, and his poultry costs 2s. and 2s. 6d. each. Then at Llandilo there is a man to whom I have introduced this system, and he is carrying it out to a certain extent; but the people are so stubborn you cannot get them to have faith in trying a new system. I have no hesitation in saying that it is quite possible for me to go down to any part of England, and show the system myself, as I did in Wales, and make such an impression as will induce people to try it; but, if you introduce it to one or two, they always want to keep it to themselves. We rather believe, however, that we should be invited down; if we are willing to do people a service, the least thing they can do is to pay travelling expenses, and if that were done I should be very glad to spread this knowledge as widely as possible.

The Chairman: Can you suggest nothing to the Royal Agricultural Society, in order to spread this knowledge which you have acquired?

Mr. Brooke: The only way in which it could be done would be by giving me an opportunity of speaking, or giving a kind of lecture, and then let them put questions, and then let it be printed and made public by the press throughout the country. I should have very great pleasure in doing it, because then it would be published in an authorised manner. For instance, I think of going down to Boston, in Lincolnshire, but unless something of this sort is done, one has to introduce oneself, which is not the most pleasant thing in the world. If something were done beforehand it would attract public attention, and show them exactly what to do.

The Chairman: I understand, from what you say, that notwithstanding the climate and soil of England, you are of the opinion that the production of poultry might be very much increased under better management.

Mr. Brooke: Certainly; I am quite certain that the supply of

R. Fnlton. Highly Commended, D. Greengrass, Harleston, Stowmarket; H. Yardley, Birmingham; D. H. Feltham.

CAGE BIRDS.—Canary (Any colour).—First, Second, and Highly Commended, T. Fenn, Ipswich. *Goldfinch or Any Variety*.—First and Second, T. Fenn. Highly Commended, J. Clover, St. Helen's, Ipswich. RABBITS.—First, G. Jones, Birmingham.

The Judges were the Rev. T. L. Fellowes, Honnington, Norwich, and Mr. Harry Adams, of Beverley.

CROOK'S IMPROVED PORTABLE HEXAGONAL CHICKEN-FEEDING FOLD.

THIS takes to pieces for packing away. The object is to enable young chickens to feed without being disturbed by the older birds. The doors at the sides are made to slide, in order to accommodate chickens of various sizes. It is also useful as a lattice coop to place a hen and chickens under. The same principle is carried out for clamping the lower portion of trees in orchards, shrubberies, &c. Total size, 6 feet in diameter.

We found the necessity for such an article in our yards, for where there are quantities of stock of all ages and sizes feeding, it is, of course, necessary to feed the young stock upon food, such as groats, &c., which is somewhat expensive, and quite unnecessary for adult poultry. By using these folds the most expensive kind of food can be placed within the fold without fear of the old birds disturbing or trampling upon the young, or eating the dainty morsels intended for the latter.—E. & F. CROOK.

HOUDANS.

In your impression of July 2nd, under this heading, you give a translation from "Le Poulailier," of M. Jacque, in which the extreme delicacy and sudden failing of constitution in Houdan cocks is mentioned. This is in direct opposition to my experience of four years concerning imported and English-bred birds kept in confinement, and even in a cold, damp situation. I can safely class them with the Cochin and the Brahma in hardness of constitution, and freedom from disease, even in a yard where roup broke out fatally amongst Game Bantams.

In the Journal of the 2nd of October of last year, you say, that "fowls without five claws are not Houdans." My experience is, that five-clawed and heavily-bearded birds will throw occasionally four-toed and beardless birds, although I have never had any without the topknot. The same thing as regards the toes is found in the Dorking.

In crossing Dorking and Brahma hens with Houdan cocks, I have produced precocious and heavy birds of dark plumage, with almost invariably strong short black legs.

I shall be glad of the experiences of other breeders, as I look to the Dorking-like features and hardihood of constitution in these birds, either by themselves or by judicious crossing, to supply the place of the Dorking on damp, cold soils, and to add materially to our food birds.—GEORGE MANNING.

ANTWERPS—DRAGONS.

My signature has quite misled "WILTSHIRE RECTOR." With the exception of the example I mentioned of the Antwerp

rearing in Belgium, I wrote entirely as a "thorough English fancier," and I have already a supporter in "J. I. B." I do not know much of German ideas respecting Pigeons; but in passing through Germany eight years ago I observed that, with the exception of the Antwerps and some of their "new varieties," they possess nothing we can envy them for, though in a future communication I shall prove that we can well envy other nations their "pets of beauty," the most remarkable of which I believe I introduced to English fanciers. So I quite agree with "WILTSHIRE RECTOR" in this. But what about the points of the two breeds in question?

I have stated distinctly the points of the "show Antwerp," compared it with the Dragoon, and proved that it is far superior in colour and points, and I am ready to substantiate this by comparison of birds. We have Antwerps blue as the best Blue Dragoon, with intelligent broad heads, in shape as a well-enlarged Bullfinch, and in carriage as graceful as any Dragoon. So, as long as we have all this, besides three additional excellent colours, and the improvement from the idiotic head to the intelligent form of the "show Antwerp," adding the great property of flying and the most valuable of feeding, what else do we desire? Can "WILTSHIRE RECTOR" corroborate his statements by comparison that they are birds of "no colour or points?"

I believe I am quite correct in saying that two-thirds of the fanciers in England possess Antwerps, and necessarily all who keep Toys for feeding purposes. Is it just, then, to exclude them all from exhibiting what in their estimation is worthy of attention because the author of "Pigeons" and "WILTSHIRE RECTOR" dislike them? I beg to refer him to a book called "Le Pigeon Voyageur Belge," by F. Chapuis, Doctor of Medicine and Natural Sciences. It treats on nothing but the Antwerp! But let us suppose that the Antwerp is not sufficiently interesting yet in appearance, let us exert ourselves to make it so. Has not encouragement made the Carrier what it is—a Pigeon not more like its Persian ancestors than the Antwerp is? and I can name a host of other breeds likewise.

I have visited the great Dragoon and Antwerp fancier I alluded to, and asked him, "What would you take for the best pair of each breed?" "It is a puzzling question," he said; but if I am to answer it I should want more for the best pair of Antwerps." And I am quite certain that he possesses some of the finest Dragoons ever bred.

Is "WILTSHIRE RECTOR" aware how many young Blue Carriers obtained lately at our shows prizes in the Dragoon class, and when older move on to the class of their superiors? "WILTSHIRE RECTOR" must have forgotten that the only fancy Pigeons we can fairly call English breeds, though not of that origin, are the Carrier and Shortfaced Tumbler? The first of these does not "take" abroad. The second is greatly and justly admired wherever it is introduced, and I intend to introduce these birds into Africa. Further still, he must have forgotten, or he would have never written, "We love in poultry and Pigeons to breed pet birds with fine and remarkable points and properties, &c." Where should "we" have been but for the importation of all the "fine and remarkable pet birds," with the exception of the Shortfaced Tumbler? Or does "WILTSHIRE RECTOR" call the Carrier or Dragoon pet birds? If so, we shall always differ, not because nations should do so, but because the majority of my fellow English fanciers, so far as I am informed, do.—A FOREIGNER.

GAS STOVE IN CANARY AVIARY.

My friend Mr. Blakston has done the state much service by his letters on Canary-breeding, but I am certain that he has made a mistake in his idea about a gas stove in the breeding-room, and I hope he may not find it out to his cost.

Gas in rooms where Canaries are kept is the very worst thing you can have. I appeal to other breeders. Messrs. Hawkins, Doel, Tully, Walter, *cum multis aliis*, will bear me out.

Gas makes birds soft-feathered, injures their lungs, and sends them into moult, to say nothing of the mischief it causes when it goes out in the night. A man in Manchester, high up in the mystery of Canary-breeding and showing, had a magnificent stud of Belgians, and in his breeding-room he had a gas stove. One morning he found all his stock, nurses and all, dead; there they lay (£50 worth), aristocratic Belgians with heads like peas and necks like giraffes, plebeian nurses with their charges, all stiff and cold. The gas had gone out, returned, and smothered

them all. An open fireplace is the best, if a fire must be had in the room.—HOWARTH ASHTON, *Polefield Hall, Prestwich.*

LIGURIAN BEES.

LAST year I had to send you a rather doleful account of the casting of my Ligurians in spite of all inducements to get them to store honey instead. Now I have pleasure in sending you a very different account. I have had eight strong stocks flying all this season, and at the present time there are four artificial swarms in addition, but I have not had a single swarm in the usual way. The bees have been so much under control that I seem to have been able to make them show symptoms of swarming or otherwise at pleasure. Without troubling you with particulars, I may state generally that my success is due to giving more facilities to the bees in passing from the stock hive to the super.

I am working almost entirely with the Woodbury hives and double-glassed supers, and cannot speak of them more highly than I think. The insect is under entire command for all purposes. On the 9th ult. my best hive consisted of the stock and three supers, the total height of which was 27 inches. I was able to remove the middle super, which contains 32½ lbs. nett of the purest honey, and the comb is all sealed. I am sanguine about obtaining another 35 lbs. from the remaining supers. The queen is not yet thirteen months old, as she came off with a second cast on the 19th of June, 1867.

In this portion of Cumberland we have had four weeks of good weather for bees. My first fruits from three hives in one day were more than 70 lbs. We are now suffering much from drought, and it is telling upon the white clover, on which we mainly depend for honey.—E. B., *Broughton Parsonage.*

THE BARON VON BERLEPSCH ON FOUL BROOD.

FOUL brood is either the dying, putrefying, and ultimately drying-up in the cells of the unsealed larvæ, or, more generally, of the larvæ which are already sealed. This disease varies considerably in its character, assuming either a contagious or a non-contagious form.

NON-CONTAGIOUS FOUL BROOD.

This may proceed from various causes. Thus some of the brood perishes when, from driving out a swarm, or by the transposition of its hive, a colony has been so weakened that all the brood can be no longer properly nourished or warmed. It may also occur in the spring if, after eggs laid by the queen in the lower parts of the combs have been hatched, a sudden change of weather constrains the bees to withdraw, and the larvæ there becomes chilled. Destruction of brood from this cause was observed as early as the days of Columella.

The food on which the larvæ are fed may also sometimes be of a deleterious quality, and cause death. Thus Spitzner relates—"In the spring of 1781 I had placed thirty colonies in a forest, where whortleberry bushes were in profuse bloom. When these colonies were brought home I observed that about 6 inches of the lower portions of the combs were perfectly black, and all the larvæ in the cells dead. The bees, however, speedily removed the defunct larvæ, and eight days afterwards I found the black cells replenished with brood, which matured in due course."

Hoffman-Brand says, "In the year 1851 the Fir trees here were greatly devastated by vast numbers of a species of caterpillar. After these had died, Wunscho, the forester at Tiefenfurh, observed that those Fir trees were frequented by bees, and soon after foul brood made its appearance in his hives. The cells of one comb containing foul brood were altogether black. Similar facts were communicated to me by Mr. Sommer, of Neuhammer," but in neither case had any further evils ensued.

Sometimes the bees will remove the defunct brood from the cells before it becomes putrid, whilst at other times they permit it to remain until it is completely dried up.

This non-contagious foul brood is generally of no importance, being confined to the brood originally affected by it. Whether under peculiar circumstances it may not sometimes assume the contagious character, or whether contagious foul brood may

not occasionally be developed from it, will be considered in another section.—A. VON BERLEPSCH.

(To be continued.)

SILKWORM-REARING IN ENGLAND.—No. 13.

The Mount and the Crop, continued.—When the worms are mounted all dirt should be drawn out, rolled up with the papers, and carried from the room. When the insects are tolerably well enveloped in silk, air may be more liberally admitted if the temperature is not below 65°. A close heat of 80° or 90° would force the worms to violent quick work, injurious to the compact disposition of the silk of the cocoon. The sun should not be allowed to shine on the working worms or the silk, as it would discolour the latter. Air is of more consequence in proportion as the little workers become covered with silk, and to withhold it would in all probability cause the black negro disease, what I term the "cholera," because worms dying of it become black and putrid.

The cocoons are completed in four or five days, the change to the chrysalis state takes place, and about the eighth day the crop may be gathered; but before doing so cut a cocoon open to ascertain if the transformation is complete, for it is not desirable to collect the cocoons unless the worms are dormant.

The cocoons complete and containing the chrysalis, the crop has to be collected by taking down the spinning materials, beginning at the lower stages and being careful not to throw the cocoons carelessly down, otherwise the silk may be stained by the worms which have died from disease. The cocoons should be laid carefully on tables, the stages, or even the floor. The good hard ones should be placed in baskets by themselves, and the weak, imperfect ones by themselves. Any that are too soft to be reeled, or which are stained, should be put aside, and will serve for inferior spun silk.

Having collected and thus sorted them, the cocoons are to be freed of the floss or superfluous silk around them. This operation is performed up to the present time by hand; holding the floss by the finger and thumb and turning the cocoons round they immediately become clean and fit for the reel or sale. If for sale it is advantageous not to keep them at home a day, for they will lose in weight by keeping; if to be reeled at home, which in England for the present is likely to be the case, the work must be executed immediately before the chrysalises change to the moth state, or they must be destroyed if required for keeping to reel at a future time.

I shall speak more fully of the methods adopted in destroying the chrysalis and reeling the silk from the cocoons so as to be marketable silk, or such as is required by the manufacturer.

Producing Silkworms' Eggs, and their Preservation.—The best cocoons should be selected for egg-production, and such generally are those which are the first spun. They should not be over-large, but evidently hard, especially at their ends, with an indented circle round the middle. An excellent plan is to mount the most forward worms on a stage by themselves, and to keep them specially for producing eggs. I need hardly mention that when white silk is desired, a selection of white cocoons must be made, yellow, when yellow silk is wanted, and so on, the quantity being regulated by the number of eggs required. Generally speaking, a pound weight of cocoons will produce about 1 oz. of eggs.

It is necessary to provide as nearly as possible the same number of male as of female moths. The signs to distinguish them in the cocoon I have found uncertain, but more often than not the small cocoons contain males, and the medium-sized and large ones females, especially such as are most rounded at the ends and at their centres. The sex, however, will be known when the moths appear, for the females are larger, heavier, and less active than the males.

The cocoons should be cleared of their waste silk and laid on a stage or table, separating the sexes by guess.

The moths of the Japanese breeds come forth in eight or ten days after the completion of the cocoons, while the larger varieties are five or ten days more, according to the temperature. It is a custom among the Italian peasantry to string the cocoons by means of a needle and doubled thread. The needle must only just pierce the silk sufficiently to hold the cocoon, otherwise the life of the insect might be in danger from a puncture. The thread should be passed in at the middle of

the cocoons, so that when strung they may lie horizontally, for the moths come out at the ends. The cocoons can be hung perpendicularly by the thread to nails in a dry wall. There are simple contrivances made harp-fashion, with string or ribbons, by which the cocoons may be held somewhat firmly in position. I have tried the plan of gluing them to boards by merely touching them with glue, and laying them thereon until dry, when the boards can be set up against a wall, and this method answers admirably, for they are as firmly fixed as though in the place where spun, and the moths certainly make their way out much more easily than when the cones are left lying about, as is done by some persons.

As to the proper degree of temperature in which the cocoons should be kept, I have no reason to vary from that which I have recommended for rearing the worms; but when the temperature is naturally more than 70°, I should certainly admit more external air to the room, and apply artificial heat if colder, admitting less air, but I would on no account shut it out entirely, for the respiration of the insect is still going on within its silken habitation.

Silkworms' moths generally push through the cocoons after sunrise, about seven or eight o'clock, and it is then necessary to watch them, in order to keep the sexes separate, for although the cocoons may have been sorted, yet there are often mixtures. The best way is to take all the females gently by their wings, and place them on an inclined cloth or piece of calico until they have discharged a reddish fluid, which will have been done by the majority of them by half-past eight or nine o'clock, when the males are introduced to them. Any that have previously coupled must be left alone. Only just sufficient light should be admitted to the room to allow one easily to execute the work. The male moths are best kept in total darkness when practicable until wanted, for when exposed to the light they beat about. To couple the moths it is merely necessary to place them one by one near each other.

After the separation the males are put away, the females being left a few minutes to again discharge some fluid, after which they are to be removed on clean linen, suspended on the kind of stand I have before described, where they will quietly deposit their eggs. Many persons suspend from the wall of the room the linen, securing it by tucks, and pinning-up the bottom corners, thus forming a channel or receptacle into which any eggs, which sometimes fall, are caught and prevented from being lost on the floor. The only objection I have to this method is the perpendicular position which the linen occupies, and which is certainly not so convenient for the heavy insects as a sloping surface. An arm's length of linen will easily contain 2 or 3 ounces of eggs.

Should it happen that more females than males are produced, then the most vigorous males may be used again if kept till the next day.

Having produced the eggs, their preservation in a suitable manner is the next consideration. After a few days, when they have all changed colour, from the yellow which they exhibited when laid, to a dark ashy or violet hue, the linen is taken from the stand, folded up, put into an earthen pot, tied down with perforated paper and twine, and hung up in a cool, airy, but dry place, such as a cellar.

About October, when the weather is cooler, the jar may be removed to a cool, dry room—one up-stairs I consider best—where no fire is kept, and the temperature during winter does not fall below freezing point, or if there be danger of its doing so in December or January, a somewhat warmer position may be temporarily provided. If mild weather occur early in spring the pot and eggs should be again transferred to the cellar, unless there is danger from damp, in which case some other cool place must be selected. My object in being thus particular is to impress upon the reader that unless care be exercised in keeping the eggs as cool as possible without freezing from laying until hatching time, they would, especially in forward springs, be liable to hatch sooner than wanted, before there were leaves to feed the worms, and before the weather had become sufficiently settled. A good plan to protect them is to suspend the jar by means of a wire or cord from the ceiling, or the wall if dry.

It is customary to detach the eggs from the linen, and I think this operation is best performed about October, because the eggs are then more at rest than in the spring, at which season they should not be disturbed more than is absolutely necessary. The best method to detach the eggs is to put the linen and eggs to soak for twenty or thirty minutes in soft water which is cool, but above the freezing point. This softens

the gum and facilitates the operation of scraping off the eggs with a wooden or bone knife, or a large spoon. When they are off they should be washed with fresh water in a basin, gently turning them about with the hands for a few minutes. All the good or heavy eggs will sink, and the light ones floating on the surface may be poured off. The good eggs are then to be spread on a napkin in a cool room to dry, turning them over now and then with a spoon, and keeping them separate by gentle friction, otherwise they would stick together as they dried. When the napkin has absorbed the greatest portion of the moisture, the eggs can be transferred to another dry napkin. They will probably be sufficiently dry next day to be put again into the earthen jar, which should be tied down as before.

I do not think it would be advisable to place more eggs in a jar than would cover the bottom to the depth of half an inch, for great quantities together would be liable to heat.

Many persons assert that the eggs keep better through the winter on the linen, but I like the contact with the earthen vessel, which, being cool, tends to preserve them; and no more need be placed in the same utensil than is proper.

Silkworms' moths generally lay two sets of eggs, the first being the most perfect. If the moths are placed on fresh linen the second day they produce inferior ones. This is or was the secret of producing the famous breeds of Bergsma and Brescia in Italy. It is not probable that all the moths will come forth on the same day, although the worms mounted together. During coupling they should be often looked at, and any that separate should be put on one side a short time to be used again. Some of the moths lay as many as five hundred eggs, but the average, I think, is about three hundred. The eggs, as already stated, are yellowish when fresh laid, but if good grow darker, and lastly assume a violet tint, which they retain until near hatching.—LEONARD HARMAN, JUN.

OUR LETTER BOX.

BOOK (A Survey Bee-keeper).—You can have "Bee-keeping," free by post from our office, if you enclose five postage stamps with your address. It contains what you require. A new edition is in the press.

CHICKENS DROOPING SUDDENLY (A Young Farmer).—If your chickens were not penned in the yard and rick-yard, we should say the complaint originated from bad flooring, but the earth is the best of floorings. The swollen legs and other symptoms arise, no doubt, from cramp, but where does the cramp come from? Your description does not tell us, nor can we help ourselves. Poisons would have the same effect. We are not friendly to the rubbish that is given to poultry under the name of small wheat, chickens' meat, &c. That which we have seen is made up chiefly of dirt. House scraps are good if any nourishing particles are allowed to remain in them, and we are thus particular because the bill of fare is not a tempting one. It does not speak of good food, and not only chickens cannot thrive without it, but the lack of it induces them to search for and eat all sorts of substitutes; many of these are, no doubt, instrumental in causing the prevalence of such complaints as you name. Having to guess at that which causes the evil, we have to suggest something that will remove it. When chickens have a rick-yard to live in they have many helps to health, but few to food. We advise you, then, to feed them more liberally than you have done. Let them have bread, some chopped egg, and bread and milk frequently, till they are three weeks old. If they have no access to green food, let them have heavy sods of growing grass. Discard the small wheat, except to throw a handful down to amuse them now and then. Feed twice a day with good barley or oatmeal, slacked with milk, if possible. In the middle of the day give some whole corn; but chickens must not be left to themselves at the early ages you mention. Thus, we believe, will prevent all maladies.

FOREIGN FOWLS (Egypci).—The Guelldres and Bredas are very useful fowls in their way, but are not destined to a great popularity in this country. As soon as we have time we will give the principal points of all the French breeds. Those called Bredas now were well known in England, and imported from Holland thirty years ago as "erow fowls." The Guelldres is only the same fowl of a different colour.

CIDER (An Old Subscriber).—No sugar is added to the expressed juice of the Apples by the cider manufacturers in Devon or Somerset, yet their cider keeps well.

POULTRY MARKET.—JULY 15.

When melting heat and scorching sun come on dead poultry, only that which is killed carefully, with strict knowledge and observation of all that is necessary for its arrival in a proper state, will enable one to realise the prices that are made by fresh parcels. It is when the careless sender finds his goods condemned by the clerk of the market, that the careful sender finds he reaps the reward of his painstaking and of his knowledge.

From observations taken near London during the last forty-one years, the average day temperature of the week is 74.2°; and its night temperature 50.7°. The greatest heat was 92°, on the 25th, 1841; and the lowest cold 32°, on the 23rd, 1863. The greatest fall of rain was 1.89 inch.

THE VERBENA, SPECIES VERSUS VARIETIES.

ELDOM is it that the points aimed at by the florist and flower gardener are alike, more often they run in direct opposition. The florist tries all he can to obtain a flower so constructed as to comply as nearly as possible with an ideal standard which he has set up, regardless of the number of flowers or the habit of the plant. On the other hand, the flower gardener wants a plant of good habit that will supply him with the greatest number

of flowers in close succession for the longest possible time. Sometimes an attempt is made to unite these two qualities in one, but it is not often successful; either the one or other feature is regarded as the more important, and it rarely happens that a plant producing flowers of the most approved colour or shape furnishes these flowers in such numbers as other plants of a kindred kind less improved by hybridisation, or any other mode adopted for the purpose; and much as such improvements have done for us in the way of furnishing additional colours in plants that in a natural state presented only one hue, there are, nevertheless, instances in which the tints of the original cannot be surpassed for brilliancy.

I may ask if the best scarlet Verbena known is any advance on the original imported one *V. melindres*? Certainly in point of habit and constitution many are in the rear of it; and as these notes are mostly directed to the culture of this plant, its rise and uses in the flower garden, and, shall we say, its decline? perhaps it may give offence to some of its best friends to say this, but it certainly held a higher position in the flower garden ten or fifteen years ago than it does now. If this is not a decline of popularity it is a proof that other plants have eclipsed it, which is about the same thing; and as there is a feeling setting in to disregard what florists call "quality" in many of the occupants of the flower garden, we may yet hope to see the hitherto disregarded qualification of constitution more attended to than form in the Verbena, and in so doing we may obtain plants capable of withstanding the attacks of mildew and other enemies which mar the appearance of many of the best beds of Verbenas. In quest of this we must go back to some of the original species of this genus, and perhaps we may find some of them even in their normal state far from despicable objects; in fact, it is a matter of doubt if some of them do not excel their progeny in many of the points which are now of importance.

Of the earlier species or varieties of Verbena my recollection of Verbena *venosa* is the oldest. This was followed by *V. pulchella*, and subsequently by *V. melindres*; the last-named, I think, in 1829, although it might be known elsewhere before that time. About half a dozen years afterwards a pink one presented itself under the name of *V. incisa*, which was speedily followed by a white one of strong vigorous habit, called *teucrioides*, contemporary with which was a sort of annual one called *V. Aubletia*, also of a loose coarse habit. Verbenas began to multiply about 1838 or

1839, a deep rose-coloured kind called *Tweediana* being amongst the first that I can call to mind, and some little surprise was felt in the floral world by a yellow one being announced; unfortunately, however, it proved to be only a dirty white. This was a time when the Verbena as a flower-garden plant was in about its greatest popularity, which might be said to be from 1840 to 1855. After the latter date the varied forms of the *Pelargonium* began successfully to compete with the plant, until in most places they have exceeded it. This, however, would not have been the case had the class of Verbenas of the present day been as vigorous in constitution as those in use twenty years ago, or the seasons less favourable to their growth now than they were then. One or other of these causes has lessened the services of the Verbena as an ornament in the parterre, and it is not likely to regain its place unless a class of plants adapted to the requirements of the times be forthcoming, and to accomplish this the standard of the florist will, I think, have to be disregarded, and quantity not quality of the flowers be the order of the day, coupled with the improved constitution of the plant.

There are a few varieties which, I believe, have not gone out of fashion yet—viz., Emma, St. Margaret, *Atror sanguinea*, and Robinson's Defiance, with some others, and, with the exception of Purple King, I am not aware of any in general use at the present day that have continued so long in public estimation; but I expect that even where they are retained (if they really are so), they no longer exhibit the long-continued floral beauty they did at or before the time of the building of the first Crystal Palace. I am not sure that the same remark holds good with respect to all Verbenas, and it is with a view to call attention to those which really still continue to do well with us that I now write. As it is manifest that the better varieties, as they may be called, are more prone to succumb to the evils by which they are surrounded—insects, mildew, lack of vigour, and the like, a return to kinds that have done duty something like half a century with a character less sullied by these faults, must have an important claim on our attention, and even if these varieties, or rather species, possess not the required form of the florists' standard, they may approach much nearer to it than the small and insignificant bloom of *Tagetes pumila* does to that of the best variety of French Marigold, and in point of colour they may rival the best results of the cross-breeder's skill.

In urging the claims of distinct species on the gardening public, it will be seen that much variety cannot well be attained; but possibly something may be done by going back to them as direct parents for breeding from. The two species I here urge more especially on the flower gardening world are Verbena *venosa* and *V. pulchella*, the two very distinct, and both deserving more attention than they receive. The claim of the first-named was many years ago urged strongly by the late Mr. Beaton for the formation of shot-silk beds, and I believe Mr. Thomson, of Archerfield, uses it extensively in other ways. Its hardihood and other qualities entitle it to a more conspicuous place than it often occupies. *Pulchella*, although less grown, perhaps,

is still better adapted for many of the requirements of the present day, as nothing makes a more compact carpet than this, and its colour is distinct from that of anything else, although I do not assert it to be a good blue. For many years we have grown this *Verbena* here more extensively than any other, and I see no reason to discontinue its use; on the contrary, its utility is as apparent this dry summer as before in wet ones, and I expect when the failures of what are called the better sorts shall be fully known, this old, much-despised species will again rise into favour.

In urging the claims of these two *Verbenas* on the attention of the great bedding-out world, I by no means assert that they are fitted for all requirements, as they do not so conveniently adapt themselves to a narrow thin line as a *Pelargonium*, *Calceolaria*, or the *Perilla*; but when a great breadth is wanted nothing can be more suitable. *V. pulchella* I very often work into a band of 2 feet wide or more, and it seems to answer admirably. *Pulchella* almost deserves still more space, or to make a bed of itself or a mixed bed; in the latter case, if it should be deemed advisable to plant it along with a *Pelargonium*, choose the most robust-growing one, and let the *Pelargonium* plant be good, so as to have a start of the *Verbena*, otherwise it is liable to outgrow the *Pelargonium*, as it is a fast and strong grower, especially if the plants be obtained by the means I usually adopt—that is, from seed; those propagated by cuttings are less robust.

Although hardy, or nearly so, *Verbena venosa* is liable to be lost when left in cold, wet, clayey soils; so that it is better to raise a few plants every year, and for that purpose sowing seed is the most easy way, and when it is sown early in spring, say in the beginning or middle of February, the plants have time to become large enough to plant-out by the usual bedding-out time. Some I raised in this way in the present season were not more than two or three days at most in following the old plants that had stood two or three years in the same situation. Seedling plants are also more vigorous than those from cuttings, and I think flower quite as well. *Verbena pulchella* must be propagated from cuttings, which it furnishes most abundantly, and each cutting becomes a plant with very little trouble; besides which the plant often stands the winter, and supplies cuttings in any quantity in spring, but it is seldom that a whole bed escapes the severity of the season: therefore it is generally better to plant over again than trust to plants that have stood the winter, for I have seen them go off in April, after having supplied abundance of cuttings a month or two before.

Like all the family, the species *Verbena pulchella* has sported a little from seed, and soon after its introduction improved varieties of it were offered, but the distinction between them and the parent did not seem sufficient to entitle them to be regarded as improvements, and owing to the partial decline of the kind in favour, in consequence of its not easily bending to the form prescribed by the florist, but little has been done with it. A striped variety, however, is deservedly esteemed, and a white one was at one time in vogue, but it was only a poor white, and quickly fell into disrepute. The so-called yellow *Verbena* was also of this section, but not being what it was called, it was discarded quickly. Improvements, no doubt, may be made, and possibly hybrids may be obtained; but Mr. Wills, who furnished hybrids between *V. venosa* and the other varieties in general use in the flower garden, was not so successful as in some other things which he accomplished. His Velvet Cushion breed seemed not to prosper well in many situations, and in some presented a very sorry appearance, so that I believe the class is almost discarded. Perhaps, however, a better constitution might be thrown into such a cross, and a useful class of bedding plants secured.

Since the advent of *V. melindres* the plant has undergone many changes, and the modes of preparing it for the flower garden have altered considerably; at one time autumn-struck cuttings were those only thought worth planting-out, afterwards they were considered not so good as spring cuttings. The preservation of the plant in winter has also undergone considerable change. I once knew a gentleman so enamoured with some beds of *Verbenas* on his lawn that he had glass frames made in the autumn to fit them, in order to protect the plants during the winter, but it is rare that a bed that has done duty well one season does the same again; either the plants exhaust the soil, and they cease blooming, or, what amounts to the same thing, mildew sets in. A dusting of soot and sulphur, and a liberal application of liquid manure, may partially arrest this plague, but the fresh vigour of a plant

approaching maturity cannot easily be given to one past that point.

On this subject, however, enough has been written by others, and as I am advocating the claims of independent species of *Verbena* rather than writing on the culture of varieties, I need only conclude with again urging on those who have not grown the two species named to give these a fair trial, and I have no doubt but they will do so again. Since the ideal forms which the florist insists on so often result in a partial, if not total, failure in obtaining blooms as well, a more certain way seems desirable. The botanist sees as much beauty in the normal condition of a flower as when it has undergone transformation at the hands of the cultivator, and his views deserve attention as well as those of the critic of mere colour and form, more especially as the former generally insures a healthier subject and a more prolonged period of flowering. In the hope of these results being realised, I trust another season will witness my two favourite *Verbenas*, *pulchella* and *venosa*, more extensively cultivated than they have hitherto been, and if other species occur presenting us with the same hardy constitution as the above, in addition to a different colour, I, for one, would regard such an introduction as a great boon. A *Verbena pulchella* with a scarlet flower would be perfection itself.—J. Robson.

M. SOUCHET'S GLADIOLUSES.

SINCE I last wrote on this flower, I have had the opportunity of seeing the famous collection of M. Souchet, at Fontainebleau, though, of course, not in bloom. I shall have something to say of them by-and-by, but wish to take the earliest opportunity of making known his request, that any real lover of the flower who may happen to be in Paris from the 10th of August to the end of the month, would favour him with a visit. This is no commercial matter with him, as he does not sell any of his bulbs, except to four Parisian Houses, and they take all he has to dispose of, so that he would be none the better if all the *Gladiolus*-growers in the kingdom visited him. The invitation is given from the love he bears to the flower, and from the thorough amiability of his kindly nature. He wished me to give this invitation as freely as possible, and I can assure any one who may accept it, that they will receive from both Monsieur and Madame Souchet the most open-handed hospitality. One only regrets that owing to bodily infirmity, it lies not within our power to return it, as he is unable and unwilling to leave his home even for one day.—D., Deal.

NOTES ON STRAWBERRIES.

ANOTHER Strawberry season is over with us, and I may also say a peculiar one. Owing to the long-continued dry scorching weather a just estimate could not be arrived at of new or unproved varieties. Where copious waterings have not been resorted to, the fruit has been very small and the flavour indifferent; but where the plants were well supplied with water, and the beds mulched with short frame dung or litter immediately afterwards, the fruit swelled to a very large size, even where the crop was abundant and no thinning of the fruit was resorted to; and what is noteworthy in exceptionally dry seasons like the present, all the varieties ripen nearly at the same time.

In August last year I planted out young runners of the following varieties in order more fully to prove them, and also to note the date of ripening—viz., Sir J. Paxton, President, Eclipse, Premier, Sir Harry, Sir C. Napier, Duc de Malakoff, British Queen, La Constante, and Dr. Hogg. Out of that lot President, Sir J. Paxton, and Eclipse were the first to change colour; Sir J. Paxton and La Constante continued longest in bearing. I selected these ten varieties from my own observations made under various circumstances last year. I have grown Eclipse two seasons, and Duc de Malakoff four, but I will omit both next season. Eclipse is an abundant cropper, but is wanting in flavour and appearance. Duc de Malakoff has a fruit of the largest size, but it is soft and seems to spoil as soon as it is ripe.

To the eight varieties which I have retained I will add for next season Lucas, Mr. Radclyffe, Admiral Dundas, and Frogmore Late Pine. The last named seems to be a very fine Strawberry; it is of the largest size, and a most excellent dish of it was exhibited at the Royal Botanic Society's July Show. At that date (July 1st), all the best Strawberries were picked here. I picked the best dish of Dr. Hogg on the 17th of June, and

the best dish of President and Sir J. Paxton at the same time. The plants were grown under exactly the same circumstances.

As I detailed fully my method of culture in the Number for July 18th, 1867, I will only add, that I have found Black Prince to be the best for early forcing up to the 1st of February, at which date I introduce Sir J. Paxton, followed by any of the other varieties which I have named, and this season I had not a single "blind" plant. I commence to pick from the orchard house and ground vineries three weeks before any berries are gathered out of doors.

The following varieties are well adapted for orchard-house cultivation, and ripened their fruit in the order in which they are named—viz., First, Sir J. Paxton, President, one of the best for pot culture in the orchard house; Premier, Sir Harry, British Queen, La Constante, and Dr. Hogg. The last named was the last to ripen, but La Constante continued longest. I gathered a dish of that variety after all the others were done. I would again recommend ground vineries for obtaining a few dishes of early fruit. They are of the simplest construction and any carpenter could make them from a pattern, or from information which has already appeared in your columns.—J. DOUGLAS.

APRICOTS.

July 16th.—For the last fortnight we have been quite satiated with Apricots, the crop being so abundant, and the hot weather ripening them so rapidly, for even the Peach Apricot is now ripe. Besides my old trees, which have been crowded with fruit, I have had some twenty or thirty seedling trees five or six years old full of fruit. As many of these are from early kinds much interest was felt in them; but although no two are alike, and all have given rich and juicy fruit, no very early sort, except, perhaps, one, has proved superior to such sorts as the Early Moorpark and the Oullins Early Peach. It seems, indeed, as if the very early Apricots produce from seed sorts of a contrary nature, for the Sardinian, the earliest of all, the Musch Musch, nearly as early and of the same race, having nearly white flesh, and the St. Ambroise, have all produced seedlings giving fruit inclined to ripen later than any other kinds. In particular, a seedling from the Sardinian has fruit four times the size of those given by the parent tree, of the same cream colour with white flesh, and, stranger than all, ripening from four to five weeks later than its parent.

Another variation from the usual routine of nice juicy Apricots, which all the seedlings seem to give, is one about the size of a medium-sized Orleans Plum—a lump of sugar and delicious mouthful, with a slight pine-apple flavour. It will, I think, require long perseverance to raise valuable kinds of Apricots from seed and a sort of breeding in continuation, by which I mean taking a variety and sowing the stones from generation to generation till some kind distinct in its character is produced; which I may exemplify by stating that I shall continue the race of my late seedling Sardinian Apricot, and when the trees raised from it produce fruit I will sow their stones, and so on from each generation. This I am inclined to call breeding in continuation (perhaps a better term may be found); and from an inclination I have seen in varieties of fruit raised from seed to revert partially to the characters of the first parent, I have some hope of raising a very distinct kind of Apricot with large fruit ripening very early in the season, and in other instances producing a very late variety. There is no hope of raising better mid-season varieties than the Peach and Moorpark, because they are perfect.

I may, perhaps, be excused for stating how to eat these sorts in perfection. When gathered from trees under glass they should be suffered to hang on the tree till the skin is slightly pucker and the fruit drooping from the stalk—if then gathered, and, to quote old Isaac Walton, "handled gently as if you loved" it, a Peach Apricot is the most perfect of all fruits, so rich, so melting, and so juicy.

In addition to the large crop of Apricots from trees in pots, I have had such an abundant one from two trees planted out in the hard unstirred border of one of my orchard houses, that it has led me into a little speculation of what can be done in Apricot culture. One of these trees is the Royal Apricot, a half-standard, the other the Peach Apricot, with a stem a little under 6 feet in height. The former ripened its fruit about the 10th inst., the latter is just now ripening its crop of fine fruit. The first produced a peck, the latter will give a peck and a quarter or thereabouts. A house of the size in which these trees are growing, 160 feet by 24, will hold three rows of trees—one row of standards in the centre, and two rows of half-

standards in the side borders at 5 feet apart—a total of sixty trees. The heads of such trees will require careful summer-pinching, or their branches will become naked at foot and apt to be broken down with the weight of fruit. The trees thus managed will have sufficient room at 5 feet apart for eight or ten years, till they are capable of bearing from three to five pecks each. Every alternate tree may then be removed, and the others still under summer-pinching will bear from one to two bushels per tree. I should add that till the standard trees come into full bearing large quantities of fruit may be grown on trees in pots placed among the standards.

A house for Apricot culture on standards and half-standards planted in the borders should be 6 feet high at the sides and 15 feet high in the centre. If any of your readers would like to see the commencement of a method of Apricot culture likely to be very profitable they are most welcome.—T. RIVERS.

THE ROYAL HORTICULTURAL SOCIETY'S LEICESTER SHOW.—JULY 16TH TO 22ND.

THE great provincial Show of this Society, held in conjunction with that of the Royal Agricultural Society of England, had this year for its scene the ancient and busy town of Leicester. On the south side of the town a space of five acres adjoining the Agricultural showyard was set apart for the Horticultural Show, and on it five immense tents served to contain one of the most extensive displays of flowers and fruit ever witnessed in this country; for although some of the subjects of exhibition were not so fine as we have seen them before, it must be remembered that the extreme heat of the season has necessarily shortened the duration, and detracted much from the freshness of floral beauty. To compensate for this drawback, however, there were magnificent fine-foliated plants in abundance, and multitudes of graceful Ferns, most refreshing to the eye, wearied by the constant glare of a burning sun. Leaving, however, the details of exhibition to the subjoined full reports, and in the absence of precise information as to the number of visitors which thronged the Show in the latter days, we can only state our belief that the great Show which has just closed will prove one of the greatest successes financially, as it was horticulturally, that the Society has yet obtained, and that it will demonstrate that the holding of provincial exhibitions from year to year is one of the best modes of increasing the love of horticulture, and extending the Society's influence and benefits.

STOVE, GREENHOUSE, AND FINE-FOLIATED PLANTS.—Many of the fine-flowering specimens usually exhibited earlier in the summer are now out of bloom, and those not so could not, after such a long continuance of hot dry weather, be expected to possess that freshness which under other circumstances they would have done; still these, with some reinforcements from later-flowering plants, made an excellent display, which was all the more effective from their being for the most part grouped with fine-foliated plants.

The two collections which competed for the principal prize in this division—namely, the Royal Horticultural Society's special prize of £25 for the best and most effective group of ten fine-foliated and top flowering plants, were arranged in the centre of the large round tent. They came from Mr. Baines, gardener to H. Micholls, Esq., Bowdon, Cheshire, and Mr. Williams, of Holloway, the former being the prize-taker. Of flowering plants Mr. Baines had very good examples of *Genetia tulipifera*, *Ixora coccinea*, *Phenocoma prolifera* Barnesii, *Aphelocera*, a *Dipladenia* and *Allamanda*, and *Erica tricolor* Holfordii, *Candolleana*, and *Fairriana*, all three in very good bloom, but exhibiting much tiring. His fine-foliated plants consisted of handsome specimens of *Gleichenia flabellata*, *Rhipsalis caradwanse*, and *Croton angustifolium*, a tabula of *Sarracenia purpurea*, probably unequalled in this country, and certainly such as only Mr. Baines has exhibited, *Sarracenia flava*, *Verschaffeltia splendens*, one of the noblest of all the Palms, *Dicksonia antarctica*, with a thick trunk and pendulous head, *Cordyline indivisa*, *Dasylium acrotrichum*, and *Theophrasta imperialis*. The collection of Mr. Williams, which was awarded a second prize, contained many remarkably fine specimens, and ran that of Mr. Baines closely. In it were *Allamanda Aubletia* with large flowers of a more intense yellow than those of either *A. Schottii* or *grandiflora*, the large-flowered *Allamanda Hendersoni*, *Dipladenia crassifolia*, *Kalosanthes Phoenix*, a showy mass of rosy scarlet bloom; a finely bloomed plant of the white-flowered *Erica oblata*, *Phenocoma prolifera*, *Statice imbricata*, *Erica Cavendishii*, *Dracophyllum gracile*, dingy, like all the other specimens of the same plant which were exhibited. The fine-foliated plants in this collection consisted of noble specimens of *Dracena indivisa*, *Caladium Lowii* with its metallic-looking leaves beautifully veined with white, the variegated New Zealand Flax, *Dasylium plumosum*, the leaves of which are shred at their extremities into a sort of small plume; *Croton angustifolium* and variegatum, *Dion edule*, *Pandanus utilis*, and the variegated *Aloc-*

leaved Yucca, the remaining plant to complete the ten being *Lantana borbonica*.

A prize of £10 was also offered by the Duke of Rutland for the best twenty stove and greenhouse plants grouped for effect, and to this a second prize of £5 was added by H. C. Bingham, Esq., of Warraby Hall. The former was taken by Mr. Williams, who had a remarkably fine *Cyathus princeps*, *Thrinax elegans*, *Allamanda Schottii*, and *Hendersonii*, which are very much alike, the large showy-flowered *Platoma elegans*, *Dipladenia amabilis* and *Houtteana* in fine bloom, *Hoya bella*, several finely-bloomed *Heaths*, especially *Erica Parmestieri rosea*, Jacksoni, and Bandoni, *Phorocoma prolifera*, *Aphelexes*, *Isorosa*, *Kalosanthes coccinea superba*, and *Imantophyllum miniatum*. T. Charlesworth, Esq., of West Lodge, Leicester, who received a third prize, had *Alocasia metallica* in beautiful condition, several fine *Caladiums*, a fine *Cissus discolor*, *Anthurium magnificum*, *Gymnostachyum Verschaffeltii*, *Calonyction sanguineum*, *Plumbago capensis*, and *Clerodendron fallax*.

The next class for stove and greenhouse plants was one in which three prizes were offered by W. Perry Herrick, Esq., of Beaumanor, Leicester, for the best six, not less than three to be in bloom. Mr. J. Bolton, gardener to W. W. Worswick, Esq., Birstall Hall, Leicester, was first with *Clerodendron fallax*, of compact growth and in splendid bloom, an excellent *Allamanda Schottii*, *Rhynchospermum jasmynoides*, fine specimens of *Caladium Bollymei* and *Cissus discolor*, and *Selaginella cœsia arborea* standing $3\frac{1}{2}$ feet high. T. Charlesworth, Esq., who was second, had *Clerodendron Thomsoni* Balfourii, which though not large was in good bloom, very good examples of *Plumbago capensis*, *Kocharis amazonica*, and *Caladiums*, of which *C. argyræa* was remarkably fine. Mr. Peachey, gardener to R. Hole, Esq., Quorndon Lodge, Loughborough, was third with good specimens of *Cissus discolor* and *Phlebodium aureum*.

The prize offered by J. Dove Harris, Esq., M.P., for the best collection of variegated and fine-foliaged plants was taken by Mr. J. Bolton, with well-grown plants of *Maranta roseo-picta* and *zebrina*, *Blechnum corcovadense*, *Adiantum tenerum*, *Alocasia metallica*, and others.

First and second prizes were likewise offered by A. Turner, Esq., of Bow Bridge, Leicester, for the best twelve stove and greenhouse plants, the competition to be confined to the county of Leicester. The first prize went to Mr. Peachey, gardener to R. Hole, Esq., for a collection in which there were fine specimens of *Croton pictum*, *Pandanus elegantissimus*, *Gymnogramma chrysophylla*, between $3\frac{1}{2}$ and 4 feet in diameter: *Cycas revoluta*, *Croton angustifolium*, not large but in fine condition; a charming plant of *Hibiscus Cooperi* with a few flowers, *Dipladenia amabilis*, *Pittonia argyrea*, and *Cyanophyllum magnificum* with leaves some 16 inches broad and 2 feet in length and in beautiful condition, though the plant itself was not remarkable for size. The second prize went to Mr. Barnett, Hinckley, for plants which though not large were very well grown. Among them were *Statice profusa* and *Vincas* in excellent bloom, *Alocasias*, *Marantas*, *Caladium Wightii*, and *Dieffenbachia maculata*. Prizes were also offered by T. Goadby, Esq., Bosworth House, Hinckley, for the best collection from the county of Leicester, and the first prize was taken by T. Charlesworth, Esq., with a collection consisting of *Ferns*, *Marantas*, *Sansevieria javanica*, *Aspidistra lurida variegata*, and other fine-foliaged plants, together with *Lilium lancifolium* and *Gloxinias*. No second prize was awarded.

The prize for the best specimen greenhouse plant, offered by G. H. Ellis, Esq., was awarded to Mr. Moore, gardener to E. Corah, Esq., of Leicester, for a plant of *Lilium lancifolium roseum*, which, though well grown and furnished with numerous buds, had only five expanded blooms.

We now come to the general prize list, and in the class for the best nine stove and greenhouse plants Mr. Williams took the first place with fine plants of *Allamanda Schottii* and *grandiflora*, *Kalosanthes Phoenix*, *Aphelaxis macrantha purpurea*, *Phorocoma prolifera*, *Erica amula*, *Erica corinthoides coronata*, a showy continuous-flowering kind, and other plants. The second-prize lot contained a fine specimen *Lantana*, *Pentas carnea*, and a small plant of *Clerodendron fallax*, with three splendid spikes of bloom.

For the best six the first prize was awarded to Mr. J. Bolton, gardener to W. Worswick, Esq., who had a well-bloomed *Allamanda nerifolia*, *Plumbago capensis*, *Clerodendron fallax* with six splendid spikes, *Yucca oculata* in fine bloom, and *Vincas roseas*. Mr. T. Lambert, Bramston House, Leicester, was second with, among others, a fine plant of *Swainsonia Osborni*, studded with its pretty rosy purple flowers, *Plumbago capensis* very good, and *Lilium auratum* with a dozen fine flowers. Mr. Barnett was third.

In the amateurs' class for the best nine fine-foliaged plants, Mr. Cruickshank, gardener to Lord Belper, carried off the first prize with a fine collection, in which the most noticeable plants were *Cycas revoluta* with a thick trunk, *Pandanus elegantissimus*, *Dracena ferrea variegata*, and *Alsophila excelsa*. The second-prize collection came from Mr. Bolton, and contained a *Cyanophyllum magnificum* with very fine leaves, *Maranta zebrina*, a handsome specimen of *Seneciothia elegans*, a fringing plant of the variegated *Pine Apple*, *Colens Verschaffeltii*, and *Pandanus*. Mr. Baines, gardener to H. Micholls, Esq., was third with a collection in which the most conspicuous plants were *Alocasia metallica* and *macrorhiza variegata*, *Croton variegatum* and *pictum*, and *Sarracenia flava*. E. J. Lowe, Esq., of Highfield

House, Nottingham, exhibited in the same class a fine plant of *Livistonia Jenkinsoni*, *Sansevieria javanica*, *Anthurium magnificum*, and *Cyperus alternifolius variegatus*. Mr. Bevan, gardener to E. F. Dawson, Esq., had likewise several good specimens.

In the corresponding class for nurserymen, Mr. Williams was first with a fine *Cycas revoluta*, a splendid specimen of *Lantana borbonica*, a magnificent *Croton variegatum*, *Dracena nimbicalifera*, *Dicksonia antarctica*, *Variegated Aloe-leaved Yucca*, and *Croton pictum*.

In the amateurs' class for six fine-foliaged plants, Mr. McLean, Donnington Park, Derby, sent fine specimens of *Cordylina indivisa*, *Pandanus elegantissimus*, and *Theophrasta imperialis*. Mr. Bevan, gardener to E. F. Dawson, Esq., had a collection in which there was a fine specimen of the beautifully variegated *Sanchezia nobilis*, and good healthy plants of *Lantana borbonica*, *Cycas revoluta*, *Lomaria gibba*, *Dicksonia antarctica* and *Blechnum corcovadense*. From Mr. Bolton, who was third, came a large and excellent specimen of *Colens Verschaffeltii* and *Pothos argyrea*. E. J. Lowe, Esq., was fourth, with a collection in which the most conspicuous plants were *Fittonia argyrea* and *Aspidistra lurida variegata*. Mr. Baines had a variegated *Yucca* and an *Ananassa*; his other subjects, quite different from the ordinary run of those shown as fine-foliaged plants, being *Dioscorea muscipala*, *Sarracenia flava* and *variolaris*, and a fine potful of *Anæctochilus intermedia*.

CALADIUMS.—For the best twelve of these, including *Alocasia* and *Colocasia*, Mr. Cruickshank, gardener to Lord Belper, Kingston Hall, took the special prize offered by the county of Nottingham. His collection contained a large *Alocasia zebrina*, a splendid plant of *Alocasia macrorhiza*, also one of its variegated form in beautiful condition, a fine *Caladium esculentum*, a large plant of *C. bicolor splendens*, *C. Belleymei*, and *C. Chantini*. Mr. Lowe had a collection, in which the most noteworthy were *Caladiums* *Chantini*, *pictum*, *Belleymei*, *bicolor*, and *Alocasia zebrina*.

DRACENAS.—Of these Mr. Williams exhibited *D. atrosanguinea*, *D. Cooperi*, a stately plant of *D. indivisa*, *D. lineata* also very fine, *D. Ehrenbergi*, and *Cordylina indivisa*. For these a first prize was awarded.

PALMS.—These were not numerously shown, but included some fine specimens. Mr. J. McLean, Donnington Park, Derby, was first with a fine *Lantana borbonica*, *Stevensonia grandiflora*, *Seafortia elegans*, and *Chamaerops humilis*. Mr. Williams was second with *Chamaerops Fortunei*, a very fine *Livistonia Jenkinsoni*, and good specimens of *Corypha australis* and *Thrinax elegans*. Mr. Peachey was third.

ORCHIDS.—For these there were two special prizes offered by H. L. Powys Keck, Esq., of Stroughton Grange, for the best collections of twelve. The first was awarded to Mr. Archer for a collection consisting of a large specimen of *Vanda terea*, a fine *Cattleya Leopoldi*, a large *Acridis odoratum* with ten fine racemes, *Acridis affine* with nine branching racemes at least 20 inches long, giving the plant some resemblance to a rosy cascade, *Acridis affine rubrum*, *Acridis Lurpentæ*, a magnificent *Saccolabium guttatum* with ten spikes, a mass of *Cypripedium barbatum* with nearly fifty flowers, the beautiful *Odontoglossum Pescatorei*, *Cattleya superba*, and *Dendrobium chrysanthum*. The second prize went to Mr. Williams, who had *Anguloa Ruckeri* with six blooms, *Dendrobium filiforme* with numerous pretty pale yellow graceful pendulous racemes, the new yellow and lemon-coloured *Dendrobium Bensonii*, *Miltonia spectabilis* with about thirty blooms, and a very fine *Cypripedium superbiens*. Among the other plants in this collection were *Acridis quinquevulnerum*, *Cattleya labiata pallida*, a very fine variety, *Cypripedium barbatum superbum* with twenty-nine blooms, *Vanda snavis*, and the pretty small-flowered *Phalenopsis rosea*.

In the amateurs' general class for six Orchids Mr. Baines was first with among others *Cypripedium Hookeri* and *Oncidium flexuosum* with several small spikes, which, however, were collectively effective. In the corresponding class for nurserymen Mr. Williams had a similar award for a collection consisting of *Vandas*, *Anguloa Ruckeri*, *Odontoglossum cordatum* with three fine spikes, *O. Schlieperianum* with three spikes of pale yellow flowers, and *Cypripedium superbiens* with a dozen blooms.

FERNS.—The exhibitions of these were very numerous, as well as the forms shown, and many of the plants were remarkably fine. The special prize given by L. Turner, Esq., for the best six greenhouse Ferns was taken by E. J. Lowe, Esq., of Highfield House, Notts, with fine examples of *Lomaria gibba*, *Neottopteris australasica*, *Pteris Kingiana*, and *Asplenium axillare*, *Fabianum*, and *lucidum*, the last large and very beautiful. A second prize, offered by J. Baines, Esq., went to Mr. Burnett, who had, among others, a fine plant of *Pteris scaberula*.

In the nurserymen's class for the best nine, the first prize was awarded to Mr. Williams, for fine plants of *Cyathus dealbata*, *Gleichenia dichotoma*, *Platycentrum grande*, *Cibotium regale*, *Dicksonia squarrosa*, *Lomaria gibba*, *Marattia elegans*, and *Gymnogramma chrysophylla*. In the amateurs' class for the same number, Mr. Bolton, gardener to W. Worswick, Esq., Birstall Hall, had a similar prize for a very excellent collection, conspicuous in which was *Adiantum cuneatum*, $3\frac{1}{2}$ feet in diameter. *Blechnum corcovadense* was also very large, having in fact a trunk. Fine plants of *Phlebodium aureum*, *Stenochlæna scandens*, and *Adiantum trapeziforme* were also shown in this collection. Mr. Baines, who was second, had also some fine plants, especially *Davallia ballata*, and *Asplenium foniculaceum*. Mr. Lowe was third, and Mr. Charlesworth fourth.

The best pair of Tree Ferns were *Dicksonia antarctica*, with thick black trunks about 8 feet high. Mr. J. McLeen was second with a pair of the same Fern, standing between 6 and 7 feet high up to the branching of the head.

The cup offered by the Mayor and town of Nottingham for the best thirty-six most distinct varieties of British Ferns was taken by E. J. Lowe, Esq., with a collection in which the following were conspicuous—viz., *Athyrium Filix-femina longirigense*, sagittatum, plumosum, Monkmanni most beautiful, being so graceful (and soft-looking, polymorphum; *Osmunda regalis cristata*; *Lastrea pseudo-mas cristata*, cristata angustata, and nitida; *Adiantum capillus-Veneris* Kalon, *Polystichum angulare Wakeleyanum*, *Scolopendrium vulgare*, digitatum, Lowe, 8, *vulgare deprano viviparum*, and *Asplenium adiantum nigrum gracileps*. Mr. Mapplebeck, of Woodfield, Moseley, Birmingham, also sent a fine collection, in which *Lastrea Filix-mas cristata angustata* and *florescens*, and *Scolopendrium vulgare crispum* were very beautiful. He had also five examples of *Athyrium Filix-femina coronatum* and *Fieldii*, as well as several others.

A prize, offered by E. J. Lowe, Esq., for the twelve most distinct abnormal *Scolopendriums*, was taken by himself with an interesting collection; and the same gentleman also exhibited a numerous collection of new forms, to many of which certificates were awarded. Mr. Lowe was also first in the class for the best twelve British Ferns, with *Lastrea semula*, *L. Filix-mas Jervisii*, *L. remota*, *L. rigida*, *L. thelypteris depauperata*, a fine specimen of *L. pseudo-mas cristata*, *L. dilatata cristata*, a fine panful of *Polypodium phegopteris*, *Osmunda regalis cristata minor*, *Athyrium Filix-femina imbricatum* Lowe, and *Scolopendrium vulgare flabellatum*. Mr. Mapplebeck was second with a fine collection; Mr. Staples, gardener to F. Harris, Esq., Leicester, and Mr. Earley, Digswell, being respectively third and fourth.

The special prize for the best twelve British Ferns, the exhibitor to be a resident in the county of Leicester, offered by J. Harris, Esq., was taken by Mr. Staples with neat well-grown plants.

LYCOPHYTES.—Of these charming examples were contributed by Mr. Bolton, gardener to W. Worswick, Esq., the kinds being *Selaginella denticulata*, *Wildenovi*, *stolonifera*, erecta, erecta compacta, and *cæsia*. Four of these had rounded heads, beautifully clothing the pans to the ground, the others being erect and placed at the back. The whole of them were very beautiful. Mr. Charlesworth, who was second, had also fine cones, 2½ feet high, of *S. denticulata*, *cæsia*, *denticulata arborescens* and *formosa*, the others being caulescens and *cæsia* arborescens.

HARDY ORNAMENTAL TREES AND SHRUBS.—The special prizes subscribed for these were taken by Messrs. Barron & Sons, of the Blavatton Nurseries, Bortowash; and Messrs. Harrison, of Leicester. Messrs. Barron's collection was most excellent and very interesting from its containing fine specimens of the newest Conifers, besides some of the best of the old ones, as well as new shrubs. In it were included *Elaeagnus japonica striatus*, the leaves centred with white and margined with green; *Cypripedium Lawsoniana stricta* forming a long tapering cone; a fine variety of Golden Holly; pignus Pines; *Retinospora pisifera aerea*, a fine golden leaved variety; *Abies Douglasii brevifolia*, very compact; *Pinus flexilis*, grotesque in appearance; *Retinospora obtusa aerea*, prettily tipped with a golden colour, very fine; *Arthrotaxus selaginoides*, the beautiful *Retinospora selaginoides*, *Picea Nordmanniana aerea* with well-marked golden variegation; *Abies Tsugana*, a little gem; *Retinospora pisifera albo-variegata*, looking as if spashed with white, *Thujaopsis dolabrata*, and several other handsome Conifers. Mr. Barron sent in addition a very extensive collection forming a long avenue from near the entrance up to the tents. This contained many fine specimens of Conifers and other trees and shrubs, and many pretty varieties and recent introductions. A plant of *Abies excelsa Clanbrassiliana*, a singular dwarf variety of one of the tallest of Pinuses, formed a fine dense mass upwards of a yard across, and such a plant could be introduced with excellent effect in a great many different situations. *Aucubas*, *Eunymnus*, *Berberises*, *Hollies*, both variegated and plain-leaved, Barron's Golden Yew, *Junipers*, *Retinosporas*, *Arbor-Vitæ*, *Raphanopsis ovata* and *Ligustrum coriaceum*, both remarkable for the great thickness of their leaves, were also included in this collection, as well as fine examples of *Cypripedium natkaensis*, *Picea Nordmanniana argentea*, with the foliage exhibiting a beautiful silvery tinge, and very effective; *Arthrotaxus laxifolia* and *cypripoides*, very fine; of *Arceuthobium imbricatum*, a large and remarkably fine specimen; and *Thuja antarctica*, forming a fine close pyramid. Messrs. Harrison's collection was also good though not so numerous as the above.

MISCELLANEOUS AND NEW PLANTS.—Of new plants Messrs. Veitch, of Chelsea, exhibited a large and very fine collection, for which they took the first prize in the miscellaneous class. It included *Crotons interruptum*, irregular, tricolor, maximum, Hillii, and Veitchii; *Coleus Scottii*, Rackeri, Batemanii, Bansei, and Saundersii; *Odontoglossum Kramerii*, *Thunia Bensonii*; several lovely Ferns, as *Davallia parvula*, *Leptopteris superba*, *Gymnogramma Pearcei*, and *Adiantum farleyense*; *Anthurium Scherzerianum*, the fine new *Caladium Chelsoni*, *Dracæna Chelsoni*, *Ampelopsis Veitchii*, which at Chelsea proves to be a valuable hardy climber, *Alocasia Chelsoni* and *Jenningsii*, *Retinospora plumosa*, a most beautiful plant, the white-flowered *Lapageria*, *Pitcher* plants, a handsome *Acalypha tricolor*, *Dalechampia Roeziana rosea*, and several other plants of recent introduction. Mr. Archer, gardener to A. Turner, Esq., Leicester, had the second prize for a

remarkably fine collection, conspicuous in which were the Bird's-nest Fern, *Adiantum traneziforme* and *formosum*, *Alocasia metallica*, *Gymnostachyum Verschaffeltii*, *Thrinax elegans* a splendid pot of *Lilium auratum* with fifteen large flowers, *Pothos argyrea*, forming an elegant cross-handled basket 3 feet in diameter in the longest direction, fine *Saccolabium*, and *Acerides*. Mr. Williams was third with a mixed collection, and among new plants exhibited new *Coleuses*, *Taxus fastigiata variegata*, which, however, did not show much variegation, *Dalechampia Roeziana rosea*, *Croton irregularis*, *Arachnæa moschifera*, *Trichomanes reniforme* and other new Ferns, *Coccos Weddelliana*, *Zamia Ghollinchii*, *Anthurium Scherzerianum*, *Ananas Portuana*, *Chamedorea Ernesti-Augusta*, which is a handsome Palm, and other plants, either rare or of recent introduction. A prize was also awarded in this class to Mr. Peachey for *Oxirandra fenestralis*, growing in a tub, and in a class for twenty succulents Mr. Geary took a first prize for a neatly-arranged collection.

FLORISTS' FLOWERS.

In those classes devoted to florists' flowers, it must be admitted that there was a falling-off in point of quality as compared with the show at Bury in 1867; in a few, however, the contents contrasted favourably with Bury.

FUCHSIAS were much inferior to those shown by Messrs. D. T. Fish and others in 1867. Mr. J. Staples in the amateurs' classes, and Mr. J. Smith in those for nurserymen, showed creditable specimens, but decidedly inferior to those generally seen at large provincial shows. A special open prize for six Fuchsias was taken by Mr. W. Staples, gardener to F. Harris, Esq., Leicester, who had well bloomed plants of *Souvenir de Chiswick* and *Prince of Orange*, dark kinds; *Blue Bonnet*, double dark; *Marchioness of Bath*, white corolla; and *Fair Oriana* and *Marginata*, light varieties. Mr. J. Smith, Loughborough, was second with *Reine Blanche*, *Annie*, *Rose of Castille*, and *Venus de Medici*, all light kinds; and Grand Admiral and *Gipsy Queen*, dark; the last a double variety. Mr. J. Burton was third. In Class 63 for six kinds, and Class 64 for the same number shown by amateurs and nurserymen respectively, Mr. J. Staples and Mr. J. Smith were first in each instance; the former having *Koderick Dhu*, *Agamemnon*, *Souvenir de Chiswick*, and *Lady Heytesbury*, dark kinds; *Rose of Castille* and *Madame Cornet*, light varieties. The other plants in this class were somewhat poor. Mr. Smith had *Gipsy Queen*, double dark; *Catherine Hayes*, single dark; *Conspicuum*, white-corolla; and *Rose of Castille*, *Annie*, and *Marginata*, single light varieties. In this class also the remaining plants were of but moderate quality. With three standard Fuchsias Mr. W. Staples was also first, having plants about 8 feet in height with good symmetrical heads well furnished with bloom; the sorts, *Souvenir de Chiswick* and *Gipsy Queen* (double), both dark kinds; and Mrs. Marshall, light. Mr. J. Bolton was second with much inferior plants that were unnamed.

The display of large-flowering and fancy *Pelargoniums* was very poor, the unfavourable weather, no doubt, operating much to their disadvantage; at the same time it would be legitimate to infer from the nature of the varieties staged that the science of *Pelargonium*-growing is in its infancy in the neighbourhood of Leicester, the pots unduly large, so that flower is sacrificed to growth of foliage, and large-flowering sorts miserably poor, with two or three exceptions. Mr. J. Bolton was first with both show and fancy kinds, having better varieties of the latter—viz., *Emperor*, *Lady Craven*, *Fairy*, *Queen of the Valley*, *Roi des Fantaisies*, and *Madame Sainton Dolby*. Second, Mr. T. Lambert, with *Emperor*, *Bridesmaid*, *Arabella Goddard*, *Evening Star*, and two others unnamed.

On the other hand, the method of showing the Zonal *Pelargoniums* would compare favourably with the great London shows.

In the amateurs' classes for twelve kinds Mr. J. Lambert had excellently grown and flowered plants, rather too flat in shape, and somewhat too formally tied out. The sorts were *Provost*, *St. Pierre*, *Clipper*, *Excellent*, *Rose Rendatler*, *Mrs. Wm. Paul*, *Adonis*, *Virgo Marie*, *Mons. G. Nabet*, *Bel Demonio*, and *Higgate Rival*. Second, Mr. J. Bolton with capital plants of *Mrs. W. Paul*, *President Johnson*, *Helen Lindsay*, fine; *Clipper*, fine; *Adonis*, *Cerise Unique*, *Tintoret*, *Madame Vaucher*, *St. Pierre*, *Eugène Mezard*, *Excellent*, and *Lady Rokeby*. Third, Mr. C. Moore. In the nurserymen's class Mr. J. Thorpe, of Littlethorpe, was first with excellent plants of *Jean Valjean*, very fine; *Tintoret* and *Excellent*, both with good heads of bloom; *Fairy Princess*, *Beauté de Suresnes*, *Mrs. W. Paul*, *Clipper*, *Gloire de Nancy* (double), excellently well done; *Adonis*, very fine; *Oriana*, and *King of Zonals*. There was no other competitor. Mr. J. Bolton was first with twelve *Nosegay* or Hybrid *Nosegay* varieties, having excellent plants of *Duchess of Sutherland*, *Lady Constance Grosvenor*, *Lord Palmerston*; *Miss Parfait*, a very fine variety that deserves to be better known; *Merrion*, *Prince Czartoryski*, *Le Grand*, *Magenta*, *Stella*, *Waltham Seedling*, *Benton's Indian Yellow*, and *Cyborist*. Second, Mr. J. Thorpe with a very good lot, having the following kinds distinct from the foregoing—*Violet Hill Nosegay*, a capital exhibition variety; *Rebecca*, *Startler*, *Fairy Princess*, *Lady Cullum*, *Sparkler*, and *Amy Hogg*, very fine. With six Zonal kinds, inclusive of *Nosegay*, Mr. J. Burton was first with *Excellent*, *Stanton Pareil*, a showy bright orange scarlet; *St. Pierre*, *Madame Vaucher*, *Eugène Mezard*, and one unnamed. Second, Mr. W. Bonlter, with *Amy Hogg*, *Beauté de Suresnes*, *Dr. Lindley*, *Rebecca*, *Gloire de Nancy*, and *Eugène Mezard*.

In Class 72 for six Variegated *Pelargoniums*, Messrs. F. & A. Smith, Dunwich, were first with capital grown and well-coloured plants of

Sanray, Retaliator, and Coronet, golden-edged Variegated Zonals; *Exquisite, a very fine new kind, Baoshee, and Miss B. Conita being very bright and effective.* Second, Mr. J. Thorpe with *Sunset, Mrs. Pollock, Mrs. Kingbury, a very effective silver-edged variety, Agnes, Flower of Spring, and Golden Chain.* Mr. J. Tomkins was third, and Messrs. Carter & Co. fourth. With six new variegated kinds sent out in 1867 Messrs. F. & A. Smith were again first with *Lenia Smith, L'Empereur, and D-fiance, golden-edged Variegated Zonals, and Impératrice Eugénie, Queen of Fairies, and Queen Victoria, silver-edged Variegated Zonals.* These were nice well-grown plants, compact in appearance, distinct, and effective. Second, Messrs. Carter & Co. with *Sir R. Napier, a fine and distinct kind, somewhat out of condition; Sophia Cusack, Princess of Wales, Anora, and Prince of Wales, all golden-edged Variegated Zonals; and Princess Beatrice, silver-edged Variegated Zonal.*

LILIUMS in pots were very well grown, though taller in growth than generally seen in such places as the neighbourhood of Leeds, &c., where they are especially well grown. They, however, formed a fine feature of the Show. In the amateurs' class for four plants the competition was good; W. Brookes, Esq., being first, Mr. J. Staples, second, Mr. T. Charlesworth third, and Mr. J. Bolton fourth. The sorts were the varieties of *L. lancifolium.* With six pots in not fewer than four kinds, Mr. J. Staples was the only competitor, having three varieties of *Lilium lancifolium*, and *L. auratum.* Strange to say, the open class for three *Lilium auratum* did not fill, but Messrs. Carter and Co. staged a grand lot, that exhaled a delicious fragrance through the crowded and heated tent.

CLEMATIS.—An interesting feature in the schedule was the class for the best three Clematises in bloom, grown in pots, but in this case there was no competition, though C. Jackmanni and others of the new kinds make admirable specimens for exhibition when grown in pots.

BEDDING PLANTS.—The special prizes offered by some Leicestershire gentlemen for the best display of ornamental-foliaged bedding plants, brought together some interesting collections, though it was to be regretted that the phraseology defining the class was qualified by the term display. Mr. W. Cunningham, Burton-on-Trent, was first with a large and varied group, grown in pots, consisting of some two hundred or more plants, in something like eighty species or varieties, nicely arranged, the dark-foliaged plants being placed among those of a whiter character to give relief, without being reduced to mere formality by an adherence to any particular plan. Some of the most striking were—*Polemonium caeruleum variegatum*, Sedums of kinds, *Veronica*s, several pretty variegated forms of the *Eranthis*s, some *Alternantheras*, variegated *Pelargoniums*, *Colerases* of kinds, Grasses, the Variegated Japanese Honeysuckle, *Chrysanthemum Sensation*, *Centauras*, *Ivies*, &c. Mr. J. Thorpe was second, and Mr. T. Charlesworth third, neither of the collections containing such a large and interesting variety as the first named. A capital group came from Mr. W. Ingram, The Gardens, Belvoir Castle, comprising some sixty different kinds, including Sedums, *Echeverias*, *Colerases* of sorts, &c., that was quite worthy of the second prize, and would have received it had not the term display governed the decision of the Judges.

ACHIMENES AND GLOXINIAS.—The way in which the Achimenes were grown deserves the highest praise; to both the open and amateur classes the same remark applies. Messrs. J. Staples and W. Brookes were respectively first and second in each class. The sorts were—*Ambrose Verschaffelt, Carl Wolfarth, Dentoniana, Longiflora Major, Grandiflora, Estella, Canata, and Purpurea elegans.* Mr. Staples was also first with six and three *Gloxinias*; Mr. Moore being second in the former, and Mr. Charlesworth in the latter class. These also were extremely well grown, the heads of bloom being large and numerous. Of erect-flowering kinds the most striking were *Elegans, Vivid, Marion, Helena, Donna Colonna, and Ophelia*; of the drooping kinds, *Diadem, Mathilde de Landevoin, Madame de Smet, Beresford, Madame Celeste Wiman, Sir Hugo, and Fair Beauty.*

PETUNIAS in pots were another special feature of the Show, being admirably grown and bloomed, much in advance of what is generally seen at horticultural exhibitions. Especially was this true of the plants staged by Mr. J. Thorpe, who was first in both classes for single and double kinds. The six varieties of the former consisted of *Clara Thorpe*, deep bright rose with white throat; *The Flirt*, a variety well named, as it has a singular changeability of character, the prevailing one being that of a white flower with a purple centre and eye-bars of the same, some of the blossoms being also irregularly blotched with bright rose; *Spitfire*, crimson, dashed with purple; *Triumphans*, crimson; *Beauty*, a mottled flower of a lilac pink and dark hue; and *Miss Earl*, like *Clara Thorpe*, but paler and having more white also. Of double kinds, Mr. Thorpe had *Marquise de St. Innocent*, violet rose blotched with white; *Christiana*, mottled rose; *Inimitabilis flore-pleno*; *Antigone*, white; *Inimitabilis Rex*, violet rose edged with white; and *Ben Nevis*, violet with white bars.

CUT FLOWERS.—The show of these was much more numerous than could have been expected, the weather being so very unfavourable to them. There was a falling-off in the Roses notwithstanding a good many collections were staged, and the flowers forming these were by no means of indifferent quality generally.

CARNATIONS AND PICOTEEES were plentiful, and though somewhat thin, many of the flowers were of good quality, and the number of stands competing in the several classes, added to their average

quality, kept the Judges a long time in making their awards. Lady Berners gave special prizes for the best twelve Carnations and twelve Picotees, shown as a twenty-four stand; and the leading award went to Mr. J. D. Hextall, of Ashby-de-la-Zouch, a well-known member of that distinguished confederation of florists residing in the midland district. Second, Mr. G. Edward, York; third, Mr. B. Simmonite, Sheffield; fourth, Messrs. J. Gibbons & Son, Birmingham. The Hinchley Horticultural Society also gave a series of special prizes for Carnations and Picotees—viz., for the best twelve Carnations, first, Mr. J. Taylor, Snainton; second, Mr. G. Edward. For the best twelve Picotees, first, Mr. G. Edward; second, Mr. E. P. Kingston, Bath. For the best six Carnations, first, Mr. H. Steward, York; second, Mr. G. Edward. For the best six Picotees, first, Mr. H. Steward; second, name of exhibitor unknown. Two first prizes were awarded to Mr. G. Edward for the two best single blooms of Carnations; and the first prize to Mr. W. Mitchell for the two best single blooms of Picotees. In the open class for twelve Carnations, Mr. G. Edward was first, and Mr. J. Taylor second. In the amateurs' class for the same number, Mr. J. D. Hextall was first, and Mr. H. Steward second. In the open class for twelve Picotees, Mr. B. Simmonite was first, and Mr. G. Edward second; and in the amateurs' class for the same number, Mr. J. D. Hextall was again first, and Mr. E. Wood second. There were two classes respectively of six Carnations and Picotees for amateurs, in the first instance Mr. Steward was first, and Mr. J. Taylor second. In the Picotee class, Mr. J. D. Hextall was first, and Mr. J. Taylor second. A great many of the flowers staged were unnamed; of those that were, some of the best can be found in the following list:—*Scarlet Bizarres: Admiral Carzon, Captain Thompson, James Gardner, Lord Derby, Lord Baschiffe, Oliver Goldsmith, Prince Albert, Sir J. Paxton, and Splendid. Crimson Bizarres: Black Diamond, Gladiator, Indispensable, Queen Victoria, Prince of Denmark, and Warrior. Pink and Purple Bizarres: Captivation, Fanny, Sarah Payne, and Shakespeare. Purple Flakes: Beauty of Woodhouse, Earl of Wilton, Earl Stamford, Plato, Premier, Squire Meynell, and Triumphant. Scarlet Flakes: Christopher Sly, Cradly Pet, Defiance, John Bayley, Splendour, and Valentine. Rose Flakes: Alonzo, Delicata, Flora's Garland, King John.*

ROSES.—The special prize offered by the Mayor of Leicester for ninety-six varieties, three trusses of each, was awarded to Messrs. Paul & Son, who had many fine trusses notwithstanding the great heat of the season. The added second prize of five guineas was not taken. Lady Crewe's special prize for a miscellaneous collection of cut Roses grown in the counties of Leicester, Derby, and Stafford by gentlemen's gardeners and amateurs, was won by the Rev. E. N. Pochin with a very good box of flowers unnamed.

Sir George and Lady Beaumont's special prize for the twelve best Noisette and Tea Roses, was also won by Messrs. Paul & Son, having good examples of the following:—*Louise de Savoie, Gloire de Dijon, Madame Halphen, Maréchal Niel, Souvenir d'un Ami, Triomphe de Rennes, Rubens, Solfaterre, President, Madame Margottin, Alba rosea, Céline Forestier.* Second Mr. J. Parker, with good flowers of *Devoniensis, Narcisse, Comte de Paris, Madame Bravy, Triomphe de Luxembourg, Niphetos, Madame Willermoz, and Homer.* The Ashby-de-la-Zouch special prize for the best twelve distinct Roses did not bring any competition. The special prize offered by Mr. Thomas Warner, of Leicester, for the best collection of new Roses of 1865-66-67 was taken by Messrs. T. Perkins & Son, Coventry, with good flowers of *Camille Bernardin, Prince de Portia, Triomphe de Ronen, Madame Fillion, Antoine Ducher, Mdlle. M. Dombain, Alfred Colomb, Madame Charles Baltet, Coquette de Alphas, a pretty white Rose, said to be new of 1868; Josephine Beauharnais, John Grier, President Mas, Jean Lambert, Madame Pulliat, La France, a pale rosy pink variety, new of 1868; Mdlle. Marie Rady, Charles Verdier, Globosa, Madame Eugène Appert, Mrs. J. Berners, Ville de Lyon, Madame George Paul, Jean Cherpin, and Comtesse de Jancourt.* Second, Mr. W. Draycott. The Rev. E. N. Pochin also won the special prize for the best twelve Roses grown by amateurs in the county of Leicester, as well as that for six cut Roses, the exhibitors also confined to the county of Leicester, the varieties being *Madame Bontin, Baron Gonella, Souvenir de Malmaison, Charles Lefebvre, Gloire de Dijon, and Madame Caillat.* Second, Mr. J. Burton, who had *Alfred Colomb, Duchess of Norfolk, Madame Willermoz, Dr. Andry, and Charles Lefebvre.*

In Class 96, for forty-eight varieties, Messrs. Paul & Son were first, having the following in good condition:—*Charles Lefebvre, Lalia, Solfaterre, Xavier Olibo, Marguerite de St. Amand, Mdlle. Annie Wood, Alfred Colomb, Charles Rouillard, Senateur Vaisse, Sophie Coquerel, Duc de Rohan, Madame Victor Verdier, La Phocéenne, Mdlle. Marie Rady, Claude Million, Mons. Noman, Madame Furtado, Maréchal Vaillant, Gloire de Sautenay, Maréchal Niel, Josephine Beauharnais, Rushton Radclyffe, Madame Moreau, Madame Rivers, Marie Bumann, Antoine Ducher, John Hopper, Madame Margottin, Madame Bonnaire, and Duc de Rohan.* Second, Messrs. Perkins & Son; third, Mr. W. Draycott. In the amateurs' class for the same number Mr. T. Draycott was first, the most noticeable flowers being *Dr. Andry, Marguerite de St. Amand, La France, Maréchal Niel, Madame Victor Verdier, Madame Caillat, Souvenir de Malmaison, Fisher Holmes, Mdlle. Marie Rady, Gloire de Sautenay, Duchesse de Caylus, Madame Margottin, Charles Verdier, Charles Lefebvre, Manrice Bernardin, Pierre Notting, Devoniensis, Madame Falcot, and Madame Bontin.*

With twenty-four Roses the Rev. S. R. Hole, Cannton Manor, was first with good examples of Mdlle. A. Wood, Abel Grand, Maréchal Vaillant, Duchesse d'Orléans, Duc de Cazes, Louis Peyronny, Olivier Delhomme, John Hopper, Prince Henri de Pays Bas, Comte de Nanteuil, Madame Charles Wood, Marguerite de St. Amand, Madame Freeman, Gloire de Dijon, Gloire de Santenay, Charles Verdier, Pierre Notting, Charles Ronillard, Triomphe de Rennes, Duc de Rohan, Maréchal Niel, Madame Bontin, Narcisse, and Charles Lefebvre. Second, Mr. J. Moore. With twelve kinds the Rev. S. R. Hole was again first, having Gloire de Santenay, Madame Rival, Prince Henri de Pays Bas, Madame Fautau, Gloire de Dijon, Madame Victor Verdier, Souvenir de Comte Cavour, Charles Verdier, and Mdlle. A. Wood. The Rev. E. N. Pochin was first with the following six kinds—Gloire de Vitry, Duchesse de Caylus, Baron Gonella, Maréchal Niel, Madame Bontin, and Charles Lefebvre. In a further class for new kinds Messrs. Perkins & Son were again first with Jean Lambert, Madame Eugène Appert, Camille Bernardin, Triomphe de Rouen, Mdlle. Marie Rudy, Chevalier Nigra, Gloire de Ducher, Madame Fillion, John Grier, Mdlle. M. Dombain, Prince de Portia, and Comtesse de Jancourt. Second, Mr. W. Draycott, who had among others Mons. Chant d'Est Ange, Black Prince, Mons. Noman, Alfred Colomb, Souvenir de Madame Boll, Mdlle. A. Wood, Charles Verdier, and Comtesse de Jancourt.

Mr. T. Warner, of the Abbey Nurseries, contributed a large collection of cut Roses, containing some remarkably good flowers, a box of fine blooms of Maréchal Niel being much admired.

ZONAL PELARGONIUMS.—Cut flowers were most admirably shown, especially a stand of twelve varieties, contributed by Mr. J. Thorpe. Instead of the five trusses of each variety being bunched together, as is generally the case, each was arranged separately, so that each lot of trusses of any one variety formed a pretty and effective group in itself. The varieties were Le Grand, Dr. Hogg, Capt. L'Hermite, a very bright double variety; Ne Plus Ultra, very bright crimson; Jules Cesar, The Clipper, Hector, Beauté de Suresnes, Queen of Beauties, a pretty salmon-coloured variety; Fairy Princess, Salmon King, and Snowball. Mr. C. J. Perry was second with fine trusses of Vivid, Roi d'Italie, Glorious, Spitfire, Shirley Hibberd, Beauty, Clipper, Andromeda, Anclina Grisan, Beauté de Suresnes, and a very promising salmon-scarlet seedling, something in the way of Andromeda.

VERBENAS.—With cut Verbenas, Mr. C. J. Perry was first, having fine trusses of Foxhunter, Annie, Géant des Batailles, J. C. Ward, Startler, James Birbeck, Cleopatra, Shirley Hibberd, Harry Laws, Madam H. Stenger, Firefly, and Mrs. Mole. Second, Mr. W. Draycott. Mr. Perry also contributed a miscellaneous lot of fine kinds, including Wonderful, Rosa Imperial, Modesty, Herenies, Magnifica, Samuel Moreton, Champion, Mazepa, Charles Perry, and Géant des Batailles.

PHLOXES.—Mr. J. Draycott was first with cut blooms of Phloxes, which consisted of Beautiful, Professor Koeb, Arthur Fontaine, Mons. Delamare, Le Lion, and a very beautiful large white variety unnamed; the flowers white, with a rosy purple ring round the eye, magnificent. The other competing flowers were of little value. Messrs. Downie, Laird, & Laing contributed some fine kinds, such as Norma, Eclair, Souvenir des Farnes, Edith, Madame Bonneau, Pins IX., Souvenir de Trianon, and Princess of Wales. The above formed a good and varied selection.

The cut **PENTSTEMONS** shown for competition were very poor, but Messrs. Downie, Laird, & Laing staged a grand lot, not for competition. The following were very fine:—John Bester, John Pow, Arthur Stern, Mrs. Steery, Maria Hild, Delicata, and Chio. Phloxes were so miserably shown, that it seemed to be a waste of money to give a prize to the value of £2 to twelve wretched flowers of the commonest character. Messrs. Downie, Laird, & Laing contributed a grand lot of English and Fancy kinds, and a stand of their new blue bedder, Imperial Blue, all not for competition.

The collections of cut greenhouse and hardy flowers were not of a character to call for special remark, being inferior to those generally seen at large provincial shows. Table decorations were sparingly contributed, and those of only ordinary forms. Bouquets were plentiful enough, and but of average merit; the best contained some rare flowers, but looked somewhat rough and loose. Wild flowers appeared in numbers, as collections, botanically arranged in the form of baskets, of which there were a great number, and also in the form of bouquets. Of the two collections botanically arranged, in one instance the natural, in the other the Linnean system, had been followed. But very few of the baskets were tastefully arranged; generally they looked something like packages of game for transmission to a distance.

The new florists' flowers, &c., that came under the notice of the Floral Committee are treated of in another column.

In the Miscellaneous class Mr. W. Chater, Saffron Walden, furnished a fine lot of Hollyhocks in cut spikes and single blooms that made a grand display at one end of the fruit tent; and Messrs. T. Draycott and Downie, Laird, & Laing also contributed cut blooms of Hollyhocks. Messrs. F. & A. Smith, of Dulwich, sent a fine lot of new Variegated Pelargoniums, and Mr. Tirebuck, of Luton, a large group of bedding Pelargoniums. Some wax flowers and skeleton leaves were shown by residents of Leicester. Some of the last-named, shown by Miss M. P. Swain, were extraordinary specimens, of fine manipulation. Some samples of British wines were also contributed by Mr. Robert Fenn, The Rectory, Woodstock, Oxon, and were tasted

by a Jury, who commended two of them. The Jury were of opinion that Mr. Fenn has made the most satisfactory progress during the past few years in the way of perfecting these British wines.

FRUIT AND VEGETABLES.

The Fruit and Vegetables alone filled nearly the whole of a tent of great length, though, except in the case of vegetables, the exhibitions in each class were generally not numerous, nor was the fruit as a whole remarkable for quality. The two first prizes of the value of ten guineas each, offered by the Proprietors of THE JOURNAL OF HORTICULTURE, for the best two desserts, consisting of not less than seven kinds of fruits of 1868, arranged as for the table, combining quality of fruit with taste of arrangement, were taken without competition by Mr. Carmichael, gardener to His Royal Highness the Prince of Wales, at Sandringham; and by Mr. William Ingram, gardener to the Duke of Rutland, at Belvoir Castle. At Bury St. Edmunds last year similar prizes were offered, and these were carried off by Mr. Blair, gardener to Sir G. N. Broke Middleton, Bart., and Mr. Carmichael; this, therefore, was the second occasion in which Mr. Carmichael has been successful in winning one of the "Journal" prizes. His exhibition was neatly arranged, with a dish of Black Hamburgh Grapes in the centre, flanked by two fine Queen Pines. In front of these were Foster's White Seedling Grapes at one side, and Black Hamburghs at the other, and between them a dish of Moorpark Apricots; at the back there was a Melon at each end, and the remaining dishes, arranged at intervals between the outsides and centre, consisted of Kentish and May Duke Cherries, Violette Hâtive Nectarines, and Peaches. Mr. Ingram had handsome silver stands, the central one bearing glass dishes on the upper sides of its branches, and hanging baskets on the lower sides. They were filled with Cherries, Gooseberries, Black and White Currants, and Raspberries, interspersed with Japanese Honeysuckle and Fern fronds, with a Vine leaf peeping up here and there. In the top dish lay a Melon, clusters of Grapes, and Apricots, with a few Ferns and Lilies. The two side stands contained Apples, Pears, Cherries, Apricots, and Plums, interspersed with Ferns, Japanese Honeysuckle, and one or two Grasses. There were in addition two bouquets, one on each side, of Orchids, Ferns, and Roses.

Of collections of Fruit, the best came from Mr. Miller, gardener to Earl Craven, Combe Abbey, and consisted of a very good Queen Pine, three splendid bunches of Black Prince Grape, weighing 13½ lbs., and the largest of the three measuring about 16 inches in length, and fully half as much across the shoulders; Foster's White Seedling finely ripened, a Hybrid Cashmere Melon, fine Royal George Peaches, large highly-coloured Violette Hâtive Nectarines, Brown Turkey Figs, and Bigarreau Napoleon Cherries. Mr. Carmichael was second, Mr. Moor third, and Mr. Holder, Prestbury, near Cheltenham, fourth. In these collections good Queen Pines, Black Hamburgh Grapes, Cherries, Melons, and Apricots were exhibited.

PINE APPLES.—But few were shown. The first prize was awarded to Mr. Rawlone, gardener to C. M. Campbell, Esq., Woodseat, Ashbourne, for a fine Queen, weighing 5 lbs.; the second went to Mr. A. Henderson, gardener to Earl Manvers, Thoresby Park, for a fruit of Thoresby Seedling, weighing 6 lbs. 6 ozs.; and Mr. G. Ward, gardener to T. N. Miller, Esq., Bishop Stortford, was third, with a fine Enville of 9 lbs.; he also sent a Smooth-leaved Cayenne of 8½ lbs., but overripe at the base, as was also a large Antigua Queen from Mr. Barnes, gardener to Lady Rolle, at Binton.

GRAPES.—For a single dish of Black Grapes, the first prize was taken by Mr. T. Rawlone, gardener to C. M. Campbell, Esq., with large beautifully-coloured bunches of Black Hamburgh, a little loose, however, and weighing 7 lbs. Mr. J. McLean, Beaumanor House, Loughborough, was second with the same kind, and Mr. Standen, gardener to R. R. Homfray, Esq., Newmarket, third, the latter having compact well-coloured bunches. Mr. Cox, gardener to Earl Beauchamp, Madresfield Court, sent, but not for competition, excellent bunches of Madresfield Count Muscat, a new kind, with a delicious Muscat flavour; the berries were finely coloured, and covered with a fine bloom. Of White Grapes but few were shown; the best were large bunches of Golden Hamburgh from Mr. Bolton; Buckland Sweetwater, from Mr. Peachey, was second; and Trebbiano, from Mr. Handley, gardener to Sir R. Knightley, Bart., Fawsley Park, third. Fine bunches of Golden Champion with enormous berries, were shown, not for competition, by Mr. Thomson, of Balkeith. To the high merit of this splendid Grape we have already several times referred, and more particularly in the report of the last meeting of the Fruit Committee (see page 22).

Special prizes were offered by Earl Howe for the best three dishes of Grapes. Mr. Rawlone was first with three splendid bunches of Black Hamburgh, weighing 7½ lbs., nice bunches of Black Prince, and fine Muscats, but not perfectly ripe. The second went to Mr. Bolton for good Golden Hamburgh, Black Prince, and Black Hamburgh, the last rather loose. Mr. Wallis, gardener to J. Dixon, Esq., Astle Park, Cheshire, was third. Prizes were likewise given by Viscount Curzon, "a County Gentleman," and the Local Fund, for the best three bunches of Black Hamburgh, and the first place was taken by Mr. Rawlone with three splendid compact bunches, with the berries equal-sized, and beautifully coloured. The weight of the three bunches was 8½ lbs. Mr. Silcock was second with excellent finely-coloured bunches; Mr. Sage, gardener to Earl Brownlow, Ashridge, and Mr. Bolton, being respectively third and fourth.

Special prizes were given by the town of Ashby de-la-Zouch, for

Muscat Grapes. The first of these was taken by Mr. W. Colegrave, Swerford Park, Enstone, with splendid bunches of Muscat Hamburgh, the largest measuring 14 inches in length and 10 inches across the shoulders. Mr. J. McLean, gardener to W. P. Herrick, Esq., was second with Muscat of Alexandria; Mr. W. Williams, Woodcote Lodge, Leamington, third, with Muscat Hamburgh; and Mr. J. Walker, Leicester, fourth, with Muscat of Alexandria.

PEACHES AND NECTARINES.—Of the former, the best in the general class was Barrington, very large and finely ripened, exhibited by Mr. Wallis, Astle Park. Mr. Draycott, gardener to T. T. Paget, Esq., M.P., Hummerstone Hall, was second with fine fruit of Royal George; and the same kind from Mr. Tillery, Welbeck, took the third prize. For Nectarines, Mr. Smith, gardener to H. H. Hangerford, Esq., Market Harborough, was awarded the first prize for Stanwick; Mr. Miller, Combe Abbey, and Mr. Cox, gardener to Earl Beauchamp, being respectively second and third, with Violette Hative and Pittaston Orange. From Mr. D. Fish, Hardwicke, came fruit of Rivers's New White.

The Countess of Howe's prizes for the best dishes of Peaches and Nectarines, were taken by Messrs. Draycott, Sage, Gold, and Peachey; the first named had fine Royal George Peaches and good Violette Hative Nectarines.

STRAWBERRIES.—The competition with these was very limited. The first and second prizes for single dishes were taken with British Queen by Mr. Bolton, and Mr. Temple, Balbirnie, N.B.; the third by Mr. Lambert with Myatt's Eleanor. The first of the two prizes offered by Charles Lambert, Esq., for the best collection was awarded to Mr. Matheson, Tulliallan Castle, Kincardine-on-Forth, for twelve varieties, among which were good fruit (for the season), of Sir Harry, Sir J. Paxton, Elton, Trollope's Victoria, Wonderful, and Cockscomb. There was no other exhibitor.

MELONS.—About thirty in all were shown in the two classes; the best green-fleshed was Trentham Green-fleshed from Mr. Rawbone; Bromham Hall from Mr. Frisby, Blankney, was second; Golden Gem from Mr. Cox third. Scarlet Gem from Mr. Earley, Mr. Stannard, and Mr. D. Fish took all three prizes in the Scarlet-fleshed class.

MISCELLANEOUS.—Under this head it will be most convenient to include all the remaining fruits, for most of which, however, classes were provided, referring to the prize list in another column for the names of the successful exhibitors. Some large Moorpark Apricots were shown by Mr. Earley, good Brown Turkey Figs by Mr. Sage, Bigarreau Cherries by Mr. Elliott, and a good dish of the same kind by Mr. Tegg, Clumber. Jefferson and Kirke's were the only Plums shown, the former from Mr. Williams, of Woodcote Lodge, receiving a second prize. The best basket of fruit came from Mr. Earley, and consisted of May Duke Cherries, Oscar, Pastoff Raspberry, and fine White Dutch Currants. Mr. Henderson, of Thoresby, had a first prize in the miscellaneous class for eight Thoresby Seedling Pines, fine large fruit, weighing from 5 lbs. 10 ozs. to 6 lbs. 10 ozs. each. Mr. Babb was second with four dishes of Apples, and Mr. Tegg, third, with Psidium Cattleianum. Mr. Laxton, of Stamford, sent French Crab Apple in excellent preservation. The special prizes for orchard-houses trees were taken by Mr. Brooks, Hineckley, and Mr. Burton, gardener to J. Stone, Esq., Leicester. The former had Grosse Mignonne, Early York, Walbourn Admirable, Royal George, and two or three other Peaches; Rivers's Orange, Hunt's Tawny, and Elrige Nectarines, and Plums. These trees were exceedingly well grown, and for the most part in abundant bearing. Mr. Burton had also some very good Peaches and Nectarines, and took a first prize for the best pot Vine, a neat compact one trained to form a flattish top, and which had a dozen good bunches.

The *Gardeners' Chronicle* cup of the value of twenty guineas, for the best collection of fruit and vegetables, brought several good exhibitions, and was awarded to Mr. McLean, gardener to W. P. Herrick, Esq., of Beammanor House, Loughborough. His collection consisted of large and very fine Black Hamburgh Grapes, two Melons, Cherries, French Crab Apples, Gooseberries; and of Vegetables, Mona's Pride and Radford Kidney Potatoes, two kinds of Onions, a fine brace of Cucumbers, Broad and Kidney Beans, Carrots, and Broccoli. Mr. Holder, Prestbury, near Cheltenham, had a large basket containing almost every salad plant in use, Globe Artichokes, large Tripoli Onions, a handsome brace of Cucumbers, Peas, Beans, Carrots, &c., but though his vegetables were excellent, his fruit was not equal to that in the prize collection. Mr. W. Ingram, Mr. Sage, gardener to Earl Howe; and Mr. Bailey, Shardeloes, also sent very good collections.

Mr. Moore, Blenheim, took the first prize offered by the gardeners of Leicestershire, for the best six dishes of fruit and six kinds of vegetables, showing fine Black and Red Currants, Strawberries, Gooseberries, Cherries, Apricots, and good Tomatoes, Onions, Peas, &c. Mr. Sage, gardener to Earl Howe, Gopsall, was second with Peas, Strawberries, Breda Apricots, Raspberries, Gooseberries, and Red Currants, and good Peas, Onions, Carrots, and Turnips. The third and fourth prizes were taken by Mr. Rogers, gardener to the Countess of Lanesborough, and Mr. J. McLean, of Donnington Park.

Messrs. Harrison & Son, of the Midland Seed Warehouse, Leicester, offered first and second prizes for the best collections of vegetables. The first was awarded to Mr. J. Holder for large red Tomatoes, Capisiums, Italian Tripoli Onions, Cucumber, Vegetable Marrow, red and white Celery, Carrots, Potatoes, Cauliflowers, Peas, and Broad Beans, the whole of which were very good. Mr. Rogers was second with a

good collection. Prizes were also offered by the same firm for the best and second best collections of first and second early Potatoes, and they were awarded to Mr. Dunkley, of Kingsthorpe, Northampton, for good clean tubers of eighteen kinds, not one of which had a name attached; and to Mr. Earley, who had fine tubers of Milky White, Hard Cash, Giant, Dalmahoy, Soden's Early Oxford, Rivers's Royal Ashleaf, and others. Messrs. Harrison's prizes for the best brace of Harrison's Favourite White-spined Cucumber went to Mr. Draycott, Hummerstone Hall, and Mr. Holder. The Queensborough Horticultural Society's first and second prizes for collections of vegetables, were awarded to Mr. Addy, Rearsby, Leicester, and Mr. Mitchell, Leicester.

In the Cottagers' department of the Show there were some excellent collections of vegetables which many gentlemen's gardeners might well envy. Autumn-sown Onions were especially good. Peas, notwithstanding the dry weather, were well filled; Potatoes, though not large, very sound and clean; Carrots very good; Scarlet Runners and Broad Beans equally so.

FLORAL COMMITTEE.

The chief novelties brought before the Committee at this grand Meeting were Ferns, some very magnificent Verbenas from Mr. Perry, and a most superb double-flowering Zonal Pelargonium from Mr. Tomkins.

Mr. Thomas Lambert, Bramstone House, Leicester, exhibited among twelve specimen Petunias a dark-veined seedling, the name of which we have forgotten. It was much admired, and was awarded a first-class certificate. Messrs. Downie, Laird, & Laing received first-class certificates for two Zonal Pelargoniums of the Golden and Bronze section, Crown Prince and Harrison Weir, both of which were marked with a deep zone. Mr. W. Cunningham, Burton-on-Trent, sent a seedling Fuchsia, Rarity, dark dull red, a rather coarse flower, useful perhaps for market purposes; and he received a first-class certificate for Zonal Pelargonium Delicatum, a pale salmon rose, not new in colour, but the petals of very good substance. Mr. Tomkins, Sparkhill, Birmingham, exhibited a seedling double Zonal Pelargonium, Sparkhill Beauty. From the truss of flowers on the plant we may safely infer that this is one of the best ever yet seen; the colour deep rose, the flowers large, and the petals smoothly arranged. A first-class certificate was awarded.

Messrs. Ewing & Child sent a seedling Lobelia speciosa, The Fairy, of free habit and growth, pale whitish pink flowers. It received a second-class certificate. Mr. Perry, Castle Bromwich, Birmingham, sent some very fine seedling Verbenas:—Mrs. Reynolds Hole, of the most beautiful clear white, with a dark conspicuous centre; Mrs. Perry, dark purple, with a large white centre; and Spot, pale rose, with a broad dark centre. These were flowers of great merit, and were each awarded a first-class certificate. Mr. G. Smith, Hornsey Road, sent three seedling Zonal Pelargoniums; one, a fine double scarlet, received a first-class certificate at the last meeting at South Kensington; Alarm, a fine hybrid Nosegay, bright scarlet and rose flowers, very promising; and Masterpiece, a great improvement upon Le Grand, flowers nearly of the same shade of colour. Only one plant was exhibited with one noble truss of flowers; when two or three plants are exhibited its great merit will be acknowledged. Messrs. Smith, Dulwich, sent six Variegated Zonal Pelargoniums, but not in condition, the colours of the foliage not being well defined.

J. E. Mapplebeck, Esq., Woodfield, Moseley, Birmingham, was awarded a second-class certificate for *Cystopteris fragilis gracilis*, and a first-class for each of the six following:—*Athyrium Filix-femina tortu-eristatum*, *Athyrium Filix-femina Howardiae*, *Scolopendrium vulgare Clifui*, *Scolopendrium spirale*, *Scolopendrium marginatum tenne*, *Athyrium Filix-femina Elworthyi*.

E. J. Lowe, Esq., Highfield House, Nottingham, received first-class certificates for each of the following Ferns:—*Polystichum angulare caudatum*, *Athyrium Filix-femina abasiphylum*, *Athyrium longridge-ense*, *Athyrium regale*, *Lastrea Filix-mas Mapplebeckii*, *Athyrium kladopteris*, *Asplenium adiantum nigrum grandiceps*, *Asplenium marinum imbricatum*, *Lastrea pseudo-mas nitida*, *Polystichum aculeatum Rileyae*, *Polystichum aculeatum nidum*, *Adiantum capillus-Veneris Kalon*, *Scolopendrium vulgare supracinctum Lowe*, *S. sculptaratum latum*, *S. Keratoides*, *S. significans*, *S. formosum*, *S. capitellum*, *S. amonum*, *S. illustre*, *S. Moorei*, *S. stenomenon*. A second-class was awarded *Scolopendrium divergens*. Mr. Lowe's general collection was most deservedly much admired; the abnormal forms most curious and interesting. There were many dozen mere varieties shown as new forms, but those selected were considered most distinct and beautiful. The *Adiantum capillus-Veneris Kalon* is strikingly beautiful, the pinnales larger than those of *capillus-Veneris*.

The latest accounts received to the time of going to press give the number of visitors up to Tuesday evening as about eighteen thousand, and the amount received as £1353.

LILIUM AURATUM ROBURUM VITTATUM.—I see that Mr. Owen desires to know if any of the readers of this Journal have bloomed the Liliun named above. With me one of these Liliums has thirty-two blooms upon it at the present time.

It is 8 feet high, and is in an 11 inch pot.—RICHARD SIMPSON, at C. W. Neumann's, Bsq., Wyncote Allerton, Liverpool.

VIOLA CORNUTA

I AM sorry to hear such complaints respecting this beautiful flower. Some cultivators say it likes a wet season, others that it will not do in a dry one. A third set assert that it likes an open position, and others that it does best in the shade. I am fully aware that there is in the soils and climate of each county a great difference that the *Viola cornuta* has to contend against, having had it under my charge in a midland county, in the south, and now in the north. During these three seasons I have never heard any complaints of it, but, on the contrary, have heard the ladies praise it very much. It has bloomed very well the whole time I have known it, and nothing could give greater satisfaction.

I would advise Mr. Bryan and all others to try it once more before they utterly condemn it. As an edging, I think it surpasses any *Lobelia*. We have for some purposes intermixed it with *Lobelia speciosa*, and it is quite lovely either so associated or in a bed by itself.

I always dig manure into my beds in the spring, then in April I divide the *Viola* into very small pieces, and plant them where I wish them to remain for an edging, giving water at the same time. It then takes its chance.

It has looked beautiful since May, and still continues to be one of the gems of our flower garden, notwithstanding the very hot, dry summer we have had.—J. E., Gardener at Eccleshill Hall, Leeds.

MR. J. BRYAN, of Andley End Gardens, suggests that some of your correspondents should give the results of their cultivation of this flower. Mine are as follow:—A packet of the seed of Mauve Queen was had in the autumn of 1866, and produced an abundance of plants. These were planted out under a north wall in rather a poor soil, and the result was a perfect failure. At the suggestion of a writer in your Journal I made in the autumn of last year a good bed, exposed to the sun; placing the plants in at a good distance from each other. In the spring of this year they soon filled the bed, and from the early part of April to nearly the end of June it was one of the most lovely-looking beds I have ever seen. All who saw it were full of its praise. The extraordinary dry and hot weather we then (end of June), had, destroyed all its beauty. It is possible if I had well watered the bed the plants might have continued in flower; but I rather think that this plant should not be depended upon for a continuance of flowering all the season, but that it is invaluable for two or three months.—AN AMATEUR, South Wales.

THE HABIT OF GROWTH IN MELON PLANTS.

THE one great defect which is inherited in common by almost all the choicest varieties of Melons, is the possession of too rampant a habit of growth, requiring a certain expenditure of vigour, even when planted in the poorest soil, before they will exhibit the least tendency to carry fruit in a sufficient quantity to be termed a crop. That but too little attention has been given to this point is quite evident; in fact, I am inclined to think but little notice, if any, is taken of it, for in the descriptive catalogues of both old and new kinds, which are issued to the public in such numbers, the only qualities considered to be worthy of commendation, are freedom of cropping, with size and flavour of fruit, and, therefore, I infer that no great demand has ever been made for varieties possessing (in addition to the above fine qualities) a close and compact habit of growth.

A Scarlet-fleshed variety called "Pine Apple," which I have now grown for four seasons, and which I believe was sent out about five or six years ago, is the closest approach to perfection in this respect that I have met with. In its habit of growth it is very compact, having handsome foliage of a deep green, which is supported by short stout leafstalks; it is a most prolific cropper, producing and setting its fruit with the greatest freedom on its first laterals, and as the fruit commences swelling it exhibits but little tendency to make any further growth, and this character it maintains on the trellis as well as when growing on the soil. I may add, I have never noticed the slightest symptoms of canker in this most excellent variety; the fruit, also, is of fine flavour, ranging in weight from 2 lbs.

to 4 lbs., and I am inclined to think it is a popular kind with market gardeners, as I lately observed several fruits of it at Covent Garden Market, and in many fruiterers' shops in different parts of London.—EDWARD LECHEURST, Kington House Gardens, Kent.

NEW BOOK.

PAXTON'S BOTANICAL DICTIONARY, comprising the Names, History, and Culture of all Plants known in Britain, &c. Revised and Corrected by SAMUEL HEYMAN, Secretary for nearly Forty Years to the late Sir Joseph Paxton. London: Bradbury, Evans, & Co.

THE first edition of this volume was published in 1840, and having for its parents such men as Paxton, Lindley, and its present editor, the contents are most trustworthy. What the volume does contain is unexceptionable. But although editors may be deeply skilled, they are not, therefore, necessarily good judges of what constitutes a useful book. That now before us proves this, and the fact that twenty-eight years have elapsed without a really new edition shows that the public coincide with us in opinion.

A Botanical Dictionary to be useful should enable one to identify a plant, and a Gardening Dictionary should direct him how to cultivate it. Now, that before us does neither. If you know a plant it tells you the colour of the flower, the month of its blooming, height, native place, and date of introduction; but there are no details of culture, and if you do not know the name of the plant there is not the slightest help to your ascertaining it. It is really a catalogue of plants, as Don's, Sweet's, and London's were.

An example will enable our readers to judge for themselves, and it shall be the genus named in honour of Paxton.

PANTONIA, Lindley. In compliment to the late Sir Joseph Paxton, F.L.S., H.S., who was for many years director of the gardens of His Grace the Duke of Devonshire, at Chatsworth, and conductor of the "Magazine of Botany," and other works on botany and gardening. *Linna.* 20, Or. 1, Nat. Or. *Orchidaceae*. This pretty species may be successfully grown in a mixture of very turfy loam, leaf mould, and sand, with the treatment given to *Blitvia*.

rosca Pink 7, S. Ter. ½ Philippines 1837.

INTENSE HEAT.—At one o'clock on Tuesday, July 21st, in the sun the temperature was 130°, in shade 97°. The *Bougainvillea spectabilis* has been very beautiful here this season, with from four to five hundred blooms upon it.—WILLIAM MAYO, Gardener to Mrs. Fitzgerald, Shalstone House, Buckingham.

WORK FOR THE WEEK.

KITCHEN GARDEN.

ABOUT the end of July and beginning of August most of the sweet and pot *Herbs* are fit to gather for drying. *Artichokes*, the young plants put out in the spring ought now to be coming into use to succeed the main bed. As soon, therefore, as you have gathered all that are wanted for Artichoke bottoms, cut down the old plants altogether, and if the suckers are too thick you had better cut some of them down altogether or pull them away. *Broccoli*, after the genial showers we have had now is a favourable time for planting. As soon as the surface is dried stir it well between the rows, otherwise it will cake together so hard that the plants cannot grow well. *Carrots*, to have a supply of young Carrots from Christmas till the forced ones come in, it is necessary about this time to sow a bed of Early Horn on a south border, or some other warm place. This bed should be formed of very light soil and be raised a little above the general surface, and as soon as the seedlings are up let them be assisted as much as possible by stirring the soil, watering if necessary, weeding, &c. *Cabbages*, the quarters where early spring Cabbages were grown should now be cleared and dunged, to be sown with Winter Spinach by-and-by. The early Strawberries being over, the old beds are trenched to be ready for the first planting-out of the early Cabbages, and as the Peas, Beans, and other crops are cleared off, the sooner the ground is dug or trenched over the better. *Black Spanish Radishes*, a bed of these should be sown alongside the Carrot beds. The soil and treatment need not differ much. They are useful late in the autumn when the other kinds are not to be had.

FRUIT GARDEN.

See that the Cherries, Currants, and Gooseberries that you

wish to prolong are covered up. See, also, to the young Strawberry plants layered in pots for forcing, and as soon as they are well rooted have them up, put them in larger pots, and plunge the small pots again for another lot of plants if you want them. When the Apricots begin to change colour, keep a sharp look-out for snails and woodlice. To keep the first in check, where they are numerous, syringe repeatedly with clear lime water, not doing it too late, as otherwise a thin film of chalk would be formed and spoil the look of the fruit. Lettuce leaves, &c., may be strewed near the wall after being greased on one side, and should be examined every morning. The syringe will also drive away the woodlice, as they do not like water, and end stalks of Beans may be inserted among the branches of the trees as traps, but the great remedy is to keep the wall in good order so as to give them no place for concealment. These very hot days are just the delight of the red spider, and if it once establish colonies on the under sides of the leaves of Peach trees it will be secure for a time, defying all the hattering from your garden engine. It is recommended to daub the open spaces of your wall with a paste composed of sulphur and water, and then the more intense the heat the stronger the fumes of the sulphur will be. Look over Vines on walls to stop laterals; thin-out weak shoots, and keep the rest neatly tied-in. The fruit will now be advancing, and the bunches should be thinned-out with a pair of scissors, which is an operation that is very essential to their perfection both in size and flavour.

FLOWER GARDEN.

Put in cuttings of different Scarlet Pelargoniums now, and they will be fit to remain some weeks in the open air to harden off before the winter sets in. Auriculas and Polyanthus must at this season be kept from excessive rain, and, above all things, avoid a continuous drip. Nothing ruins an Auricula so soon as wet lodging in the crown or heart. The aphis must be sedulously watched for and never allowed to get ahead. Tulip seed continues to ripen; secure the heads as soon as the seed is set open, or the stalk becomes dead, put them in paper bags, and hang them up in a dry place. Continue to layer Carnations. A great deal of the success of wintering Carnations depends on having strong and early-rooted layers, that they may be well-established in their pots before winter.

GREENHOUSE AND CONSERVATORY.

As the varieties of *Thambergia alata* are among the best plants for the conservatory at this time, and are coming more into fashion every season, a few suggestions for their management may be acceptable, as some find them difficult to manage. A key to the natural or true management of these plants is given by Mr. Backhouse in his narrative of a visit to the Mauritius and South Africa. He says "They grow in shady places, much in the same way that Ground Ivy grows in England." From this we may infer that the back border, or under the large specimens planted out in the conservatory, is the proper situation for these plants; then they might scramble among Ferns, roots, moss, stones, &c., after the manner of Ground Ivy. To prepare them for this purpose they ought to be planted out in pits early in May, using very rich rough compost, and fresh moss placed all over the bed, keeping the moss damp, shading the plants in the middle of the day, and allowing them to run all over the moss. As we draw towards the autumn this house will become of more general interest. In the height of summer, especially if like our present one, plants do not keep long in flower in the conservatory, and there is so much to be seen out of doors that people do not spend much time among house plants, but we shall soon have cold mornings and evenings when a houseful of fine-flowering plants with a mild temperature becomes a matter of great luxury, especially if the conservatory is attached to the living-rooms. Ipomaeas and Passion-Flowers are the chief autumn climbers for this house, and the fragrant *Mandevilla suaveolens* is now clustered from end to end with large bunches of its delicious fragrant blooms. Plumbago capensis, cut down last May when coming into bloom, is now blooming the second time, and will be in flower till October. *Stephanotis floribunda* is the most accommodating plant we have, and ought to be in every collection, and in numbers too. It will flower freely in the conservatory when first brought forward in ainery or stove, and it flowers in every intermediate degree up to the roasting or broiling heat of the Orchid house. This is a critical time with greenhouse plants out of doors. The fervid heat is now so great as to produce the tropical winter of vegetation, when the parching heat of the sun acts upon and produces in some degree a dormancy in the system of plants. When occasional

showers fall and we see the surface of the soil in the pots moist, we are satisfied until the drooping or withering foliage upbraid us for our neglect, and, perhaps, particularly with Heaths, New Holland, and similar plants it is noticed when too late to save. These ill effects may be avoided by plunging the pots in coal ashes, and by syringing the plants overhead in the evening, examining them when doubtful on the subject by gently turning one or two out of their pots to see the state of the ball, as it requires some experience to distinguish whether a plant wants water or not from the ring produced by rapping your knuckles against the side of the pot. The Camellias out of doors should be surfaced with fresh soil if they require it. Cinerarias, whether seedlings or suckers, should have regular attention, and those intended for autumn work ought to be potted forward without delay.

STOVE.

About the beginning of August some of the best gardeners treat their established stove plants somewhat like those of the greenhouse for five or six weeks. They either remove the plants to more open houses, or throw their stoves open on purpose, removing dwarf, tender, and young delicate plants into close frames. Whatever conveniences of this nature may be at hand should be made the most of at this time. Nothing can be more injurious to stove plants than keeping them growing late in the season, and thus preventing the ripening of their wood, which renders them more liable to injury in the winter and prevents them flowering freely next season.

PITS AND FRAMES.

The lights should now be drawn off at night where the plants are of the hardier kinds. Stout cuttings of Plumbago capensis struck now will force next spring for the conservatory, and may afterwards be planted out in beds in the flower garden, for which they are admirably suited.—W. KEANE.

DOINGS OF THE LAST WEEK.

It is somewhat tantalising to hear and read of the nice rains round London and elsewhere a week ago, whilst in this district up to this the 18th there has been none whatever, and as yet no appearance of its coming. It is distressing to see the large ponds, on which many farmers depend for common purposes, quite dried up, and the water-cart constantly in use to bring water for the supply of the cattle. Were it not that for a number of miles round the pastures are bare, many would do what was done four years ago—take pastures for the cattle for a time where there was a water supply, as that was found to be more economical than driving water for four or six miles.

If the Turnip seed fails from having just germinated and then dried up, it furnishes a good example of how in gardening seed-men are often blamed for sending out old worthless seed, when it has been young, and fresh, and good all the time. Whether choice seeds are sown most carefully in the open air or in a pot, with glass and other squares of glass over them, the most critical time for them is just when the seeds have chipped, when vegetation has commenced. If they have enough of moisture and air to bring them to that point, and then should be subjected to enough of dryness to shrivel-up the young cotyledons and radicles before the former give any sign of their presence aboveground, then no after-treatment will ever cause these seeds to shoot a second time. An excess of dryness is, therefore, to be avoided with all seeds after they begin to swell, and an excess of moisture is also to be avoided, as that would have a tendency to rot them, owing to the want of enough of air. Old seeds should be kept somewhat dry rather than wet until they have swelled freely. All small seeds will be treated most safely when managed as directed last week for *Caleolarias*.

Planting Early.—The comparative goodness of the Wheat in this parching season, furnishes us with a lesson as to the importance of getting plants established in the open ground early in the season. The roots can then cater for themselves as respects moisture from great depths. We have several times traced the fibres of the Wheat plant in stiff subsoil to the depth of more than a yard, and that would be nothing to the depth from which moisture in the shape even of vapour would rise to meet the evaporation from the foliage. Plants from seed sown late in spring have not a similar chance, as in such a season as this they would have a contest for existence almost from the first, and no reserve of supply stored up in the roots to meet the emergency.

Planting Trees Early.—The same facts, with an extended observation of the results of spring planting on a large scale, and especially in districts such as this, where we have had nothing worthy of the name of rain for close on three months, will demonstrate the importance of autumn over spring planting. Could we have our own way, we would have all shrub and forest-tree planting done in the month of November. Then, in general, the earth retains something of its summer warmth, which encourages root action at once, however feeble, and the rains of winter give enough of moisture to encourage that action, and by the time the heats of summer come there is something to meet the expanding of the buds, and if there is not much growth the first season, the plants hold their own, and are ready to grow freely the second season.

Then, again, this will be all the more successfully done if the plants are on the place, if they have had even one or two seasons' growth after purchasing before being transplanted for good. We have several times insisted on this, and at least a score of gentlemen have told us they have acted on the suggestion, getting young trees home from the nursery early in the autumn (generally by the end of October), placing them out in nursery lines, and then in a year or two taking them up as wanted, and not more than is wanted at a time. This answers the nurseryman quite as well, nay better, for planters become discouraged when they plant unsuccessfully, and in such a summer as this, spring planting on a large scale, where no help can be given, except what nature supplies, will ever be so far unsuccessful. On the other hand, though advocating this reserve nursery at home, unless in the largest establishments, where a regular tree-raiser with suitable assistance is kept, it will always be the most economical for a gentleman to purchase from the raisers in the first place, even if he keeps the plants a year or two before finally transplanting. If the planting is to be done at once, it is very important it should be done early, from the end of October to the beginning of December, and the sooner in November the better. When the plants are procured late, there are many casualties to be encountered. For instance, once we had many thousands of plants sent in, taken up all right, but in the several-days journey they encountered a severe unexpected frost, and we judged that the roots were greatly injured. What would such plants be after being well frosted, and finally turned out in March, with such a season before them as this has been? We have such a case within no great distance of us, and we would rather not see the results. We know what the consequences are too well. Such plants taken up in the end of October, would have had scarcely a small per-centage of failures, and now we should not like to guarantee an estimate of them. The warm dry weather soon brought out the buds, but the roots could do nothing towards supplying the exhaustive evaporation, and death was the consequence. There was no moisture from above to encourage rooting, the roots inserted had not come into fresh operation, so as to draw up for themselves moisture from beneath.

If one fact more would be of use it would be this—never have established trees presented a more gorgeous foliage than this season. Now, after three months of dry weather, we perceive that Ash, and even Elm, are showing signs of a little distress, which, most likely, will result in an earlier ripening of their foliage; but these trees are comparatively surface-rooters, hence they do not so well avail themselves of the moisture deeper in the earth. We have, however, never seen Oaks with more healthy vigorous foliage, but then the Oak roots penetrate the soil deeply, and the tree is, therefore, when established, pretty well independent for one season of a surface-moisture supply. The sooner after the middle of October that we plant trees, forest or otherwise, the sooner do we enable the roots to avail themselves of the moisture beneath, when in such a season as this there is no moisture available from above.

Deep Stirring of the Soil for vegetables and flowers that have to be planted out. This comes in our way from the same line of thought and observation. With little water at our command, we believe that many of our crops look better than when water was given freely almost every day. We would rather put a bandage over our eyes than look at our lawn; but, from what we are told, others are a great deal worse. With little water, as above stated, the flowers in the flower bed are rather nice, and some rows of *Pelargonium* Brilliant, and even yellow *Calceolarias*, are fine. The first has had little water, the *Calceolaria* a little more—that is, a little at the roots of sewage in eight or ten days, and though we should have liked to have refreshed them and good beds and rows of *Verbenas* with clean water from a syringe or engine over the foliage, we have been

unable to do so, and the only refreshing they had was the slight shower a fortnight ago on Sunday morning. That has been the only damping of the foliage for a month, for, unfortunately, we have had scarcely a perceptible deposition of dew for a long time. Now, we understand, that these plants are as fine as others where water has frequently been given, and that judiciously, and we are sure they are much better than some which were watered every day. The standing so well of these plants and braving the fierce sun we attribute partly to surface-stirring, and thus breaking the lines of the radiation of heat and the evaporation of moisture, but chiefly to the deep stirring of the soil, which enables the roots to descend freely in search of that which to them is an essential of growth and existence. But for the following fact we could not have believed that the surface soil was so very dry. In our ribbon border one, if not two rabbits had endeavoured to make breeding nests for themselves. Most of our readers know that until the young rabbits get their eyesight they are kept shut up from the light, and with a very small portion of air, as the old one covers up the hole securely. We tried to follow one of these holes to its termination, but it went so far that we gave it up, fearing that our spade would do more harm to the plants than even the rabbits would before they were caught. What surprised us, however, was the almost impossibility of getting the soil to lie on the spade, owing to the extreme dryness, to the depth of a spade. It rolled off like so much kiln-dried sand, and yet with all this dryness the plants were growing as above, not luxuriantly, as in a moist season, but still holding their own and blooming freely. Of course, with a little water at the bottom in ten days the soil immediately below the plants would not be so dry as that in the spaces between them; but moisture, like heat, is so diffusive, that after making this allowance we must conclude that they chiefly supplied their wants from the moisture far down below, and that the deep stirring of the soil enabled the roots and the moisture to come all the easier into connection with each other.

What we mean by deep stirring is stirring to the depth of from 18 to 30 inches, instead of a mere spade in depth. In flower beds and vegetable beds it would often be advisable not to turn up the lower spit, but leave it at the bottom until it was gradually ameliorated. In flower beds as a rule, we like the finest and richest soil to be at the surface, as in that case we are more anxious to have bloom than excess of luxuriant foliage. In all seasons the comparatively deep stirring answers. In very moist seasons the moisture has a free passage to descend, and in dry seasons, such as this, besides encouraging the roots to go down, the moisture ascends more easily to meet their wants.

In general the want of rain and the scarcity of water have rendered our work much like that of previous weeks.

KITCHEN GARDEN.

We had to water Cucumbers and Vegetable Marrows with what we could get. In one fine day the vigorous leaves of the latter would have been turned up into as many drinking cups, but a good soaking of sewage immediately brought them back right. This, however, we must also use sparingly. The Vegetable Marrow gave fine returns in June this season, treated on the old-fashioned ridge plan, with a little rough fermenting material beneath it. No doubt the early gatherings were owing to the hot season. After trying many kinds we have gone back to the old Vegetable Marrow, as still for all purposes being by far the best, richest when cooked, and easiest to cook. We think it best when boiled whole, when small, as carefully as a Beet, and as far as possible no water whatever admitted to the centre. Then cut the Vegetable Marrow open, remove the centre pulp, and dress according to taste.

FRUIT GARDEN.

We could only water what was under glass. Took off lots of small Strawberry runners, and pricked into beds, and watered and shaded to make roots, as our plants of Strawberries in the main beds are so dry. These runners when rooted we will raise with balls, and pot. Trees in pots in the orchard house we have mulched above the rim of the pot again, as the previous one had melted away, or had sailed off in the watering. Gathered the last fruit in the Peach house, and cleared it out, and gave a heavy syringing with weak soap water, and shut up early, so that the vapour would settle the few red spider that appeared. There are no free spaces in the wall, or the damping them with sulphur, and such a syringing, and shutting up with a bright sun between two and three o'clock, would destroy nearly all insects. In the hottest days damped the shelves of even the

earliest vineries. Out of doors we fear good crops of Apples and Pears will be small, and many of the former are dropping from nice little trees. We could have kept them on only by a good watering at the roots, and that we could not afford. We could only lessen the evil by mulching.

ORNAMENTAL DEPARTMENT.

Dressed flower-beds, and twiggd up plants where not secure, as heavy rains and winds combined would do great injury to plants not secured in our windy place. The removing of all faded blooms and petals before rain is also important, as the faded flowers then would greatly disfigure those that were fresh. Some Scarlet Pelargoniums are very fine, the *Viola cornuta* in one place is dead for want of moisture; but no *Viola* would stand such weather long without watering. Went on potting for autumn, and sowing biennials for next season, Stocks, &c., for spring, &c. In the houses the chief work was to keep cool by shading, and sprinkling paths and stages in preference to soaking the plants too much. Pelargoniums done blooming are left standing in a sunny place, and are principally watered by damping the ground below the pots.—R. F.

COVENT GARDEN MARKET.—JULY 22.

THERE have been heavy arrivals of foreign and home-grown produce, comprising Apples, Pears, Plums, Apricots, and Peaches and Nectarines from open walls. Forced produce is now realising very low prices, the supply being in excess of the demand. Potatoes are good, and in them there is a steady trade. Raspberries and Strawberries are nearly over for this season.

TO CORRESPONDENTS.

•• We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—We are obliged to postpone until next week many answers.

FRUIT (E. M.).—Write to Messrs. Webber & Co., Fruiterers, Central Avenue, Covent Garden.

RED SPIDER ON PEAR AND APPLE TREES (S. M.).—Give the trees a few good syringings with a solution of soft soap, 2 ozs. to the gallon of water. This and moisture weather will free the trees of these pests. The white substance on your brick wall is a result of the dry season. It will shortly disappear, but the wall may be washed with lime water, thirty gallons of water being poured over 14 lbs. of fresh lime, stirring well up. Let it stand two days and nights, then wash the wall with the clear liquid, which will not discolour it or damage the trees. It may be applied with a syringe.

PEACH TREES AND VINE INFESTED WITH RED SPIDER (Inquirer).—The Peach-tree leaf enclosed is destroyed by red spider. There is no trace of the brown aphid. No amount of fumigation with tobacco will destroy red spider. Your remedy will be to give the trees a thorough syringing with a solution of soft soap, 3 ozs. to the gallon of water, and repeat it again within a week, keeping the trees well syringed every evening with water up to the time of the fruit beginning to ripen. If there is no fruit continue the syringing up to the middle of September, but we fear the leaves will all fall prematurely. The *Vinea* leaves, we fear, are infested with the same pest. They should be well syringed until the Grapes change colour. The red spider seldom attacks Apricot trees, but it does occasionally when the season is unusually dry and hot, and the supply of water at the roots not so plentifully furnished as required.

ERINGS LYCHNIDEA CULTURE (J. S. E.).—It should have efficient drainage, the pot being one-third filled with crocks, and then a little moss, or a little of the rougher parts of the compost placed over the drainage. In potting use a compost of light, sandy, fibrous loam one-third, and sandy peat one-third; silver sand and pieces of sandstone from the size of a pea to that of a hazel nut, in equal quantities, forming the remaining third, the whole well-mixed. Make the compost pretty fine, and keep the plant rather high in the centre of the pot. It requires to be near the glass in a greenhouse to winter, and cold pit or frame in summer, being careful not to overwater in winter nor at any time, and yet if it ever suffer by the want of water it rarely recovers. After potting watering should be carefully done for a time until the roots are working freely in the fresh soil, and in potting do not disturb the roots more than can be avoided; indeed, the less the ball is disturbed the better.

STEPHANOTIS FLORIBUNDA IN WARM GREENHOUSE (Stephanotis).—The *Stephanotis* succeeds fairly in a warm greenhouse, providing it is the warmest part and has a light situation. We have seen it very fine in a vinery, the temperature being at times as low as 40°. In summer the temperature required is higher than is usual in greenhouses, it being desirable to secure a good growth, and to have it well ripened. The plant should be kept dry in winter, which will enable it to withstand cold better than if the soil were kept moist, and it is better for the plant.

STRAWBERRIES AND CHERRIES FOR EXHIBITION (A Young Beginner).—The two best Strawberries for exhibition and dessert we think are Dr. Hogg and Lucas. Two Cherries for the beginning of July are Tartarian Black and May Duke, both large and good.

MELONS NOT SETTING (T. S. M.).—You should, when the Melons were setting, have kept the surface of the bed rather dry, giving a good watering so as to wet as little as possible the foliage or surface of the bed. We can only suppose there has not been sufficient moisture in the soil, and that the plants have been kept too close. Give more air, keep well supplied with water, and do not employ liquid manure again until the fruit is the size of a hen's egg. Thin out the shoots, keeping them from 9 inches to 1 foot apart—that is, the main branches, and stop the side shoots one joint above the fruit, impregnating the flowers.

TOMATOES IN GREENHOUSE (Idem).—Tomatoes can be fruited very well in 9-inch pots, but they require to have plenty of liquid manure, but not too strong. We prefer 11 or 13-inch pots, and we would give years a shift now into larger pots without disturbing the ball. Keep the plants well stopped above every cluster of fruit, thinning the shoots when much crowded, and stopping all one joint above the fruit. Confining stopping all shoots one joint above the fruit.

SAVING CABBAGE SEED (—).—The head of the Cabbage should not be cut off but allowed to burst, the plants for seed being sown in May of the previous year to that of their seedling. Turnips in flower, if near, at the time of the Cabbage flowering will have a degenerating effect on the Cabbage seed. They should be grown in plots a considerable distance from each other. We think you are mistaken about August grafting. Refer us to the page.

APPLE TREES INFESTED WITH RED SPIDER (L. B.).—Give your trees a few thorough syringings with soft-soap in solution at the rate of 2 ozs. to the gallon of water, directing the force of the syringing against the under sides of the leaves, and give the trees a thorough watering with liquid manure, not too strong, and mulch for a yard distance all round the stems, using cow dung if convenient, or other rich compost. There is no preventive of red spider, except frequently washing the foliage through syringing, and supplying proper nourishment to the roots in the shape of top-dressings of rich compost, with liberal supplies of water and liquid manure in dry weather.

PALENESS OF ROSES—GOOD YELLOW (G. H. M.).—"The paleness of the yellow Roses proceeds from the buds at the time of expansion being soaked with heavy dews, which are evaporated by the sun; hence the colours fade. Sometimes a Rose loses its colours from starvation; this, however, cannot be the case with your Roses, which appear to be well fed. The remedy is sheet-covering. To provide for the loss of dew water should be given freely, so as to reach all the points of two days. All Roses for exhibition should be covered previously for one or two days. As you seem fond of Tea Roses, I advise the purchase of Bontou d'Or, a perfect button-hole Rose and quite golden, also Madame Margottin, a beautiful Tea Rose—in my judgment the best that has come out since Souvenir d'Elise made her appearance. This last, I fancy, is the handsomest of the Tea Roses. The contest for primacy, however, rests between Devonians and the two last-named. I have seen Fisher Holmes out since last week. It is handsome, but I fear it will not be full enough. I recommend in addition to those named in my last contribution, Exposition de Brie, and Charles Romillard. I have also had two beautiful blooms of Miss M. Dombrain.—W. F. KADLYFFER."

SUBSCRIPTION CEASING (Planagon).—No other notice is necessary than to write saying that you wish to cease from subscribing.

SEEDLING CARNATIONS (H. B.).—You put a letter into the "Sample Packet," and we had to pay £4. for it.

HARDY HERBACEOUS PLANTS.—We never heard of such a plant as your No. 3. Nos. 1 and 2 are hardy bulbs. The others are all hardy herbaceous plants, at least some species of No. 8 are. To avoid controversy, why not ask the secretary which he considers admissible?

CATERPILLAR (A Subscriber).—The caterpillar found in the Aspen is that of the Goat Moth, *Cossus ligniperda*. It is very destructive to the wood of growing trees.

INSECTS (*S. Dibble*).—It is the humming-bird moth, *Macroglossa stellatarum*. We know of no cheap illustrated work on wild flowers.

NAME OF FRUIT (*Constitution*).—Your Apple is the Red Astruchan.
NAME OF PLANTS (*A. S. A.*).—*Acanthus spinosus*.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending July 21st.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

HOUDANS.

I HAVE to thank many kind poultry fanciers for their answers sent to me some time back. Each, as a matter of course, recommended me to try the child of his own fancy. Unfortunately I am not yet prepared for entering on their introduction into my grounds. Were it not for my love of a garden I should have no hesitation, but I want to keep them out of the way of the garden; and as some of those who were good enough to answer me are not very distant neighbours, I hope to get their advice as to how I am to manage. Taking all the various points into consideration I am inclined to take to the Houdans, and it is for this purpose I wish to say a few words in reference to Mr. Manning's communication this week. Surely he must have misread your remarks in the Journal of July 2nd, for the description there given of the Houdan cocks does not profess to be that of M. Jacque but of the writer; the translations of "Le Poulailler" commence at the paragraph "Proportions and General Characters." Certain it is I have "Le Poulailler" before me, and not a word is said in it regarding their supposed tenderness or want of constitution; indeed, in addition to the remarks translated he adds these—"It is one of the most beautiful breeds of fowls, and nothing can be more rich than the appearance of a poultry yard composed of Houdans, but its qualities surpass very much its beauty." In his description of the Crève-Cœur he adds, "The varieties of Calmont, Houdan, De Gournay, and all the Norman fowls in general, are veritable ramifications of the Crève-Cœur;" and it is to this fowl he gives the palm when he says, "It is the foremost race in France for the delicacy of its flesh, the ease with which it is fattened, its precocity, and I think that it is also the first in the world in these points of view."

In my late visit to Paris I endeavoured in vain to see anything like a good stock of either. On the Quai des Mégisseries I saw a few in baskets, but on applying as to where I could see a good stock I could get no answer. At the end of "Le Poulailler" a Mons. Gerard at Grenille is mentioned as the great breeder of native birds; but I could not discover in the Paris Directory any such name, and it was too hot to go out to Grenille on the chance of finding any one. Is there anywhere in the neighbourhood of London where I could see some good Houdans?—D., Deal.

STAVELEY (DERBY) POULTRY SHOW.

ALLOW me to make a few remarks with regard to the above Show, which was fixed for June 23rd and 24th, and which is postponed till September 30th. When our entries closed on June 13th we had ten entries, each succeeding post bringing more; so that on Wednesday, when our Committee met to decide whether we should hold the Show under the then existing circumstances, we had only sixty-nine entries, too small a number to hold a show with any amount of success, after offering so liberal a prize list. At this meeting our Committee postponed their decision until next day (Thursday), and then concluded to postpone the Show, and return each exhibitor (who had kindly entered) his fee, and we enclosed a note stating our reasons, which was accordingly done on the Friday and Saturday following, to be in time, as we hoped, to stay any fowls being sent.

It was our first attempt, and we hoped to merit more entries.

Had we known before we had made our arrangements of Spalding and Beverley Shows being held at the same time, we should most decidedly have altered our date. I am extremely sorry that it should have caused any inconvenience to any exhibitors, but hope at the same time when our entries close on September 9th next we shall find their names in our list, and merit that liberal support which we have tried to gain.—T. W. SPENCE, Hon. Sec., Stanley, Derbyshire.

PROGRESS OF GROWTH OF DORKING CHICKENS.

COCKEREL hatched March 2nd; July 11th weighed 7½ lbs. Pullets hatched same date, 6 lbs. each. In 1863 I exhibited a cockerel at the Darlington Show in December weighing 12½ lbs. — he was hatched on the 11th of March—and two pullets with him, hatched April 3rd, each weighing 8½ lbs.

This year I sold many Dorking cockerels for the table at six weeks old, some of which weighed as much as 2 lbs. 7 ozs. each. This was after they were killed by bleeding. The least of them weighed 2 lbs. 5 ozs.

This may appear incredible, but I add my name, and if requisite can refer you to the dealer who bought them and weighed them.—THOMAS E. KELL, Wetherby.

JAPANESE BANTAMS.

IN your report of the Oundle Poultry Show you allude to an extraordinary pen of Japanese Bantams, and suppose them to be a cross between the Silkies and Frizzled Bantams. The birds in the pen alluded to were imported from Japan last year, and I believe them to be a pure breed. I do not think they are half the weight of either the Silkies or Frizzled Bantams. I have raised a fair number of chickens from this pair of Bantams in the present year, and they are all perfectly true in feather and size to their parents. I believe them to be the only specimens in England; at least I have heard of or seen none like them.

We have for some years been breeders of the Frizzled Bantams which we show in the same class, but I believe them to be a distinct breed from the fowls in question in every way, and the cross between them and Silkies produces a full and smooth-feathered Bantam with a top knot.—JOE N. BRASLEY.

BUDE HAVEN POULTRY SHOW.

JULY 17th.

DORKINGS (Coloured).—First and Second, Mrs. Thynne. Cocks.—First, J. Tarrett. Second, J. Bines. Chickens.—First, Mrs. Thynne. Second, Miss E. Galsworthy.

SPANISH.—First, R. Hoskin. Second, W. Leech.

MINORCAS.—First, J. Glynne. Second, D. Ham.

GAME.—First, I. Rosekelly. Second, A. West. Third, J. Francis.

CHICKENS.—First, R. Bowhay. Second, A. West.

COCHIN-CHINA.—First and Second, W. L. Trewin.

BRAHMAS.—First, J. Tarrett. Second, Mrs. Thynne.

MALAYS.—First, H. Darch. Second, W. Allin.

CORNISH.—First, Mrs. Thynne. Second, D. Maynard.

HAMBURGERS (Golden-pencilled).—First and Second, J. F. Delmar.

HAMBURGERS (Golden-spangled).—First and Second, J. F. Delmar.

HAMBURGERS (Silver-pencilled).—First, J. Turner. Second, J. Cheese-
worth.

HAMBURGERS (Silver-spangled).—First and Second, W. M. Lancaster.

CHICKENS.—(Golden-pencilled and Spangled).—First, J. F. Delmar. Second, J. Woodley.

POLAND (Golden-spangled).—First and Second, H. P. B. Sly.

POLAND (Black White Topknot).—First and Second, W. L. Trewin.
BARNDOR.—First and Fourth, H. Francis. Second, C. Rodd. Third, R. Francis. Fifth, T. Barrett.
EXTRA PRIZES.—First, W. Scown. Second, Mrs. Thynne.
ANY BREED —Cock.—First, W. L. Trewin. Second, Capt. Freeman.
BANTAMS (White).—Prize, J. Francis.
BANTAMS (Black).—Second, J. Heal.
GUINEA FOWLS.—First and Second, W. M. Lancaster.
DUCKS (Ayresbury).—First, W. Bines. Second, Rev. T. S. Carnsew.
Third, Miss Radcliffe. Ducklings.—Prize, Rev. T. S. Carnsew.
DUCKS (Common).—First, J. Heal. Second, T. Pickard. *Ducklings.*—
First, S. Brown. Second, T. Medland. Third, H. Francis.
DUCKS (Rosen).—First and Second, Rev. R. R. Wright.
GEES.—First and Second, J. Heal. Third, H. Francis.
TURKEYS.—First and Second, J. Heal. Third, G. Risdon.
PIGEONS.—First, Miss Radcliffe. Second, W. Medland. Third, T. M. Medland. *Fantails, Jacobins, Trumpeters, Tumblers, Nuns.*—Prize, Rev. J. R. Whyte.
RABBITS (Lop-eared).—Prize, Master R. Treleven. *Common.*—First—
Master J. Edgecombe. Second, Master H. Saunders.
JUDGES.—Rev. G. F. Hudson, North Petherton, Bridgewater; Mr. H. Leeworthy, Barnstaple.

LONG SUTTON POULTRY SHOW.—We have received a prize schedule of this, and considering the serious drawback of last year's Show, as to receipts at the entrance gates, owing to its raining incessantly all the time the Exhibition was open to the public, the present prize list must be admitted to be a liberal one. The Show takes place on the 14th and 15th of October next. The prizes offered are £1 and 10s., in the general classes for poultry, with an addition of six silver cups of the value of five guineas each. The prizes for Pigeons are £1 and 10s. in each class, with two five-guinea cups in this portion of the Show. The local prizes offered are not less liberal, and the well-known name of Mr. George Clarke, the Hon. Secretary, is an undoubted guarantee that everything calculated to benefit the birds will receive the most direct personal attention. The names of the three Judges selected are given in full on the prize schedule.

PIGEON-FLYING MATCH.—One day last week twenty-four Pigeon fanciers of Southwark flew a match from Dover for a stake of one sovereign each. A bird of the Skinnum tribe won, accomplishing the journey in seventy-eight minutes.

MY DOGS.

SOUTHEY somewhere states as his opinion "that a house is never perfect unless it has in it a child rising two years and a kitten rising six months." I do not like to dispute so great an authority, but as to the child rising two years, I think the time might be extended to several years above the two; for instance, what makes a house more perfect than having in it a daughter rising eighteen? As to the kitten, well, tastes differ. Southey's love of cats was remarkable in a man. But not to be too particular. Grant the child and grant the kitten: why did not Southey mention a dog? surely as superior to a cat as a lion is to a tiger—though modern travellers will make out that a tiger thrashes a lion in combat, so sometimes a cat beats a dog. But rightly, so I deem it, does that Landseer of literature, who has done for dogs with his pen what Sir Edwin has done for them with his brush—rightly does Dr. John Brown say, "A dog in a house is a perpetual baby." And pardon the digression "gentle reader"—and why are readers in old books always called "gentle?" I am sure that any cat-loving reader, of this article, for instance, is just now by no means a gentle reader, but ready to scratch me for speaking slightly of her (a her, of course), beloved animals. But yet again to come back, gentle or ungente reader, if you have never read Dr. John Brown's "Rub and His Friends," the best bit of dog literature ever written, go out and get a copy; it will only cost you sixpence, and you will thank "WILTSHIRE RECORDER" with eyes running over with happy tears (especially if you know "bonnie Scotland" and "Elmhurst town"), for introducing you to that wonderful "bookie," and for giving you an hour's intense pleasure, to be renewed as often as you read it.

Well, Dr. John Brown, as I said before, tells us, "A dog in a house is a perpetual baby." Think of that, ye whose hearts are yearning to love something; think of that, ye now not young fathers and mothers, who remember the joy in the house that baby No. 1 gave you from the first hour of its baby life until baby No. 2 took its throne and reigned in its stead. But to have a perpetual baby—a toy—a plaything—a something knowing much, yet not judged accountable, and so a large

margin given to do as it likes, and all it does gives you pleasure! A perpetual baby—that is, a dear good dog, who looks at you with intense loving eyes, all affection in their clear hazel, brown, or black depths—a being who obeys you implicitly, waits for the hour at the door of the house at which you call—a being who loves you just the same whether you are rich one year and very poor the next; who into the bargain takes upon him to defend your house, your home, your castle; and if you have no home he does not leave you—no, he all the more defends you, yourself, as much as to say, "Cheer up, my poor unfortunate master. You have got no home for me to take care of; never mind, I will concentrate my attention, I will watch and take care of you." Yes, a good affectionate dog, to whom you are everything, who loves you with his great affectionate heart. Of such a one the old proverb ought to be strictly kept true, "Love me, love my dog."

Dog and man, how snited they are to each other! Notice a dog without a master, how very wretched he is. He looks a miserable outcast. How he follows each likely-looking person in whose face he thinks he discovers the least trace of dog love. And how he tries to ingratiate himself with such a one! He wags his tail, and looks as much as to say, "Do let me be your dog, I will be such a good dog!" And then with a more beguiling wag and look which says, "Now do, you dear good man, now do." Poor masterless dog! This has to go on many days, until to his joy he finds a master—a boy, perhaps, still a master. Then he has to envy favour no more; he has not to wander about tail between legs—for why? he has got a master.

Then how dog and man contribute to each other's happiness! as in a happy marriage, each party is made the happier. Man has not domesticated or reclaimed any animal so perfectly as he has the dog, for the dog does not even wish for liberty. His feelings are won over. He is no longer, as naturally, a gregarious animal. He passes by other dogs with a brief "How do you do?" but he knows better than to forsake man and herd with his species—unlike the horse, who kicks up his heels in the pasture and fain would not again be stabled. But the dog does not even wish to be free. Man has raised him in the scale of existence. He is more sensible, intelligent, and sagacious than his wild ancestors (half wolves, perhaps). His heart has been won, and his heart is better since it was won; so he no longer wishes—even wishes to be free.

Now as to my dogs. I have not had many, for I do not readily transfer affection from one dog to another. The first dog I loved was scarcely mine, for I was rather his property, for certainly I was much his inferior. My childhood's home was one which for many years never lacked an infant within its walls; and each little one was duly presented to old "Keeper," for that was his name, who sniffed, and sniffed, and licked the tiny thing's face, and I looked as if he knew all about it; his old brown eyes saying, "Ah! I understand. That child belongs to the house, and I'll take care of it—all right." And he did. Down on the lawn the youngster was by-and-by put, and old Keeper romped with it, kept it happy and out of mischief, save mischief with him, such as putting its tiny hand into his mouth and poking straws up his nostrils, both deeds permitted with good-humoured patience.

But I have not yet given to you, gentle reader of our gentle Journal, a picture of old Keeper. He was a bull terrier, very much bull, in colour white. He had been a noted fighting dog. He had fought many battles (those were bull-baiting, badger-drawing, cock-fighting, dog-fighting days—things have happily improved since). Old Keeper was humanely bought and made a gentleman's dog of, so that he might retire with dignity into private life. There was the old spirit in him; but "No, Keeper, no!" brought him to a peaceful disposition; but "At him, Keeper, at him!" would, I fear, have pleased him far better. His face was wonderfully scarred—marks won in fair fight. He looked made for combat, as I suppose Garibaldi looks, even when at Caprera. His dear old scarred face and stout limbs are perpetuated; for there is a portrait of him in the old house at home, done in oils by the clever scene-painter of a moving company of theatricals. There he is rigid as in life, the attitude obtained by putting a rabbit in a basket, which made the old fellow cock his ears and tail, and look animated as in his youthful days. Poor scene-painter! Born for better things, as that picture shows, you were a poor ne'er-do-well, who had not even a dog for a friend.

Many years, considering he was a dog, did Keeper live honoured. Very faithful was he, very true to his master. The horse, a great friend of his—they shared the stable together—

dared not venture to do wrong, for once he broke his bridle and prepared to gallop off, but Keeper seized him by the nose (rather too severe a punishment), and there held him till his master came up. Many a cat did he kill, and such-like vermin. At length he grew very lean, and mangy, and heavy-eyed, and ceased to enjoy life; then leaner, more mangy, and more heavy-eyed, until he died. And as he had lived honoured, so he died lamented. There was a formal burial, and then a tombstone was erected, but no more. We could never agree as to a fit epitaph, after the "Here lies Keeper." We could not find words, fit as we thought, to record his merits. So month after month passed, the stone remained blank, then year after year, and it is blank still, for I saw it a few weeks ago, and the stone looked blue and clean, and blank as ever, though more than thirty years have flown since old Keeper was laid beneath. The tomb looked as fresh as the old dog is in the memory of the two that are left, who knew him, his master and—WILTSHIRE RECTOR.

(To be continued.)

INVASION OF BEES.

I HAVE a hive of bees, from which, as I took a glass of honey from them rather late last season, I fed them well all the winter, and until the end of March. Early in May I found they worked very little, and seemed to be fighting, some dead bees being on the ground under the bee-stand. So they have gone on working little, and with more and more dead bees on the ground, till I think there must be very few left. Being but a tyro in bee-keeping, I should like to know the reason of this. I had given up my bee-keeping in despair (this being my only time), when this morning a great sound of bees was heard in the air; my man rattled some tins, and threw up earth at a swarm which appeared in the garden, apparently looking for somewhere to settle. He expected them to go to a pear tree near them; they began, however, to enter the hive until they all settled within it, and they have been working all day, and at present appear as much at home in it as if they had been there a year. Is not the above a somewhat unusual occurrence?—C. R.

[There is little doubt that the queen died during the winter and that the colony gradually dwindled away, until about May or June none were left. Those which afterwards appeared to inhabit the hive did not really belong to it, but were merely scouts from other stocks, and any fighting which took place was doubtless between these and the remnants of the aborigines, or between the invaders themselves if they came, as is most probable, from more than one hive. What followed is common enough, swarms being very prone to look out for and occupy hives which are ready furnished with combs.]

BEEES IN A SODA CASK.

ACCORDING to your request, I send you an account of the ultimate result of the swarm which was domiciled in a soda cask, as reported in your columns August 22nd, 1897.

The owner at first proposed placing them over the brimstone pit, as the easiest method of dealing with them, but I said I hoped he would not be guilty of such wholesale murder, and offered to go over and drive them for him if he would give me the bees. He seemed to think if I could drive them he could manage to do it himself; "Very well, do so, only remember you will have such a job as you never had before." It seemed he had some acquaintance with a person in the neighbourhood, said to be wise in bee lore, and this party promised his assistance; "he had driven dozens of hives, and could manage it in an hour," &c. I inquired how this "bee man" proposed to conduct the operation, and I was informed "a hole was to be dug in the ground to receive an empty cask, and that then the full one was to be placed upon the top, and the bees were to be driven down into the empty one." Of course I had a good laugh at them, and it was finally arranged that I should go over and drive them for him about the end of July. However, what with the advice and persuasions of one wisecrack and another, he allowed this adept to commence operations on the 25th June, in my absence, and the result was even worse than I should have anticipated. He tried, and tried again, and was at last obliged to beat an ignominious retreat, and leave his work unfinished, and the owner found he knew no more about driving bees than he did himself. So he was obliged to try, but could not succeed. Determined not to be beaten, he employed a lad a whole day to beat the sides of the cask incessantly, but with no other result than that the combs were loosened, and slid up and down when

the cask was moved, and then didn't the enraged inhabitants give chase and repay with compound interest the indignities they had been suffering for two or three days previously.

Then they sent to know if I would come immediately and help them. This I could not do, and as the bees would not take to the new cask they got them at last into a large straw hive, after having sacrificed thousands of bees and the whole of the eggs and larvae in the brood combs, which must have amounted to 20,000 or 30,000, and they got, what think you, for their honey harvest?—about 8 or 9 lbs. of very indifferent honey. And I was afraid when I saw the swarm the other day they would not prosper, and had doubts from their movements the queen was not in the hive, as they had been in it five days and there was only a bit of comb about the size of a threepenny-piece; so to satisfy all parties, I got a sheet and dashed them all out, and searched them over until I found her majesty was safe; at the same time I told him if he did not commence feeding at once he would lose them altogether, for there seems to be a great scarcity of honey this season about this neighbourhood although some bee-keepers have done better than others.

I have had very bad success this season, having lost so many queens one way or other, thus keeping all my stocks weak in numbers, those with queens being so often called upon to contribute brood combs to save the others from becoming extinct.

I lost a fine Ligurian queen the first week in May, and always fancied a goodly company of bees accompanied her. And judge of my vexation at hearing only two days ago that a swarm of Ligurians had possession of a tree some two or two and a half miles away, and had been there for weeks to the knowledge of certain parties who had been trying to hive them, but could not get the queen. I sent a man to see whereabouts they were, and had the mortification to learn that they had been so harassed by men and boys (some of whom got pretty well stung over it), that they had decamped entirely, and gone no one seemed to know where.—J. R. J., *Hull*.

BEE GLASSES.

IT is with much pleasure I accede to your e-teemed contributor, "B. & W.'s" request for further information as to the style of bee glass figured at page 415 of No. 375.

Like him I had almost discarded glasses from my apiary, finding, as a rule, bees would readily store 3 lbs. in wood against I, after the utmost care, in the best description of glasses offered by Messrs. Neighbour & Sons; but those employed by Mr. Mitchell, of Abington, being the design of no mere theorist, but the ingenious result of very many years' practical experience and efforts to produce a glass "all but perfect," offer such facilities for the storing of honey in this material, as will induce me to give them a prominent place in my apiary for the time to come.

But, first of all, to take up the faults and suggestions, by way of improvement, of your correspondent, I may remark, the rim forms portion of the lid or top, and consequently already rests upon the body of the glass, and not within it, as he supposes. Then, again, the concave or saucer-like form of the upper portion of the stalk serves the purposes of bearing the glass and retaining any slight leakage. Of course, when set upon the table to be broken up, the lower circular aperture would require to be securely stopped, and by the above arrangement the stopper is kept out of view—indeed, when photographed there was a thick knitted wire rubber doubled up beneath the body of the glass, quite unseen in the sketch.

Your correspondent's last and best idea of substituting a wooden top suggested itself the first glance I had of the glass. The comparatively small portion stored in the upper portion or lid is a capital feature of the plan, and it occurred to me that by temporarily removing the lid, and in lieu setting on a thin board with a number of good deep pieces of empty guide comb, storing would go on about as rapidly as in wood till its completion, when I proposed with a thin-bladed knife or thread to sever the attachments to the board, remove it, and replace the lid. The bees would at once gather up to lick up the loose honey, and finding the vacuum above them, speedily work up the combs; and here, I may remark, your correspondent's fears, however legitimate with regard to loaded combs giving way of their own weight in common glasses, overlooks the fact that this is an impossibility in the new glass, as when completed they are self-supported from the narrow base, independent altogether of upper attachments to either glass or wood—another happy thought. My plan I duly submitted to Mr.

Mitchell, and found it had occurred to himself some years ago, been tried, and found wanting.

The usual disinclination bees display to begin work on a smooth surface, such as glass, and the persistence with which, when started, they stick to one comb or side of a glass, is a chief cause of the slow progress made. This difficulty Mr. Mitchell, like every worker in glass, experienced, and at last overcame by a very ingenious contrivance, by which, instead of beginning one comb the bees can be induced to start several simultaneously in a regular figure, both downwards and upwards. This is effected by the construction of a little frame of very thin wood, consisting of three pieces crossing and attached to each other by means of a little broad-headed wooden pin in the centre, as shown in the annexed sketch.

To each division of the frame, and on both sides, points of pure guide comb are attached, and it is suspended by means of a thread passing through the hole in the knob on the lid till such times as the combs are fixed to the sides of the glass, when the thread is drawn up.

Another most important point is the thorough shading of the glasses, and keeping up an equable warmth, best effected by means of thick plies of woollens, or if wool can be had it answers capitally. By neglecting shading, Mr. Mitchell, when in his novitiate, lost thirteen young swarms in one hot season, the bees abandoning their hives, and going off after three weeks' occupancy, which mishap, together with the loss the same season of a large order of glasses from London, save one, through bad packing, he expressively added, "About finished me;" and yet he persevered, avoiding similar blunders, and by the use of good roomy stock hives, and combining several swarms, admitting only the honey-gatherers of the end combs into the glasses, he has at last attained such wonderful results.

The glasses are made by Messrs. James Conper & Sons, at the City Flint Glass Works, Glasgow, and can be had of any size, from 4s. 6d., to hold a few pounds, up to the monster glass illustrated, which cost £1.—A RENNESHIRE BEE-KEEPER.

OUR LETTER BOX.

EXHIBITING MALAYA AND WHITE DORCKINGS (Fair Play).—A Malay comb that has been tampered with is a disqualification. A purely bred Malay wants nothing taken off, nor can he spare anything without positive detriment. The White Dorking cock would not be disqualified by the hollow comb, as it is not a breed in which comb is of any importance. The spur on the outside of the legs are a deformity, and should disqualify.

PRESERVING EGGS (W. M.).—Eggs may be kept perfectly fresh and fit for any purpose by being put in an earthen pan, and covered with lime worked with water into a paste; alternate layers may be put in till the vessel is full. Care must be taken that the eggs be always covered, and they must be fresh when put in. The process is preservative, not preparative. We have eggs now fit for any culinary purpose that were preserved last year.

POINTS OF SILVER-GRAY DORCKINGS (Silver-Gray).—It is wrong for your Silver-Gray pullets to have black heads. It is still worse for them to have grey mottled breasts. The last is a positive disqualification.

CHICKENS' FEATHERING (D. S.).—A chicken never molts; that is an operation of mature age; but the chicken's feathers drop, and are replaced by those that will last till the first regular moult comes. An April chicken should be in full and perfect feather in October and November.

BRAHMAS FOR EXHIBITION (A. E. H.).—Your Brahmas are hatched too late for early showing, as they are only just now getting their plumage. It will be months before they moult. The weight is satisfactory, a pound per month is a good average. There is nothing that will promote the growth of feathers. The twist is not so important in the comb of a Brahma as an inclination to fall over. Inefficient feathering of the leg is a great fault. You will be more easily understood by those who know poultry, if you leave out the word neck before hackle. A fowl has but one hackle, that is the neck; the other long feathers form the saddle. The cocks will not crow yet, not till they are past four months old. Judging from the weights you quote, we believe you are just four months old. Showing against breeds of the same age. If you show against older ones, your chances of success would be diminished.

PREPARING GAME FOWLS FOR EXHIBITION (M. T.).—Game fowls should always be penned some days before exhibition, for several reasons. One very important one is to see whether the cock will agree with the hens, and whether they will agree together. If you exhibit a pen, the members of which are always quarrelling, there is no hope of success. They should not be put in a warm room. An out-house or shed, with protection from draught, is all they want. They should in their pen be able to perch. If there are signs of fighting, remove the weakest bird at once. No food has so much effect on the plumage in making it hang, as good white peas. Most exhibitors and cockers have favorite foods; that, some feed their Game cocks on raw yolk of egg; others give ramp-scraps scraped for food, and allow old ale for drink; others give suet and stale crusts steeped in port wine. There is no doubt a little of these is good and very instrumental in producing high condition, but it also develops their pugnacious propensities to an extent that often destroys any chance of success. Their legs and faces should be washed scrupulously clean.

POULTRY FOR TABLE AND LAYING (An Old Subscriber).—If you have plenty of room and fields for one breed, you have enough for two, if you manage them right. You should keep Dorkings for the run, and Brahmas for confinement. The latter will do well in a small space. We believe you very candidly and naively give us the history of your disappointment as regards eggs, when you go to the winter laying of twenty Dorking hens, and five dark Brahmas. Hens do not lay in the winter, chickens do. Winter laying may be made a certainty by keeping proper breeds of proper ages. Dorking pullets hatched in April, Brahma pullets hatched in May or early in June, will be laying in the winter. The poor mongrel that did lay, did not do so because it was a mongrel, but in spite of it. When pullets attain a certain age they must lay, because the time is come, and this acts independently of season or temperature; but it is only once in a lifetime. Afterwards, they are hens, and produce eggs only in the natural season. Substitute pullets for hens and you will have eggs. Eschew fines, and all artificial heat; they will only cause you trouble, and will make no return in any profitible way. Do not cross between Dorkings and Hamburgs; no mistake can be greater. Hamburgs are non-layers. It is yet time to save some of our early pullets, and we advise you to save the handsomest for winter layers. They will not disappoint one.

CARRIER PIGEONS FLYING AND EGGS NOT HATCHING (A Young Fancier).—Do not let your Carriers fly yet, wait until the young ones are a month old; then put them and food on the landing-board, and the old birds after their first fly will be enticed home, especially if you let them out when hungry. Be sure you do not drive them out, but let them come out as, and when, they please. Meanwhile have a good-sized wire front on the landing-board so that the birds each day can walk about, see themselves, and get a knowledge of the locality, also feed them there. As to your other question we are not quite sure that we rightly understand you. This hot and dry weather has been very bad for all hatching. We have before now had eggs fail us, owing to their being bruised, when chipped, between the bird's body and the floor on which just under the eggs there happened to be no nest, and so the young were not hatched. Are your birds liberally fed? After a little longer trial and re-mating we should kill each disappointing Pigeon. As a last thought, you may have too many birds in your loft; if so, a fancier never succeeds.

TEACHING BULLFINCHES TO PIPE (H. T.).—Their education consists in keeping them from hearing any other birds, placing them in a small basket, feeding them every two hours or thereabout, and after each meal covering them up to prevent their attention being diverted, and playing or whistling their lesson over to them two or three times; and even after they feed themselves it is necessary to continue their tuition incessantly for nine months. Some birds can learn as many as three tunes, but it is rare for them to pipe them without fault, and it is often necessary to whistle their tunes over to them after the moult, to prevent their forgetting them. One tone well piped is, perhaps, better than three imperfectly.

SALE OF YOUNG CANARIES (Spot).—Try Mr. E. Hawkins, 11, Bear Street, Leicester Square, though Canaries of "no particular breed" are not much in demand.

AUSTRALIAN PAROQUETS (Lucian).—Without seeing the birds we can only judge from the description you have given that they are the Badgers or Australian Grass Paroquets. They eat canary seed, oats, and millet; a handful of fresh gathered grass with seed on, should be given frequently, also water to drink. They are easily tamed with careful attention.

CHANGING FLOOR BOARDS (A Novice).—It is immaterial at what season you substitute movable floor boards for fixed ones.

PROFITABLE BEE-KEEPING (A Cheshire Bee-keeper).—We doubt whether the average wholesale price of run honey exceeds the offer which you have already received (8½d per lb.), although it appears but a low figure for so fine a quality as yours is described to be. You may, however, obtain a much better price for super honey by selling it in the comb. Messrs. Fortnum & Mason, Piccadilly, and Messrs. Neighbour, 149, Regent Street, and 127, Holborn, are large purchasers of honey, and either of these firms would inform you in what kind of vessels it should be forwarded to them.

FINING WINE (J. R. M.).—Take the whites and shells of three fresh eggs, beat them in a wooden vessel till they become a thick froth, add thereto a little wine, and whisk it up again. If the cask be full take out four or five gallons, and give it a good stirring; next whisk up the finings, and put them in, after which stir the whole well; drive in the bung, bore a hole for a vent, and in about three days close it with a peg.

5	W	[and General Meeting.]	74.2	51.0	62.6	18	32 4	39 7	36 8	21 6	17	5 41	218

From observations taken near London during the last forty-one years, the average day temperature of the week is 75.1°; and its night temperature 50.4°. The greatest heat was 92°, on the 2nd, 1856; and the lowest cold 31°, on the 2nd, 1864. The greatest fall of rain was 1.23 inch.

THE INFLUENCE OF THE HOT SEASON OVER THE GOOSEBERRY.

THE present season promises to test the capabilities of certain plants and fruits whose well or ill doing has been generally ascribed to the influence of climate, for a summer approaching those of continental Europe and America is hurrying things on more rapidly than we have been accustomed to see in former years. That there are certain plants and fruits which seem to benefit by this rapidity of growth, or rather of maturity, there can be no doubt, but whether the benefits so gained are not more than counterbalanced by the injuries that others suffer is a question which need not be entered into here. Rather let us examine into the conditions of one of our most popular hardy fruits, and see in what way it has been acted upon by the dry hot weather of the last six weeks or more.

The Gooseberry is admitted to be an especially British fruit, owing its present enlarged size and good flavour to the care and perseverance of our ancestors, who have from the small, wild, worthless-looking, spiny shrub furnished us with a plant producing fruit of large size and good flavour, and possessing as much diversity of colour as the Plum. It does not appear, however, that the Gooseberry out of Great Britain is held in such great esteem as it is with us, and the inference drawn would be that no other climate suits it so well. This view was taken by the late Mr. London nearly half a century ago, and, more than that, he pointed out what part of the empire produced the best subsequent experience has proved that he was in the main right, and the present summer confirms the correctness of his views. On further inquiry it will be discovered that other things as well as the Gooseberry are influenced by a scorching season, so as to become less valuable than they are in ordinary years. This and other inconveniences, as we are often tempted to call them, may reconcile us to dull and showery summers when we see and feel the effects of bright continental ones like the present, which is seriously affecting many things that will be missed hereafter, and at the present time is inflicting an amount of injury upon us more than equivalent to the advantages it brings.

Confining my remarks to the Gooseberry, let us see how it has fared with the most extensively-cultivated of all our hardy fruits, for there are few cottage gardens without a Gooseberry bush, while it is equally valuable in a royal garden. In general we shall find that the Gooseberry crop of 1868 was a good, if not an abundant one, and it was so early that a neighbour of mine sent several bushels to market on the last day of April, and I do not think he was first.

Gooseberries have been plentiful, and the trees in general free from the caterpillar, but occasional visitations of it are to be met with, and some little time ago I was grieved on passing a plantation of about four acres of this fruit to find scarcely a leaf on the trees, the attack

being the second in the season, when the caterpillars are much more difficult to conquer than in the first assault, for then hand-picking does much towards thinning them. The trees, as I have said, were almost leafless, and the fruit all but useless. Now, when it is understood that the occupier last year estimated his crop on the four acres at twenty tons of Gooseberries, it is easy to conceive what a loss must have been caused by the caterpillar, and that, too, with one of the hardiest of our hardy fruits. It would be wrong to blame the cultivator in this instance, for where it can be done he has spared no expense in picking off these pernicious insects, and I will not say how many gallons have been gathered off his grounds in some seasons, for he has other fruits as well as Gooseberries, but the quantity seems astonishing.

I would ask all who have noticed the ripening of Gooseberries this season on dry soils and in the broiling sun which we have had, if they have not noticed a great deficiency in flavour? I have certainly thought so. The trees are healthy, the crop good, and apparently it ripened properly, but evidently the season has been too forward for it, and the lack of moisture in the atmosphere has also affected it; for when we had a little rain on the night of July 12th, the fruit being then fully ripe, I expected, in accordance with the experience of former years, that the berries would burst with the pent-up luscious juice. Such, however, has not been the case, not one Gooseberry that I have met with has done so; on the contrary, the skins seem to toughen, and the pulp by degrees to turn sour, the whole fruit having less inclination to drop off than in former years. Now, is this not a proof that the season has been too hot for the Gooseberry? In flavour the fruit has never approached even mediocrity, and I should think that in general it has been somewhat undersized.

The want of the Gooseberry has evidently been those occasional showers which our British climate in the majority of seasons affords, while in the case of the present summer even the assistance of the ordinary dews has been wanting, for we have scarcely had dew all the season, and very often of late a withering north-east wind has been blowing all night. Since the 29th of May up to the present time (July 17th), we have scarcely had any rain, not so much as 1 inch in depth all over the surface. Such extreme dryness is, in my opinion, the cause of the Gooseberry lacking flavour, while, possibly, such fruits as Peaches and some others may in this respect be improved by the drought.

The Gooseberry, being a native fruit, does not require a Persian or Australian summer to ripen its fruit in, and the correctness of the opinion of a garden authority of the last generation, that better Gooseberries are grown in Scotland and the north of England than around London, seems to be confirmed this year; at all events I would like to have the opinion of others on this matter. We may feel some anxiety for our other fruits as well, for they may be affected in a similar manner by the hot summer we are passing through, and in the end present us with fruits resembling those of southern Europe or other warm countries. Should this be the case, our Apples will be more

found fault with than have been our Gooseberries, for the latter in a green state were as good as usual; but if our Wellingtons, Winter Quoinings, Sturmer Pippins, and other favourite Apples be as difficult to cook as these we have from abroad early in spring, we shall remember the season of 1868 for that cause alone, independently of its many other advantages and disadvantages. Coupled, therefore, with my present inquiry as to the Gooseberry, I would ask, What effect is the continued hot weather likely to have on the Apple and other hardy fruits?—J. ROBSON.

BIRDS AND CHERRIES.

ALL lovers of Cherries—their name must be legion—know well the difficulty of keeping their Cherries from the birds till they are ripe; in fact, a ripe Cherry on a tree in the open air in woodland districts is not, it is true, a *rara avis*, but it is a very rare thing. I have, therefore, a small pleasure in saying that I have this day (July 20), some of the finest May Duke and Archduke Cherries thoroughly ripe; and that I have circumvented my feathered friends, who in spring give me so much pleasure in listening to their harmony, and in summer so much vexation because they will take the best of every kind of fruit.

I had this season the most abundant crop of Duke Cherries I ever saw. The trees, now ten years old, were at first dwarf bushes on the Mahaleb stock planted on my lawn. A few years ago I trained up from each bush from seven to ten branches, making every branch into a cordon by pinching in closely all the summer every lateral shoot. The effect has proved remarkable and beautiful, for last April every branch was a perfect cordon of flowers, followed by fruit in equal abundance. I need scarcely add that this was before we received a decree from France that no tree with more than one branch could be a cordon. My Cherries commenced to colour, and then nets, and white worsted, and the gun were called into action; but all of no avail, for the birds seemed to laugh at me as I did at the cordon decree. They tore the nets with their claws, and thrust their beaks through the meshes they could not tear, so as to destroy, although they could not enjoy—too common among men as well as birds. Owing to the dry season I partially foresaw it would be one of bird-hunger; and happening to have a nice row of Duke Cherries, single upright cordons, thirty in number, and about seven years old, I put in practice an invention I gave to the public some years ago—viz., that of enclosing each tree in a tube of coarse muslin—a sort of bottomless bag, made by stitching two yard-widths of coarse muslin together, say 2 yards in length, and then slipping it over the tree, leaving the leader out, and then tying it at top where the fruit commences, and at bottom where no fruit is, so as to enclose all the fruit in a bag. I am inclined to think this coarse muslin at about 3d. per yard is better than tiffany, as it admits more air; and I am not quite sure but that it might be used in spring to protect the blossoms from frost, but that I have not yet tried.

I have never seen anything in fruit-culture more interesting than my row of upright cordon Cherry trees. They are exactly 8 feet in height, their straight stems the size of a stout broomstick, so that no support is required; and they have been so carefully pinched-in all the summer for some years, that their diameter, measuring through the fruit-bearing spurs, is not more than 10 inches. They have had their leading shoots shortened, and it is not intended to allow them to exceed 8 feet, their present height. It is surprising the quantity of Cherries these upright single cordons produce. In the course of years they will become stout trees, and bear abundantly from "top to toe." I have said 8 feet as a reasonable height, but 12 feet may be in small gardens a better height, for the taller the trees the larger the crop, only they will require muslin robes of 4 yards in length instead of 2.

The best method to form these very nice garden trees is to plant pyramids of the Duke Cherry tribe, to cut in all their side shoots to 1 inch in length, to train up a straight leader, with a stake if needed, and to pinch-in during the summer every shoot to three leaves as soon as it has made four or five. My trees have been pinched for the third time up to this date, and they will require being looked to till the end of August. The great advantage of these upright cordon trees is their adaptation to either small or large gardens. They should be planted 3 feet apart, and thus any small suburban garden may have its dozen of prolific Cherry trees. The best sorts for the purpose are the Empress Eugénie May Duke, Archduke,

Royal Duke, Love Apple Cherry, Duchesse de Palluau, and Nouvelle Royale, a late sort. These are all compact upright growers, and here they all succeed best on the Mahaleb (*Cerasus mahaleb*) stock, which appears to act upon them as the Quince stock does on the Pear, in circumscribing growth and making the trees fruitful, more particularly in a calcareous soil.—T. RIVERS.

DESTROYING INSECTS.

SOME delay has been caused in the preparation of my notes on insects from my having been favoured with a compound from Mr. J. C. Clarke, Vinery House, Allerton, Liverpool, inventor and patentee, also maker of Clarke's water-jacket furnace boiler, a boiler I think not half so well known as it deserves to be. I have it heating a conservatory and three vineries very satisfactorily, and with a small consumption of fuel. Of this boiler I trust to give a more extended report at some future time, and shall, therefore, confine myself to the insect-destroying compound.

Mr. Clarke, I ought to state, is very fond of gardening, having extensive glass houses and gardens, and takes a more than common interest in the gardening at Vinery House.

The compound very much resembles soft-soap in colour, but it is moderately hard like brown common soap, and it is mottled. The compound came to me in a roundish lump, half of which I was to cut in thin slices and boil in a gallon of water for ten minutes. This was done, and I had a liquid holding the whole of the compound in solution—no sediment; no straining required. It passed freely through a syringe without any clogging; but I made a blunder at the very commencement, for the solution put in a painted watering pot whilst cooling showed its effects upon the paint. Transferring it to a bucket, a narrow one, in order to give depth for dipping, I dipped several plants in the solution, holding them in it for a short time, the solution being cooled so that the hand could bear it comfortably.

I first dipped a small Fig tree infested with red spider; 2nd, a plant of The Czar Violet, also infested with red spider; 3rd, several young plants of Ferns, including *Platyloma adiantoides* infested with green aphids, *Blechnum coreocladense*, *Pteris serrulata*, *P. tremula*, *Cystopteris fragilis*, and other small plants, in all about a dozen, which though clean, I dipped to test the effect of the compound on the young tender growths; 4th, a *Cineraria* in flower and infested with thrips; 5th, four branches of Cactus, all having two or three flowers, some open, others on the point of expanding, and covered with green aphids; 6th, a plant of *Platycerium alcicorne* infested with brown scale; 7th, two plants of *Eletia Tankervillei* infested with brown scale, much honeydew, and ants busy sucking the sweet secretion, Now, upon withdrawing the plants, the ants were giving their last kick. I had been longing for more than twenty years for something to kill ants, and now I had it unexpectedly. I must now stop further dipping the plants and hunt ants. These are not difficult to find at any time, but particularly this season. As they run I dipped my middle finger in the solution, and a drop hanging from it, the solution on touching the back of the ant fell, and with a marvellous effect on the ant, which began to writhe in the agonies of death. The ants did not stir beyond giving a few convulsive movements of the head and legs, and died in less than half a minute.

Satisfied that the compound would kill ants, I continued further search for plants infested with insects, but finding none having different insects from those already dipped I gave up dipping, thinking I might have injured the foliage of quite enough plants at once; but as this was an all-important consideration with any insect-destroying compound I dipped *Pelargonium* Countess of Bective, Mrs. Pollock, Fontainebleau, Argus, Mountain of Light, and other plants all in full flower, for it was one part of the recommendation of the compound that it would not injure the flowers. Finally, I took a syringe and syringed a bed of Roses (dwarfs on the Manetti stock), consisting of such kinds as John Hopper, Prince Camille de Rohan, Madame Rivers, Charles Duval—all in full bloom, and from which the sparrows had been for several days at work clearing off green aphids. I gave them the whole gallon of the solution, very little being lost in dipping the plants, and made the flowers thoroughly wet. All the above were done in the evening of a very hot day, and the succeeding days were equally fine and hot. The following evening I went to register the results, having given attention to the plants in the morning, expecting to find the flowers at least discoloured; but the Cactus buds of the previous evening were expanded and gorgeous,

and in this respect the flowers of those plants in my eye outvie those of all others. Mrs. Pollock was as fresh as ever.

I thought, however, that it would be well to wait until evening and then chronicle the results, as the promising fine day must have done something. In the evening I found—1, on the Fig tree the red spider killed, the foliage not injured, and brighter and more glossy; 2, on The Czar Violet the red spider killed, the foliage not injured, taking off some fine pods of seeds; 3, of the Ferns not a frond was injured, the green aphid on *Platyloma adiantoides* killed and quite brown like the Peach aphid; 4, on the Cineraria the thrips dead, the leaves not damaged; 5, on the Cactus branches and flowers the green aphid killed, the flowers not discoloured or injuriously affected by the compound; 6, on the *Platycerium* the brown scale dead, the centre sunk, the young fronds not injured; 7, *Bletia*, brown scale shrivelled, skeletons of ants remaining, deposit of honeydew peeling off, foliage not affected otherwise than made fresher-looking; 8, *Pelargoniums*, not a flower discoloured nor a leaf injured; lastly, the Roses in full bloom were not injured in leaf or flower, and the aphid had become brown.

I waited to give the plants dipped in the solution of the compound time to perish, and they have not done so. I waited to be able to say it would kill mealy bug, white scale, and American bug, it being rendered more effectual for these pests by the addition of a few drops of spirits of turpentine. I have written to Mr. Clarke, and obtained his permission to state publicly the results of the trial of his compound made solely for his own private use; and after pointing out to him the value of his invention and the great good it would be to the horticultural public, he has consented to let others have the benefit of the invention as well as himself. It can be made and sold, I believe, cheaply, costing to the consumer about 3d. per gallon of solution. The quantity I used was 1½ oz. to the gallon, which is quite strong enough for thrips and scale; but it should be made rather stronger for mealy bug, whilst 1 oz. to the gallon will destroy green aphid. I hope Mr. Clarke will not lose any time in having it advertised and made known as it deserves.

In conclusion, allow me to ask Mr. Fish if he syringed the British Queen Strawberry plants before dusting with tobacco powder, and also afterwards. Mr. Fish is aware that the British Queen and others of its race are subject in parching weather not to swell well. I do not grow the British Queen now, finding the Frogmore Late Pine vastly superior to it, freer in growth, a better fruiter, the fruit larger, and the flavour good—indeed, it is the best late Strawberry. Dr. Hogg Strawberry is also surpassingly good; also Lucas, after La Constante, excellent. I cannot account for the tobacco powder damaging the Strawberries. I have used the powder extensively both in and out-doors, and with the best results. If Mr. Fish tries this compound I think he will not care for any other insecticide.—G. ABBEY.

SOME ROSES AND THEIR MERITS.

I FIND that in my rambles among Roses, I have noted Dne de Wellington as in every respect a superior dark crimson Rose, although its habit of growth may not be quite so vigorous as some of its rivals. I was also very much pleased with Madame Clemence Joigneaux, which I saw eight days ago blooming most gloriously in a Rose nursery in the south of Scotland. I have also added Murillo to the list of my proposed investments. A neighbour of mine has bloomed Mademoiselle Bonnaire, which certainly is a superior white Rose.

I shall be glad to have Mr. Radclyffe's approval or condemnation of these Roses, and also his opinion of Mr. Cranston's new English blush Rose, Miss Ingram. I have never been able to see a bloom of this new Rose, and a propagator of Roses in one of the largest wholesale Rose nurseries in Scotland, tells me he has been looking in vain for some favourable or adverse criticism on this new aspirant to fame.—THOS. WHITELAW, LL.D.

[The Duke of Wellington is a beautiful Rose, wanting only in fulness. It is a moderate grower. Mille, Bonnaire is a lovely Rose, but is in most soils a wretched grower. Murillo is a beautiful dark Rose, wanting in size and fulness. Miss Ingram, raised at Frogmore by Mr. Ingram, is a beautiful Rose. It is growing freely here, but I have not yet bloomed it myself. I advise Dr. Whitelaw to buy Souvenir de Dr. Jamain in the place of Murillo, and Princess Mary of Cambridge in the place of Mille, Bonnaire. The Duke of Wellington we must all have.

I have two sorts of blush Roses here which on the Manetti stock bloom well and are very fine Roses—viz., Duchesse d'Orleans, and Sœur des Angos. I do not think they would generally do well on a Briar except in first-class ground. Madame Clemence Joigneaux is a fine and healthy strong-growing Rose.—W. F. RADCLYFFE.]

NORTHWICH GOOSEBERRY SHOW.

THIS was held at the Angel Inn, Northwich, on the 25th inst., when the following varieties were exhibited:—

—THOS. DOBELL, Seedsman, Northwich, Secretary.

FILBERT-BEARING.

EVERYONE who has at all examined his Filbert trees in the spring knows that the male and female flowers are both produced on last year's wood; but I notice with surprise that the fruit is borne on spurs of this year's growth, varying from 6 inches to 1 foot in length. The explanation is, of course, that besides and behind the fertile flower, there is a dormant leaf bud, and that there is sap enough to ripen the fruit and to form wood likewise. As far as I know this elongation of a fruit bud is so unusual in fruit-bearing trees, that I think it deserves notice, yet I find no notice of it in any of the books I have consulted, and it has seemed to me that this may not be the rule, but the exception in this hot summer. I should be glad to know if such is the case, and whether any of your readers have observed the same? I should be glad also to know whether these fruit-bearing spurs should be cut out or back after fruiting? My own idea is that they will not bear again, at least I can see no signs of incipient buds.—H. N. E., Bitt'n Vicarage.

[The fruit of the Filbert is generally produced on short spurs, formed in the preceding year, but unlike those of many other trees these short spurs elongate from 6 to 12 inches, but the

fruit is always at their point when the little red blossom buds appear. Owing to the dry season the catkins, or male blossoms, are now forming on long shoots of the present season—that is, on shoots from 12 to 30 inches in length. In pruning the Filbert treat it as a Gooseberry bush, leaving plenty of slender shoots, and shortening and removing the stray succulent shoots. The female flowers will appear on the small well-ripened side shoots and buds.]

POTATOES SUPERTUBERATING—ESTIMATE OF VARIETIES.

You would confer a very great benefit on all classes if you could give any advice as to what is best to be done with the present Potato crop, which is beginning to grow, the young Potatoes throwing out spears. Would it be best to take any of the crop up, as, for instance, those that are nearly ripe, such as Milky White and Kings, or must they be left to take their chance?—H. C. RIPLEY.

[We sent the above to one of the most experienced of Potato cultivators, and he has sent the following very instructive reply.—EDS.]

I am sorry to learn that the Potatoes in Mr. Ripley's neighbourhood are showing symptoms of supertuberating; nevertheless, Mr. Ripley may take heart, for hereabouts the later sorts are generally doing so, although as regards the haulm they are wonderfully vigorous considering the drought, and at stool after stool of the very late kinds that I have inspected, not a symptom of a tuber larger than a horse bean is to be found. I advise in such cases that they be allowed to remain unmoved, as there may be just a chance of a crop maturing before the frost comes; root and branch are each waiting for the coming of rain. With regard to those Potatoes which Mr. Ripley mentions as beginning to grow, the young Potatoes throwing out spears, let me advise him to have them taken up immediately, and rub off the spears, then sow the ground with Turnips, or crop with the Cabbage tribe. To leave the Potatoes to take their chance would be equivalent to allowing the tubers that are nearly ripe to exhaust themselves of their present nearly matured nourishment by reproducing a progeny of undersized supertubers. Let me advise also that the crop should be lifted early in the morning, or when the sun has lost its power in the afternoon, otherwise it will be found, if the tubers are allowed to remain exposed in the midday sun, that their flavour will be completely destroyed. I would rather dig Potatoes in a pouring rain than in a broiling sun; in fact, when dug in a Scotch mist and stored moist, providing they are healthy, Potatoes keep best and also preserve their flavour best.

I have many kinds of Potatoes under cultivation in different soils experimentally. I will give instances of extremes. On field stonebrash, in a neighbouring parish, Wootton, from my Onwards, an early second early sort, to the Cornish Kidney, a very late kind, the following is the result:—My Onwards I had dug up quite ripe on the 10th inst., and very excellent they are, though not so prominent for size as they would have been in a "dripping time." The patch is now sown with Turnips. The Emperor Napoleon, or Early Emperor, is producing a good crop of tubers, but it is sadly spearing. I shall have the sort taken up directly. Almond's North Riding Beauty, a rather early Regent, has tubers about the size of horse beans, and the Cornish Kidney has nothing distinguishable but a mass of roots, with the old sets as intact as they were on the day when planted. My Regents are growing in a field of better soil, too far distant to allow an inspection at present; I will give a report of them shortly. Mr. Radclyffe has some of what I consider to be the best; doubtless he will also favour us with their behaviour.

I have examined the Potatoes in numerous cotters' allotments, and the following may be considered as general features of field crops about here. Early and early second-early sorts small, but matured without sprouting. Those of the second earlies about three parts ripe are supertuberating badly, and on the late sorts scarcely a formed tuber is to be found. What the result may prove for them it is difficult to say; but the disagreeable fact clearly to be seen is that the breadths planted with late sorts are thrice the extent of those planted with second earlies.

In the rectory garden, a sound dark loam I have, on the ridge-and-trench plan, thirty-eight kinds growing under my immediate observation, both for good quality and for comparison, besides forty-two new seedlings on trial, and six Potato-grafting

experiments. After this year I think of concentrating my attention entirely on my own seedlings, therefore I will now give the names and features of the thirty-eight.

The figure 1 in parentheses after the name denotes Early; the figure 2, Second Earlies; 3, Late varieties. The kinds that are beginning to supertuberate I will signalise by an asterisk (*); those condemned by an obelisk (†).

Mitchell's Early Albion Kidney (1).—Excellent; dead ripe.
Early Ten-week (1).—Very good; dead ripe; syn. Early Betty.
Hogg's Early Coldstream (1).—Excellent; dead ripe.
Sbutford Seedling (1).—Very good; tops green with laterals.
Webb's Telegraph (1).—Dead ripe.
Sutton's Racehorse (1).—Excellent; tops still rather green, but no laterals.
Thomas Almond's First Early (1).—Very good; dead ripe.
Mona's Pride (1).—Excellent; dead ripe.
Birmingham Prizetaker (1).—Excellent; tops quite green, but no laterals.
Gardner's Premier (1).—Excellent; dead ripe; not yet in commerce.
Walnut Leaf (1).—Very good; dead ripe.
Old Early Ashleaf, true (1).—Excellent; dead ripe.
White Blossom Ashtop (1).—Dead ripe.
Penn's Rushbrooke (1).—An improved Ashtop for pot culture, not yet in commerce; dead ripe.
Penn's Rector of Woodstock (1).—Not yet in commerce; dead ripe.
Penn's Onwards (2).—Not yet in commerce; some of the tops rather green with laterals; ripening off.
Rivers's Royal Ashleaf (2).—Excellent; ripening off.
Rintoul's Early Don (2).—Very good; ripening off.
*Edgecote Second Early (2).—Vigorous tops, quite green.
Hague's Kidney (2).—Ripening off partially.
Transell's Seedling (2).—Round; dead ripe; excellent.
*Sussex Kidney (2).—Dead ripe.
Beehive (2).—Very good; tops quite green, no laterals to the stalks; a "brother bee-keeper's" Scotch seedling.
Daintree's Baker's Dozen (2).—Excellent; ripening off; not yet in commerce.

*Almond's Yorkshire Hero (2).—Vigorous; tops quite green.
*Wheeler's Milky White (2).—Very good; tops partially ripening off, the remainder green with laterals.
+Emperor Napoleon (2).—Tops quite a forest of green laterals.
*Taylor's Yorkshire Hybrid (2).—Tops quite a forest of green laterals.
Dean's Waterloo Kidney (2).—Excellent; ripening off.
*Dawe's Matchless (3).—Enormous dark green tops, no laterals.
*Paterson's Scotch Blue (2).—Dwarfish tops, quite green, no laterals.
*Paterson's Victoria (3).—Enormous tops, quite green, with no laterals.
Dean's Improved Ashleaf (2).—Very good; ripening off.
*Ainsworth's "Kidney (3).—Monstrous dark green tops, no laterals.
Royal Albert (2).—Round; very good; dead ripe.
A variegated-foliaged Potato (2).—Only variegated when young; I shall cast it away.

+An Anstralian Potato (3).—Monstrous light green foliage without laterals.
+Old Cobbler's Lapstone (3).—Vigorous foliage, quite green, beginning to throw up laterals.

After thirty years' attention to the culture of the Potato, you may conclude that I should not retain an uncertain kind. If any supertuberation shows in the trials of my seedlings I destroy them without mercy. A Potato that will supertuberate this year may prove an excellent sort next year and the year after, but in some succeeding season, sooner or later, it is sure to supertuberate again, and so seriously destroy the hopes of a crop. This is the case of the Lapstone and all its family. I have repeatedly proved it, and although from the superior appearance and quality of this kind I always grow it, it is never to an extent to trust it.

Again, a Potato that will supertuberate one season is more liable to suffer from the disease in another. Do not the Lapstones confirm this? If another example is wanted, take the Emperor Napoleon. Four years ago when I first grew this kind it supertuberated so badly that I could scarcely save seed enough. The second season I was in a similar case from the disease. Last year from the same cause I found myself in the same position, and for the present I believe if I am rewarded with a dozen of its tubers free from supertubers, that will be the outside, and this from two soils as opposite in their nature as it is possible for them to be. Equally objectionable from the same defect are Old Betty and Early Ten Week, Mitchell's Early Albion Kidney and Sutton's Racehorse, Old Walnut-leaf and Thos. Almond's First Early, Taylor's Yorkshire Hero and Edgecote Second Early, Daintree's Baker's Dozen and Dean's Waterloo Kidney, Dawe's Matchless and "Ainsworth's" Kidney.

Mr. Gardner's Premier is very superior for early exhibiting. The Emperor Napoleon, Paterson's Victoria, and Dawe's Matchless, with their coarse foliage, are fit only for light poor garden soils, or field culture. I fear I must say the same of Taylor's Yorkshire Hybrid. I shall have more to write about the origin of this sort, but express my sorrow now for its present behaviour with me. I found it last year to be one of the very best-flavoured Potatoes I ever tasted.—UPWARDS AND ONWARDS.]

BEWARE OF THE WONDERFUL.

We received last week a letter informing us that "now" something marvellous in the vegetable world is to be seen, not the "gigantic Gooseberry," which annually is placed in the columns of the daily newspapers, but a new and veritable wonder—namely, a Plum tree bearing Apples. Our first informant is well known to us, as is the owner of the tree, both respectable and intelligent, nor was the wonder vouched for by them alone, for several gardeners had examined the transformed fruit, and declared that "they would not have believed it if they had not seen it." We came to the same conclusion, so resolved to go and see it; almost inclined to believe, as was observed, that this was one of the "strange effects which will be caused by this hot dry summer." We said we did not see how heat and want of moisture were likely to turn Plums into Apples; but we were told in reply that it is not at all an improbable transformation. "They are both in the natural order Rosaceæ. The Apple gradually approaches the Plum through the intermediate forms of the Medlar and Sorb. The flesh of their respective fruits contains malic acid, and their seeds hydrocyanic acid. Moreover, Pliny says the Plum is altered by being grafted on the Apple." "There's something in all that," observed another; "and be assured, 'There are more things in heaven and earth than are dreamt of in your philosophy.'" We could not gainsay this, so we resolved to endure the tropical heat whilst we travelled over one hundred and forty miles of railway, to see and return from seeing this prodigy. But we would wait to hear the tidings the morrow would bring. Fortunate procrastination! and we thought at the time we would in future act upon Sheridan's rule of action, "Never do to-day what you can possibly defer until to-morrow." Intelligence reached us the following morning that the Apples were attached to the bough broken off from an adjacent Apple tree, and so lodged in a cleft of the Plum tree branches as to seem to issue from them.

CYCAS REVOLUTA, OR THE SAGO PALM.

A most noble specimen of this plant is now in fruit in the gardens of John Hutton, Esq., of Sowber Hill, and as I believe it is very rarely known to fruit in this country, I thought the announcement might be of interest to your readers.

The plant is about sixteen years old, and has been under my care for the last ten years. On June 22nd the fruit first appeared, and up to the present time it has daily increased in size, and is now nearly 2 feet in height, and 12 inches in circumference at the lower extremity, gradually tapering to a point. Its colour is a rich golden yellow, and altogether it very much resembles a large Pine Apple.

The stem of the Palm is 36 inches round, and bears seventy-two large graceful fronds, which give it a most noble appearance.

I shall be very glad to hear of anyone else who has been successful in fruiting this Palm, and I shall be well pleased to show it to anyone who comes to see it. I am sure it will well repay the trouble.—J. NICHOLSON, *Gardener, Sowber Hill, Northallerton.*

AN EDEN IN CALIFORNIA.—The vineyards and Orange and Lemon orchards make Los Angeles the garden spot of California. Just imagine a collection of gardens, six miles square, and producing at all times of the year almost everything that grows under the sun. One of the largest and most beautiful places in the city is the Wolfskill vineyards, containing 2000 Orange trees, 1000 Lemon trees, 500 Walnut, 100 Fig and 100 Lime trees, and 55,000 Grape Vines. Near by is the vineyard of Mr. Childs, containing 500 Orange, the same number each of Peach, Plum, Nectarine, Apricot, Olive, Walnut and Chestnut trees, and 10,000 Vines. Right in the heart of the city is Don Mateo Keller's place, containing 100,000 Grape Vines,

1000 Lemon, 500 Orange, 100 Lime, 100 Olive, 200 Walnut, and 100 Fig trees, and all of the other varieties of fruits known in the south and in the semi-tropics. He also raised Hops, Cotton, and Tobacco, Wheat, Barley, Corn, all kinds of vegetables and everything of the berry tribe. Last fall Mr. Keller made 100,000 gallons of wine and nearly as much brandy. A few miles from the city a Mr. Rose has a vineyard of 200,000 Grape Vines. Near him is the vineyard of Colonel Kewen, containing 75,000 Vines, 800 Walnut, 500 Orange, and 300 each of Lemon and Olive trees. It must be recollected that from a little elevation in the centre of this garden-city may be seen the broad Pacific on the one hand, and upon the other 200 miles of mountains covered with snow.

CUCUMBER TROUBLES.

"I wonder if amateurs ever succeed in growing Cucumbers," said Mrs. Scott to her friend, Mrs. Thornicroft, "my husband never does. He has been trying ever since I knew him, and, doubtless, years before. After every year of failure he tries again on a new plan, or an old one slightly altered. He is always near to success, but somehow it does not come. I wonder he does not weary of such repeated failures."

"Well, I can assure you gardeners do not always succeed to their satisfaction," replied her friend. "We could eat twice as many as our man brings us in, and he has every appliance."

"Yes, but then Henry litters up our poor little garden through half the spring months, the loose straw blows about here and there, and everywhere. It takes us all the summer to clear it away, and I seldom dare venture to look over into our neighbours' garden, for I am sure our long atrawa have gone over the low wall, and are wrapping round their Rose bushes, clinging to their annuals, and they cannot gather up the rubbish without dragging up their seedlings. 'Oh, never mind,' says Henry, 'we will send them in the first Cucumber we cut, and I shall have lots this year, and that will make amends.' But the straws come sure enough year after year, and do their mischief; but the Cucumbers do not grow, and I am afraid our patient neighbours will never know the taste of our home-grown Cucumbers. I do not know how it is my husband fails, as most assuredly he does, though he will not own it. He uses the best material, judging by the price he pays for it. Two loads come every spring; 5s. a-load, without the cartage, which is not a little, for the material generally comes a long distance, I suppose to enhance its value. Dear me! the cost of our pit would supply us with wholesome vegetables for the summer. This material never seems to be just in the right condition, it is always too hot or too cold, too fresh, or not fresh enough; come when it will, and as it will, it is never in a proper state to be put into the pit and got out of sight. And, then, Henry thinks so much about it, why only the other week he rushed out of doors quite sure his fragrant heap smoked too much, and the very next day it did not smoke enough."

"They are not very easy things to grow," replied Mrs. Thornicroft, "last season our man destroyed two very good plants by putting them in too soon. They were burnt up in one night."

"Henry will never burn his up, he guards against that evil to the very extreme. He leaves his material for nearly a week an unsightly nuisance in our back garden smoking and smelling. He calls it letting the bad gas escape—we get the benefit. I should not wonder if we were all to have the fever annually, and I think it might come ready for use. And during this time my husband lives in torment lest it should rain, and spoil all. He gets up in the night, times without number, to look out. If he ever dreams—I do not think he does, he sleeps too soundly—it would be about Cucumbers growing all over our garden. He once thought of buying an advertised tent to cover up this precious heap in case a wet time should set in; but upon calculation found it would cover up our neighbour's garden as well as our own. After a time a man comes to turn it over, it takes him a day to do this, at 4s. a-day, and he is sure to spoil the only tidy bit we may chance to have left. After a few more days he comes again to fork it into the pit, along with this forking he pours in a considerable quantity of water. 'A hundred gallons of water if there's a drop in, sir,' he says. Then Henry is sure he has put in too much. They always do put in too much or too little. They then spread a little soil over this, put on the lights, and it is left to settle. I used to think in my inexperienced days that the worst was over, no

such thing with my amateur Cucumber-growing husband, it is only beginning. A long slender stick is thrust down into the pit, and I cannot tell you how many times a-day it is pulled out and felt at. This might not matter much, but then the poor stick is always in fault. Sometimes it is much too hot. 'This will never do, cannot put plants in here, they will be burned up in no time,' says Henry, or it is too cold. 'Worse than doing nothing to expect plants to grow in this miserable place.' So a period of great anxiety follows. He comes home from his business in a state of great excitement, and goes off to his Cucumber pit to see how it is getting on, before he makes any inquiries about little Harry's whooping cough, and in the mornings he rises hours before he otherwise would, to see if all is right. He says it is to get an appetite for his breakfast. He never thinks about his health at any other time of the year. Sometimes to ease his mind he goes up and down other places, to look into other peoples' Cucumber frames and pits. I do not know how he feels when he sees long, smooth, dark green Cucumbers ready for cutting, in beds made weeks after ours."

"Yes, you seem to lose a great deal of time. Our man says they are very ticklish things to manage. He would rather grow anything else. So much depends upon the seasons."

"Seasons do not influence us, we cannot comfort ourselves that way," replied Mrs. Scott. "Henry often comes home quite sure he has found out the mistake, and can remedy it; but then the remedy cannot be applied at once. He must wait until another season, and he can never remember one year how it was he failed the year before. At last the pit is taken as it is, and the plants put in. The oldest plants are chosen as likely to bear fruit first. Long, slender things they are, unable to support themselves, with large leaves a foot from each other, and dry roots dangling from the hole of a small flower pot. Of course, these plants do not always grow. Sometimes they put forth a few small white roots, and then drop off all at once, as if the exertion had been too much. Sometimes they make plenty of leaves and stalks, and yellow flowers, but nothing more. We have frequently three sets of Cucumber plants in a season, and these cost generally from 6d. to 1s. each. Nor is that the only expense we have, two new mats each year, for the old ones are either lost or stolen during the winter. These mats are spread over the lights, over these thick double canvas, then lengths of boarding to keep down canvas and mats, for fear the wind should blow them about. Ours you know is an exposed position. When thus made up for the night, only this takes place early in the day, it is impossible for a ray of light, or a breath of air to penetrate. If these are necessary for the growth of Cucumbers, as I think they are for most other plants, then Henry must be trying some new system, working out some Darwinian theory as to what Cucumbers will be when grown under adverse circumstances. This wrapping-up for the night usually takes place at half-past three. Then the poor plants are left in breathless stillness and total darkness for sixteen hours."

"That is not much too early, Mrs. Scott, ours are done up for the night at four."

"Yes, but ours are sometimes done up at two, or even one. I have watched Henry do it as I have taken off my bonnet after coming home from church, and we have a short service, and a short walk, and when I ventured to suggest the possibility of their having too long a night, received the candid reply, 'Oh! I do not think it matters much, and I cannot be bothered to turn out after dinner.' And when morning comes the boards and the canvas are removed, but the mats remain to keep out the sunshine, a little air is allowed to enter if the wind blows from the right quarter, which it seldom does. I do not know how other people grow their Cucumbers; this is how Henry manages his."

"Then do you never have any fruit, Mrs. Scott?"

"Yes, we have sometimes two or three small bitter things, and a basketful of Gherkins our cook will not pickle, because she says 'they are all outside.' Yet Henry will have it that he does not always fail, he counts back to a period of glorious success, when he cut a Cucumber 2 feet long, and as thick as his arm. But then the said Cucumber was full of seeds, and hollow, and within its yellow green rind contained only a narrow ring, about the third of an inch, of eatable fruit, and the little there was had an unpleasant flavour. And spite of its success, it was rather an unfortunate Cucumber, for it burst the glass tube it was grown in to keep it straight, and was removed from it only by doing damage to its appearance. It had been entered for some great show, and was intended to take a

first prize, but its very presence in such a mutilated condition was not to be thought of. And there was very little pleasure in the using of it, the seeds were so large and thick and plump, Henry was quite sure every one of them would have grown, and to this day he regrets not presenting it to some seedsman for that purpose. So you see Cucumber-growing with us is not only a great failure, but a great expense. Yet in such a light my worthy husband will not regard it, he ever asserts that when all things are considered, there is a large balance left in favour of Cucumber-growing. One thing is certain, all the troubles are forgotten during the winter, and he starts anew each spring with the hope of success. If it ever come I think it will be by chance."—MAUD.

MUSHROOMS FAILING IN HOT WEATHER.

I HAVE been very much annoyed and puzzled after having every prospect of a good crop of Mushrooms, to find that they are all rotting and becoming full of insects when about the size of a shilling. I send you two. Will you let me know what course I should adopt to cure them?—J. E. P.

[Your Mushrooms are infested with grubs of different kinds, and this is a common infliction in such weather, when you cannot give them a cool airy position. The tendency is increased if rank manure is used. We used to be troubled with them in a house; but have never been annoyed since we grew Mushrooms in an open shady shed in the hot summer months. A cool house or a cellar is equally good. Most likely if this weather lasts the evil will remain, and therefore what we recommend is just a chance to miss or hit. In our case the remedy in one instance prevented us having another Mushroom; in two other instances we had a fair crop of sound Mushrooms: so you can choose whether you will run the risk or not.]

We proceeded as follows:—We cleared the bed of all Mushrooms with a hair broom, made small holes with a pointed stick, say one-eighth of an inch in diameter, at every 3 inches, and 1 inch deep, and then watered to that depth fully with water at 200°. In half an hour we left a smooth surface with a clean spade. In the two cases we had Mushrooms in a fortnight; in one case we never had one.]

THE SEASON IN NORFOLK.

Of our garden crops some are quite dead, others are struggling for existence, Scarlet Runners and other Beans requiring to be kept alive by frequent waterings. Of Peaches and Nectarines the forced crops were good, and the flavour was pronounced to be very very fine. Of Grapes, the crops in the first and second houses were very good, and of more than average sweetness and flavour. Grapes in the Muscat house, now nearly ripe, are above the average for size of berry and flavour, and two late Hamburg houses promise well. Many perennial and biennial flowers have died. Bedding plants, which have been kept constantly watered, are looking tolerably well; but as it is impossible to water everything, many hundreds of bedding plants and annuals in borders are either nearly or quite dead, and such a continuance of cold spring water seems to be of but little use. The grass around the mansion we water once a-week, and then it seems barely to exist, owing to the great heat, excessive evaporation, and almost entire absence of dew.

The heat has been very great, the thermometer standing in the open, and shaded from the sun, having registered several times 95°, 98°, and on July 16th, 101°, and this day (July 21), 99°.

The amount of rain which fell from April 20th to July 20th was only 0.88 inch, and from April 1st to July 20th the whole amount was only 3.87 inches. In the corresponding period of last year it was 8.78 inches. Thunder we have heard but very seldom. We have now no appearance of rain, the wind being changeable, but generally north, with a low night temperature.—J. P., Gardener to Sir Wm. Folkes, Hillington Hall, Lynn, Norfolk.

NEW BOOKS.

SUPPLEMENT TO JOHNSON'S COTTAGE GARDENERS' DICTIONARY. London: Bell & Daldy.

This supplement contains the species and varieties worthy of culture introduced between the date of the publication of the first edition of the Dictionary, and the commencement of the

present year. Besides this it corrects some errors and omissions, and makes some additions to the cultural details. No better testimony to the usefulness of the work can be adduced than that it is a text-book accepted by the Royal Horticultural Society in the examination of young gardeners previously to granting them certificates.

HORTICULTURAL BUILDINGS, HOT WATER, AND HYDRAULIC APPLIANCES. By T. MESSENGER, *Horticultural Builder, &c.* Nottingham: T. Forman.

This is a catalogue of garden structures manufactured by the author, who resides at Loughborough, but it is much more, for the thirty-one lithograph plates are worth more than the half-crown which is the price of the volume. They represent very tasteful conservatories, greenhouses, vineries, pits, and their fittings, and the introductory observations explain Mr. Messenger's mode of combining wood and iron in their construction, so as to avoid the disadvantages attendant upon employing either material exclusively.

HARDWICKE.

A MORE pleasant place to visit at any time cannot be found than the beautiful demesne of Hardwicke, near Bury St. Edmunds, and the dwellers in the neighbourhood always avail themselves in large numbers of the privilege of rambling in its admirably arranged grounds whenever Lady Callum kindly throws them open. Many thousands were tempted by the gloriously fine weather, by the prospect of witnessing a capital summer show of the Bury and West Suffolk Horticultural Society, and by the anticipation of listening to the strains of a first-rate military band, to pay them a visit yesterday (July 3rd). Beautiful as the grounds always look, their charm was enhanced beyond measure by the brilliant colours of the ladies' attire as they promenaded in the flower garden, and in the shady paths.

Viewed from the gallery which has recently been erected over one of the conservatories the scene was enchanting. To the right is the spacious lawn, dotted with fine trees, the Purple Beech—a superb specimen of its class—rising to a great height, and its long limbs sweeping down to and gracefully kissing the green carpet at its base. Close by and in striking contrast to this is a robust Cedar of Lebanon of great age, size, and beauty. Nearer to us is a tall pyramid of Cypress, one of the finest in England, and in the distance are other fine trees and shrubs. Immediately beneath us are the Rose arches clothed with their beautiful white and red wreaths, and some distance beyond that we see the shimmer of the white tent containing the floral beauties that the Horticultural Society has been the means of gathering together. Joining the throng of gay visitors we pass along the first terrace walk, bounded at each end with splendid iron gates in blue and gold, and on one side with a ribbon border, and on the other with a massive wall surmounted with vases, and supported on the garden side with a conical Rose and a Yew or Cypress alternately, and fine masses of Hollyhock already coming into blossom. Another winding ribbon bounds the end of the flower garden. Here, also, is one of the finest trees at Hardwicke—an Elm of extraordinary size and beauty.

Passing along the end of the flower garden, which is bursting into full beauty notwithstanding the dry weather, and gazing with delight along the graceful corridor of Roses, we step on to the upper terrace, a noble walk about 12 feet wide and 300 yards long, bounded at each end with handsome crescent-shaped stone seats. Within a few yards from the western end the cool shade of the Yew walk tempts many of the visitors to ramble down it, while others prefer to visit the lady's garden, devoted to old-fashioned spring and other flowers, and pass by the Roses and among some rare Firs until they come suddenly upon the avenue, a wide piece of turf lined on each side with a row of fine trees and a margin of evergreens, prominent among which are Variegated Hollies. The avenue runs for about a quarter of a mile towards Bury, and it terminates in a fine view of the Abbey Gate. From here we pass along a magnificent winding walk bordered by a large piece of most exquisite turf, devoted to the culture of rare Conifers, to the kitchen garden. Turning sharply to the right, the visitors lost themselves in the many labyrinth of the fernery, and wandered among blocks of stone and larger blocks of wood and masses of earth resembling either or both, so skillfully clothed with Ferns as to make one forget that the whole is the creation of art, and almost mistake it for a natural dell.

Passing through a tunnel, and ascending from the fernery we catch delightful views of Ickworth, the stately mansion of the Marquis of Bristol, and we then at once emerge on the kitchen garden. The first thing that strikes our eye is the extraordinary neatness of arrangement, its cleanness, and the excellence of the crop. Neither are the flowers forgotten here. Fringes of bloom formed of Antirrhinums, Roses, Sweet Peas, Cloves, Marigolds, and Pinks accompany us along most of the walks, while here and there groups of Hollyhocks are placed at fitting points for effect. Nearly all the fruit trees, except those on walls, are trained into pyramidal and spiral forms. A large collection of fine Pear trees runs in double lines around the garden, while most of the inside borders are furnished with Apple trees of the same shape. We also noticed that between each two Pear trees a *Rosa* has recently been planted, to be trained in the same form as the Pears.

Passing another of the beautiful blue gates with which visitors to Hardwicke are familiar, we pass along shady walks, through shrubberies, American plants, Pampas Grasses, and numberless choice trees, until we come to the little lawn where stands a fine tree of the *Aracaria*, and a young, but remarkably healthy plant of the *Wellingtonia gigantea*. From here we pass up the delightfully cool Yew walks, and back to the house.

Entering the conservatory we pass through a continuous range of glass houses, over 600 feet long, divided into various lengths, and maintained at different temperatures for the cultivation of the many flowers and fruits grown at Hardwicke. The conservatory is stocked mostly with Fuchsias and Pelargoniums, and a number of climbers hanging from the roof. Then we pass through a corridor hung with *Heliotrope*, along a passage with plants of Cactuses, Begonias, and Ferns dangling from the roof or springing out from the side of the walls, and arrive at the orangery. Here there is a large collection of Orange and Lemon trees, with Citrons on the back walls, and the giant white and other Trumpet-Flowers just beginning to bloom. A large *Hamburgh Vine* also covers the roof of this house. A few steps farther and we enter the tropical fernery with a rich screen of Passion-Flowers hanging from the roof, Mosses and Ferns peeping from the sides, and an enormous bunch of *Banana* in fruit furnishing the centre. Emerging from this we pass through the Peach house into a house devoted to the culture of Fuchsias and Figs, and, having visited the *Camellia* house we arrive at the first vinery, where the ripe clusters of Black and White Grapes look temptingly down upon us. From here we pass through a second vinery of *Hamburghs* into what is called the Muscat house, which is filled with a heavy crop of this splendid Grape. This brings us to the end of the conservatories.

Having now inspected the glass houses and the pleasure grounds we must pay a well-deserved tribute to the extreme care which is shown by Mr. Fish in the cultivation of everything at Hardwicke. The neatness and cleanliness of every part could not be surpassed, and at all points are seen proofs of the cultivated taste and designing mind which has contributed so much to make Hardwicke the paradise that it is.—(*Bury Free Press.*)

ORNAMENTAL AND FLOWERING SHRUBS.

(Continued from Vol. XIV., page 296.)

SHRUBS THRIVING IN PEAT SOIL.

ANDROMEDA FLORIBUNDA.—Evergreen. Leaves bright dark green. Flowers bell-shaped, white, fragrant, produced in great profusion, from February to April. It is a very handsome shrub, and of close low growth, and does well in pots for forcing. It succeeds best in a slightly shaded situation, and is impatient of drought; therefore it does not succeed under large trees, which by their shade and roots make the soil little better than dust in summer. Under favourable circumstances it attains the height of 3 feet. The best plants are those from seed, which may be treated in the same manner as that of the *Rhododendron*. It is also propagated by layers.

Andromeda calyculata and its varieties minor and major, *A. axillaris*, *A. mariana*, *A. polifolia*, *A. cassinifolia*, *A. formosa*, and *A. pulverulenta* are all pretty little evergreen shrubs, having white bell-shaped flowers in spring, some tinted with pink; but they are all inferior to *A. floribunda*. They grow from 1 to 3 feet in height, and are increased by seed and layers.

ARCTOSTAPHYLOS UVA-URSI.—Evergreen. Leaves small and shining. Flowers rose or pale red, produced from April to June, succeeded by small red berries. It is of procumbent growth, and is suitable for rockwork. Height 1 foot. Seeds and layers.

AZALEAS.—These, from the profusion of their brilliant sweet flowers, are among the most magnificent of flowering shrubs, and form a splendid display in May and June. The varieties are very numerous, and

I can only give a selection of a few of the best. Of the varieties of *A. pontica*, Thompson's *pontica alba*, creamy white; *macrantha*, deep sulphur, large; *magifica*, creamy white, large; *grandiflora*, deep yellow; *conspicua*, yellow; and *multiflora pallida*, pale sulphur. Of the English varieties, *Anrantia major*, pale orange; *Calendulacea coccinea*, orange scarlet; *Coccinea major*, dark scarlet; *Calendulacea elegans*, yellow shaded with red, distinct and large; *Cuprea splendens*, pink with yellow; *Decorata*, pink, very beautiful; *Hartnelli*, orange, shaded red; *Mirabilis*, pink; *Prince of Wales*, salmon red, orange in the upper segments, large; *Princeps grandiflora*, deep pink; *Rosea flavescent*, rose and yellowish; *Triumphans*, orange; and *Rosalie*, salmon red, yellow in the upper segment; and, for their sweetness, *Viola odora*, orange and salmon, small, very sweet; *Viscocephala*, sulphur white, very highly scented; *Viscosa floribunda*, white, small, and very sweet; *Double Blush*, pretty; *Monstrosa fascicularis*, yellowish orange, dwarf habit; and *Monstrosa variabilis*, yellowish orange, changeable, dwarf habit. Of the Ghent varieties the following are good:—*No Plus Ultra*, orange scarlet, large; *Morteri*, rich yellow and deep rosy red; *Princesse d'Orange*, salmon pink, large; *Marie Dorothee*, whitish, slightly shaded with pink, with yellow in the upper segment, large; *Admiral*, deep red, large; *Coccinea speciosa*, orange scarlet, large; *Cymodoce*, deep red, shaded orange, large; *Elector*, orange scarlet, large; *Julius Caesar*, deep scarlet red, reddish orange in the upper segment, large; *Grand Duc de Luxembourg*, deep scarlet, large; *Fulgida*, orange scarlet, large; *Perle de Printemps*, salmon pink, large; *Rubens*, red and orange, dark, large; *Quadriceolor*, buff, shaded salmon and deep sulphur; *Van Dyck*, deep red, large; *Reine de l'Angleterre*, orange red, yellow in the upper segment, large; *Splendens*, bright orange scarlet, large; and *Unique*, deep scarlet, large. All the preceding are good varieties, and make excellent groups, which is the best method of planting; indeed, groups of not less than half a dozen plants, the more the better, should be planted in order to afford a full estimate of their beauty and effect. The groups or beds may be edged with *Azalea amœna*; its neat habit and bright rosy purple flowers render it very desirable for the front of American beds. The *Azalea* thrives under the same conditions as the *Rhododendron*. I shall therefore treat of the propagation and culture of *Azaleas* when treating of the *Rhododendron*.

BRYANTHUS ERECTUS.—Evergreen. Leaves bright deep green. It forms a dense dwarf bush, having fine heads of pale pink flowers in June. It does not exceed 9 or 12 inches in height, and is best grown on rock-work, in sunny fissures, in a compost of peat and grit, which must be kept moist. In appearance it very closely resembles *Rhododendron chamæcistus*, and its flowers seem intermediate between that *Rhododendron* and *Kalmia latifolia*. Probably it is a natural hybrid. Layers.

CASSIOPE TETRAGONA is a very beautiful Heath-like shrub, and ought not to be overlooked. It attains a height of from 9 to 12 inches, and produces several white bell-shaped flowers. Requires to be grown in wet stones, peat, or grit, in sunny fissures of rockwork, and should never lack water, nor have defective drainage.

CHAMELEDON (AZALEA) PROCUMBENS.—A neat-growing alpine *Azalea*, succeeding under the same circumstances as the *Bryanthus*. It produces pinkish flowers in June.

EPIGEA REPENS.—A pretty trailing shrub, having in July white flowers that are delightfully orange-scented. It is an evergreen, requiring heath soil or sandy peat, and needs slight shade from powerful sun, being best grown under bushes.—G. ABBEY.

(To be continued.)

A HANDY AND POWERFUL LEVER.

In working in soft ground, whether at pulling stumps or moving stones, the great want is a firm place on which to set

the lever. The accompanying engraving is of a lever which requires a very simple base, and if rigged with a pulley or block and tackle, as shown, gives a great lifting power. For

such lifts a crooked lever has many advantages. The ring to which the powerful inch-iron hook is attached should, perhaps, pass through the bar closer to the inner angle than is represented. It might equally well be made so as to slip over the bar and hold in a notch on the inner side. Such a lever may be from 7 to 9 feet long, and made of oak or ash. It may be operated by hand, by attaching the upper end of the rope to a stump, and pulling down upon the lower end; or by horses, by fixing the lower end and carrying the upper one off to where the team may be conveniently and efficiently used.

NOTES AND GLEANINGS.

LIEUT.-GEN. HON. C. GREY has been elected by the Council a VICE-PRESIDENT OF THE ROYAL HORTICULTURAL SOCIETY for the year 1868-9, in place of Mr. Henry Cole, C.B., resigned.

WORK FOR THE WEEK.

KITCHEN GARDEN.

It is a good plan to dig down early in summer the plot of Winter Spinach when it has attained the height of 2 or 3 feet, and to plant the space with Brussels Sprouts, Scotch Kale, and Savoy, for an early supply; and the vigour with which they will grow will convince one that such a method might be adopted with great advantage where manure is scarce and ground plentiful. *Cabbages*, in late situations it would be advisable to sow a bed of the earlier sorts for transplanting about the beginning of next March. The middle of August used to be the appointed time for this sowing some years ago, but this is too late for many places. See that the beds previously sown are not too much crowded with plants. *Endive*, sow a large bed for the last time this season, and if you keep it over winter it will help the salads till the spring-sown Lettuces come in. *Kidney Beans*, sow in a situation where it will be possible to defend them from early autumn frosts by covering with mats, choosing the dwarfest sorts, such as the Early Dun, or the Robin's Egg or China. *Onions*, preparations should now be made for sowing thickly the Strasburg, or any other hardy sort, to stand over the winter and furnish large Onions early next summer. Part of them may be drawn for salads during winter, and the other thinnings planted out in March. Sow again in a fortnight; ground previously occupied with early Cauliflowers, or Strawberries that require digging down, will be suitable. *Peas*, make the last sowing, choosing the earlier varieties. *Turnips*, if you have no access to field-grown Turnips, which are always preferable to garden ones, you had better sow a large breadth of them in some light portion of the garden for winter use.

FRUIT GARDEN.

Attend to removing the breastwood of Apple, Pear, Cherry, and Plum trees, shortening the leading shoots, and cutting back to a couple of inches the side shoots of Currants and Gooseberries (unless when the latter are made to bear almost exclusively on young wood), and thinning and shortening the shoots of Apricot and Peach trees as previously recommended. Cover with mats or thin waterproofed cloth those Cherries, Gooseberries, and Currants, that you wish to preserve as late as possible, and defend the remainder from birds by netting. This is a much more pleasant method than attempting to exterminate the feathered tribe. It is only during the fruit season that blackbirds, thrushes, &c., interfere with our comforts, and for a little peccation now they amply repay us by the number of slugs and other enemies which they devour in spring, to say nothing of their cheerful notes at "early morn and dewy eve." The Hawthornden and Codlin Apples grow freely from cuttings planted under a north wall in November, and no doubt many Pears will do the same. Sometimes people express a wish that they could rear sufficient of these cuttings to plant in a kitchen garden to see if they would be more dwarf, and to ascertain if the flavour of the fruit would be different from that of grafted trees. There is nothing in particular to recommend this experiment, but there are points connected with it which may be of more general application, and are not usually acted on, if, indeed, they are rightly understood. Any one who intends to put in cuttings in November of fruit trees, or, indeed, of any hardy tree that is difficult to strike, ought to begin to prepare the cuttings before the end of the month, by shortening the shoots to one-half or one-third of their length. The passage of the ascending sap being thus cut off, it will so accumulate in the remaining portion of the

shoots as to be ready to burst their buds into another growth. Now, gardeners know very well that when the eyes of any plant are in this prominent state in the autumn, they will shoot with greater vigour in the spring, and there is no reason to doubt but the same effect, to a certain extent, will take place if these shoots are used as cuttings. It follows, then, that all cuttings of deciduous trees are benefited by being stopped before the growing season is over. When cuttings of exotic plants that are difficult to strike, or that take a long time to do so, are first put in, they are kept in a close, cool place till they form at the bottom a callosity whence the roots issue; they are then put into bottom heat to facilitate the emission of roots. It seems, therefore, that the most eventful period in the life of a cutting is that at which the callosity is formed, and fortunately we can accelerate the period of its formation by operations performed long before the shoots are separated from the tree.

FLOWER GARDEN.

It may be well to consider what is best to be done to counteract the effects, as regards flower-garden decoration, of cold, wet, or dry seasons. It may be remarked, that an improvement will be effected in the first place by thoroughly draining and pulverising the soil to the depth of at least 2 feet. This will allow of the free percolation and distribution of moisture throughout the whole mass of the soil; not only of the moisture which falls as rain, or is applied by the hand of man, but also of the moisture which is ever finding its way through the soil by capillary attraction. Where flower gardens are situated on a subsoil of strong retentive clay, it will be best to remove the soil to the depth of 2 feet, placing 6 or 8 inches of brick rubbish or rough stones over the bottom of each bed, and making the remainder good with top or spit loam. To do this with large gardens will be attended with considerable expense and labour, and, therefore, as a makeshift, it will do considerable good to remove only a part of the bad subsoil, and then mix the remainder with brick rubbish and half-decomposed vegetable refuse.

GREENHOUSE AND CONSERVATORY.

No matter how soon in August the Dutch bulbs for very early forcing are potted; the more roots these bulbs make before they are brought into heat the better. In Holland, the bulbs for the first crop are well established in pots before we think of ordering ours. *Gesnera elongata*, *Crowea saligna*, and some of the *Correas*, will now stand more heat, and with a little forcing they may be brought into flower a month sooner. Attend well to late-autumn flowering plants for the conservatory. *Heliotropes*, Sweet Briar, *Mignonette*, Lemon-scented *Verbena* (*Aloysia citriodora*), and Fairy *Roses*, with the Rose-scented *Pelargonium*, are always in requisition for bouquets after the middle of October, or as soon as the early frosts nip them out of doors. Examine every plant one by one, and give such treatment as the different cases may suggest. This has been a trying season for the best gardeners. Besides thus exercising our patience, a large addition is made to the stock of our experience, upon which we can fall back more readily in future.

STOVE.

Plants which flower late in the autumn, and especially those that may be taken to the conservatory to bloom, should now or very soon be in their flowering pots. *Eranthemum pulchellum*, several *Justicias*, *Aphelandra cristata*, *Poinsettia pulcherrima*, *Eschynanthus grandiflorus*, and many more of similar character belong to this class. Another very essential point to be observed with stove plants in general, which are removed to the conservatory while in flower, is to have the compost lighter for them, and not to give them more pot room than will just keep them healthy, with the assistance of liquid manure. Plants of this nature suffer very much in a cool conservatory late in the season, if they are growing in heavy, rich compost, and in large pots, whereas in a stove that would be the right way to make them flourish.

PITS AND FRAMES.

We are now on the eve of a busy time for pits and frames. *Mignonette* is to be sown immediately for winter use. Large quantities of the best China *Roses* are to be struck without loss of time, to bed-out next May. All sorts of tender annuals that are to be sown in the autumn must be put in early. *Calceolarias* and *Pelargonium* seed ought to be sown as soon as gathered after this time. Cuttings of bedding *Mesembryanthemums* should be put in among the very first, as they do not flower well or early from late autumn cuttings, and hardly at all from those taken in spring. Every cutting that can be

spared of the bedding *Pelargoniums* should be in the cutting-pot or bed as soon as it is ready to take off, till you have a full supply.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

NOTWITHSTANDING the great heat of the 21st and 22nd of July, we see no change of weather as respects moisture. We fear that we shall soon be unable to have crisp young Lettuces, as the seed refuses to grow, or the young plants, from want of moisture in the air, spindle when very young. Celery we have managed to keep healthy as yet, chiefly by covering the bed between, and even very slightly over the plants at first, with dry litter. The sun strikes on the litter without drawing a great amount of moisture from the soil. We have watered Celery seldom, but gave it a good quantity of water when any was supplied. We were obliged against our will to use our house sewage, but that and all manure waterings must be applied with care to Celery, otherwise the leafstalks will be apt to be injured. Such water should be communicated to the earth by the spout of the pot alone. Manure waterings overhead to Celery often begin to show injuriously weeks after the watering. So much is this the case frequently, that when using sewage or dunghill drainings weak enough, we would like to follow with an application of clear water from a rose overhead, and then there would be little of that danger.

We experience great difficulty in such weather in getting men to hold the watering pot low enough. They will stand upright, and send the water down in jets, instead of pouring it on gently. In watering some small seedlings lately a young man was actually throwing the water up as high as he could, enough, by the mere force with which it reached them, to clear all the soil away from their tender roots.

After the parching heat of the 21st and 22nd, the dull day of the 23rd was a relief, and furnished a chance for watering, but any common watering was quite out of the question. Unless the watering reached the most of the roots, it would have been worse than labour thrown away. Much of our soil was as dry as if baked in an oven for fully 6 inches in depth, and yet the plants held their own, drawing moisture from beneath. The damping of half an inch on the surface was, as previously explained, worse than labour lost. A moving of the surface or mulching would in such cases be better than surface-stirring, when anything more was attempted than a mere cleaning and refreshing of the foliage.

Winter crops planted are standing still, with little or no growth, and yet can hardly be said to be standing still, for the fly of different kinds has attacked them, and we dread ere long myriads of caterpillars, as never did we have such clouds of the white butterfly. When we had young boys we used to get them to chase and capture thousands, but such work does not suit staid grown-up men. By thus catching the moths we were seldom troubled much with caterpillars. It is of little use planting vegetables now, even owing to the fly, unless they are protected. We planted out a piece of *Camelliflowers*, nice little plants, but in a day they were scarcely discernible; the leaves left were like delicate network. The next lot will have a pot turned over each plant; that will also save watering.

Broad Beans not watered are apt to get hard, even when young and well mulched too, the foliage throws off so much water by evaporation. Dwarf Kidney Beans, too, unless watered, though bearing profusely, are apt to be hard when cooked. Scarlet Runners are doing well; also Peas that have been soaked with sewage. Those not watered are soon over. We shall be glad of Scarlet Runners and Dwarf Kidney Beans, for Cabbages will soon be scarce, unless we can water them, and of that we have no hope, as our sewage failed on Friday, and we shall have to wait a few days for a fresh supply. Onions are still holding their own without watering, but not growing. The autumn-sown Onions have been very fine. If we contemplated such seasons we would sow more in the autumn. Those sown in summer for salads refuse to grow without watering and shading. Our Globe Artichokes have done well, but they will soon be over, unless we can drench them well.

FRUIT GARDEN.

Without watering, the dwarf Apple and Pear trees seem as if they would cast no more fruit until it is ripe.

We have mulched the *Vine borders* to keep moisture in, being well assured that the earth is quite warm enough. Though the Peach house is empty, we had to surface-stir and

give a good watering to prevent the soil cracking from dryness. The outside border was mulched in the beginning of the winter, and as the season was so dry the mulching has rotted down, and has never been removed. That border has had no watering all the season, and has kept sufficiently moist owing to the 2 or 3 inches of rotten mulching. There was just a little assistance from Strawberry pots standing on the border, which were several times watered. In such seasons, and in fact in any season, fruit trees would do much better with this mulching than with waterings of cold water. Many years ago we proved this to our own satisfaction, and to the saving of our water supply, and we should have done much more in this way of late, but our mulching material was scarce. A little stable manure and tree leaves formed the protection given to the Peach border; now, of course, all is well rotten, and what at first might be 8 inches deep when loose, will be 3 inches when compact; in fact, the mulching will range now from 2 to 3 inches. It has saved all watering, even in this hot summer, and the fruit swelled beautifully. We shall have something more to say on this subject when alluding to the practice in this respect of one of the best Grape-growers in the country, who never waters his wide outside borders.

Last week we stated that we had fresh-mulched all our orchard-house trees in pots, and we have given the ground a good watering with what we could get. Owing to the heat we have gathered fine Figs in the orchard house earlier than usual. Plums have also come in useful; and Peaches and Nectarines, which could have been in, we are for a definite purpose keeping back, by air-giving night and day. When much is attempted in one house, and that house is unheated, we are apt to injure something. For instance, the higher temperature we were giving this house, merely by reducing the air given, would not only have prevented a little stoppage between fruit-gathering from the Peach house and the orchard house, but the same treatment that would have afforded Peaches and Nectarines a few weeks earlier would also have suited the Vines growing in the house, as such Vines, chiefly late kinds, do best when ripened rather early in the autumn. As it is, there will be a considerable difference in the time of ripening in our two houses, but there would have been more had we not tried to retard the first house, which we may manage for eight or ten days by keeping it as cool as possible in this weather, and slightly shading the roof with a sprinkling over the glass of whitened water. Coolness is also much promoted by slightly sprinkling the floor with water in the hottest time of the day. This is a very different affair from dribbling as an excuse for watering. When real watering is intended it is best to water thoroughly, and then wait until watering is again needed. When clear water can be obtained, refreshing the foliage and even slightly damping the surface so that the water may rise again in vapour are very different affairs.

Some years ago we were asked to look at a large Peach house of promising young trees that refused to swell their fruit after stoning; but at and after that period, though well thinned, the fruit fell from the trees in great numbers, and being chiefly Nectarines were of no use whatever. The trees from constant syringing morning and evening looked well, and the soil of the house seemed good, and if anything too moist; on inquiry we found it was frequently watered and well drained, and therefore stagnant moisture could not be the reason. Being somewhat at a loss to account for the falling of the fruit we turned up a portion of the border with our walking stick, and on doing so in several places we found that the moist soil scarcely extended 2 inches from the surface. Farther down the roots were receiving no benefit from the surface-watering—nay, were injured by it, because the ascent of moisture from beneath the roots was thus arrested. Now, in such a case the remedy had to be applied with judgment. Only a few fruit had begun to fall; and we felt tolerably certain that if the soil of the house were saturated to and beyond the roots, the stimulus given so suddenly would be apt to throw the fruit off in numbers. Our advice was carried out with the best results. The house being a lean-to, about a third of the border next the back wall was forked over, and that was well watered. In four days the middle part had holes made in it, and that received half a watering; in other four days the front part was done in the same way; and then in other four or five days these two parts received enough to saturate the ground about the roots. The trees so treated, we have been informed, have rarely dropped a fruit since; so that the owner says it is of no use delaying to thin, as he is sure to have too many if he does not thin freely at once.

Strawberries.—As we could not water our beds, runners are scarce, and as layering them at the beds, in pots or otherwise would have been of little use without watering, we have taken the runners almost as soon as visible, and pricked them out in beds under old sashes as a protection, and then we will lift them with little balls and pot. We find this plan even in moist years saves much labour in watering, and generally the results are all that could be wished. We almost envy those who will have late Strawberries in August. What with late kinds and turned-out forced plants we have often gathered moderately well until the frosty nights came.

ORNAMENTAL DEPARTMENT.

Proceeded with potting, and shaded most plants under glass, chiefly to save watering. Our chief work, however, has been trying to save the flower garden as much as possible. The parts farthest removed from observation we have been forced to leave unattended to. Hollyhocks would have been fine in a moist season, and even now are good, though shorter than we like to see them, as their grandeur in our opinion consists to a great extent in the height of the stems and the length of the gorgeous spikes, instead of being snubbed and shortened for a mass of flowers for exhibition purposes. These, too, have been left to themselves without a drop of water, and but little or no mulching, though that would have helped them. The flower beds and borders that we have attempted to keep good are looking better than could be expected, those suffering most from dryness being watered only once in eight or ten days. The 21st and 22nd tried them considerably, but the dulness of the 23rd gave them a chance; and in order to do what we could for them in giving water on that and the following day, and applying it so as to reach the roots by making holes and moving the surface previously, we followed the watering by mulching all the exposed soil again with rough Mushroom dung from an exhausted bed, merely passing through an inch-sieve that which was placed near the outside. The beds would have had this mulching long before, but we could not well use the Mushroom bed earlier, as it kept on producing later than we expected. We hope to have enough of sewage to go over another principal part of the flower garden on Monday, and this we will mulch in all open places directly after the watering.

Of course, in such weather the drier the mulching when so applied the better it will act. Many of the beds can receive no attention in this way, as they are too full to permit of any such material getting in among the plants; but in many beds, though seemingly full, the plants can be held a little to one side to permit of a little surfacing, and then the moisture exhaled will chiefly be from the foliage. As to what we have been able to give even such very limited waterings, we have little fault to find, if we only could have a green lawn around them. Even the Lobelia edgings, so unmercifully cut down by rabbits, promise to form blue lines at last, as the rabbits disliked poking their noses so near the lime and sulphur. As regards the beds so watered and mulched, with a slight shower now and then, and the decreased temperature that has prevailed since the 23rd continuing, we hope to be tolerably independent of watering.

A gentleman who visited us lately seeing so much free growth in the plants, and such masses of flowers, notwithstanding the drawbacks, would scarcely believe that we did not water, if not every night, at least every other night, and even now we are doubtful if he does not believe that we have some secret never-failing source of supply to go to. He told us that cocoa-nut fibre would be a neater mulching for the flower beds where it could be seen, and we quite agree with him, but a ton or half a ton that would cover all his beds well, would do little or nothing for us. Many gentlemen with their neat little places which they partly superintend themselves, with the help of a good handy man or two, often run away with the idea that in larger places a proportionate amount of money is spent. Such give a sort of incredulous assent to the statement, that large places are often managed with an economy that would be startling to the possessors of small places. Nurserymen could often tell how not noblemen's gardeners, but amateurs with their little gardens, are their best supporters. However, in such a season as this, many who have from six to a dozen flower beds would have found their labours lightened if soon after planting they had covered their beds over with cocoa-nut fibre refuse. Quite as good, but not so neat, would have been rotten hotbed manure, broken and passed through an inch sieve.

Obtaining Water.—It is singular how well-educated men will

run away with any fresh idea, and consider that what is applicable in one case will be applicable in all cases. Through the kindness of a friend who saw the operation, we were among the first to draw attention to the American pump, so successfully used in Abyssinia, by which all sinking of wells is avoided. Visitors have said to us, "Why do you not have two or three American pumps, and thus get plenty of water?" We see there is water in your ponds, there is or must be plenty a little deeper in the ground." It is almost useless to tell them that the water in the ponds is that collected from rains, that a tube pump can be of little use where the water is not found under less than 30 feet from the surface, whilst our well only retains water at something like 250 feet from the surface, and even that has dried at times.

Some also tell us there is nothing like artesian wells. "Why don't you get one sunk, and have the water bubbling up for you?" and all this though we occupy the highest ground for miles, and must go to the level of the nearest streams before we can obtain water at all, and then raise it by machinery and force-pump to the surface. An artesian spring can only run over when the water comes from a much higher altitude, and therefore, as a rule, can only be had in a valley, and not on the top of a hill. Strange things as respects water do sometimes take place. For instance, on one side of Barret, and that on high ground, you cannot sink 3 or 4 feet without coming to water; on the other side you must go down some hundreds of feet. Those who think they can have American tube pumps and artesian wells anywhere would admire water-work fountains as much at the top of a hill as in the level in the valley, though the valley is the only place in which a fountain can appear naturally; and all fountains on higher grounds will suggest to the considerate the machinery that is required to raise the water. The water works, as at Chatsworth and Enville, will ever be the most successful when no such thought of machinery, steam power, &c., is obtruded on the mind of the spectator. At the former place the knowledge that there is a lake on the top of the hill throws everything of the artificial as to obtaining the water aside. At the latter the splendid fountains in the lakes are supplied from a large elevated reservoir, and if not told, you know nothing of the steam power that keeps the large reservoir full. The smoke and the clanking from the steam-engine, if seen and heard, would rob the gorgeous scene of half its charms. The lesson to be learned is not to attempt much in the way of wells and fountains on the tops of hills, and to make no great effects with jets or falls of water unless you are placed in a valley, as then a fountain would look natural.—R. F.

COVENT GARDEN MARKET.—JULY 29.

A GREAT falling off in the supply of soft fruits, Raspberries and Strawberries being quite over. Large arrivals of West Indian Pines are again reported, and we have heavy consignments of Apples and Pears from the Continent. Good vegetables are scarce.

TO CORRESPONDENTS.

•• We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

DARK OR PINK HYBRID PERPETUAL ROSE (J. Subscribers).—"You require a dark or pink Hybrid Perpetual which will bloom abundantly and late in the season, and which must be a successful and quick climber on a west aspect." For the dark, I recommend *Dun de Cazes*, and for the pink, *Anna Alexiiff*; they are both good. If first-class flowers are needed, for dark procure *Prince Camille de Rohan*; and for salmon pink, *William Griffiths*, a Rose that has never been excelled.—W. F. RADCLYFFE.

ROSE CARDINAL PATRIZZI (E. H. Dawson).—"Having earthed-up Cardinal Patrizzi 8 inches over the point of union, no doubt it has made roots of its own, independent of the *Moucti* stock. If you wish to have blossoms this season from the 4-feet blind shoot, you must cut back 6 inches or so to a plump eye in tolerably hard wood. At the fall of the leaf you will be well to take the plant up, cut away the *Moucti* stock which is too far removed from the surface, and having repainted, dry-mulch through the winter.—W. F. RADCLYFFE."

ROSE OVER-LUXURIANT (The Rose at the Cottage).—"The glorious crimson Rose, of a deep colour, and large size, growth of wood 6 inches, I imagine was *Louis XIV.* Another Rose of moderate growth, and of a similar description, would be *Victor Emmanuel*, a Bourbon. If the lady will forward me a bloom, or a piece of wood, or foliage, I might be able to tell the name. *Louis XIV.* is of the colour of rich blood, dark-shaded, and not over-full. *Victor Emmanuel* is crimson purple. There are two other deep crimson Roses of moderate growth, and which may be called glorious—namely, *Madame Ma-sou*, large, expanded, a claret crimson; and *Xavier Olibo*, globular, fine before expansion, but hollow as a drum. I expect if the rate of growth is correct that the Rose is either *Louis XIV.*, or one of these two. Supposing the variety not to be any of these, it may be *Dun de Cazes*, *Pierre Notting*, or *Prince Camille de Rohan*. The first is not over-full, the second is globular and full, the third is flat, or expanded, and dies off nearly black. With regard to the long blind shoot, cut the shoot back one-third, and if the Rose is not a summer Rose, it will probably put forth side branches and bloom this year. No matter what the Rose is, if the growth is rampant, the less it is cut the more chance there is of producing blossoms. If the ground is not in high condition when the Rose is cut back, supply a little manure, and water.—W. F. RADCLYFFE."

GRAPE SPOTTED (O. C. G.).—"The Grapes you enclosed are affected with what gardeners call "the spot." It is believed to be an ulcer caused by the roots not supplying a sufficiency of sap. Water them with tepid water abundantly, and give a little weak liquid manure. Thin half the berries out from each bunch in which they are as close as in that you enclosed.

NAME OF GRAPE (John Ferme).—"The berries were totally smashed and dry. Send some in a tin box.

VINES FOR CONSERVATORY (T. E. B.).—"We recommend a Black Hamburgh and a Royal Mascadine.

FERN AT THE LEICESTER EXHIBITION.—"In your account of the Floral Committee's awards at Leicester, you give Mr. E. J. Lowe, instead of J. E. Mapplebeck, the credit of receiving a first-class certificate for a Fern exhibited by me, which I found, and he does not possess. The name of it is *Lastrea Filix-mas* var. *Mapplebeckii*.—JOHN E. MAPPLEBECK, Moseley, near Birmingham."

ADDRESS (J. F. N.).—"Messrs. Downie, Laird, & Laing's address is Stanstead Park, Forest Hill, London, S.E., and 17, South Frederick Street, Edinburgh.

TRAINING VINES IN A VINERY (Reader).—"If you make no other use of your front glass, there is no objection to spurring the Vines from the ground to the top of the front glass, and thence along beneath the rafters, but here we should advise the mode of management to be the same, for if under the rafter you were chiefly to use the rod-system, it would starve the lower part of the Vine. With Vines 3 feet apart you will do little good on the back wall by training down after the Vines are established, but the plan may be tried. The shade will be against them there. If you grow much below the Vines, your spurs in front will keep out light from the secondary crops.

PRUNING FRUIT TREES (Richard Taylor).—"If the strong leading shoots are stopped early, the laterals produced would have time to ripen their wood perfectly, and the shortening of the stronger shoots would diffuse the strength more equally over the tree. We should in your case stop back freely, and we think that as you have so little fruit, we would also root-prune in September, doing it so as to check growth, but not so much as to cause the trees to flag.

HEATING A PEACH HOUSE WITH HOT WATER (J. M. Northfield).—"Although it is not necessary to heat a Peach house, it would be an advantage to do so, as you can take pipes very readily from your present boiler. Pipes on the Truss principle will be best for removal. We think they will cost a little more, but it would be best to ask the advertiser, as we have used none ourselves. As you have common jointed pipes in the other houses it would be well to have an understanding as to removal with the landlord. A boiler complete in itself may be removed, but one

brickwork we think is not removable without a proper understanding to that effect.

DESTROYING ANTS (A. G.).—In another column you will see a notice of a compound Mr. Abbey has used for the destruction of insect pests. A solution of 2 ozs. to the gallon of water is instant death to every ant it touches, and poured into the nest it will destroy the colony. If you sprinkle guano over their haunts it will drive the ants away.

SAVING AND SOWING FUCHSIA SEED (H. B.).—The berries should be left on the plant until they are quite black, and readily part from it, then with the fingers squeeze them in a basin of water until the seeds are separated from the pulp. They will then sink to the bottom; next drain off the water and pulp, and set the basin on its side in a dry place, so as to dry the seeds. When dry wrap them up in paper, and keep them until spring. They may be sown at the beginning of March, or if now ripe we would sow forthwith. Sow in pots or pans, well drained, and filled to within a quarter of an inch of the rim with a compost of two-thirds sandy fibrous loam, one-third leaf mould, and about one-sixth silver sand. The compost should be sifted. Place the soil remaining in the sieve over the crocks to the depth of an inch, and on it the sifted soil. Level the surface by pressing it with the bottom of a small flower-pot. Scatter the seeds rather thinly and evenly, and cover them lightly to a depth about equal to the thickness of the seed; give a gentle watering, and place the pots in a house where there is a temperature of from 55° to 60° at night, and from 70° to 80° by day, keeping the soil moist, and near the glass. When the plants appear afford plenty of light and air, and by degrees harden them off. The pot or pan may be placed in a hotbed, and the seedlings forwarded there until they are of sufficient size to be put singly in small pots. This should be done as soon as they can well be handled, and after potting they must be returned to the hotbed, and kept there until they become again established; then harden them off, and remove to an airy position in the greenhouse. A shelf near the glass is the most suitable place.

SUNFLOWER SEED SAVING (B. B.).—Cut the heads as soon as the seeds are ripe. Lay them on a floor in a dry, airy building for ten days or a fortnight, and then beat them with a stick, and the seeds will fall out. In a windy day winnow them, placing a sheet or cloth on the floor or ground. The seeds being thus freed of husks and dust should be stored in bags in a dry place. The heads should be gathered in a dry day.

SYRINGING FERNS (A. B. S.).—We are in the habit of syringing our Ferns in the evening, and we do not find their foliage damaged. The specimen sent appears scorched, probably owing to the syringing being heavy, and the house being closed at night; there will, consequently, be more or less condensed moisture on the fronds in the morning, and the sun's rays falling upon them in that state will account for the brownness of the specimen. Do not give more than a gentle sprinkling, keep the atmosphere moist by sprinkling the paths, walls, and other surfaces with water morning and evening, and give a little air at night, but not in excessive quantity so as to create a current. A temperature of from 70° to 75° at night is much too warm for the kinds of Ferns you name. Admit air more freely so as to reduce the temperature. Spongy peat is not good for Ferns. That most suitable is of a brownish colour, and full of fibres and of particles of sand. If upon wetting the peat does not when squeezed form a ball of mud, nor give off very black water, it will grow Ferns well, and almost all plants needing peat soil. *Ficus repens* is a stove climber.

SITE FOR HARDY FERNERY (W. O. B.).—We have found a north aspect most suitable. The plants are less liable to injury from cold in winter, as the house does not become hot in the day and very cold at night. Extremes of heat and cold, or sudden changes of temperature, are not beneficial to the growth of Ferns. The house, though with a north aspect, will need shade in summer. We have not noticed any tardiness of growth in the case of Ferns in a north aspect.

PORTUGAL QUINCE (R. S.).—The Portugal Quince is the finest, but not so productive nor so hardy as the Apple-shaped. The tree bears when of comparatively small size, and a good tree two or three years grafted will bear the second or third year after planting. A Quince tree or two would be desirable to a selection, but whether it is worth while growing one must be determined by the taste of the proprietor.

THRIPS ON MELONS (Primus).—The best means of destroying thrips on Melon plants is to fumigate them, when the foliage is dry, with tobacco, filling the house with smoke. Shade from bright sun, give a thorough syringing on the evening following the fumigation, and repeat the fumigation next evening if necessary. It may be necessary to repeat the fumigation at intervals, taking care to have the foliage dry, and to deliver the smoke cool.

LILIUM AURATUM STEM BROKEN OFF (W. D.).—The bulb should not be disturbed, but left in the soil and pot. It would not do to take up the bulb and store it away in a dry place until winter. It will, no doubt, make a good growth next year, and early. You could hardly expect it to flower this year, as the flowering portion of the stem was broken off.

SEDUM CALIFORNICUM PROPAGATION (W. D.).—The plant used as an edging to some of the beds in Hyde Park, we think from your description, is *Sedum (Scarpervivum) californicum*. It forms large dense green rosettes tipped with reddish brown. It is increased by division, which may be performed early in autumn or spring; it is also raised from seeds when these are procurable. They may be sown sown in light, sandy, open soil. It is a free grower and of easy culture. Any of the principal nurseries could supply you.

MISTLETOE SOWING (De Foix).—We would sow the seed at once, making incisions in the under sides of the branches of the trees you name similar to those made for budding, and insert a seed in each incision between the bark and wood. Being on the under sides of the branches the seed would not be so soon discovered by birds, and placed in the incision it would not be so liable to be displaced, as if it were merely placed on the branch, which, however, is quite sufficient. In addition to Poplar and Elm we may name Lime, Apple, Thorn, and Crab, as suitable for the growth of the Mistletoe.

PLANTING AN ORCHARD HOUSE (T. B.).—Your plan will answer very well. The height of the house will do for standards, but they will need root-pruning. The front row will do well for pots. If you aimed at the least trouble we would plant the front and train the trees on a trellis the same as the back.

STRAWBERRY PLANTS (W. B.).—We cannot recommend nurserymen. Any who advertise in our columns could supply the varieties you name.

GRAPES MARKED (An Old Subscriber).—The box was smashed, as well as the berries, by the post-office punches.

SEEDLING PANSY (C. Stuart).—Your Pansy may look well in a mass, but the flower is deficient in form and substance. It appears to be a seedling from one named Magpie, whose only recommendation is the contrast of colour, the flower being of very bad form.

RATING GARDEN STRUCTURES (S. Walters).—The appeal we alluded to is to the Quarter Sessions; and if the decision there is adverse, and you were advised to do so, you might have the case brought before the Judges in London. A subscription should be raised among the gardeners interested to have one case thus fully decided, and by which the other cases would be ruled. It is perfectly useless to occupy any space in our columns with mere outcry.

PELAGONIUMS (H. W.).—What are intended to be shown as Pelargoniums, are not as you suppose any of the genera of the family Geraniaceae, but species or varieties of species belonging to the genus *Pelargonium*; and the Zonal Pelargoniums mentioned in the show schedules are varieties of either *Pelargonium zonale* or *inquinatum*, and their hybrids. In the class of Variegated Pelargoniums, any plant may be shown that belongs to the genus *Pelargonium* and which has variegated leaves. Paxton's "Botanical Dictionary" is published at 25s.

FRUITS FROM FRANCE (Centurion).—The Pears called Marie Louise de Jersey and Windsor de Jersey are merely the ordinary sorts known by that name, and the affix "de Jersey" indicates that the possessor obtained them from that island. Columbia is an American Pear which in some seasons is of good quality in this country, but not always so. Chasselas Rouge Royale is the same as Chasselas de Falloux, of Joug's "Fruit Manual." The Apples, Calville Rouge and Calville Rouge d'Hiver, are synonymous. It is only of second-rate quality. Of Duchesse de Brabant we have no experience.

BLACK SOIL (A Constant Reader).—A little of the soil sent would be useful for Fern culture in a house, but not much of it, for it seems as soot, and also when wetted and dried again, to become so hard. If we are not mistaken, it would act much like pieces of grit or sandstone, but it is not easy judging from such small quantities.

VINE MILDEWED (Idem).—What you have done for your Vines is all proper and ought to have lessened the tendency to mildew. We would advise dusting the parts with flowers of sulphur, daubing the open parts of the wall with sulphur and soft-soap, and giving a good watering to the roots. We fear the roots want more help than they have received.

TRAINING VINES (Half-pay).—Having successfully treated your Vines as advised on the 9th of January, we would now nip out the points of the shoots that have reached the top of the wall, so as to throw back more vigour to the stem nearer home. For this purpose encourage laterals there for a couple of months, merely tipping out their points. This will do more to strengthen the stem than allowing the Vine to run along the back wall, but you may let some laterals grow there. The reason of this will be more obvious if you attend to what is said about cutting back these Vine shoots after the wood is ripened in the autumn. Recollect that taking much fruit from these Vines next year will paralyse them for the future. You did quite right with the Peach tree. Alice Maud is a good Strawberry for a pot and for your house, and so is President and Prince of Wales; the former is generally fruitful.

COST OF ERECTING A VINEY (B. M.).—We cannot enter on the subject of estimates, as there is such a difference in the mode of doing work. We have allowed others to state how cheaply they erected fixed glass roofs by using large squares and no rafters. Tradesmen advertise in our pages how cheaply they can send out sashes complete. Given a wall, a lean-to about 13 feet wide may be put up for something like 10s. per foot run, but it will be useful rather than ornamental; the rafter sash-houses fixed, and the glass from 18 to 20 inches from bar to bar. A span-roof 20 feet wide will be a useful house. If the wall is to be built, the span-roof will be the cheaper, as glass costs less than brick, and then you would only need a low wall all round, say 2½ feet, and glass 3½ feet. Iron piping will cost from 2s. 6d. per yard, and the boiler for such a house would be from £5 to £6. You can have good glass cut for 2d. per foot, and the prices of wood in battens, or in rafter pieces to receive the glass, from 3½ to 4½ inches in depth, can easily be ascertained.

CUTTING DOWN AN INDIANRUBBER PLANT (C. T. O.).—You may cut down your one-stemmed Indianrubber plant to 1, 2, or 3 feet, according to the space you have, and then you may have several shoots or branches instead of one. Before you do so, let the soil in the pot become as dry as the plant will endure without much flagging, and if you tie a string tighter and tighter every day for a week, before you cut off the head, there will be less bleeding. Sear the cut part with a hot iron, and put damp white lead on it.

CONSTRUCTING AN ORCHARD HOUSE (A Constant Reader).—To meet the most of your requirements obtain from our office Pearson on "Orchard Houses," which you can have for nineteen postage stamps. Such a house, if 16 feet wide, would be best if a span running north and south, with sides facing east and west, but as on the east side you have a wall 8 feet high, you might put your house against it. In this case a hipped and a sloping roof would be best for the width—say a short hipped-roof at the wall, 5 feet in length, forming a ridge-board 13 feet from the floor. This, with a front of 6 feet, part glass and part wood or brick, would give you a front rafter of about 13 feet. But for your wall, a span-roof would be best, say 12 feet high in the centre, 6 feet high at the sides, and having a double ridge-board so as to have a swing ventilator between. Then, in the first place, you should have a fixed roof, and the wood should be 4½ by 14 inches, and from 16 to 20 inches apart. In the span-roof, the roof would be so much shorter that 3-inch-deep rafter sash-bars would do. In either of these cases there would be no sashes. The size of the squares of glass might be 16 inches by 12, or 20 by 12. Have the floor level if convenient, but there is no great objection to a sloping floor and a sloping roof, but the level floor will always be most easily managed. As you can easily go up, there is little use in sinking the earth or floor. What you gain in warmth you lose in damp. A heating apparatus will be an advantage if you contemplate flowers as well as fruit. A good iron or brick Arnot's stove would, however, keep out frost; if you want much more you had better have a flue or hot water. The most pleasing

and profitable way of stocking such a house, if span-roofed, is to plant at each side, train to the ridge-board, and have a broad walk in the centre. There are numerous modes, either by pot culture, growing as bushes, &c. If Grapes are wished, Black Hamburgh and Royal Muscadine will be the best. The best time to build is as soon as possible. The best time to stock it is as soon after October as the wood of the trees is ripe. The flowers, if in pots, may be obtained as soon as the house is finished.

NAMES OF FRUITS (Mr. Cobbett).—The White-fruited Black Currant. (*J. Ashmead, Hford.*)—Early Harvest Apple.

NAMES OF PLANTS (Julia).—*Veronica agrestis.* (*J. D. G.*)—*Rhus coccinea.* (*H. Oakley*).—*Veratrum nigrum.* (*S. J. M.*).—*Athyrium Filix-femina*

rhaticum; 2, 4, and 5, *Aspidium* (*Lastrea*) *Filix-mas*; 3, *Cystopteris fragilis.* (*J. B. Boyd*).—No fructification to the specimens. (*F. E. H.*)—1, *Gymnogramma japonica*; 3, *Nephrodium setigerum.* (*G. E. Cox*).—Seedling frond of *Athyrium Filix-femina.* (*Penelope*).—*Cystopteris fragilis.* (*J. H. of B.*).—*Asplenium bulbiferum.* (*Stephanotis*).—*Nephrodium glabellum.* (*J. B. P.*). 1, *Aspidium trichomanes*; 2, *Selaginella Martensii*; 3, *S. Kraussii*; 4, *Saxifraga sarmentosa.* (*S. POULTRY, BEE, and HOUSEHOLD CHRONICLE.

FEEDING GAME FOWLS FOR EXHIBITION.

Good barley, white peas, or good peas of any colour, bread steeped in strong red ale, or in port wine or sherry, are the best things in feeding for exhibition. Meat should never be given, as feeding Game fowls on meat is technically termed "foul feeding," and makes the birds smell rank, as butchers' Game fowls generally do. Some give the raw yolk of eggs, but I do not approve of any egg-feeding. If the birds are penned, a good green turf containing worms, ants' eggs, and insects, is excellent in the pen with them. They should have a little pure water as well.

Exhibitors should be especially careful about not sending to an exhibition any bird in a pen in the least roup, or at all inclined to be so. One bird will, if in this state, infect all the other occupants of the pen, and they on their return will infect the whole run and spoil the stock. The roup, it should be remembered, is when bad just like the glanders in horses; and all birds having it, like glandered horses, should be at once destroyed.

Exhibitors should also recollect in putting up a cock and hens for exhibition, that the hens, or rather their eggs, will be influenced by the cock the hens have been penned with for the next three weeks or month at least, even if they are separated from him directly they return from exhibition, a cock's influence lasting on the average three weeks after separation from the hens.

Feeding on meat is called dirty or foul feeding by all good judges, and it not only makes the feathers smell rank, but I have been informed tends to encourage the breeding of insects under the feathers. Worms, insects, and ants' eggs are the only proper animal food for poultry, and never meat, either raw or cooked, though cooked meat if fresh is better than raw meat. Stinking or putrid meat is very bad food.

The hampers in which the birds are sent should be well lined and covered with canvas in cold weather, and there should be hay at the bottom of the hamper. If the exhibitor resides only a short distance from the place of exhibition, it is better to put the birds in large bags, having a hoop stitched in each to keep it open, with hay in the bottom of the bag, and then to sling the bags to a dogcart, and drive with them to the exhibition in the old cockers' style. I used always to do this when living near Newmarket in former years. Bags do not ruffle and disorder the feathers, especially the cocks' long tails, so much as hampers do. I believe it is legitimate to trim or cut the bristles on Game cocks' heads, but never the smallest feather. Some strains have more bristles than others have.—**NEWMARKET.**

(To be continued.)

MIDDLETON (NEAR MANCHESTER), POULTRY SHOW.—The prize list is liberal, with but few alterations in that of last year. A

new class has been made for French fowls, and birds shown in this class will also have the chance of a £5 cup; another alteration has been made in the Selling Class, which will make it a rather dangerous thing for those who enter valuable birds merely to take away the prize and buy in their own birds. We allude to the paragraph at the top of the class, which states that birds are not to be claimed before eleven o'clock on the morning of the show. If this plan were adopted at all shows, much of the trickery now practised in the Selling Class would be prevented. For Pigeons the prizes have advanced from 15s. and 7s. 6d. to 20s. and 10s., without a corresponding increase in the fee, which still remains at 2s. A new class has been made for Silver-Gray Rabbits.

JAPANESE BANTAMS.

By a letter published in last week's Journal, I find that Mr. J. N. Beasley complains that in the report of the Oundle Show a pen of his "Japanese Bantams" were described as a "cross between the Silkies and the Frizzled Bantams;" "that being imported from Japan last year, he believes them to be a pure breed; that they are not half the weight of either the Silkies or the Frizzled Bantams, and that he believes them to be the only specimens in England." The report itself simply runs thus: "We noticed in the Bantam class (here open alike to every variety of Bantams), birds of very novel character, being evidently a cross between the Japanese Bantam and the Silky fowl." It is evident, therefore, that no such statement exists as that of which Mr. Beasley complains, the birds that were exhibited at Oundle being beyond a question the cross of the Silky and Japanese, not the Frizzled Bantams.

The simple fact of their importation from Japan last year does not necessarily involve purity of descent, as not a few individuals proved to their personal loss and vexation at the time so many of the large cross-bred Asiatic fowls were imported as true Cochins, during the "mania" some years back, when anything under the name of a Cochins realised an almost fabulous price. Again, there are now two hatches of chickens bred within a few miles of my residence purposely of the cross named; they are identical both in plumage and general character with the pen exhibited at Oundle Show, and they will, I am told, be entered for competition in a little time when perfectly matured, under a name purposely manufactured by the breeder and owner, to give them due importance with the public. I am quite aware by personal experience that the product of the Frizzled fowl and the Silky is, as stated by Mr. Beasley, a full smooth-feathered fowl with a top-knot; but the product of the true Japanese and Silky fowl is another bird altogether, both as to form, plumage, and character.—**YOUR REPORTER.**

BRIGHOUSE AND RASTRICK POULTRY SHOW.

THOUGH not a large Show, this was a generally good and very attractive Exhibition, and the very numerous attendance of visitors made the Meeting a decided success. The arrangements were excel-

lent, and every possible provision for the comfort of both the visitors and poultry had been well considered. The Game classes were the worst in the Show, scarcely a single pen approaching perfection being entered. Grey Dorkings and Spanish fowls were well shown. Of *Cochins* and *Brahmas* the entries were very limited in number, but *Hamburghs* and *Puffs* were superior. The prize pen of *Rouen* ducklings was by far the best we have seen this season. There was only one entry of *Turkeys*—a very good pen, but of *Geese* there were several, all of which were good.

The *Pigeons* were numerous, and in general superior. In the extra "Variety" class for Pigeons two additional second prizes were given, as a well-deserved mark of general high quality; and several pens were favourably noticed by the Judges. A pen of English Turtle Doves in splendid feather, entered as *Australians*, were shown in this class.

GAME (Black Reds).—First, L. Binny, Manchester. Second, H. Beaman, Bowling, near Bradford. Commended, J. Hodgson, Bowling Old Lane, near Bradford.

GAME (Brown Reds).—First, R. Hemingway, Shelf, near Halifax. Second, J. S. Spector, Queensbury, near Halifax.

GAME (Any other variety).—First, J. Mason, Worcester. Second, J. P. Edwards, Flixby Park. Commended, J. Pickles, Banks, near Mytholmroyd.

SPANISH.—First and Cup for best pen of poultry exhibited, H. Ebdon, Bingley. Second, J. Thresh, Bradford.

DORKINGS.—First, W. H. King, Sandfield, Rochdale. Second and Commended, Mrs. F. S. Arkwright, Derby.

COCHINS.—First, H. Ebdon. Second, L. Binny.

BRAHMAS.—First, E. Leech. Second, H. Ebdon.

POLISH.—First, H. Ebdon. Second, J. S. Senior, Dewsbury.

HAMBURGHS (Golden or Silver-spangled).—First and Second, H. Ebdon.

HAMBURGHS (Golden or Silver-pencilled).—First and Commended, H. Ebdon. Second, W. Bentley, Hippurhime.

HAMBURGHS (Black).—First, H. Ebdon. Second, J. Robinson, Pailsworth, near Manchester.

GAME BANTAMS.—First and Second, W. F. Entwistle, Leeds. Highly Commended, J. S. Senior. Commended, L. Binny.

BANTAMS (Any variety).—First, T. C. Harris, n. Hull. Second, C. D. Riley, Ovenden, near Halifax. Highly Commended, Messrs. S. & R. Ashton, Mottram, Cheshire.

DUCKS.—First, J. White, Netherton, near Wakefield (Rouen). Second, T. C. Harrison, Hull. Highly Commended, E. Leech.

GEES.—First, J. White (Tomb-geese). Second, E. Leech. Highly Commended, J. Crossland, Huddersfield.

TURKEYS.—Prize, E. Leech.

ANY VARIETY.—Cup, H. Ebdon (Spanish). Highly Commended, J. S. Senior (Polish); H. Ebdon (Polish). Commended, H. Jackson, Huddersfield (Chinese Silver Pheasants).

PIGEONS.

FOUTERS (Any colour).—First, H. Yardley, Market Hall, Birmingham. Second, J. Hawley, Bingley.

CARRIERS (Any colour).—First, J. Hawley. Second, H. Yardley.

DRAGONS (Any colour).—First and Second, H. Yardley. Highly Commended, J. Crossland. Commended, Jesse Thompson, Market Place, Bingley.

TEMBLERS.—First and Second, J. Hawley. Highly Commended, Jesse Thompson; J. Fielding, jun., Rochdale. Commended, W. Lund, Shipley, near Bradford.

BALES (Any colour).—First, J. Hawley. Second, H. Yardley. Highly Commended, J. Crossland.

JACOBS (Any colour).—First, Jesse Thompson. Second, J. Crossland. Highly Commended, H. Yardley.

OWLS (Any colour).—First and Second, J. Fielding, jun.

TURBETS (Any colour).—First, J. Crossland. Second, Jesse Thompson. Commended, J. T. Sykes, The Market, Rochdale; J. Crossland; J. T. Lishman, Gillington, near Bradford.

COMMON.—First, W. Lund. Second, J. Hawley.

ANY OTHER VARIETY.—First, J. T. Lishman (Black Swallows). Second, H. Yardley (Satinettes). Extra Second, J. Hawley; H. Yardley (Ice Pigeons). Highly Commended, H. Jackson; Jesse Thompson (Isabells). Commended, T. Denton, Southwam.

Edward Hewitt, Esq., of Birmingham, and E. Hutton, Esq., of Pndsey, officiated as Judges.

PONTEFRACT POULTRY SHOW.

THE eleventh annual Exhibition of the Pontefract Agricultural Society was held on the 23rd inst., and being favoured with delightful weather, there was a large attendance. The Show, so far as poultry was concerned, was but indifferent, a first prize of 12s. 6d. not being sufficient to bring into competition first-class birds. Subjoined is the list of prizes:—

COCHINS.—First, S. Robson, Brotherton. Second, T. Turton, Ackworth.

BRAHMAS.—First, Lord Hawke, Womersley. Second, E. Ingle, Stubbs.

DORKINGS.—First, Lord Hawke, Second, Dr. Horsfall, Carleton Grange.

HAMBURGHS (Golden-spangled).—First, Master Kenworthy, Ackworth.

Second, C. Bradshaw, Pontefract.

HAMBURGHS (Golden-pencilled).—Prize, J. Charlesworth, Pontefract.

HAMBURGHS (Silver-pencilled).—First and Second, J. Wardie, Ackworth.

GAME (Black-breasted or other Reds).—First, J. Turton, Ackworth.

Second, J. Quire, Rothwell.

GAME BANTAMS.—First and Second, Lord Hawke.

BANTAMS (Any other variety).—First, T. Woodcock, Carleton. Second, J. Addy, Cutsyke.

ANY OTHER VARIETY.—First, J. Ashworth, Tanshelf. Second, C. Bradshaw.

CHICKENS.—First, C. Bradshaw. Second, H. Poskitt, Darlington.

ANY VARIETY.—Cock.—First, A. Hathorn, Smeathalls. Second, S. Robson.

DUCKS.—First, Master Kenworthy. Second, J. Wilkinson, Great Houghton.

DUCKS (Rouen).—First, Lord Hawke. Second, Dr. Horsfall.

GEES.—First, H. Poskitt. Second, Lord Hawke.

TURKEYS.—Prize, Lord Hawke.

GUINEA FOWLS.—First, Mrs. Lodge, Upton. Second, Lord Hawke.

PIGEONS.

FOUTERS.—First, S. Robson. Second, W. Fowler, Pontefract.

CARRIERS.—First, S. Robson. Second, J. Briggs, Ferrybridge.

TRUMPETERS.—First, S. Robson. Second, W. Fowler.

JACOBS.—First, W. Fowler. Second, Amery, Methley.

PANTAILS.—First, Master Earnshaw, Rawcliffe. Second, D. Longstaff, Monkroyd House.

RUNTS.—Prize, S. Robson.

BALES.—First, W. Fowler. Second, Master Simpson, Pontefract.

TEMBLERS.—First, J. Dele, Pontefract. Second, C. Gravel, Thorne.

NUNS.—First, W. Fowler. Second, Master Simpson.

ANY OTHER VARIETY.—First, J. Briggs. Second, W. Fowler.

The Judges were Mr. J. Wright, Snaith, and Mr. Coulson, of Park Hall.

BIDEFORD POULTRY SHOW.

At this Show, held at Westward Ho! on the 23rd inst., there were upwards of 170 entries of Poultry and Pigeons.

DORKINGS (Coloured).—First, L. Patton, Taunton. Second, Rev. A. C. Thynne, Penstow, Stratton, Cornwall. Third, J. Tarratt, Stratton. Highly Commended, L. Patton.

DORKINGS (White).—Prize, C. Hammett, Bideford.

SPANISH.—First, E. H. Ricketts, Banwell, Weston-super-Mare. Second, J. J. J. Bideford. Third, G. Piper, Exeter.

GAME (Black and Brown-breasted).—First and Third, Rev. G. S. Crawys. Second, W. A. Deane, Bideford.

COCHINS (Crim).—First, W. L. Trewin, Kilkhampton, Cornwall. Second, L. Patton. Third, Mrs. Baker, Barnstaple.

BRAHMAS.—First, Capt. J. O. W. Scott, Smytham, Torrington. Second, J. Tarratt. Third, Capt. Page, Hfrescombe.

HAMBURGHS (Gold-pencilled).—First, F. R. Harris, Cosgarne, Gwennap, near St. Day, Cornwall. Second, W. L. Trewin. Highly Commended, Messrs. Stevens Brothers, Bideford.

HAMBURGHS (Gold-spangled).—Prize, J. Oliver, Bideford.

HAMBURGHS (Silver-spangled).—First, W. Colwill, Bideford. Second, R. Grant, Bideford.

HAMBURGHS (Silver-pencilled).—Second, J. Turner, jun., Abbotsham.

POLANDS.—First and Second, W. L. Trewin.

EXTRA PRIZES.—First, W. Aldin, Venn Mills, East Putford. Second, H. Gloom, Bridgerule, near Holsworthy. Third, Rev. A. C. Thynne.

SINGLE COCK (Any pure breed).—First, L. Patton. Second, J. Tarratt.

Third, R. Andrews, Barnstaple. *Chickens*.—First, Rev. A. C. Thynne. Second, G. Walsh, Hulsdon, Dalton. Commended, Rev. A. C. Thynne.

BANTAMS.—First, Capt. J. O. W. Scott. Second, T. R. Higham, Mordard Bishop. Highly Commended, H. M. Bazeley, Bideford.

GUINEA FOWLS.—First, W. Piddham, Bideford. Second, W. M. Lancaster, Tholborough.

DUCKS (Aylesbury).—First, J. Heal, Parkham. Second, Mrs. Baker.

DUCKS (Any other sort).—First, L. Patton. Second, R. Petherbridge, Ham, Alverdiscott.

GEES.—First, L. Patton. Second, J. Heal.

TURKEYS.—First, L. Patton. Second, Capt. Willett, Petticombe.

PIGEONS.

CARRIERS (Black).—Prize, N. L. Greet.

BALES.—Prize, T. Tossell, Barnstaple.

PANTAILS (White).—Prize, N. L. Greet.

JACOBS (Red).—Prize, N. L. Greet.

TRUMPETERS.—Prize, J. S. Heath, Barnstaple.

TEMBLERS.—Prize, E. A. Bazeley, Bideford.

NUNS.—Prize, J. S. Heath.

COMMON (White).—Prize, J. Heal, Parkham.

The Judges were the Rev. G. F. Hodson, and H. Leworthy, Esq.

ANTWERPS VERSUS DRAGONS.

HAVING been a breeder of Antwerps for upwards of twenty years, I have read with interest the articles on the above subject inserted in your Journal, and should have joined the controversy sooner but for a severe illness. I have during my time won and lost a great many flying matches. I have tested Antwerps against Dragons, the latter in every instance failing to return so quickly as the Antwerps, and in sending Dragons a long distance I invariably lost them.

I have personally bought Pigeons in Belgium from the best flying strains. I fancied the Dun Red-chequered and the Blue-chequered, which, if well bred, will be found good homing birds. I have tested the above colours, and always found the Red-chequered and the Dun to come the longest distance. I therefore kept Pigeons of the colour which homed the best. I find the Red-chequered Antwerps breed true to colour. I may say, without being guilty of egotism, that I have one of the best cotes of Red-chequered Antwerps in England, that breed well to colour, and I always dispose of the young at good prices, which is a good proof of their excellence. I dare say many of your subscribers can bear out this statement from the fact that they are now waiting until I can supply them. It is, therefore, my firm opinion that Antwerps are one of the most valuable breeds a fancier can keep. I have kept all kinds of Pigeons, but none which paid me so well as Antwerps, and if I had not

them for feeders I should have lost many a valuable pair of another kind.

If "WILTSHIRE RECTOR" could spend a short time in Yorkshire, he would find that Pigeon-flying is a favourite pastime with a portion of the working classes, both for profit and amusement; Antwerps being their favourite birds, and the majority being Red-chequered, Dun, and Blue-chequered.

I need scarcely say that the merits of the different breeds have been well tested, and always in favour of the Antwerps. They are a grand style of bird, breed well to colour, and are faithful to their homes. I am of opinion that, instead of leaving them out as a class, as suggested by "WILTSHIRE RECTOR," there should be more classes made for them. This would be to the advantage of exhibitors and the Committees of the different Pigeon shows, as I am well persuaded the classes would fill as well as those for Game Bantams.—JOHN CROSSLAND, JUN., Wakefield.

MANAGEMENT OF PIGEONS IN HEALTH AND DISEASE.

We are obliged at present in England to keep our "fancy pets" in confinement, contrary to what their welfare requires, though future generations will see the valuable kinds at large in the same way as I have seen flocks of the most valuable fancy Pigeons which we possess flown just the same as the common Tumblers are in England, and to this I shall refer in due course.

No Pigeon can exist long in confinement without the greatest possible attention to cleanliness and diet. I have adopted the English saying, "Prevention is better than cure." With the exception of what I may term a general epidemic which happened the first year of my English career, nearly seven years ago, my pens have been free from all diseases; and I have often met with valuable birds unhealthy, which I bought for a trifle, and by my usual treatment in many cases have been able to restore them.

I consider that confined Pigeons require top ventilation and a dry floor; but the most important consideration of all is their diet. I never feed my birds with the same grain for more than six months in succession, and I feed them very sparingly indeed on white or grey peas, Indian corn, vetches, buckwheat, and barley. I feed thus—six months with white peas and vetches, six months with grey peas and Indian corn, then with white peas and buckwheat, and so on. The proportions I prefer are two of peas to one of any of the other kinds of food. I never give Pigeons Indian corn in winter, and never buckwheat in summer. I never give them any salt, nor any water to bathe in, though there is an aviary attached to their loft in which they flutter and get sprinkled when there is rain. I keep their floor always covered with gravelly sand about half an inch deep, and give them daily in a pan some crushed old mortar.

I feed them, when breeding, twice a-day, and when not breeding but once, and give them only what I consider enough—that is, I stop when I see they can do with a handful more, so you can never see a grain lie on the floor; and this I suppose is the reason that I never saw a mouse in my pen yet.

When they have done breeding I take away the straw and turn the pens upside down. This causes the birds to take to the perches, which should be plentiful and at different elevations, so as to enable the Pigeons to keep in motion. I never divide the pairs, as I consider it quite unnecessary.

I find that nearly every disease commences with bad digestion, and this is occasioned by overfeeding; and the proof is, that diseases are prevalent in winter when the birds are almost in a dormant condition through inaction and bad weather, and then overfeeding is equivalent to killing. As soon as I perceive a bird with the food in the crop from the preceding day, which makes it look rather dull, I shut it up at feeding time, so that it will have none till all the swallowed food has gone. I give it very little water, and to assist it, give it a pinch of carbonate of soda. In some cases digestion is restored in twenty-four hours, in others it may take two and even three days. In no case do I let such a bird have more than half the usual quantity the first day I allow it to feed, and I supply it with grain differently from that previously given.

I find roup and canker the prevailing diseases in England, and I do not consider either contagious. Both may originate in a pen through the bad constitution of the birds. I have twice admitted into my pen birds with roup, and not only

were none of my birds affected, but one of the birds became well.

I have tried many remedies for both diseases, and I find that some Pigeons are recovered by one remedy, some by another, and others never; some will get rid of the roup by a dose or two of charcoal powder, some by a dose of carbonate of soda or a pinch of alum, and some by a dose of flowers of sulphur. I am now trying some pills which the inventor forwarded me, and which he states will cure any Pigeon or fowl from the worst case of roup, and I will report the result.

The birds that never get well are those in which the disease is hereditary. I know a friend nearly all whose birds bred from a certain strain have the roup; I tried the same breed, and I found that though all my birds were quite healthy, the young of this breed had the roup when only a week old, and they died of it when about six weeks old.

The canker is, in my opinion, easier to cure. If in the mouth, I apply a strong solution of alum with a feather twice a-day. The next day I find the white substance getting loose; I remove it with a feather, and again apply the solution for the last time. This will do if you discover the disease in time. Some fanciers never think of examining their birds, and only discover the disease when all the mouth and throat down to the crop is a mass of inflammation. Then it is too late for any remedy. If on any part of the beak, peel the canker off, wash the place well, and apply finely-powdered alum and charcoal. In both cases feed the birds very sparingly, and only with bread crumbs, and pull out all or half the feathers of the tail.

I keep for water an earthen fountain of a size sufficient to contain water enough only for one day in winter, so that I am compelled to fill it daily, and twice a-day in summer. I keep in it a quantity of large iron nails, which help to preserve cleanliness inside, they being well shaken every time it is filled, and at the same time they are most beneficial by making the water chalybeate.

There is in no small degree another plague prevailing on the Continent and also in England—namely, a kind of abscess formed in the joints of the wings, which terminates in death, or cripples the bird for life. I have tried for this every remedy suggested, and some very cruel ones, and at last perfect success has crowned my efforts. As soon as I discover a bird beginning to fly awkwardly, I examine the joints of both wings, and if I perceive any swelling, which is always the beginning of the disease, I pluck out the ten long light feathers of the wing affected, and by the time they grow again the birds will be perfectly free from disease, and will fly as usual. If the swelling is very bad I pluck all the long feathers of the wing, examine the swelling, and see if it is hard, and if not, but like a bubble, it contains matter about the colour and thickness of liquid glue. In this case I treat the bird as before, but cut the skin of the bubble, and press all the fluid out. Many consider plucking cruel, and I am of the same opinion; but in this case it is the only remedy, and the most certain of success—in fact, it will never fail.

Pigeons at liberty can do with less attention. I do not supply them with mortar, nor clean them so often, with the exception of the nests containing young ones. They may be fed more liberally, but they must be supplied daily with fresh water. During summer I supply all my birds with green food every other day, and soaked bread. I give them a lettuce, lay a brick on its root, and they soon devour it.

In using fresh birds to fly, I am opposed to plucking the wing, as I do not like to see them crippled for nearly a month. I adopt, therefore, the method pursued on the Continent, which, in my opinion, is the safest. I thread a needle and pass it through the two first quills, about an inch from the root, then twist it round nine of the flight feathers and tie it. This prevents the bird flying, the tying cannot become undone, and when in the pen the wing so tied is in a natural position. In this state I keep the bird till it takes to a perch in winter, or till it pairs in summer; and when I intend to let it out I free some of the flight feathers from the thread, so as to give it the chance to get on the building when about feeding time, and after it comes down once or twice then I cut and pull the thread off, and let the bird have full liberty. The best time for breaking birds is when they are sitting, and the worst when they are feeding their young. I have two birds which I broke a distance of only one mile; these go home even now, the third year, every time they have young. They do not go at all during the winter, but they commence their visits about a week after the hatch. Though I supply them with abundance yet

they will go, sometimes three or four times a-day, walk about with their former companions, but never going into the old pen, and then return.—A FOREIGNER.

QUERIES AND ANSWERS ABOUT CANARIES.

1. I HAD a pair of Canaries together last month, but for certain reasons I took away the cock, on say Monday morning, and put a new mate in the side compartment of the breeding cage. The next morning I withdrew a wire, and he passed through to the hen, who received him very spitefully, but he soon thrashed her into submission, and in two or three days she built her nest, and the morning following laid her first egg. She laid four in all, and hatched out three young ones. Two died, and the survivor so closely resembles the first mate that was removed, that I want to know if it is possible he could be its father.

[Quite possible. The fact of her resisting the overtures of the second cock seems to favour this conclusion.]

2. A hen lays soft eggs; she is fed as usual on rape and canary seeds. Please state cause and cure.

[The absence of a supply of chalk or lime. Give her a piece of old lime rubbish to nibble at, and strew some at the bottom of the cage.]

3. A young Canary does not put its hind claws round the perch, but they stick out and up in front. Is this a deformity? What could cause it, and what cure it?

[It is a natural deformity; a freak of Nature, and incurable.]

4. What are the exact measurements of the nest box?

[Mr. Blakston's are 3 inches square inside, and 1½ inch deep.]

5. What is the proper food for young birds? and when do they begin to feed themselves on hard food?

[Crushed hemp seed and hard boiled egg mixed, or take a slice of stale bread, soak in cold water, and squeeze nearly dry, which substitute for the hemp seed. They will help themselves to this as soon as they leave the nest, and will crack seed in from a fortnight to three weeks afterwards.]

6. Are scales on a cock bird's hind claws a sign of his being too old for breeding purposes?—C. A. J.

[No.]

GAS STOVE IN CANARY AVIARY.

I do not see that gas, when properly managed, should necessarily be injurious in a Canary room. At the same time, I am quite ready to admit that there is a risk of the "mischief it canseas when it goes out in the night;" but that risk can be reduced to nothing if the apparatus be properly erected, with due regard to draughts, &c. My bird room is at the top of the house; in fact, it is the attic or garret, which I think Walker defines to be the uppermost room in the house, and my chimney is conveyed into the cockloft, which he defines to be the room above the garret. The outlet is immediately under the roof, and sometimes in very gusty weather I wish it were not quite so gusty; and I believe I have been known to get out of bed at strange hours of the night, in a costume more airy than elegant, and creep up to my bird room just to see if it was all right. I also believe that on one occasion, a very squally night, I did turn the gas off altogether for fear of its going wrong; but as a rule, I never found the slightest ill effects result from it, and certainly never the least effluvia. I keep an open vessel of water on the stove, the philosophy of which I will not enter into, because I do not quite understand it, but I fancy it rectifies the dryness of the atmosphere. I do not advocate gas *versus* an open fireplace, but I have no fireplace.

My birds have been very healthy all the season, and I have been fortunate enough to breed a few which I hope will be heard of at the "British National," at Manchester, in which I am happy to find Mr. Ashten is taking an active part.—W. A. BLAKSTON.

THE BARON VON BERLEPSCH ON FOUL BROOD.

(Continued from page 53.)

CONTAGIOUS FOUL BROOD.

In some districts this form of foul brood never appears to occur. Spitzner, in Upper Lusatia; Busch, of Arnstadt; Kaden, of Mayence; and Kleine, in Hanover, state that they have never witnessed this disease in their apiaries or in their re-

spective neighbourhoods. In Thuringia it was entirely unknown until 1858, and my old instructor in bee-culture, Jacob Schulze, had not met with it either in his own colonies or in any others during an extensive practice of more than fifty years.

This, the most formidable of all the diseases to which bees are subject, presents itself in various aspects, being sometimes more and sometimes less destructive; at times running its course rapidly, at others lingering through a protracted period. Sometimes it is of so manageable a character as to be easily removed; and not unfrequently it spontaneously disappears. It is impossible to specify these various grades minutely, though three of them may readily be distinguished:—

First Grade.—We find at the commencement of the disease in one or more combs from ten to twenty sealed cells, more or less, with collapsed covers or caps. If closely examined these caps will be found perforated with a small round hole. When the cap is removed we find the full-grown larva stretched out at length with its head towards the septum of the comb, and its body discoloured of a brownish hue. The larva usually dies before the head enlarges, evidently soon after the cell is sealed and before assuming the pupa state. Unsealed putrid larvae are seldom seen, and putrid pupae (the form approximating to the winged state of the insect), still more seldom. When crushed we find the contents consist of a viscous slimy mass. The specific form of the larva speedily becomes no longer recognisable, decomposing into a clammy glutinous substance, which in the course of ten or twelve days dries up into a dark brown scale or crust approaching to black, adhering to the under side of the cell. This crust the bees are unable to remove, but while they remain sufficiently numerous to work with some spirit they will demolish the entire cell and rebuild it with new material; but when the disease has made greater progress they abandon all efforts to remove the obnoxious matter and cease building altogether, as they are not disposed to build combs unless the stock be strong and pasturage abundant. When the disease has become very virulent and overpowering they almost cease flying, and content themselves with endeavouring to expel the vitiated air from the hive. They are apt also to swarm out and desert their hive altogether, either in spring or autumn, if tempted thereto by the occurrence of a fine genial day.

If minute brown or black scales or granules which produce a slimy foetid substance when rubbed between the fingers are found on the floor-board, the existence of foul brood in the hive may be considered certain. When once commenced it usually spreads rapidly, and frequently from a half to three-quarters of the brood becomes affected and dies. At this stage of the disease its existence is proclaimed by the offensive smell, resembling that of putrid meat, which is diffused from the mouth of the hive in place of the agreeable scent usually perceptible there, the bees ventilating the while with unwonted vigour.

It is a very singular fact that all the brood does not perish. Even in hives in which foul brood exists in its most malignant and noisome form, some portion of the brood, however small, will always be found in a healthy state and attaining a perfect development. Considering the great contagiousness of the disease, this is in truth a great mystery. The malady will not, however, be long confined to the hive in which it originated, but will gradually spread to other hives, so that in the course of a year two all the stocks in the apiary or even in the neighbourhood will be more or less affected. Colonies infected with this kind of foul brood in its malignant form never survive long. The malady progresses rapidly, and not only does the brood first affected die, but the very brood-cells are converted into nurseries of disease, so that in a short time the queen can find none in which to lay her eggs. Thus the colony becomes rapidly depopulated, and generally perishes during the first year, or certainly in the second.

Second Grade.—This grade differs from the first only in this, that first the malady does not spread so rapidly; secondly, that it rarely becomes so intense; and thirdly, that it usually disappears spontaneously. I have myself had frequent opportunities of observing this. For instance, in the spring of 1859 many stocks belonging to Mr. Umbreit, of Wolfis, in the duchy of Gotha, were strongly infected with foul brood; yet in 1862 the disease had entirely disappeared, though no means had been adopted for its removal or cure. Mr. Klein, of Tambuchshof, has experienced a similar case as related in the "Bee Journal" for 1864. The disease when occurring in this grade is always curable if treated with ordinary care and attention, and is even in many cases easily removed, as I have repeatedly

had occasion to observe. In 1860, one colony in Mr. Kalb's apiary at Gotha was infected, and in the summer of 1865 three more became diseased, and in each of these four cases a cure was effected by simply removing the combs containing the diseased brood. Probably the disease would have disappeared spontaneously. But such expectation should not induce the bee-keeper to become careless or inattentive, for not unfrequently instead of disappearing this grade of the disease will (generally during the second year), degenerate into confirmed virulent and contagious foul brood, such as might appropriately be styled *brood pestilence*, and which so far as we now know must be pronounced utterly incurable.

Third Grade.—Dzierzon says:—"Where this form of foul brood exists the greater portion of the unsealed larvæ perishes. That portion which is sufficiently advanced to be capped or sealed over usually remains healthy and becomes perfectly developed. A sealed and yet putrid brood cell is here a rarity. The matter into which the dead larva decomposes is more paste-like and less tough than that resulting from the malignant form. It dries into a scale at the base of the cell, which is easily detached, and so long as the colony remains strong it will be removed in the shape of dark brown scales, dropped on the floor-board and afterwards carried out of the hive. When such dark brown scales are found on the floor-board they may be regarded as proof positive that foul brood, even though it be yet in its milder form, exists in the hive. Colonies thus infected not unfrequently sustain themselves during two seasons, because only a portion of the brood dies, and that being in open cells is easily removed by the workers. The cells are then again furnished with eggs by the queen, a portion of the larvæ from which will remain healthy and mature perfectly, thus keeping up the strength of the colony tolerably well for a protracted term. At times, too, the disease will disappear again. Colonies which in the summer diffused a strong putrid smell have been found perfectly pure and healthy in the autumn." I have myself had no opportunity of witnessing this stage of foul brood.—A. VON BEULEPSCH.

(To be continued.)

SILKWORM-REARING IN ENGLAND.—No. 14.

SILKWORM DISEASES.

ATROPHY, or wasting consumption, is the scourge of silkworms at the present day, and is but little understood. This malady is more confirmed after the fourth crisis of the worms, when great part of the trouble and expense of rearing them is over, which makes the loss the more vexing. I have noticed particularly that the insects wake from the fourth sleep, presenting a dirty nankeen colour, flabby, and weak. They look shrivelled, fall off in appetite instead of growing, diminish in size, discharging a fœtid humour over the leaves. The existence of this complaint is to be apprehended when there is great inequality of time in hatching the worms, not all coming out of the eggs under a week or more, instead of two or three days. It is observed during the successive slow development of the insects, and their not eating vigorously, as those do in a healthy state. It is discernible in their being less active than they should be, and by their withdrawing more or less from their food. Mortality is frequent among such worms. Their beds become humid, although the renovation of the air has not been neglected, and the proper temperature maintained. Black blotches or spots appear on the insects' bodies, feet, and horn over their tail ends. The moths seized with this malady indicate it by great inactivity, and do not discharge any reddish humour like the healthy ones, but blackish. Black drops of fluid often appear on their wings, which are dirty-coloured instead of a creamy white, often small and shrivelled, whereas they should be of a goodly size indicative of perfection. The moths sometimes present a reddish or blackish swelled body. These have no desire to pair, and if they lay, the eggs are few and of no use. Such moths should be immediately removed when discovered. Care should be taken that only healthy ones are used in the production of eggs.

THE REDS usually shows itself after hatching, or some time during the first age of the worms. Naturally the skin of silkworms is white, and their dark appearance when hatched is caused by the innumerable hairs covering their bodies. Worms affected with the reds show more or less redness. Those which do not succumb, little by little acquire a dirty darkish white, and become languid, whereas healthy worms are vigorous and active, showing the same by the manner they attack their food

and consume it. When this complaint progresses consumption generally follows, although sometimes slowly. Often the insects arrive at spinning, although imperfectly. Several authors affirm that it is produced by hatching the eggs at a high and sudden temperature. It is my opinion that it is more likely to arise from bad preservation of the eggs than from a high temperature, or from bad ventilation along with heat. The silkworms do very well at 65° or 70°, and are only a few days longer coming to maturity, therefore why endeavour to force them on by undue means, endangering their lives by disease?

THE JAUNDICE.—Another mortal complaint, generally manifesting itself at the second age of the worms, and sometimes later. Of the insects having this disease the heads swell or the skins wrinkle. They look shining, as though varnished, having more or less a yellow appearance. They crawl slowly, and at last perish. Count Pandolfi attributes this disease to humidity, too much heat, fermentation of beds, vitiated air, &c. Doubtless, the noxious gas from fermenting beds entering the worms' breathing holes, and mixing in the fluids, causes a general tension of the body, accompanied by death. This complaint is of an epidemic nature, and as soon as any worms are discovered with it they should be removed from the healthy ones, and any dying of it should be buried.

SUFFOCATION.—There are no noticeable symptoms in this malady, for the worms die almost in their natural state without indicating any altered appearance. Their form and colour are preserved, but they soon putrefy after death. In Italy I have particularly noticed this disease. It occurs during hot close weather. Sometimes it occurs at the mount, and the insects having spun feebly imperfect cones, die therein without changing to the chrysalis state, spoiling the little silk produced with their decomposed bodies. Other worms die immediately they are mounted, and are often to be seen hanging, head downwards, from the spinning materials. To prevent the effects of this malady, renovation of the air in the room, and keeping the worms as much as possible in a state of nature, having plenty of room to crawl about, and never neglecting to maintain cleanliness, are the means to be adopted.

LUCIDITY OR TRANSPARENCY is a complaint appearing after the fourth sleep, but the causes of it are not altogether clear. I find Signor Nisten believes it proceeds from deficiency of leaves, and Signor Moretti, a good authority, that it is caused by feeding the worms with those that are too hard; and infected air, and sudden changes of temperature may produce it. Worms having this complaint become somewhat transparent, presenting a rose colour, and having a clear discharge from their mouths. They contract or shorten, and then die, their bodies becoming black and corrupt. Sometimes they mount, but fall without forming their cocoons. Some walk about wasting their silk, but if taken and placed in a basket containing small branches, shavings, straw, &c., will go to work and spin.

THE SPOT.—This is a terrible disease, more general after the fourth sleep of the worms, and before or after spinning. It is indicated by black, yellow, livid, or rose-coloured spots usually appearing on the head, and afterwards on other parts. It is not uncommon to see an eruption of black spots over the entire bodies of the insects. It is attested by Signor Pitro, that he has seen worms with this malady covered with numbers of the most minute lice, generated from neglect of cleanliness. I have never noticed the lice, but they may occasion the black spots by biting, although no suspicion of their existence be entertained. When the disease makes progress, the surface of the worms' bodies, especially the anterior parts, becomes of a cinnamon colour. The insects die, but do not become corrupt. They harden, so as to resist being cut, and remain in this state until acted on by atmospheric humidity.

THE DROPSY.—This malady generally appears after the third sleep. The worms gradually swell, appearing as though they would burst their skins. From the great tension, the skin cracks, and a whitish yellow humour comes forth, which wets the leaves, and death puts an end to their misery, when they immediately putrefy. Some persons assert that this disease is caused by too tender leaves, but I do not think this at all feasible, unless, indeed, they be bad leaves, or what I would term "watery," from having grown on stagnant and wet soil.

DIARRHŒA.—Silkworms having this malady discharge an almost liquid greenish matter, which dabs over and wets the leaves, producing corruption of the air in which they live. It is said to be produced from feeding the worms with leaves covered with honeydew; also in conjunction with this the fruit of the mulberry. The suppression of respiration, producing indigestion, also causes it, and then the cure is to raise the

temperature in order to re-establish respiration, giving the worms small and frequent meals of good leaves rather dry, or which have been gathered a day or so. This cure, however, is not always effectual; indeed, I am a small believer in the cure of silkworm diseases when established.

THE MUMMY DISEASE, so called because the worms dying of it become black and mummy-like inside their cocoons. It is not discoverable what morbid action precedes, for worms apparently in good health mount and spin their cocoons, but afterwards are found dead, either in the worm or chrysalis state, black and solid, although there is a modification of this disease, and the worms instead of becoming solid remain soft, of a soapy nature, and acquire a foetid smell. The cocoons remaining in this state propagate a quantity of insects, which eat out, spoiling the silk for reeling.

THE CALCINE MALADY.—Writers generally do not agree in respect to this disease, for while some affirm it to be identical with the mummy complaint, only differing by reason of some atmospheric or chemical combination, producing calcination; others teach that it is totally different. Be this as it may, the symptoms are certainly different; nevertheless, I am inclined to think the causes of it may be similar, as, indeed, I do in regard to most of the complaints of silkworms. Certain atmospheric changes may produce diseases which man could not always prevent; but my opinion is that the majority of cases arise from neglect to keep the worms clean, by frequently removing their refuse, excrements, &c., which, left to accumulate, ferment and produce gases infecting the air of the room, which too often is not kept properly renovated with fresh from without. Often worms are allowed to be too thick on the stages, with the idea of economy of space. Most of these errors produce an obstruction of the respiration of the insects. I myself incline to think with Moretti, that this disease is contagious, and communicated by the lime-like powder covering the bodies of the worms dying of it. Sometimes the calcine disease does not show itself until the worms have completed the cocoon. The danger from it, then, is over, the only defect being that such cocoons are lighter and of no use for breeding purposes; the quality of the silk is just as good. Such cones being much lighter are worth more money, for the insects drying up quite hard lose in weight, producing in proportion more silk.—**LEONARD HARMAN, JUN., Old Catton, Norwich.**

STEWED APRICOTS.

As some of your readers may be at a loss to employ their abundance of apricots agreeably, I beg to be allowed to tell them how they may be made into a wholesome and pleasant dish. I daresay the recipe is very old, and was perhaps known, if not to Adam, at least to our mother Eve.

To employ the phraseology of the *cuisine à la Glasse*: take your apricots, cut them in halves, take out the stones, blanch the kernels, break them, and mix them with the fruit, which should be placed in a pie or other dish, and powdered loaf sugar thickly strewed over them. The dish should be closely covered and suffered to remain in the oven about an hour, depending upon how hot it is. They will come out floating in their transparent juice, and should be served cold either among the sweets or with the dessert. They are wholesome and perfectly delicious.—**MR. GLASSE.**

OUR LETTER BOX.

DORKINGS (H. Boren).—We hardly understand you when you ask if a Grey Dorking cock will do to put with your half-bred hens. Do you mean a Silver-Grey? We only know the Grey as distinguished from the White. Either in our opinion will do, because just as you have the speckled breast in the Grey, so you have the black one in the Silver-Grey. Both are met with in the coloured Dorking cock. The Silver-Grey Dorking pullet has points in common with a good pencilled Brahma hen; for instance, the striped hackle and the grey body. The resemblance ceases there. We believe the only two decent crosses are Brahma and Game, the latter the better. We conclude by advising you to use the Silver-Grey cock if you have one of that kind.

CHICKENS HATCHED LATE IN APRIL (F. C.).—They will be young to exhibit, but we have seen good winners that were no older. That they should be thin is natural, as much of the food they consume goes into growth. You are feeding very badly when you give brewers' grains. They are too stimulating, and induce a fevered and unwholesome state of body. They cause the feathers to grow under the skin. Instead of picking these out draw the end of the feather through the skin with a needle; it will grow well afterwards. A few days' confinement often add considerably to the weight of Brahma or Cockerhens. Feed them frequently thus, recollecting you have an especial object in view:—Give in the morning ground oats or oatmeal mixed with milk, afterwards give them the scraps from the breakfast table, pieces of cooked meat, and crumbs. We have little faith in thrush when we want to push chickens along, and none in porridge unless we know its component parts. Our

food would be chopped cooked meat, kitchen scraps, good barley, ground oats or oatmeal mixed with milk, and stale crusts steeped in strong broth. For a change give every other day a handful of Indian corn. If on examination you find them put on weight, and we think you will, continue them at liberty. If they do not, put them in comparative confinement, not in a very small place, but in one where they will not have the opportunity of gnawing all the flesh off their bones. It is difficult to explain some judgments, but, as a rule, the oldest chickens get the prize, and justly—they are the earliest, and that is a great point. The deformity you mention is not important, and would probably never be noticed.

WHITE-CRESTED BLACK POLAND COCK (Z.).—He should be straight-backed, full-breasted, proud and upright in his carriage, and have dark legs. Unlike many of his brethren, he should have full gills. His plumage should be scrupulously black, without any mixture of any other colour. The topknot should be entirely white, composed of long hackles or saddle-shaped feathers, growing all over the head and falling outwards. This topknot should be large, and in good specimens there should be no hollow in the middle of it.

DARK BRAHMA POOTRA COCKESEL (C. L.).—He is hardly in formed plumage at sixteen weeks old; we have a weakness for the white hackle and saddle, but seldom meet with them. They are generally more or less striped. In a very choice specimen we should ask for the white hackle and saddle, spotted breast, black thighs, black and white wings, black tail, and yellow legs. We should ask in vain. Perfect Brahmas are as scarce as perfect men. We should not then object to the few white feathers.—**B.**

PROLIFIC CANARY (T. C. Hose).—"A Norwich Canary producing fifteen young ones is unusual, inasmuch as it is far above the average, but it is not extraordinary. Such instances of fertility and good nursing are by no means rare. I have several in my memory at this moment. If the whole fifteen, however, are all 'well marked,' that is unusual—very unusual. Bear in mind there are marked birds, and marked birds! If the hen be in health and apparently not distressed, let her try once more, and give the Canary world the history of the result. I see no reason why she should die in moulting, but it is probable that before she succeeds in bringing up another nestful she might commence moulting, in which case she would refuse to feed.—**W. A. BLACKTON.**"

POULTRY—BEEES (Overdeseh).—Brahma-Pootra pullets and a Dark Dorking would be most useful. You can have "The Poultry Book" free by post from our office if you enclose seven postage stamps with your address. So you can have "Bee-Keeping," a new edition of which is in the press, if you enclose five postage stamps. Nutt's collateral hive is one of the most objectionable. You will find full particulars in the book we have named.

DRIVING BEES (B. R. Kidwell).—The best modes of driving and uniting bees have been repeatedly described in our pages. We may particularly refer to an exhaustive series of articles on "Utilising and Uniting Condemned Bees" from the pen of Mr. Woodbury, which commenced in January and was concluded in April of the present year. As, however, you may not be able readily to obtain access to them, we extract the following from the "Bee-keeper's Calendar" of "The Gardener's Almanac" for 1888. "Driving should always be performed in the daytime, and the beginner had better wear a bee-dress and a pair of stout gloves; but the only absolutely essential implements are a couple of empty hives (one of which should be of the same diameter as the hive to be operated upon), an empty bucket, a long piece of stout linen (a roller towel with the seam ripped answers admirably), a sufficient length of small cord or large twine, and a lighted famigator or cigar, or a smouldering roll of linen rag. The bucket having been placed so as to stand firmly on the ground, about a yard from the stock to be operated upon, a little smoke should be blown into the entrance; as soon as the bees retire, the hive must be slightly raised from its floor-board, and a few whiffs of smoke blown under it all round. Then raise the hive altogether from its place, and steadily invert it on the bucket, covering it immediately with an empty hive of the same diameter, and closing the junction between the two by first winding the cloth round them, and then securing it by four turns of string, taking two turns round the upper and two round the lower hive. The bees within being thus safely enclosed, the second empty hive may be placed on the floor-board, to amuse those returning from the fields, and the united hives, with the bucket, conveyed to a shady spot at a little distance. Here it will be found very convenient to have a couple of kitchen chairs, upon one of which the hives and bucket may be placed, whilst the operator seats himself on the other; and then a smart and regular rapping of the full hive with the palms of the hands should take place. In about ten minutes, the great majority of the bees will generally be so alarmed as to quit their own hive and take refuge in the empty one—a fact which may be ascertained by listening to the noise made by them in ascending. The cloth may now be removed, and the hives sufficiently separated by raising one side of the upper one to admit of inspecting the interior. If nearly all the bees have ascended into the hitherto empty hive, the operation may be deemed complete, the remaining bees being brushed out with a feather. If, on the other hand, many bees still adhere to their original domicile, or if, as is sometimes the case, only a few stragglers are found to have quitted it, one side of the top hive should be up-raised a few inches, and an iron skewer having been stuck into the edge of the lower hive to prevent slipping, kept steadily in that position, with the left hand, whilst the under hive is rapped smartly with the right. When all, or nearly all, have quitted, the upper hive should take the place of the decay one upon the stand; and when stragglers have collected, the whole may, in the dusk of the evening, be united to another colony, by being knocked out on a cloth spread on the ground, and having the inhabited hive stood over it, supported on a couple of thick sticks, laid on the cloth to avoid crushing the bees. Early the next morning the now doubled hive should be placed on its own stand, and all will then generally fall to work in peace and with renewed vigour.

DRIVING BEES (C. R. Norwich).—The bees in your three hives can readily be expelled by driving, and advantageously added to other stocks in the manner described above; see also page 59 of "Bee-keeping for the Many." No one who has once witnessed the effects of chloroform on bees would be likely to repeat the operation.

WINE FINING (J. R. M.).—The recipe will suffice for sixty gallons. Of course, put back the four or five gallons. The time clapsing before the fining is effected varies with the temperature and other circumstances. You must draw out some of the wine from time to time until you find it is clear.

WEEKLY CALENDAR.

From observations taken near London during the last forty-one years, the average day temperature of the week is 74.6°; and its night temperature 50.5°. The greatest heat was 93°, on the 10th, 1842; and the lowest cold 33°, on the 11th, 1861. The greatest fall of rain was 1.08 inch.

RIPENING THE WOOD OF FRUIT TREES.

ACCORDING to the maxims of some gardeners of former days it was time enough to think of this when the leaves first commenced decaying, and consequently we find them urgently recommending the use of the besom pretty freely in October. Brushing off the leaves to assist in ripening the wood is an old practice now tolerably obsolete, but, notwithstanding its repudiation, it may be attended with some advantages, for perhaps a broken crutch is better than no crutch at all. I will not go so far as to assert that sweeping off a few decaying leaves early in autumn may not have the effect of rendering the buds in the axils of those leaves still remaining more perfect, but this only proves a previous neglect; for if light and heat acting on the fully exposed surfaces of the leaves of tender trees be essential to the proper organisation of the bud—and who shall dispute it?—why should an improper amount of the annual spray be reserved during the thinning or disbudding season only to cause mutual injury in the first place, and in the second to render necessary a more troublesome course of winter pruning than there is any real need for? What a controversy has been carried on in the pages of horticultural periodicals about the covering or non-covering of fruit trees in order to protect the blossom, and to facilitate the setting of the fruit! Some say that covering does not always insure a crop. I wonder how many yards of canvas it would take to insure a crop of fruit on a Marie Louise Pear tree, or, indeed, on any other tree, the embryo buds of which had been smothered in the previous summer with watery spray?

Trees are at many places suffered to hang in a wild state from the walls until the approach of September, and then, for the first time perhaps, the future blossom buds have full daylight for about three weeks, and are allowed to enjoy that degree of light which a darkening autumn affords. Then, in the spring, a great to-do is made about covering; it is done, yet the blossoms perish, and the unhappy cultivator comes forth like a lion with a fresh argument against the utility of covering or protection.

What would be thought of a writer who recommended Strawberry-forcers not to get their runners too soon for forcing purposes, but to delay until the end of August, and then to select them from gross and overcrowded plants, with leafstalks dangling a foot in length? I wonder whether the best of winter protection, or the most complete and expensive pit ever invented, could insure a crop of Strawberries on such plants? I think this is sufficiently illustrative to all who will grapple with the real bearing of the question. Those who will persist in adhering to a set of notions which have no real foundation either in science or practice, must still be content to endure disappointment.

If, then, protective coverings are not to be shorn of their great utility, let the extra labour and attention requisite for tender fruits be bestowed in summer, instead of practising so much elaborate winter pruning. Both common sense and economy will be found in favour of this view.

Surely a man's day's work is more productive in July than in January. Let those, then, who deem it expedient to follow the advice oft-repeated in this Journal carefully examine all their trained trees immediately. There is still time on all good aspects to obtain tolerably firm wood by a careful and immediate removal of all waste spray.

To give my observations a definite character, in which shape they are chiefly useful to amateurs and young beginners, I will point at once to some trees, with their probable condition.

The Peach and Nectarine about this period, and a little sooner in the case of Peach trees which have grown at only a reasonable rate during the early part of summer, burst forth with an improper amount of strength; and shoots which had been pinched long since on account of their luxuriance, or a doubt as to the propriety of retaining them, finally produce a considerable number of axillary shoots, and these shoots at once arrest and appropriate the ascending sap; they also cause an injurious amount of shade to the true and bearing wood. All of them should be pinched immediately, and it is not unlikely that they will require pinching again within another fortnight or three weeks. The production of such spray at a late season indicates a too-powerful action of the roots, and some persons would be ready under such circumstances to advise root-pruning. Now, although a strong advocate for this operation, and probably the first to urge it in general practice in this country, yet I would by no means interfere at this period with trees bearing fruit.

In the Peach and the Nectarine, fine growing young shoots frequently may be seen over the centre of the tree, and, perhaps, on one particular side, while the extremities of the limbs which are carrying a crop are destitute of young shoots, or have a stunted appearance. This frequently happens from such shoots having carried a large crop on their extremities the year previously: these portions, therefore, being too heavily drawn upon, a temporary exhaustion is the consequence. Now, if the ascending current of sap is not transmitted in sufficient abundance to excite these branches to produce young wood, a partial contraction of the sap vessels will take place, and such branches will have to be pruned away before long, in order to give place to a progeny which has fattened at their expense. Now, lopping off the older limbs of Peach and Nectarine trees is a perilous practice at the best, and it is well to know that by an early stopping of most of the stronger young shoots below them, and stopping again if necessary, such old shoots may be re-invigorated by the sap thus directed towards them, and which, as before observed, had been arrested in its passage. In other words, they will commence making young shoots with freedom, and these young shoots will encourage a renewed vitality, as well as cause the fruit to be better fed, and more perfect.

As to stopping, my practice is to stop in the first week in August every shoot that is of sufficient length to be useful in the next year, excepting in the case of delicate or weak trees. Here there is no occasion; Nature will stop such soon enough. An exception is also made in

favour of weak shoots on robust trees; these are left altogether unstopped.

Now it is that the renewed balance of strength takes place, the weaker and unstopped shoots at this general stopping soon show signs of having gained strength at the expense of their proud neighbours, and before the latter can develop other buds, autumn with its chills has arrived, and it is scarcely possible for them to do much mischief.

There can be little doubt that this general stopping, which should be performed as soon as the last swelling has fairly commenced, increases both the size and the flavour of the fruit.

The Pear—that fruit so necessary to the winter dessert, for who does not wish for a rich melting Pear in December and January?—deserves some consideration as well as the Peach. Although the principles of stopping, and the general control and equalisation of the sap are equally applicable to both Pear and Peach trees, yet some peculiarities of habit in the former, partly arising from modes of training, require special notice.

In the first place, then, go over the trees thoroughly, and remove all watery spray produced since the previous disbudding, leaving not a vestige of it. Next, take care that every leading shoot considered necessary for the future year shall be carefully tied down or nailed. This done, all that remain may be examined closely, and every short-jointed shoot that is brown and fruitful-looking, especially those with enlarged buds, and affording, therefore, a guarantee of early and sure fruitfulness, should be tied down or nailed. The remainder will be rejected spray, but a little caution is necessary in the disposal of this on the cooler aspects; and where a doubt exists in any situation in our northern counties it will be well to cut such all away to within two or three leaves of the base of each shoot. In doing this regard must be paid to kind as well as to aspect. Such varieties as the Easter Beurré and some of the autumn Pears will be apt to ripen prematurely if exposed too suddenly to intense sunshine, for that which perfects the future blossom bud is not always favourable to the development of the highest amount of flavour in the fruit. Nature, it would seem, is more intent on the former than the latter process. Everyone, therefore, should regulate his proceedings according to the climate, aspect, and variety with which he has to deal, and to enter fully into these points would require more explanation than I have now time to give.

As soon as the more tender fruits, as Apricots, Peaches, Nectarines, and Pears, have been attended to, the Cherry and Plum trees must also undergo a revision. As to Plum trees, they may be treated precisely like the Pear trees; and tie down the Cherry trees in a similar manner, but they are not so manageable by this mode as the other fruit trees. The Morello Cherries may have their shoots laid in three times as thickly as the large-leaved kinds.

With Apricots the utmost care should be taken after this period to keep down all superfluous breastwood. The sun must be permitted to shine on the embryo fruit buds without hindrance until the leaves fall; this is the chief secret of the blossom setting well in the following spring, and thus it is that old Apricots which produce scarcely any breastwood, generally succeed much better than young and gross trees.

I hope ere long to read in the pages of this Journal the opinions of brother fruit-growers as to the best mode of ripening the wood of fruit trees in general.—CHARLES ROBERTS, *Dorfold Hall.*

THIN PLANTING OF FLOWER BEDS.

SOME writers, both in these and other pages, are not unfrequently in the habit of comparing flower gardening to music; and though the idea is not altogether a happy one, yet taking it as it is, and in a matter-of-fact sense, there are some features in both which do rather resemble one another. As an instance, everybody knows the ludicrous effect produced when the first note of a piece is struck in a key so high that the succeeding higher notes are found to be far above the shrillest capabilities of the human pipe, so that a dead halt or something worse is the inevitable result. This fact is called by rustic musicians, "a going up and never coming down again," and though it is anything but pleasant to listen to, it yet carries with it a useful lesson, as the most of misfortunes do.

Somewhat analogous to this is the common mistake which many of us commit, of attempting to decorate a far greater area with what are popularly known as bedding plants, than the extent of our winter and spring accommodation will permit. When an increase in the number of beds or borders to be so

decorated is not met by a corresponding increase in the number or size of glass structures, then thin planting must be resorted to, and the ambition of having an extensive display thus defeats itself by having little or none for the greater part of the season. Eight weeks of rainless weather are a fearful ordeal for even thickly-planted beds to pass through; but when we come to look at those planted on the "extended" system, we are forced to the conclusion, that we have indeed aimed too high, that we have, in fact, "gone up never to come down again," at least, not during the remainder of the present season.

There are several ways of preventing a recurrence of this state of things without adding to either glass or labour, and the first which presents itself, and the most natural, is to reduce, where that is practicable, the number of beds to be filled; but that is a retrogressive step, and unless as a last resource ought never to be thought of. Another is the more extensive use of florists' and other flowers, both showy and interesting, and which at most need but the aid of a cold pit to help them through the winter. Such plants as Phloxes, Pentstemons, Antirrhinums, Pyrethrums, &c., when only the best named sorts are grown, have that charm of individuality or separate attractiveness about them which is not to be found in a great bed of Pelargoniums, where each plant is an exact counterpart of all the rest; and if these and such as these were planted with a more liberal hand we should then be enabled to concentrate our limited number of bedding plants upon some given spot, making it as perfect as possible, bearing always in mind that a dozen beds well filled and properly cared for afterwards, will ever give more satisfaction to all concerned than a score of the same size thinly planted. We are not all Handels to compose oratorios, or Costas to render them, but a little song exquisitely sweet and simple is what we all may sing.

Some of the hardier variegated-leaved plants are proving themselves subjects which, on the score of economy, we ought to be really thankful for. Chrysanthemum Sensation, so far as the roots are concerned, is almost hardy, for if laid in somewhat deeply in a dryish border over winter, and allowed the protection of a few leaves and branches in hard weather, they shoot up in spring most vigorously. Large quantities of the Golden Feverfew can also be reared at one-half less cost and trouble than is often bestowed upon many worse subjects, while a cold frame or even a turf pit winters autumn-struck cuttings of the variegated Polemonium to perfection. Any, or all of these three can be used in conjunction with the best bedding plants we have without putting them to the blush. One of the finest beds I have seen this season is a large one, which for ugliness of outline could not be easily beaten. It has a rather broad edging of the old-fashioned variegated Pelargonium Manglesii, the narrow-petalled pink trusses of which are not removed; all over the bed about 15 inches apart are well-grown plants of this Polemonium, while the ground colour is supplied by a very light variety of Lobelia Paxtoniana, and the result is, despite its ungainly form, a bed of surpassingly light and airy beauty.

Another disadvantage to which we subject ourselves by thin planting—of bedding Pelargoniums at least—is that cuttings in sufficient quantities cannot be obtained in time to strike them out of doors without giving a twinge to our heart-strings every time the knife descends. Taking one cutting off each plant it may be thought will not much hurt the appearance of a bed, but when the plants do not meet by some inches it is a painful proceeding.

It is only just to state that this growl at the dry weather and at thin planting, comes from a place where the soil is naturally light and shingly, and where the beds do not in winter and spring receive that elaborate treatment so long and ably advocated by writers in the Journal, and without which anything like perfection in bedding cannot be obtained.—A. B. S. GARDENER.

SPECIAL GLADIOLUS EXHIBITION.

I AM sorry to say that for the present year this must be abandoned, for owing to the absence of the Secretary I did not receive the answer of the Crystal Palace Company until this week; but it was quite in accordance with their usual liberality, as they placed £20 at Mr. Wilkinson's disposal, to be added to whatever sum might be subscribed for the purpose. I had, however, received several communications from Gladiolus growers, stating that owing to the very exceptional character of the season and the forwardness of their blooms, they very much questioned whether they could exhibit; and as everything

in this matter depended on the character and number of the flowers set up, I thought it better to stay proceedings. In one respect I am not sorry. Had it been held this year I should have been obliged to arrange the schedule myself, whereas if deferred I shall have the opportunity of consulting other growers, and of thus, I hope, making a more generally acceptable one. Will lovers of this beautiful flower bear all this in mind? They will now have fair notice, and an exhibition may be held which will astonish those who have not hitherto taken any interest in the growth of the *Gladiolus*.—D., Deal.

THE SCARLET PELARGONIUM IN A HOT SEASON.

At a time when the outcry for water is heard far and near, it is least while looking round to ascertain what crops or plants suffer from the want of moisture, and we may find some which exhibit no sign whatever of distress, but, on the contrary, show to greater advantage than when those refreshing showers we so much long for exert their influence on vegetation. Among the plants whose capabilities of withstanding heat and drought stand out most prominently, the Scarlet Pelargonium may be placed in the front rank, for in the present season this ornament to the parterre does good service by the brilliancy of its bloom and the healthy condition of the plant itself. Exceptions there are even to this, but in general the Scarlet Pelargonium, where it has had fair play, will be found to have performed its duty in a more satisfactory manner than most other plants, and without that assistance which some of them seem to require. To ascertain the cause of this we must go back to planting-out time, and likewise take into consideration the habit and character of the plant.

The Scarlet Pelargonium in its wild state enjoys a climate which is even hotter and more sunny than the present season, therefore sunshine and want of moisture are nothing strange to it. Neither would it appear to require the shade of friendly trees; on the contrary, basking in the blaze of an African sun, external heat is not likely to hurt it in this country, if the other conditions necessary to its existence are afforded. Now, in the present season, one of these conditions would appear to be depth of soil to grow in, and where this has been suitable, and where the plant has not had to contend with other plants more robust than itself for the appropriation of this soil or subsoil, it has invariably succeeded well. Where, on the other hand, a shrub or tree, a standard Rose, a Hollyhock, or any other strong-growing plant near it, has usurped the subsoil, and the Pelargonium has had to subsist on the surface soil only, the result has been unsatisfactory. In many cases, indeed, the plant has succumbed altogether, as watering only tended to encourage the roots of its robust neighbour to intrude themselves among its roots, and then all progress was at an end, and the plant, expanding what flowers it had formed in embryo, gradually sank into that condition between life and death which is even worse than the latter. As this want of success is easily accounted for, it would be well on all occasions where practicable to give the Pelargonium a position where its roots are not likely to be interfered with by those of a more vigorous opponent.

I have been induced to give the above short notice of the Scarlet Pelargonium, from having observed how much better it withstands the heat and drought than most other plants, and even as compared with some of the pink varieties of Pelargoniums. The cause of the latter not doing so well I cannot discover, as I hardly think the flowers of those which have proved so unsatisfactory contained sufficient blue in their tints to account for the failure. The very worst I have is Christine, an old popular variety, which has invariably done well for many years, but this summer the blooms seem to bleach into a dirty white, and fall off so quickly that only three or four flowers are met with on a truss, with plenty of seed-vessels sticking out, porcupine-like, in all directions. Now, if the cause of failure is flimsiness of the petals or some other defective arrangement of the flower, perhaps it may do duty again another year; but if other varieties withstand the heat better than Christine, then I say discard it. In my own case I need hardly state that it is not likely to occupy such a high position again, as some other pink kinds appear to be less injured, although not so much favoured by situation. Perhaps some of your readers will give their experience with this plant.

Having said that the Scarlet Pelargoniums have done best with me, I must also state that the best of them are those

partaking of the Nosegay character—as Stella, Cybister, Wal-tham Seedling, &c.; or when the other varieties have succeeded it has generally been those of robust habit, as Punch and some others of its class, while the dwarf varieties of the Tom Thumb breed have not done well. Later in the season, however, will be a more fitting time to report upon them, but while the hot weather continues it would be worth while for all to observe how their various plants support themselves under it, with a view to giving their experience afterwards. In my case I may say that, with the exception of some Pelargoniums on high-raised beds and mounds, not one of mine on the ordinary level has had a drop of water, excepting from the clouds, since planting, and where the soil was well prepared for them I can find no fault with their success. Where, as already stated, they stand near other more robust neighbours, they have suffered as described. Some other plants left to themselves have also done well. On the other hand, there are plenty of failures, one of the most prominent being a plant I predicted many weeks ago as not likely to do well in a dry season—namely, *Viola cornuta*, while blue *Lobelias* are but little better. Indeed, I am half-disposed to think that blue flowers are the worst to withstand bright sunshine, and I partly attribute the failure of Christine Pelargonium to its partaking in some degree of this tint; but I would like to hear the opinion of others on the matter.—J. Rensson.

SAVING CABBAGE SEED.

I SEE in notices to correspondents, page 66, some advice on this subject to which I must beg to take exception. Indeed, I think there is some error in the printing, because Cabbages sown in May would run to seed the same season, not the following year. Though much Cabbage seed is thus raised it is a very bad practice, and no doubt much of the mischief in the way of runners so often complained about is traceable to this cause. My opinion is that Cabbage ought to be treated as a biennial—that is, grown one season and seeded the next. If you seed it the same season as it is sown, can you be surprised at its running to seed when you would rather it formed a good solid heart? It has been treated as an annual, and behaved accordingly.

I have been for some years rather famous for an early Cabbage of the Battersea race, called Conqueror, and have always raised it in the following manner:—It has been sown in July, and grown as if for Cabbage. When fit to cut the whole have been looked over, and all not quite up to the mark pulled up, and the remainder cut off. The stumps of the good ones are planted the following autumn in well-manured ground, and flower and seed the next season. This is the only way, I believe, Cabbage seed ought to be grown. It is true this is not the way to obtain a fine-looking sample of seed; it is neither so large nor so black as seed from plants sown the same year. Nor is it the way to produce cheap seed. A large amount of labour bestowed on a two-years crop is a very different affair from what is required by a crop which occupies the ground but four months, say from May to July or August.

This changing the nature of biennials is a very serious subject. You see a farmer sowing his Mangold Wurtzel in May, and say, "My dear sir, how is it you did not sow in the second week of April? Your land at that season would have been sure (if got ready in the autumn), to have been moist enough to make your seed grow—in fact, mine are all in full rows; but now if dry weather set in yours will, perhaps, not grow at all, and, besides, you lose several weeks, and consequently some tons per acre." He will very likely answer you, "Ah, yes! I used to sow earlier, but I had so many runners I determined to sow later." Now how is this? Why, because instead of Mangold seed being grown from large, formed roots, it is grown from seed sown in August, thus making it nearly an annual. So it is with Turnips. In travelling through the country you see acres of Turnips sown on corn stubbles, which when winter comes are like little Lettuce plants. These are intended for seed; and when Turnips from seed thus produced for some years run away to seed when they are expected to form roots, no one is in fault, but the farmer is a great loser.

In the same reply (page 66), it is stated that Turnips in flower near Cabbage will spoil the latter. Permit me to say this is a mistake. If you want to keep your Cabbage seed pure, plant it, if you can, in the middle of or close to a large piece of Turnips for seed. The bees will have plenty to do on the Turnip flowers, and will be much less likely to find the

Cabbage after having fed on some other Cabbage or Borecole. If a bed of Red Cabbage be in flower anywhere within a mile, your early Cabbage will in all probability show it has been injured, and in a less degree the Broccolis and Savoy, &c., will injure it; but I never yet saw a cross between a Cabbage and Turnip, though, as you are aware, I am a large grower of Turnip seed, and generally grow my Cabbage close to it.—J. R. PEARSON, *Chilwell*.

BUDDING ROSES IN JUNE.

IN your number for May 28th, a correspondent under the above heading gave so very clear and simple a description of the method which he had pursued with success, that I was resolved to follow his example. About the middle of June I selected buds from Gloire de Dijon and Madame Julie Daran, and have been so successful as to be able to measure the growth of the buds by inches, the latter Rose having already attained a height of half a foot. About the 23rd of June I budded another lot, and with the exception of two or three all are doing well.

There can be little doubt that early is preferable to late budding when the season is a very dry one. During the latter half of June and the first week in July I budded about a hundred Briar and twenty Manetti stocks. At least two-thirds are growing, though the relative proportion of success is much in favour of the Briar; yet I budded on the shoots and not on the stem of the Manetti. Rose-growers in this neighbourhood, who have put off the budding until this month, complain that they can seldom get the bark to rise freely, and when they can the buds soon become shrivelled up. This result, so inevitable with an almost tropical sun and a total absence of moisture, I have obviated by copious watering every other day at the root of each stock. The rise of sap is something wonderful, for I often find that a stock innocent of its own buds in the morning, has put out several tiny shoots before I reach home in the evening. I should like some of your correspondents to explain, if they can, why buds "take" so much less easily on the Manetti than on the Briar stock.

The hot weather has produced butterflies in myriads, and I have noticed a singular fact in connection with them. My garden has, perhaps, five hundred Lobelia plants in it, and seven or eight hundreds of other kinds of plants. I rarely see a butterfly on any plant save the Lobelia, and it is no unusual thing to be able to trace the pattern of the blue in butterflies alone. Can you account for their singular attraction to this pretty hedder?—C. W. M., *Wylde Green*.

AN EXPERIMENT IN BUDDING.

IN August, 1866, I budded upon Late Admirable Peach Violette Hative Nectarine, the reason for doing so being the habit of that Peach, here at least, of casting its buds during winter or early in spring.

The tree in question is one of the healthiest trees in the place, and its one bad habit led me to try the effect of putting a Nectarine upon it. I put in about twenty buds. They all grew, but four or five proved blossom buds, which in the end fell off. The remainder grew well in 1867, and were tied in. This year, 1868, I left on the tree about fifty Nectarines and all the Peaches, about the same number. The Nectarines are quite ripe—in fact, most of them are gathered, some a fortnight ago. The Peaches are just beginning to swell off, and will be quite a month later than the latest Nectarine.

By a person of limited means and time I think this idea might be carried out with advantage much further. I cannot perceive any difficulty in having by this means ripe fruit from the same tree for eight or ten weeks, instead of, as before, for two or three.

I cannot see much difference between the fruit from the parent tree and the fruit on the Peach, except that the latter is larger and more coloured—a rather singular fact, when we consider that Late Admirable Peach scarcely ever has any high colouring.

The Late Admirable Peach did not cast its buds this year so much as before; the Nectarine not at all. This is the point of my experiment. Still, I think this matter worth looking into by some of our large fruit-growers.—A. S. KEMP, *Haughton Hall, Shifnal*.

[Mr. Kemp sent us specimens of the Nectarines. Those from the parent tree were not more than half the size of those

from buds inserted in the Peach, neither were they so highly coloured nor so luscious. Mr. Kemp also sent a Peach from the tree. It was only about two-thirds the usual size, and quite green and hard.—Ens.]

THE ROSE.

HAVING grown Roses for twenty years so successfully that I have won more than thirty cups "open to all England," with a multiplicity of money prizes; having originated the first show of Roses, that is to say, of Roses only; and having attended since that time nearly all the great Rose shows, either as a judge or as an exhibitor,—I ought to have something to tell worth hearing to those who love the Rose. I will try to tell it, as Bossuet preached, *sans étude, familièrement, de l'abondance du cœur*.

De l'abondance du cœur—these words shall be the text of my sermon, because he who would have beautiful Roses in his garden must have beautiful Roses in his heart. He must love them well and always. To win, he must woo, as Jacob wooed Laban's daughter, though drought and frost consume. He must have not only the glowing admiration, the enthusiasm, and the passion, but the tenderness, the thoughtfulness, the reverence, the watchfulness of love. With no ephemeral caprice, like the fair young knight's, who loves and who rides away when his sudden fire is gone from the cold white ashes, the cavalier of the Rose has *semper fidelis* upon his crest and shield. He is loyal and devoted ever, in storm-fraught or in sunny days; the first upon a summer's morning to gaze admiringly upon glowing charms, and the first to tread upon the deep white snow to discover anxiously what harm is done, and to give what help he can. And as with smitten bachelor or steadfast mate the lady of his love is lovely ever, so to the true Rose-grower must the Rose tree be always a thing of beauty. To others, when its flowers have faded, it may be worthless as a hedgerow Thorn: to him, in every phase, it is precious. "I am no more the Rose," it says, "but cherish me, for we have dwelt together;" and the glory which has been, and the glory which shall be, never fade from his heart.

Is it rare or frequent this fond and complete affection? Go to one of our great exhibitions, and you must surely bring the conviction home, that true love, however rare in the outer world, may be always found "among the Roses." From all grades and epochs of life, what vows of constancy, what fervid words! "Sir Thomas and I are positively going to ruin ourselves with a new rosarium." "As soon as I get home," says a country rector, "I shall plant an acre of my glebe with Roses." There you may see a Royal Duchess so surprised out of her normal calmness, that she raises two pale pink gloves in an ecstasy of surprise, and murmurs, "Oh, how lovely!" over *Maréchal Niel*. There a Cabinet Minister stands tiptoe to catch a glimpse of his brother senator, *l'aisné*, and wishes he had a neck as long as Cicero's. Obstructing his view with her ample form and beautiful bonnet, our old friend Mrs. Brown, who has just had "one drop of the least as is," informs the public that she "knows for facts that Mr. Turner of Slough has a dead horse under every Rose tree, and Pauls & Sons has hundreds of young men with gig umbrellas standing over their Roses when it rains heavy." Mrs. Brown is delighted, like all around, and "means to tell Brown, as soon as ever she sets down in her own parlour, that Marshal Niel all over the house, and Sulphur Terry round the back door, grow she must and will. But, goodness me," she suddenly exclaims, "what a mess o' them reporters!" No, my dear madam, they are not reporters, only spectators, putting down in their note-books the names of Roses, with an expression of eager interest which says, I must have that flower or die.

Every year this enthusiasm increases. It is not easy to collect reliable statistics; some shut their mouths closely; some open them so widely as to justify the amusing sarcasm of my reverend and roseate brother, Radclyffe, "When they count their trees, they include the aphids;" but I have obtained trustworthy and interesting information from some of our chief rosarians, who have kindly answered my inquiries in a fraternal and friendly spirit. Without mention of names or minute details, I may state that these all bear witness to a most extensive and progressive enlargement of the demand for Roses. The largest of our wholesale growers writes to me that he has more than twenty acres of Roses, and that his stock of Briars and Manetti, with Roses on their own roots and Roses in pots, exceeds one million. The young but most successful represen-

tative of one of our older firms informs me, that their first planting of Rose stocks, so an old Briar-man tells him, was a lot of 2000, some forty years ago; and that from 2000 they advanced in 1861 to 62,000 Briars. In 1860, he adds, we commenced the out-door culture of the Manetti with 4000: this year (1867) we have 60,000. Rapid as this increase appears, the same writer goes on to say that he anticipates a time when their present stock will seem lilliputian in comparison with that which will be required for the home and export trade. I propose to revert in some future chapter to the history of this development, concerning which I am favoured with some very interesting facts by one who has had more to do with it than any living man—my dear friend, Mr. Rivers, of Sawbridgeworth. Suffice it to say now, that where Roses were grown twenty years ago by the dozen they are grown by the thousand, and where by the thousand now by the acre.

But now comes a most important question:—Have we beautiful Roses in proportion to this great multiplication of Rose trees? The printer will oblige me by selecting a brace of his biggest and blackest capitals, with which I may reply emphatically, NO. It is indeed, at first sight, a marvel and perplexity, that while the love of Roses is professed so generally—while the demand for Rose trees has increased so extensively, and the flower itself has every year disclosed some new and progressive charm—Roses should be so rarely seen in their full and perfect beauty. Queen Rosa, in common with other potentates, has greatly enlarged her armies, but how few young officers have as yet distinguished themselves fighting in the wars of the Roses. Field-Marshal Rivers still commands from his hill at Sawbridgeworth. The names of the generals who were eminent when I first joined as Cornet—Paul, and Wood, and Lane, and Francis—are still famous in our ears. Mitchell, and Cranston, and Cant have long been men of renown; and though Turner and Keynes have joined more recently the Royal host, and, rushing at once to the van, achieved the first honours of victory, they are well known veterans in other fields, and men of war from their youth. It is the same among the amateurs as with the professionals, among the volunteers as with the regular army. The old champions ride into the lists and hold their own against all comers; the new aspirants for the smile of our Queen of Beauty go home, with one exception, the gallant Knight of Sibley, discomfited. They may say as they enter the arena, with the gladiators of old to the emperor, or, in absence of an emperor, to the policeman at the entrance of the exhibition, *Morituri te salutant*.

We must pass from the public Rose show to the private Rose garden to see in its saddest phase the difference between what is and what ought to be, the feeble harvest of good Roses from the broad acres of good Rose trees. These remind us of Martial's description of his works, "*Sunt bona, sunt quedam mediocritas, sunt mala plura*." Collectively we can hardly say of them, as an Edinburgh Reviewer (was it Sydney Smith?) of a volume of sermons, criticised in the first number of that work, "Their characteristic is decent debility." As a rule, the amateur rosearian has made about as much progress as George III. with his fiddle. After two years' tuition, the King asked his tutor, Viotti, what he thought of his pupil; "Sir," replied the professor, "there are three classes of violinists; those who cannot play at all, those who play badly, and those who play well. Your Majesty is now commencing to enter upon the second of these classes." There is not a garden now-a-days, of any pretension, which has not its collection of Roses, and yet there is not one garden in twenty where the flower is realised in its beauty. I have scarcely known at times whether to laugh or weep, when I have been conducted with a triumphal air by the proprietor to one of those dismal slaughter houses which he calls his roseroy. The collection is surrounded by a few miserable climbers, justly gibbeted on poles or hung in rusty chains, and consists of lanky standards, all legs and no head, after the manner of giants, or of stunted "dwarfs," admirably named and ugly as Quilp; the only sign of health and vigour being the abundant growth of the Manetti stock, which has smothered years ago the small baby committed to its care, but is still supposed to be the child itself, and is carefully pruned year after year in expectation of a glow of beauty. There is no beauty, and there never will be, for the florist; but to the entomologist what a happy peaceful home! There can be no museum in all the world so exquisitely complete in caterpillars, so rich with all manner of flies. And oh! if clever "M. J. B." could only see the fungus and the mildew, what leaders we might have in the *Gardeners' Chronicle* when he had toned down his joy! For me there is no solace in these charms. I stand

sorrowful and silent, like Marius among the ruins, until my companion wishes to know whether I can tell him why that wretched Charles Lefebvre behaves so disgracefully in his garden? On reflection, perhaps I can. Charles Lefebvre is placed, like Tityrus, "*sub tegmine fagi*," under the drip and shadow of a noble Beech tree, whose boughs above and roots beneath effectually keep all nourishment from him. And do I know why Charles Lawson, Blairii 2, and Persian Yellow never have a flower upon them? Simply because they are pruned always, as no man with seeing eyes could prune them twice, so closely that they make nothing but wood. The single standards, again, are grassed up to the very Briar, except where a circular span is left for "just a few bedding-out things,"—leeches draining the life blood of the Rose. It is Mrs. Hemans, I think, who sings,—

"Around the red Rose, the Convolvulus climbing,"

and it sounds sweetly pretty, and would be the loveliest arrangement possible, only that, unfortunately, it is death to the Rose—death to that queen who brooks no rival near, much less upon her throne. Look, too, at those vagabond suckers clustering like Jewish money-lenders or Christian bookmakers round a young nobleman, and stealing the sap away. The earth is set and sodden; no spade nor hoe has been there. As for manure, a feeling of profound melancholy comes over us, as over Mr. Richard Swiveller, when he discovered that the Marchioness had passed her youthful days in ignorance of the taste of beer. We know that they have never seen it, and yet they are expected to bloom profusely; and when they are covered, not with Roses, but grubs, the nurseryman, or the gardener, or the soil is blamed. Then there is dole in Astolat, and a wailing cry over dead Adonis. "Is it not sad that we cannot grow Roses? We have spared no trouble, no expense, and we do so dole on them!"

The last time I heard a howl of this kind I felt myself insulted as a lover of the Rose and of truth; and instead of yelping in concert, as I was expected to do, I snarled surlily: "You have taken no trouble which deserves the name; and as to expense, permit me to observe that your fifty Rose trees cost you £5, and your sealskin jacket £20. You don't deserve beautiful Roses, and you won't have any until you love them more." If I am accused of discourtesy to the fair sex (she was not very fair, my reader), I can only plead that I have been far more explicit with the male specimen of pseudo-rosist. "I say, old fellow," remarked to me a friend as we rode together in the Row, and with a tone which, though it pretended a cheery indifference, was fraught with rebuke and anger, "those Rose trees which you recommended me to get turned out a regular *do*. Cost a hatful of money—precious near a *tenner*, if not all out—and, by Jove, sir, our curate at the county flower show came and licked them all into fits!" "Robert," I responded (I was too indignant to address him Bob, as usual), "I never in my life recommended a person of your profound ignorance to have anything to do with Roses. You asked me to give you a list of the best, and I did so reluctantly, knowing that you had neither the taste nor the energy to do them any justice. As to the outlay, the animal on which you have recklessly placed yourself, and whose hocks are a disgrace to this park, cost you, I know, more than eighty guineas; and for a tithe of that sum, without further supervision or effort, you expect a beautiful Rose garden. I rejoice to hear that the curate beat you, just as that earnest boy on his nimble pony is out-trotting at this moment your expensive but tardy steed."

Not a *soupeon* of sympathy can I ever feel for the discomfiture of those Rose-growers who trust in riches. They see lovely blooms at the Rose shows (yea, the Duchess of Kensington said that they were lovely)—selected, probably, from fifty thousand trees, and the results of excellent culture, untiring vigilance and care—and they say, We will have these Roses for our own forthwith, and in abundance. They have only to put down the names, give an order, and sign a cheque, to buy as they buy chairs and tables. They go home and tell their gardener that they have ordered a most splendid collection of Rose trees, and that they quite expect him next summer to have the best display in the county. From my heart I pity that gardener. They might as well have brought him Bob's hack, and told him that if he could not win the Derby and the St. Leger with him they really must find somebody who could. He is not even allowed to choose a situation. The tall ones are to be planted on each side of the broad walk, and the little ones opposite the bowdier window. The broad walk may be as black as a common, or, under the shade of me-

lancholy boughs, as dank as a mausoleum; and the dear little bed opposite the houndir never sees the sun until mid-day, when it is grilled for three mortal hours, and then given back to gloom. So there the poor Rose trees stand—through the winter, *ludibrium ventis*, or without any air at all, and in the spring a rialto, rendezvous, common room, and tap for all the riff-raff of the insect world—an infirmary for all the diseases which the neglected Rose is heir to. Some few, perhaps, may brave all, and bloom, but they no more resemble the glorious flowers which my lady saw at Kensington or the Crystal Palace, than my little boy's toy railway train resembles the Scotch express.

In my next chapter I will tell what may be done in a very small garden, by a very poor man, who really loves the Rose.—**S. REYNOLDS HOLE** (in *The Gardener*).

ROYAL HORTICULTURAL SOCIETY.

AUGUST 4TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Messrs. Barr & Sugden exhibited a specimen of Lettuce called *Bossia*, a variety received from France. It is a Cabbage Lettuce with fringed leaves, and with a tinge of brown. Mr. Barr stated that it was a variety that resisted the very dry weather, and was one of very few in his collection which were slow to run to seed. Mr. Cooling, of Bath, sent specimens of a seedling Apple called *Brailbrook Seedling*, which possessed considerable merit as an early variety. He also sent tubers of a handsome Kidney Potato called *Shivers*. Some were cooked, and received the high approval of the Committee; and it was proposed that it should be sent to Chiswick to be grown and compared with other varieties.

Mr. Fenn, the Rectory, Woodstock, sent dishes of six varieties of Gooseberries, all of which were of large size, and of the sorts known as Lancashire Prize. They consisted of *Rifleman*, *Leveller*, *Young Wonderful*, *London*, *Stockwell*, and *Leader*, and from the lateness of the season and high condition in which they were exhibited gained the commendation of the Committee. Mr. John Heamen, gardener to J. Conits Antrobus, Esq., Eaton Hall, Congleton, sent fruit of a Peach unnamed, which appeared to be Royal George. He also sent fruit of a Pear, which proved to be the Peach Pear. Mr. Whiting, The Deepdene, sent fruit of the July Green Gage Plum grown against a north wall, and notwithstanding the disadvantages of position, they were perfectly ripe and of delicious flavour. Mr. Eckford, gardener to Lord Radnor, Coleshill, Wilts, sent a bunch of a firm hard-fleshed Grape, of an oval shape and yellowish white colour, but without any flavour. Mr. M. Henderson, gardener to Sir George Beaumont, Colceorton Hall, sent a large bunch of a Grape received from Australia. It is of the race called *Olivette Noir*, a long oval berry, which colours at the point while the lower part of the berry is green, in the same way as Black Morocco does. The flesh is rather firm and the flavour sweet, but the variety was not considered to be of any great merit.

FLORAL COMMITTEE.—Although the hot weather and lateness of the London season might have reduced the number of the attendants at this meeting, the exhibition of plants by no means fell short, and many new and interesting subjects were exhibited. Mr. Salter, of Hammersmith, introduced a new *Campauala* called *floribunda*, a useful plant for rockery decoration. It received a second-class certificate. G. T. Davy, Esq., Colston Hall, Bingham, Notts, sent a bulbous plant without any name; the flowers were of the form of a small *Crocus* bloom. A second-class certificate was awarded it, and a name was requested to be given. The Rev. E. Hawke, Willingham Rectory, sent two seedling *Hollyhocks* of great merit—*Ida*, rosy salmon, and *Willingham Rival*, pale sulphur-coloured. A first-class certificate was given to each. Mr. Bull received a first-class certificate for *Allamanda nobilis*, a fine flower highly scented; also for *Hemerocallis picta*, a plant curiously marked just above the surface of the soil. W. Sladden, Esq., Ash, Kent, sent twelve seedling *Gladioli*, which were awarded a special certificate. There were some very nice flowers among them, but they were not equal to the standard, being deficient in form. In a collection of plants sent from the Society's garden at Chiswick, *Cyanophyllum Bowmani* was awarded a second-class certificate as a fine ornamental-foliage plant.

Messrs. Standish & Co., Ascot, exhibited a very fine seedling *Isora*—*Dixiana*, one of the finest yet seen, having pale orange and red trusses of flowers, with excellent dark green foliage. A first-class certificate was awarded it. G. F. Wilson, Esq., sent an interesting group of *Liliums*, arranged in a stone vase. Among them were *Lilium tigrinum Fortunei*, distinguished from the ordinary *Tiger Lily* by the white down clothing the stem; *Lilium lancifolium rubrum*, *L. lancifolium punctatum*, *L. lauifolium album*, and *atro-purpureum*, a dark variety of *rubrum*, *Lilium Wilsoni*, and *L. longiflorum*. A special certificate was awarded the collection.

Mr. Green, gardener to W. Wilson Saunders, Esq., received a second-class certificate for *Yucca de Smetiana*, and a special certificate for his collection of curious plants. Mr. Green also brought a cut specimen of a *Myrsiphyllum*; this was very beautiful; the numerous

small white flowers gave it a light and pleasing character. As a climbing plant it will be most useful. Messrs. Rolliason, Tooting, received a second-class certificate for *C. ladium Meyerbeer*, and a special certificate for a collection of *Orchids* and other plants. Messrs. Veitch sent a fine collection of plants. *Darlingtonia californica*, one of the North American Pitcher-plants, received a first-class certificate; *Caladium Reine Victoria* was likewise awarded a first-class certificate, and *Caladium Alfred Bleu* had a second-class certificate; *Cyathia Hookeri*, a beautiful Fern, was awarded a first-class certificate; and *Odontoglossum Krameri*, a very neat and delicate Orchid, distinct, a first-class certificate; *Acridea Huttoni*, a beautiful Orchid, was also awarded a first-class certificate, and a special certificate was given for the group of plants. Among them were *Nepenthes hybrida maculata*, *Miltonia virginialis*, *Lachia elegans Wolstenholmiana*, and several new *Caladiums*.

Mr. Parker, Tooting, was awarded a first-class certificate for *Primula einensis filicifolia* with double white flowers. Messrs. Downie, Laird, and Laing sent several new continental varieties of *Caladium*. *Caladium Dr. Lindley* received a first-class certificate; *Caladium Louis Porrier* a second-class certificate. The same firm sent three seedling *Phloxes*—Mrs. Laing, R. B. Laird, and *Venus*, good flowers, but not superior to many varieties in cultivation; also *Phlox Madame Atger*, a continental variety of a very distinct colour, rosy red; *Pentstemon Mrs. Arthur Storey*; pale lavender-striped *Verbena Lady Dixie*, and *Sedum atro-purpureum*, a dark variety of *S. telephium*. Mr. Hodge, gardener to E. Wright, Esq., Birmingham, was awarded a special certificate for a cut specimen of *Catacetus barbatus*, a very curious fringed or bearded Orchid.

Mr. Cooper, Reigate, exhibited a very interesting collection of *Mammillarias* and *Echinocacti*, which were awarded a special certificate. Mr. Eckford sent a stand of seedling *Verbenas*. One, a white variety named *Pearl*, was awarded a second-class certificate; it is a fine flower, but with too green a centre. The rest were rough and deficient in form. Mr. Frost, gardener to C. Fortescue, Esq., Dropmore, sent two flowers of a beautiful *Passiflora*, which was named *cineinnata*, from its early purple thread-like filaments; it is a beautiful greenhouse plant; a first-class certificate was awarded it. Messrs. E. G. Henderson exhibited a small collection of fine bedding plants, which was awarded a special certificate. Among them were a new *Fuchsia* called *Golden Treasure*; *Gnaphalium tomentosum*, a very useful plant; *Dactylis elegantissima*, *Salvia officinalis aurea*, *Centaurea ragusina*, and *Centaurea ragusina compacta*, *Polemonium caruleum variegatum*, *Pyrethrum Golden Feather*, and *Fuchsia Golden Piece*. Mr. G. Smith, Walworth, sent a small promising plant of his variegated *Lilium eximium Smithii*. Mr. Tanton, of Epsom, had a fine specimen of *Allamanda Wardleana*, which was considered to be *Allamanda Schottii* of Henderson, a fine kind, but well known as a plant of some years' standing. We may probably hear more of this plant, as a diversity of opinion was expressed as to its merits, and especially as to its not possessing the climbing habit of its congeners. As a proof of its freedom in producing an abundance of flowers, even when the plants are small, some cuttings in pots only recently struck were very remarkable.

GENERAL MEETING.—G. F. Wilson, Esq., F.R.S., in the chair. The following new Fellows were elected—viz., Lord Courtney, John Buck, Esq., W. Penn Cox, Esq., and T. Charlesworth, Esq. The last three were elected forty-guinea Life Fellows, in recognition of the services rendered by them in connection with the Society's Leicester Show. M. Louis Van Houtte, and Mr. Thomas Ingram, of Frogmore, were elected Corresponding Members. A list of donations having been read, and a vote of thanks accorded to the donors, the Chairmen of the Fruit and Floral Committees announced the awards of these bodies, and in doing so the Rev. Joshua Dix directed attention to the *Gladiolus* competition which will take place at the meeting to be held on the 18th inst.

SCIENTIFIC COMMITTEE.

REPORT OF CHEMICAL SUB-COMMITTEE, DRAWN UP BY DR. AUGUSTUS VOELCKER.

At the meeting of the Scientific Committee of the Royal Horticultural Society, held June 2nd, 1868, Dr. Gilbert brought forward the subject of "The characters of growth by virtue of which one plant dominates over another in mixed herbage, under the influence of different manures, &c."

This subject, having excited considerable interest and discussion, was referred to the Chemical Sub-Committee, with the request to report whether the Sub-Committee deem it desirable to recommend experiments to be tried as likely to throw further light on various questions relating to vegetable growth and the specific action of certain fertilising elements, such as potash, phosphate of lime, nitrogenous matters, &c.

It will be remembered that Dr. Gilbert, at the June meeting, referred to some very striking experiments conducted for many years at Rothamstead Park, by Mr. Lawes and himself, on permanent pasture, which has been under grass probably for centuries.

Under ordinary management this herbage yielded about fifty species of graminaceous, leguminous, and other plants usually found in permanent meadows.

The number of species of plants was but little changed on those experimental plots in the park to which a complex but purely mineral manure was applied, consisting of salts of potash, soda, magnesia, and sulphate and phosphate of lime.

On the other hand, salts of ammonia, nitrate of soda, applied by themselves, or the addition of nitrogenous manures to mineral fertilising matters, greatly diminished the number of species in the herbage.

According to the particular kind of nitrogenous manure used, and the quantity and combination with other fertilising matters in which nitrogenous manures were employed, the diminution in the number of species varied, but in all cases it was strikingly apparent, and in some instances amounted to about one-half of the species in the herbage from the unmanured part of the park, or those parts dressed with purely mineral manures.

Attention was further directed to the fact, that not only the weight of the produce reaped per acre was much influenced by the description of the manures which were put on the different experimental plots, but that likewise the relative proportions of graminaceous and of leguminous and miscellaneous plants in the produce were found to vary considerably with the manures employed.

Thus, to cite only a few examples, the weight of the graminaceous plants in the produce from the unmanured plots, and those dressed with purely mineral manures, in round numbers amounted to about 60 per cent. of the whole produce. Dressed with salts of ammonia or nitrate of soda, and other purely nitrogenous manures, the herbage yielded from 70 to 80 per cent. of the whole weight of produce in graminaceous plants, and in some instances in which an abundance of both nitrogenous and mineral manures were employed together, the weight of the graminaceous plants in the whole produce amounted to nearly 95 per cent.

The effect of nitrogenous manures in encouraging the growth of true Grasses, and raising the weight of graminaceous produce and the corresponding diminution of the weight of the leguminous and miscellaneous plants in the produce, was strikingly exemplified in these experiments.

On the other hand, it was found that purely mineral manures, such as salts of potash and phosphate of lime, favoured materially the growth of the Clover tribes, and greatly increased the percentage by weight of the leguminous plants in the whole produce of the permanent pasture.

A wish having been expressed by several members of the Committee to inspect the interesting and highly important experiments which for a succession of years have been carried out and are annually in progress at Rothamstead Park, Mr. Lawes kindly issued an invitation, of which several of the members were able to avail themselves.

The remarkable character of the results obtained in experiments on permanent pasture, and other no less interesting results, having reference to the growth of Wheat, Barley, Beans, and other crops, highly impressed the visitors with the importance of the experimental inquiries instituted at Rothamstead in relation to many physiological and horticultural problems.

At a subsequent Committee Meeting it was agreed to call together the Chemical Sub-Committee, who, regarding the co-operation of botanists and others interested in vegetable physiology, were joined by Dr. Masters, Dr. Hogg, Mr. Murray, Major Trevor Clarke, and Mr. Miers; Dr. Hooker and Mr. Benthams expressing regret at being unable to attend the meetings of the Sub-Committee.

Accordingly the Sub-Committee met on Thursday, June 18th, the following members being present:—Professor Abel, Mr. G. F. Wilson, Dr. Masters, Dr. Gilbert, Mr. A. Murray, Dr. Voelcker.

Dr. Gilbert invited the botanical members of the Sub-Committee to examine the herbage reaped this season on the several experimental plots of the permanent pasture in Rothamstead Park, and promised to furnish them with the requisite materials for such a botanical examination.

The Sub-Committee next fully discussed the manner in which manuring experiments on graminaceous and other plants occurring in pastures might with advantage be instituted, and considered it advisable to investigate rather the more strictly scientific physiological questions, which no doubt will suggest themselves in the course of the experiments, than to bear in mind the purely agricultural and economic points of interest which they may present.

Instead of growing together a number of plants such as are common in pastures, it was deemed desirable to study the influence of various manures on particular species, grown separately in wooden boxes 2 feet square and 18 inches deep, filled with poor soil, such as is found in unmanured and rather exhausted soils of our fields, and not with good garden mould.

The boxes are conveniently sunk in the land, level with its surface, in order to protect the soil in them from excessive evaporation.

It is suggested that the experiments be carried out in the Society's gardens at Chiswick, and also at Rothamstead by Mr. Lawes and Dr. Gilbert, as well as by any gentleman who feels disposed to undertake them.

In each set of experiments the same kind of soil should be employed, but as the nature of the unmanured soil must exercise its due influence on the growth of the plants submitted to experiments, it will be desirable, if possible, to try one series of experiments on rather light sandy soil, and another on more heavy clayey soil. Dr. Voelcker will

willingly undertake the chemical analysis of any soils that may be employed for the experiments.

After due deliberation the Chemical Committee have selected the following plants for experiments:—

- | | |
|--|---|
| 1. <i>Dactylis glomerata</i> . | 8. <i>Lotus corniculatus</i> (perenne),
Bird's-foot Trefoil. |
| 2. <i>Anthoxanthum odoratum</i> . | 9. <i>Trifolium repens</i> (perenne),
White or Dutch Clover. |
| 3. <i>Lolium perenne</i> . | 10. <i>Plantago lanceolata</i> . |
| 4. <i>Poa pratensis</i> . | 11. <i>Achillea millefolium</i> . |
| 5. <i>Poa trivialis</i> . | 12. <i>Carum carui</i> . |
| 6. <i>Bromus mollis</i> . | |
| 7. <i>Trifolium pratense</i> (perenne),
Red Clover. | |

It will be seen that of the dozen plants recommended for experiment, six are true Grasses, three Clovers, and three common weeds in pastures.

For each of the preceding plants, six boxes, each 2 feet each wide and 18 inches deep, are recommended.

1. One box to be left unmanured.
2. " manured with a purely mineral mixture.
3. " " with ammonia only.
4. " " with nitrate of soda only.
5. " " with ammonia and mineral manures.
6. " " with nitrate of soda and mineral manures.

The following manures and quantities are recommended:—

	lbs.	
For box 2. 1.47 oz. of sulphate of potash, or at the rate of 1,000 per acre.	1,000	
1.47 oz. of carbonate of lime.....	1,000	
15 oz. of chloride of sodium.....	100	"
1.47 oz. of bone ash treated with.....	1,000	"
1.10 oz. of sulphuric acid.....	750	"
For box 3. 59 oz. of sulphate of ammonia.....	400	"
59 oz. of chloride of ammonia.....	400	"
For box 4. 1.62 oz. of nitrate of soda.....	1,100	"
For box 5. The manures used in 2 and 3.		
For box 6. The manures used in 2 and 4.		

The amount of nitrogen in the preceding quantity of nitrate of soda recommended for box 4, it may be observed, is the same as that in the sulphate of ammonia and chloride of ammonia, employed in box 3.

Dr. Gilbert has kindly promised to furnish the preceding manures, which should be intimately incorporated with the whole of the soil in the several boxes.

When necessary, the plants under experiments should be watered with soft pure water, and otherwise attended, and their progress be watched and recorded.

A sample of water to be retained for examination when distilled water can [not?] be used.

It may, perhaps, also be desirable to fill moderate-sized flower-pots with soil from each of the experimental boxes, and to grow in each a single and strong plant, side by side with the more numerous specimens in the several boxes.

The preceding experiments cannot be undertaken without a good deal of trouble, but it is confidently expected that they will throw light on the conditions most conducive to the rapid development of various orders or species of plants, as regards some of the more characteristic manuring elements present in complex manures, and they may lead to a more systematic and certain mode of treatment of not only these but also of other plants as regards manuring.

Some of the manures recommended in the foregoing scheme are known to favour early maturity; it is therefore likely that the experiments will suggest others which may be of much value to fruit growers.

M. SOUCHET'S GLADIOLUSES.

I HAVE just heard from my friend M. Souchet, and send an extract from his letter.

"The drought having continued with extraordinary intensity, the bloom of the Gladioluses, which I had expected to be very brilliant, is up to the present time a complete failure; it will be, perhaps, better from the 10th to 25th of the present month, we hope so, although not counting upon it. I am greatly grieved at this want of success. Will you be good enough to communicate this sad news to any who may be interested in it?"

There can be no better way of complying with his wishes than to ask for your insertion of this extract. It quite confirms me in my judgment, that it was better to postpone the Gladiolus Exhibition for another year.—D., Deal.

MR. CRIPPS'S NURSERY, TUNBRIDGE WELLS.

I DERIVED much pleasure from a hasty visit to this well-known nursery. The seedling Clematises particularly attracted my attention; for form and beauty they cannot be equalled. A white variety named Madame Van Houtte, and a purple one called Crippsii, were superb. Although for abundance of flowers they may not equal some of the new and leading varieties, the

exquisite form of the flowers is unrivalled. A variety of *Anemone japonica* with pure white flowers was most beautiful, and I believe not generally known.

The fine specimens of *Fuchsia Dominiana* excited my admiration. It is very remarkable that this plant is not more generally cultivated. There were some fine specimens in great perfection. *Bignonia grandiflora* was also in fine condition, and is a most beautiful greenhouse plant.

The collection of Conifers cannot be surpassed for vigour and luxuriance of growth. To enumerate the species and varieties grown in this nursery would occupy too much space. I will only add that a visit to this establishment will afford a treat to any admirer of ornamental plants.—X.

ORNAMENTAL AND FLOWERING SHRUBS.

(Continued from page 78.)

ERICAS.—There are many varieties of hardy Heaths. The best of them in my opinion are the following—*Erica australis*, the tallest, attaining a height of from 5 to 6 feet; *E. mediterranea*, also a free grower, sometimes attaining a height of 4 feet—both of the preceding have red flowers in spring and early in summer—*E. scoparia stricta*, pale red, end of summer; *E. cinerea alba*, white, June to September; *E. cinerea atropurpurea*, purplish red; *E. cinerea rubra*, and *E. cinerea rosea*, the one with red, the other with rose-coloured flowers. The varieties of *Erica cinerea* flower in summer and autumn. *E. tetralix alba*, white, and *E. tetralix carnea*, flesh, flower from June to August. *E. vagans alba*, white, *E. vagans carnea*, flesh, and *E. vagans rubra*, red, all flower in July and August, and, with the last-named three species and their varieties, attain a height of 1 foot. *E. vulgaris alba*, white; *E. vulgaris flore-pleno*, reddish purple; *E. vulgaris carnea*, flesh; *E. vulgaris coccinea*, bright red; *E. vulgaris decumbens*, red; *E. vulgaris variegata*, red; *E. vulgaris Hammondi*, rose, and *E. vulgaris Alporti*, red, all flower in summer, and attain a height of 1 or 2 feet. Heaths are very pretty, and considering they flower in summer, and their flowering is often prolonged until autumn, it is surprising they are not more generally cultivated. They succeed admirably on banks, on slopes and ledges of rockwork, and in any situation not damp. They are very handsome in beds well drained and formed of suitable materials. The soil should be a sandy peat. *Erica australis* and *E. mediterranea* should have a sheltered situation. Propagation is effected by layers, and by cuttings of the young shoots in silver sand under a band or bell-glass, keeping them close until rooted.

FOTHERGILLA ALNIFOLIA.—Deciduous. The leaves on their under sides and the shoots, are covered with white down. Flowers white and sweet-scented, in April and May. Height from 3 to 4 feet. It requires a moist peat soil, and is increased by layers and cuttings.

GAULTHERIA PROCUMBENS.—Leaves oval, shining, green. Flowers white, succeeded by bright red berries. It flowers from July to September, and is a pretty shrub of 6 inches in height. Sandy peat is most suitable for it. Propagation is effected by division and seeds.

GAULTHERIA SHALLON.—Habit procumbent. Leaves dark green and shining. Flowers white, tinged with red, followed by purple berries. It flowers in May. Layers. Height, 2 feet.

GORDONIA PUBESCENS.—Deciduous. Flowers white, in August and onwards to November. Height, 4 feet. Layers.

IREA VIRGINICA.—Deciduous. Flowers white, numerous. A pretty shrub, flowering in July. Layers and root cuttings. It ought to have slight shade as well as peat soil. 4 feet.

DAPHNE CNEORUM.—Leaves small, lanceolate. Flowers numerous, rose-coloured, very sweet scented. Being of trailing habit, it is very suitable for rockwork, and planting in well-drained soil among stones. It is easily propagated by layers, and grafting on the Spurge Laurel (*Daphne laureola*), upon which the sweet-scented *Daphne* forms handsome drooping heads. Very suitable for forcing. Peat soil is desirable, and a slightly shaded situation. Height, 1 foot.

DAPHNE PONTICA.—Flowers yellowish, sweet, and numerous, in April and May. 3 to 4 feet. It should have a warm sheltered situation.

KALMIA LATIFOLIA.—Leaves large, lanceolate, shining, green, and very dense. Flowers rose or flesh-coloured. Very handsome in June when in flower, and at all seasons by its dense foliage. Height, 5 feet and upwards; the tallest plant I remember was 7 feet in height.

KALMIA LATIFOLIA MAJOR SPLENDENS is finer in foliage, and has flowers of a bright red, which retain their colour until they fall. A pretty companion to the very handsome *Kalmia latifolia*.

KALMIA LATIFOLIA MYRTIFOLIA.—Very like *K. latifolia*, only smaller in every way, and on that account desirable for planting around groups of *K. latifolia*.

KALMIA ANGUSTIFOLIA.—Leaves narrow, dark green. Flowers red. 2 to 3 feet.

KALMIA GLAUCA.—Leaves narrow, glaucous on the under side. Flowers red. 2 feet.

The *Kalmias* are increased in the same manner as *Rhododendrons*, requiring a peat more sandy than for *Rhododendrons*, and the situation should be moist and slightly shaded. They are not very hardy, and should have a situation sheltered from cutting winds.

LEDUM LATIFOLIUM.—Leaves lanceolate, downy beneath, of compact globular growth. Flowers white, in spring. Layers. 3 to 4 feet.

LEDUM ANGUSTIFOLIUM and **PALUSTRE** are pretty shrubs with white flowers in spring, but inferior to *L. latifolium*. Height, 2 to 3 feet.

LEDUM THYMSIFOLIUM and **L. BUXIFOLIUM** are of dense dwarf habit, and are on that account suitable for edgings to beds in the American grounds. They have pretty white flowers, and the buds are pink before expanding. Layers.

MENZIESIA POLIFOLIA.—Small leaves, white on the under side. Flowers white, tinged with purple. There are several varieties, the best being *alba*, white; *globosa* or *erecta*, purplish; *atropurpurea*, purple; and *pumila*, purplish red. *Menziesia globularis* and *empetrifolia* are pretty Heath-like bushes. All flower from June to September. 1 to 2 feet. Layers and cuttings.

PERNETTYA MUCRONATA.—Leaves shining, dark green. Flowers white and drooping. May. 2 to 3 feet. Layers.

POLYGALA CHAMÆLUXUS.—A pretty evergreen. Flowers pale lemon, and sweet scented. April and May. Of trailing habit. Height, 6 inches. Moist, well-drained peat and grit. Layers and suckers.

RHOBOA CANADENSIS.—Deciduous. The flowers appear before the leaves, being of a reddish purple and sweet scented. 2 to 4 feet. Layers. It flowers in April or May, and is a good plant for forcing.

VACCINIUM VITIS-IDÆA.—Leaves shining. Flowers bell-shaped, pink in summer, succeeded by red berries in autumn. It does best in a rather moist situation, and where slightly shaded. 1 foot. Suckers.

VACCINIUM ARCTOSTAPHYLOS.—Deciduous, requiring a sheltered situation. Flowers reddish, in June, succeeded by red berries of large size. 6 feet. Layers.

VACCINIUM OVATUM.—Leaves, as the specific name implies, ovate, bright green. Flowers pink, in May, succeeded by numerous purplish red berries in autumn. Height, 2 feet. Layers.—G. ABBEY.

(To be continued.)

WHO IS AN AMATEUR?

My husband is very fond of gardening, and for amusement has put up three vineries. We keep no gardener, and my husband attends to all the gardening himself. Having saved more of Mrs. Pollock Pelargonium through the winter than he required for his own garden, he sold a few to people near our house, who could take them away, just to accommodate them, and to pay for coal for his Vines. Does that exclude him from exhibiting at our flower show as an amateur? Will you also say if selling a few flowers would exclude any one more than selling Potatoes?—S. O.

[The question is best answered by inquiring, Who is a professional gardener, and who is a nurseryman? A professional gardener is a man who for wages serves one or more employers in some department of gardening. A nurseryman lives wholly or chiefly by the sale of the produce of his nursery ground. Now, your husband, though he sells his surplus plants, fruits, and flowers, clearly does not come within either of these definitions. If he were to be so included, then hundreds of noblemen and gentlemen must be nurserymen, for they sell their surplus garden produce. Your husband is an amateur gardener beyond any just doubt.—Eps.]

DUC DE MALAKOFF STRAWBERRY.

I AM sorry to see (page 56), that Mr. Douglas has quite condemned Duc de Malakoff. Is it possible that Mr. Douglas has a spurious variety of this Strawberry? From the description given of it I feel doubtful, for here it is one of the earliest, coming in within a few days of Black Prince, either with forcing, or when ripening in the open garden.

I have discarded Black Prince for forcing, as Duc de Malakoff comes in nearly as early, and is sure in producing a crop.

In character it is not one of the largest kinds. It has a medium-sized fruit of the Pine shape, and fine in colour and flavour. The plant is not very strong in foliage, and is a prolific cropper. In fact, this variety is one of the best in cultivation in, I believe, any soil. In flavour and appearance it much surpasses Eclipse, and for packing is considered one of the very best to travel to a distance, a property which is deserving of notice, and which makes it the more valuable to the many gardeners whose Strawberries have to be sent to a distance, and to appear fresh when they arrive at their destination.

I have grown Duc de Malakoff three seasons for forcing, to come in during the last week in April. Black Prince put in at the same time will only come in two or three days before it; but then you may gather a dish of Duc de Malakoff first, as the size makes up for the small number of the fruit, and is more to your credit. You need not be afraid of its being

attacked by mildew, to which we all know Black Prince is so liable. I would willingly exchange a few runners with Mr. Douglas.—WILLIAM BIGGS, *Sandfield Park, Liverpool.*

A FEW SALAMANDER PLANTS.

SUBJECT as we occasionally are to long seasons of drought like the present, it is comforting to us florists to know that there are some flowers which seem to defy both dryness and heat, and to flourish with undiminished loveliness in spite of a burning sun and an almost total absence of rain; and I cannot forbear telling my floricultural friends of two plants which for the last four weeks have always cheered and comforted me as I have wandered amid the dead and dying beauties of my burnt and dried-up garden.

I allude to *CONVOLVULUS MAURITANICUS* and *CENTRANTHUS MACROSIPHON*. The former is a perennial far too little known. It is increased by cuttings, and requires protection in a frame or greenhouse during the winter. It grows most rapidly when planted out in spring, and if pegged out like a *Verbena* soon covers a large space of ground. From sunrise to noon, throughout the summer months, it is one sheet of lovely mauve flowers of an almost unique tint. I mean to have a large bed of it if spared till next year.

Centranthus macrosiphon is an old-fashioned and somewhat exploded annual; but its dwarf though luxuriant growth, its fresh green foliage, and dense bright heads of magenta-coloured flowers, and its brave defiance of sun and drought, render it a most desirable, and in seasons like this, an indispensable ornament in every flower garden.

Sollya heterophylla and *Abelia uniflora* have bloomed well with me out of doors this summer.—H. HARPER CREWE, *Drayton-Beauchamp Rectory, Tring.*

CUTTING DOWN AND TRIMMING EVERGREENS.

INQUIRIES having been made as to the best time for cutting-in evergreens of various kinds, a few notes on the subject may be useful to those about to operate on these ornamental features of a garden or landscape, and especially on large full-grown specimens which have not previously been subjected to much cutting-in. As this is the class most difficult to manage well, it will be necessary to consider the condition and nature of the plant before we commence too rashly to use the axe and saw.

Very little consideration will convince us that an evergreen of large size cannot be entirely cut down without inflicting on it great injury, and possibly the operation may kill it; but although a total deprivation of foliage may be fatal, the removal of one-half or even more of it may not be so: consequently, when a large Laurel or other shrub has so far outgrown itself as to be no longer ornamental, becoming naked at the bottom, or otherwise unsightly, partial cutting-down is essential to appearance, and when it can be so managed as to leave some of the lower branches well clothed with foliage, the energies of the plant soon repair the disaster. Perhaps of the shrubs which show most conspicuously the utility—nay, almost necessity of this plan, the *Arbutus* is as good an example as any. The part that was left may also be cut away in about two years afterwards. *Alaternus*, *Phillyrea*, *Laurustinus*, and some other shrubs generally succeed well under this treatment, the common Laurel especially so, and the Portugal Laurel does as well when thus treated as in any other way, but it is a plant rather impatient of cutting-in, although in every other respect amongst the hardiest we have.

Perhaps the best time for cutting-in such evergreens may not be that adopted at this place (Linton Park), but as it answers very well, and is attended with some advantages, there seems to be no objection to it. The beginning of April is the season at which we usually do such work. However well the cutting may be accomplished, there cannot be any difference of opinion about the plant operated on looking badly for a time; and, as it is advisable to reduce that period to the shortest possible space, by not cutting the plants until shortly before they will continue to grow again they are not long in a naked condition. I do not, however, affirm that they are any better when left till April. For the reason already given, observe in all cases where possible to retain some branches with leaves on, even if such branches have to be bent to the ground to hide their

unsightliness. After the rest of the plant has grown for a year or so, these old branches may be cut off if necessary.

Laurel and other hedges of a formal and regular character ought to be cut with the knife, especially shrubs with large leaves, as the Laurel; but when this cannot be done the shears may be employed. In the latter case it is best to cut the common Laurel, and I believe most other shrubs of a similar description, early in June, just before the growth is completed, so that a second crop of short shoots may be formed. This takes off the appearance of close raw cutting, and hides the deformity caused by cut leaves. For many years we have been in the habit of adopting this plan, and it is rarely, indeed, that the second shoot does not ripen itself, and it is seldom more than 3 or 4 inches long. Any longer or unsightly shoots may be cut out with the knife before winter, so as to allow of the hedge, bank, or whatever is cut, looking uniform during the winter.

Choice evergreens against walls may be treated differently, as their flowering is of consequence as well as their appearance. The common Ivy when growing luxuriantly requires trimming; excepting in special cases, we have found a severe cutting-in about the end of July, so as not to show a single leaf, resulted in the production in a month or six weeks of new foliage, which remained good all winter. When the Ivy is not so robust it is better, perhaps, to cut it in at the end of March. There is then a greater certainty of its doing well afterwards; but if it grow vigorously it will have projected a long way from the wall by the end of summer, and some cutting-in with the knife may be necessary in autumn. For this reason I prefer summer cutting, as furnishing a more lengthened period of trimness.—J. ROBSON.

NOTES AND GLEANINGS.

THE gentleman elected to fill the place of Mr. Henry Cole, C.E., on his retirement from the COUNCIL of THE ROYAL HORTICULTURAL SOCIETY in May last is D. Hingford D. Burr, Esq., of Aldermaston Court, Reading.

WORK FOR THE WEEK.

KITCHEN GARDEN.

DURING the continuance of heat and drought little can be done in this department, but advantage must be taken of the first good fall of rain to prick out into beds the *Cabbage* plants intended for spring use, that they may become stocky before their final planting. To those who would insure a constant succession of the choicer kinds of vegetables and salads, the next fortnight will be the most important in the whole year. *Endive*, planting must now be proceeded with in earnest, for what is now planted will constitute the great bulk of the autumn and mid-winter salads. Let elevated beds of 4 feet in width, and possessing a bold curvature, be provided in an open and dry situation. Such beds should be a foot or more above the general level of the ground, and must be made very rich. They may be hooped over in the end of October, so as to be readily covered with mats when frost arrives. *Celery*, the main crop should now be planted out, taking care to water it frequently. Other crops of *Celery* must be earthed-up in due time, removing all suckers and tying-up the plants neatly. It is an excellent plan to give a good soaking of manure water the day previous to earthing-up. The slug defaces the stalks much. It is a good practice to give the plants a thorough liming previous to the first earthing. *Onions*, the remains of the autumn-sown *Onions* should be taken up as soon as possible. The same may be said of *Shallots* and *Garlic* as soon as the leaves decay. Spring-sown *Onions* may have their tops gently bent down with the head of a rake to cause the bulbs to swell better. The sowing of seed to stand the winter should proceed without delay upon cold stiff soils; on light soils and in warm situations it will do a fortnight hence. No sorts are better than the *Strasbourg* or large *White Spanish*. The main crops of winter *Colcaccorts* must be planted within a fortnight. Manure we, and plant a foot apart. *Winter Spinach* for the whole winter's supply should be sown now, or a week later according to the situation.

FRUIT GARDEN.

Vines will now require much attention where there is a prospect of ripening the fruit. The bunches should receive their final thinning, and, unless in the case of small sorts, no more than one bunch should be left on a shoot. Remove all super-

fluous wood in order to direct as much of the energies of the Vine as possible into the fruit. If the spur-system of pruning is adopted leave as many shoots besides those in fruit as will be wanted next season. Shorten bearing shoots one joint beyond the bunch, or to the joint of the fruit, provided the leaf is preserved and one joint or lateral allowed to remain. Pick out a few of the buds in the axils of the leaves towards the points of these shoots, that the buds at their base may be rendered more plump for the next season. If the long or succession-rod system is followed, no short shoots need be left that do not carry fruit, and these must be kept well shortened, so that by removing all useless growth and picking out the young buds in the axils of the leaves of such shoots, more strength and full exposure may be given to the long shoots intended for bearing next year. Leaving a lateral with a leaf or two attached has a tendency to strengthen the bud at its base, and prevents this bud bursting if the shoots should be rather prematurely shortened, but some gardeners object to leaving such laterals, considering that they render the buds three-cornered instead of plump and round. Grafts should now have their bandages loosened and the shoots properly secured from wind.

FLOWER GARDEN.

Any time after the middle of this month these hardy annuals that stand our ordinary winters, and which flower from the middle of April to the middle or end of June, may be sown in very light soil on an east border in the reserve garden, or in any open spaces in the shrubberies. When the flower beds are dug over in February, these annuals could be transplanted in groups according to their colours or the fancy of the owner. At the same time the seeds of other annuals could be sown so as to have no blanks in the beds; even those beds filled with spring bulbs, such as the dwarf early Tulips, Hyacinths, Narcissuses, &c., should be planted or sown with these annuals between the rows of bulbs, and by the time the latter would begin to fade the annuals would be gay and continue so till the leaves of the bulbs were ripe. As soon as the bloom begins to fade the whole could be dug over, the bulbs taken away to be dried, and the beds planted immediately with strong, healthy, half-hardy plants intended for summer and autumn display.

GREENHOUSE AND CONSERVATORY.

The early spring cuttings of Pelargoniums are now good-sized plants ready to turn into the conservatory for the last successions. If the house is large four or five of the plants may be put into a large pot, and great bushes thus formed at once to fill up recesses or vacant corners. The leaves and flowers will soon turn to the light, and by turning the pots round twice a-week fine plants will be secured without a forest of sticks, which although sometimes necessary to show off plants at an exhibition, are most intolerable in a well-regulated conservatory. As the autumn advances the conservatory is again kept more or less close, and much less water is given to the plants; those from the stove now in flower require but very little water, and as soon as they are past their prime they should be returned to the stove. It is the misfortune of greenhouse plants out of doors that they too often are in vigorous growth at the time they are housed for the winter, and this is another reason out of many for growing the finer sorts in frames and pits, as their growth can be thus regulated according to their habits or the wishes of the grower.

STOVE.

After the middle of August, if the weather is dull, established stove plants should not be watered late in the afternoon; the drier the stove is kept at night during the autumn the better the plants will ripen their wood, and we all know that on the perfect maturity of each season's growth depend in a great measure the flowering and fruiting of exotic plants; therefore, allow the plants as much room as possible for the next three months. This cannot be too much insisted upon. An early viney where the leaves have all fallen would be a good place into which to remove some of the strongest specimens from the stove for six weeks or so. Here, with a dry atmosphere and plenty of air and light, they would ripen their wood perfectly, and the Vines would not be injured by the treatment.

PITS AND FRAMES.

Every encouragement should now be given to frame plants to grow to their utmost, the lights during most of the day admitting a portion of air, and towards the evening being taken off altogether to let the plants have the night dews, which are always heavy in the autumn, and make plants look green and

healthy. We can always stop the growth when we think fit by keeping the plants and frames drier, by having the lights off during the day and on at night, or reversing our present system. Is it not curious that plants should grow better in turf pits than in those made of bricks? I suppose bricks heated by the sun absorb too much of the moisture from the plants at night. Many of the more tender Heaths suffer much from wet autumns, and nurserymen turn these into pits or greenhouses about this time. Pits are by far the best places for such plants, as the glass can be put off or on as circumstances may require. Chrysanthemums and Violets must be well attended to from this time. Give abundance of liquid manure to both, now that they are strong enough to make use of rich food.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

STILL no rain with us, except a few drops that scarcely refreshed the foliage; and in the extreme dryness of the soil and the parching heat, planting out vegetables of any kind is almost out of the question. What we have planted of Cauliflower, &c., has been protected by a 5-inch pot placed over each plant during the day, and after a few days lifted off at night.

This would not disturb us so much, as we trust rain must come, and then we might bring up our leeway, for after rains vegetation will make very rapid progress, as the ground is like a huge hotbed; but the difficulty will be to obtain good plants to fill it with, owing not so much to the heat and dryness as to the depredations of the fly, which seems to miss nothing that produces cruciform flowers. We have a border of Cauliflowers that otherwise would have produced well, as, owing to having been several times watered with house sewage the plants are strong, but there is scarcely a green leaf on them owing to the attacks of the fly. A fresh piece we planted out was out of sight in a couple of days—not a vestige left but the stumps at the roots, and that after using sprinklings of ashes and other deterrents. We have found no safety for the young plants after planting except covering with a pot, and in the seed beds nothing will save them except a covering of some sort during the day; and for this purpose, for want of a better, fresh spruce branches often act well, the fly having a great dislike to the aroma given off by the branches. We found that lots of young plants, as Cabbages, Stocks, Wallflowers, &c., would soon have been out of sight if we had not placed some old sashes over them, whitened them to moderate the heat, and given air back and front, putting on the sashes in the morning and taking them off in the evening, as the fly is the most active when the sun heat is the most powerful.

If the fly is as destructive elsewhere it will be next to impossible to keep the earliest sowing of Cabbages, unless protected with some material during the day. Mats would do very well, especially if made to smell unpleasantly; but old moveable sashes are very good, as, even with plenty of air back and front, the fly will scarcely ever go beneath the glass. What was, and would have continued to be, a fine border of autumn-sown Stocks, has for the present lost all its attractiveness, for most of the foliage is yellowish or as prettily perforated as the Lace Plant. If we have plenty of rainfall and a few dull days, we think they would break afresh, and be good again. All our neighbours among the cottage gardeners unite in saying that without some protection better than soot, ashes, or sawdust, it is of no use to sow their little beds of their favourite Cabbage, as the plants that are good to-day will be gone to-morrow. Contrary to our custom, we will sow them and Lettuces in places covered with an old frame and sashes.

Let us bear in mind the importance of trying to meet the difficulty. Were we a little short of supply just now it might be passed over, as, except where water and labour are abundant, such continuous drought and heat will tell their own tale; but when all this is gone, and the rains of autumn and the colds of winter have come and gone, there will be few excuses entertained for the want of the usual supply at the usual times. It is of little use discussing the propriety or the reasonableness of such expectations. We must act as if we well knew that the expectations will be entertained all the same, and if we are unsuccessful in one mode, we must try others. Not that these expectations are always reasonable. If they were, the world would not be exactly what it is. In such districts as this, where we have had none of the downpourings which have visited the metropolis, the effects of the drought will show themselves, and for a considerable time, do what we may to

lessen them. It will be a satisfaction, however, even if we partially fail, to feel that we did what we could. It is all a mistake, and something worse, to make the reason an excuse for our own want of forethought or consideration. We may rest assured that the drought and heat will soon be forgotten by employers as a sufficient reason for obtaining but little from their gardens.

Whilst on this matter of expectations, we will just allude to another side of the matter, brought prominently before our notice by some half-a-dozen of writers complaining that whilst the employer gives orders for certain work to be done at certain times, and in a prescribed manner, if the results are not to his mind, he blames the gardener as the cause of the failure. Now, the matter here lies in a very small space. The master has the right to have everything done in his garden at the time and in the way he wishes. He may wish a tree to be planted with the branches in the ground, and the roots in the air, and the workman if wise will do the work as desired. If a gardener is employed it would be his duty quietly to say of that and many other such proposed schemes, that he did not think they would answer, but there his duty in the matter ends, and if he does as desired his responsibility likewise ends. This is just, however, the place where the grievances of our correspondents culminate. It would appear that in their several cases the employer is so much his own gardener that he takes on all chief occasions the responsibility of ordering not only operations, but the time and mode of performing them, takes as a consequence not only the responsibility and credit of success, but diverts the responsibility of failure on the incompetence of his gardener. Now, this is not fair. We can hardly expect every possessor of a garden to be as noble-minded as the great Duke of Bedford, who, when he would have a plantation of trees thinned against the opinion of his gardener, had a large placard put up, that every passer by might see that the Duke and not the gardener was responsible for the result. The results proved that the Duke's opinion was the better and the sounder of the two; but if it had proved the reverse, the principle involved was the same—namely, that the responsibility of ordering must be connected with the responsibility of results. We cannot at present enter on all the grievances brought before us, but will just allude to two as more apposite than the others at present.

One tells us, "That he has for some time been a convert to the ideas on watering lately propounded, and would have liked to have used what little liquid he could command in greater quantities at a time, and then leave well alone, but that his employer will insist on having the beds slightly sprinkled every afternoon or evening, and then he is grumbled at because every succeeding hot day finds the plants looking more wretched than on the preceding day." Now, our own candid opinion is, that in such weather it is quite possible to sprinkle plants until they entirely disappear.

Another tells us that he could get no rest from his employers, but was forced to turn out his bedding plants in the month of April and the beginning of May, and now there is continual grumbling because the plants, from the first chill, have never overtaken the plants of a neighbour that were not turned out until the end of May. Now in such a season as this has proved, we would have liked as well if our plants had been out earlier, so as to have been better established before the hot weather set in; but even these, planted in the last days of May and the first days of June, have stood remarkably well, and in our changeable climate, wherever much is to be done north of London, we would not care about planting out tender subjects before from the 18th to the 25th of May, and *Coleus* and *Iresine* we would not trust until the middle of June. We have proved that somewhat late planting is generally associated with a quick healthy filling of the beds. We have bedded-out in the beginning of April, but unless under orders would never think of doing so again, and then would free our-elves from all responsibility as to the plants thriving. One night's sharp frost might kill the whole, or make the plants unsightly for most of the season; and it is only fair that those who insist on such work being done prematurely, as well as on the dribbling system of watering, should be responsible for failures as well as successes.

We turn from these random remarks about responsibility, to say that if this heat continue we fear much for autumn Peas. As yet we have them tolerably fair; but we begin to think the heat will be too much for the late ones, even if water can be given them—that, unlike natural watering, giving none of the shelter of the cloud and the humid atmosphere. We have often enough been told of the fine green Peas gathered in the

open air at Naples on Christmas-day; but it would be interesting to know how such vegetables are obtained in the warmest parts of Italy and the south of France in July in such seasons as this.

Nothing could have looked better than several long rows of Scarlet Runners; but though these were mulched over the roots we found that the spikes of bloom were, instead of setting the pods, dropping the blooms nearly as fast as they opened. Looking on these as one of our best assistants for getting through the summer and autumn, we had them well drenched with sewage after stirring the ground, and then covered along each row with about 1 foot deep of dry litter. This has stopped the dropping of the flowers considerably, and furnished hopes for a good succession of gatherings; but yet there is a want of rich juiciness in the pods in use, very different from what they appear in a moist season.

Lettuce has been very good, and we shall have plenty for a little longer, but during the last two or three weeks young plants refuse to grow, and even when we can give a little water they come on so slowly, owing to the heat and dry atmosphere, that, resolved to have young growth if no other, we have cut-over a lot of strong plants that were showing their flower stems, and as the roots were well established we shall have lots of young offsets from these cut-over stools, until the weather permits us to have crisp Lettuces in the usual way.

Most of the complaints of failures with Mushrooms, such as young firm heads refusing to grow, and others that are larger going off and being infested with larvæ, are owing to the heat. The Mushroom does best when the temperature of the air is little above 60°, and then a cool moist atmosphere, whenever and however obtained, is one of the essentials to success. In one shed thatched with straw, open on one side, and shaded by large trees, we have not been troubled with these evils. The sprinkling of walls and pathways will do much to moderate a high temperature. Out of doors we have secured this low temperature and a humid atmosphere round the Mushrooms by sprinkling the bed with old hay not good enough for cattle, and keeping that hay frequently syringed with water.

FRUIT DEPARTMENT.

Apples and Pears, with not enough of rain drops to damp the foliage, have swelled freely of late, and in most cases the foliage is good. Raspberries have given us little more than the first good gatherings; the ground then became too dry to swell the succeeding crops, and the watering we could give could not benefit them. Red Gooseberries, which we used to keep late, are looking as if they needed to be picked, and even bushes in a border on the north side of a wall are looking distressed and want what we cannot give them. Orchard houses have needed an endless amount of watering to bring to maturity the heavy crops in pots and otherwise. We have used sewage at the roots for these trees, and against the wall freely, and with no injury, but our great want at present is clean water for syringing. We keep the surface of the ground wetter because we cannot throw much water on the foliage. In fact, water not quite clear does as much harm as good. Had we a good store even of water a little muddy, we would make a rough filter for ourselves by means of a barrel, but that at present is hardly worth doing until the supply is larger. Planted out Melons for a late crop, and thinned the wood of Fig trees to give a better chance to the second crop.

ORNAMENTAL DEPARTMENT.

Some of our best flower beds are rather disfigured by the attacks of the fly on nice edgings of variegated *Arabis*, white and yellow. We never had them injured by fly before. They will look dirty and dull until fresh leaves are formed. As yet we never had Brilliant scarlet *Pelargonium* better, and with just a little water once in ten days; but fine rows look as if they would suffer from a downpouring, and then some days would elapse before the flowering was as dense again, as, though healthy, the plants have made little growth for the last month. To what was said in recent numbers about florists' *Pelargoniums*, *Cinerarias*, *Primulas*, *Balsams*, *Cockscombs*, &c., we will merely add some remarks as to saving the seed of the best kinds of large-flowering herbaceous *Calceolarias*. As "AN OLD SUBSCRIBER" is anxious to keep his old plants, so as to secure the kinds, we advise him to give up all thoughts of saving his plants, which he has now in *Sinch* pots. We would proceed thus:—Take these pots to the shady north side of a fence, cut down the plants a few inches from their bottom—that is, a little above the rim of the pot; clean the stumps and leaves left, take away the surface soil, put in as high as the rim of pot light rich sandy soil, as sandy loam and leaf

mould, plunge or part plunge the pots, give a good watering and merely sprinkle the surface frequently. Before long young shoots will come from the bottom, either as suckers or otherwise; take these off when 2 or 3 inches in length, pot separately in the smallest pots, shade, and otherwise encourage at first, shifting into larger pots in autumn and winter as the plants may require. You may thus have plants of any size before May, and that for their health and beauty would far surpass those obtained by any other treatment of the old plants. —R. F.

COVENT GARDEN MARKET.—AUGUST 5.

We are again obliged to have recourse to a foreign market for a supply of good Cos and Cabbage Lettuces, our own growth offered here being very poor indeed. Those imported are, on the contrary, remarkably good. With the exception of Apples, Pears, and Plums, very little fruit is offered. Filberts are good, and the crop is also good, but Cob Nuts are not so promising. We are now without any Cauliflower, a thing almost unknown in any former year.

TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

ANTIRRHINUM BLOOM (*Overdressed*).—The post-office punches effectually prevented our observing whether the flower was abnormal. It was quite smashed.

CARNATION SEEDLINGS (*W. B.*).—We have received the stamps. The flowers were too withered by the heat for a relative judgment to be formed.

LILIUM LANCEFOLIUM—FUCHSIA TRAINING (*W. B.*).—*Lilium lancefolium* is hardy, therefore ought not to be exhibited as either a stove or greenhouse plant. We quite agree with you that Fuchsias are most graceful when grown in a pyramidal form with a single stem, and the branches untrained. If we were to award prizes we would give them to specimens without sticks, though those with sticks were rather superior.

PANSIES (*F. J.*).—Your Pansies are of the average kind, but too faded to be identified. Take cuttings for plants to flower in the spring, the young plants produce the finest flowers.

EXUDATION ON GRAPES (*Diadem*).—The exudation and disturbed bloom are probably caused by the excessive heat of the house, and the air being too dry. More moisture both at the roots of the vine and in the air would prevent it.

SAND—PEAT—SPHAGNUM (*Fred*).—We have examined the specimens supplied by Mr. W. Short, Horticultural Depot, Reigate, Surrey, and they are all good. As he supplies these either in large or small quantities, his depot is a great convenience.

PLANTING A GRAVE IN THE EAST INDIES (*J. W.*).—No one could advise you, the locality being "unknown." It may be near the snow in the Himalayas, or it may be in the torrid temperature of the tropical plains. The acorns and Horse Chestnuts you mention certainly would not succeed.

PLANTING STRAWBERRIES (*A Young Gardener*).—Select an open situation away from the shade of trees or buildings, thoroughly trench the ground to the depth of 2 feet, working in a liberal dressing of manure, breaking any clods, and otherwise well mixing the soil and manure. The ground may be made firm by treading, particularly in your case, as from being newly trenched it will be open and light. The ground must not be trodden if the weather is wet, as doing so will only tend to render it a compact mass. Plant after the first rain, the earlier the better. The

advice as to not digging the beds at any time after planting is sound, good top-dressings of manure being given.

POT PEACHES AND FIGS FLAVOURLESS (*J. Pim*).—We cannot account for the fruit of Peach and Fig trees in pots having no flavour when ripe, unless they have been either over-watered or over-shaded. Orchard houses will do much, but not impossibilities. If the roof be covered with Vines, there will not be enough of direct sunlight to give flavour to the crops beneath. We should think if your Vines are fully exposed there will be no want of flavour in the ripening fruit.

PEACH TREE MILDEWED (*Probo*).—The Peach leaves (No. 1), are infested with mildew. Give a good syringing, and dust the leaves and the parts of the shoots infested with the white powder-like fungus with flowers of sulphur. The cause of mildew appearing is not known, but the fungus is destroyed by dusting with flowers of sulphur. Give more liberal supplies of water to the roots, occasionally a thorough syringing, and admit air freely.

PLUM TREE INFESTED WITH RED SPIDER (*Idem*).—The Plum leaves (No. 2), are attacked by red spider. Syringe the tree forcibly with a solution of 2 ozs. of soft-soap to the gallon of water, directing the water against the under sides of the leaves, wetting the tree thoroughly in every part. This should be done in the evening, and repeated within a week. The roots should have a thorough watering with water, or, better still, weak liquid manure, mulching the ground around the tree with half-rotten manure.

CUTTING-BACK MIGNONETTE (*Idem*).—You may cut back the shoots of Mignonette that have flowered, leaving space for the new shoots, and the plant will flower freely on the young shoots. It is a half-hardy perennial.

OLEANDERS FLOWERING TWICE (*Spider*).—We cannot agree with you that your plant has flowered twice. We understood you to say that your plant had two shoots springing from the side of the flower spike, and that these had at their apex a prominence. You now say they were flower buds, therefore, the first flowers were borne by the wood of the previous year, and the succeeding flowers on the wood of the current year. This is not unusual, but the shoots so producing flowers have in the apex in the previous year embryo flower buds, and they elongate, and, of course, flower in the ensuing season. We have plants now in splendid bloom, both on shoots that have not grown at all this season, and on those that have, and on these plants there are many shoots of the current year that had not last year prominent apices, and these have not and will not flower this season, though the flowers exist now in the form of a prominent bud in the apex, but will grow a little next spring and bloom finely. It was to these buds that our remarks applied, whilst you applied them to buds in a forward state for development, and not as embryo flower buds.

RED SPIDER ON VINES (*Idem*).—You may have yellow leaves and not now have red spider, for the leaves once made yellow by red spider will not again become green. We presume you not only applied sulphur to the warmed flues, but give a good syringing afterwards. The application being ineffectual it should be repeated, as this inveterate enemy is only to be overcome by persevering resistance. The guano remedy is an effectual one, and so are all the others, as we have proved by experience.

CROCUS SEED SOWING (*Idem*).—The seed of the Crocus may be sown from this time to October, the sooner the better, in a bed of rich, rather sandy soil, placing the seeds thinly on the fine surface, and covering them with about a quarter of an inch of fine soil. You will have bulbs by the following autumn. When the foliage decays take them up, and replant them the same day in lines 6 inches apart, and 3 inches from bulb to bulb in the lines, covering them about an inch deep with fine soil. When the foliage appears mulch between the rows with decayed leaves or short manure, and leave them in this bed until they flower, keeping them clear of weeds, and stirring the soil between the rows in autumn. Do not remove them again until they flower, then take them up and plant them where required.

CUCUMBER PLANTS INFESTED WITH MEALY BUG (*Apprentice*).—The only means that we know likely to keep the mealy bug under in your case will be to give the plants a few good syringings with water at a temperature of 120°. This, and hand-picking, will enable you to keep the bug in check until the plants have done bearing, and then give the house a fumigation with sulphur, and a thorough cleaning.

BITTER CUCUMBERS (*S. E. B.*).—The chief cause of bitterness in Cucumbers is their being grown slowly. To have them sweet they should be grown quickly and cut young. We would never send to table at this season a cucumber of more than ten days growth, and we do not care to have them of greater size than will be cut up at once. Large Cucumbers are no longer sought after, and yet a large cucumber may be good, only cut it whilst young.

CUCUMBER CULTURE (*H. B.*).—You will never have good Cucumbers at such a temperature, 80° to 90° at night, and 110° during the day. In such weather, except by syringing the walls and shading, you cannot have a much lower temperature during the day; but with air the highest should, if possible, range from 80° to 90°. At night there need be no difficulty, as the thermometer out of doors is seldom above 70° at night, and from 65° to 70° will suit them better than from 80° to 90°.

PEACH TREES UNPRODUCTIVE (*An Amateur*).—Your trees are very vigorous. You could not do anything to promote their fruit-bearing in autumn or winter, but you may now do so by stopping the shoots for next year's bearing at 12 inches, and when they push later, a pinch out their points after they have made a leaf, and keep them closely pinched in to one leaf as often as new growths are produced. The shoots should not be left closer on the branches than 9 inches or a foot apart, and the branches ought to be fully that distance from each other. The leading shoots or main branches should not be stopped but trained-in at their full length; any laterals appearing on them should be stopped at the first joint or leaf, and immediately above it.

EGG-BEARING CHILERY NOT STONING (*Idem*).—After the fruit is set give a good watering with liquid manure, and mulch around the stem for a distance of 2 or 3 feet with 2 inches in depth of short manure, cow dung being best, continuing the waterings during dry periods until the fruit begins to ripen. The curling of the bark is peculiar to the tree.

COVENT GARDEN MEASURES (*S. F.*).—A Punnet for Mushrooms is 7 inches by 1 inch; Sea-kale punnets 8 inches in diameter at top, 7½ inches at bottom, and 2 inches deep; Radish punnets 8 inches in diameter at

top and 1 inch deep to hold six hands, or 9 inches by 1 inch to hold twelve hands; salading punnets, 5 inches by 2 inches. *A Half Sieve* contains 3½ imperial gallons, and averages 12½ inches in diameter and 6 inches in depth. *A Sieve* contains 7 imperial gallons. Diameter, 15 inches; depth, 8 inches. A sieve of Peas is equal to 1 bushel; a sieve of Currants to 20 quarts. *A Bushel Sieve*, 10½ imperial gallons. Diameter at top, 17½ inches; at bottom, 17 inches; depth, 11½ inches. *A Bushel Basket* ought when heaped to contain an imperial bushel. Diameter at top, 14 inches; at bottom, 10 inches; depth, 17 inches. Walnuts, Nuts, Apples, and Potatoes are sold by this measure. A bushel of the last-named cleaned weighs 56 lbs., but 4 lbs. additional if they are not washed. *A Pottle* is a long tapering basket that holds rather over a pint and a half. A pottle of Strawberries should hold half a gallon, but never holds more than 1 quart; a pottle of Mushrooms should weigh 1 lb. *A Hand* applies to bunches of Radishes, which contain from twelve to thirty or more, according to the season. *A Bundle* contains from six to twenty heads of Broccoli, Celery, &c.; Sea-kale, twelve to eighteen heads; Rhubarb, twenty to thirty stems according to size; and of Asparagus, from 10 to 125. *A Bunch* is applied to herbs, &c., and varies much in size according to season. A bunch of Turnips is twenty to twenty-five; of Carrots, thirty-six to forty; of Greens as many as can be tied together by the roots. Grapes are put up in 2-lb. and 4-lb. punnets; new Potatoes by the London grower in 2-lb. punnets. Apples and Pears are put up in bushels, sieves, or half-sieves. *A Hundredweight* of Kentish Filberts is 104 lbs. Weights are always 16 ozs. to the pound. Being often made of osier or deal shavings the measures vary triflingly in size.—(*Hogg's Year-book for 1868*.) Your other question shall be attended to in a week or two.

GOURDS (H. C.).—The cultivation of Gourds does not differ from that of the Vegetable Marrow. All they require is to be sown in heat, to be grown in pots, and planted out at the end of May in good rich soil over a slight hotbed, making choice of a warm situation, sheltered from winds. The varieties you name may be edible, but we have no experience of them in that way.

SOWING CARNATION SEED (Idem).—The present is not a good time for sowing Carnation seed. It is best sown in April. Seed sown now will hardly furnish plants sufficiently strong for blooming next year.

THRIPS ON CINERARIA LEAVES (A. S. A.).—At first we thought your Cineraria leaves were scorched, or rather scalded, by hot vapour, the result of not giving air early enough, but on closer inspection we found traces of where we think thrrips had been, though no insects. In that case you must smoke and shade, as well as give air early.

VINE LEAVES SHADING GRAPES (Idem).—Never mind the Vine leaves shading the bunches, at least, cut away no large leaves, but if the shade is very dense thin out the laterals and some smaller leaves. The thickness of a leaf will benefit the branches rather than otherwise.

MUSHROOMS NOT SWELLING (J. R. Boyd).—The chief reason why the Mushrooms do not swell is the excessive heat. We do not think the watering over the hay would be so injurious. A light covering of hay, and that frequently just sprinkled with water, would be so far in their favour that the beds would be kept cooler. If you think the beds are rather wet remove all the hay covering, brush the bed lightly with a hair brush, and suspend a few inches above the bed a mat or cloth, and this and the walls, &c., sprinkle or rather dew with water to produce a colder atmosphere by evaporation. We think that then your pin-head Mushrooms will become larger and grow. Much heat for many things is as prejudicial as too much cold; indeed, we have had good Mushrooms from beds slightly frosted.

HEATING A SMALL PLANT STOVE (X. Y. L.).—We presume the fireplace is to be in your small house, and if not well sunk you may have a difficulty with back draught at times. The flue we should think quite sufficient for such a small house, and more especially if you confined your attention to Cactuses and other succulents. Your hot-water cistern would be useful if you also grow softwooded stove plants; but a small

house confined to succulents alone would be more unique and interesting. You do not say how the cistern is to be heated. A square iron stove, with a pan of water set on the top, and a pipe-chimney into the open air, would be the simplest mode of heating such a house for succulents.

SELECT ROSES (Deconiensis).—"I have not cultivated *Mario Bannmann*, *Marie Kady*, and *Monsieur Noiman*; but I mean to buy the first and third, and also *François Treyve*. The last is much recommended to me. With regard to *Madame Charles Wood*, *Oliver Delhomme*, and *Beauty of Waltham*, I may say that *Madame C. Wood* is a fine large platitude; *Oliver Delhomme* did not grow well with me; and *Beauty of Waltham* was not so good as *Lady Suffolk*. As regards *Luc Franco*, it is distinct and pretty. It has, however, a long limp neck and reflexed petals. It is a free and quick bloomer. I recommend in red, the growth and foliage are good. Its colour is a fine vermilion red. The growth and foliage is good. *Antoine Ducher* is also a fine rose, of strong growth, and with fine foliage. In the line of rose colour I think well of *Mlle. Jeanne Marix*, and the new rose *Madame Alice Dureau*. They promise well, but I must see more of them before I can give them a certificate. I merely call attention to these last two roses. I never saw better growth, health, and foliage than in *Jeanne Marix*.—W. F. RADCLIFFE."

GRAPES MARKED (In Old Subscriber).—The berries are what gardeners call "ruined." They usually consider it to be caused by handling the berries, or rubbing of the hand against them in the process of thinning. We do not think those are the causes, but exposure, especially when moist and in a high temperature, to sudden cold draughts of air.

TOBACCO GROWING (G. A.).—1, Removing the flowers will tend to increase the size of the leaf, but it is seldom if ever practised. 2, The round thick leaves are the best and strongest, but the others are good. 3, The best plan of drying is that you name, only we think it well to dry the leaves as your gardener does, then damp them, placing in layers in a box, and under pressure for a time until they warm, then take them out and shake them out to cool, placing them on shelves to dry, and when dry store them away in boxes or tubs. 4, The temperature is immaterial, only keep the tobacco dry. 5, Of the use of the flowers picked off we are not aware. 6, The growing of tobacco for fumigating purposes is lawful, only you must not grow more than a certain number of plants, and it may be given away the same as any other article.

WATER IMPREGNATED WITH IRON (D. R. C.).—The water although coming a distance will not be injuriously affected by the iron pipes. If it does dissolve any of the oxide of iron, exposure in the cistern will free it from the impurity. We use water from closed iron tanks, and have no bad results. Putting lime in the cistern is not desirable.

SALVIA ARGENTEA SEED SOWING (Idem).—The seed should be sown next March in a hotbed. By pricking out the seedlings when large enough to handle, and growing them in heat, you will have at the end of May plants suitable for planting out then. They should be well hardened-off prior to doing so.

LOAM BECOMING HARD (Idem).—There is nothing in tidal water that would injure the loam. The soil is deficient of sand, and is naturally too tenacious. You may improve it by adding sand and limy rubbish liberally.

NAME OF FRUIT (S. A.).—We cannot identify your Apple.

NAMES OF PLANTS (Joseph).—We cannot undertake to name the varieties of florists' flowers. They are too numerous and too nearly alike. (*A. R.*)—*Campanula betonicifolia*, *Hedysarum coronarium*. (*A. S. P.*)—*Cerastopetalum gummiferum*, *Eschynanthus speciosus*. (*Jane*)—*Lathyrus sylvestris* (narrow-leaved). (*A Cottageer, Thirk*)—*Taxacetum vulgare* (Common Tansy). (*T. H. C. D.*)—*Eryngium alpinum*. (*Essex*)—*Pteris serrulata*. (*M. T. F.*)—1, *Retinospora pisifera*; 2, *Lastrea Filix-mas*; 4, *Selaginella Martensii*. (*J. Murray*)—*Potentilla tormentilla*. (*H. Wright*)—*Dipsacus fullonum*.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

GAME FOWLS FOR EXHIBITION.—No. 2.

GAME fowls that run too high in flesh on their walks when about to be exhibited should be taken up and penned for a week or two, and their diet reduced to one moderate meal of corn a-day, with a certain proportion of green food. This also accustoms them to penning before exhibition, as well as to handling, and renders them tamer and quieter. Care, however, should be taken that the two hens are not quarrelsome, also that the cock's sickle feathers do not get broken while in the pen.

Birds that are in proper condition and not too fleshy on

their walks, do not require any dieting, and need only be penned for a short time to accustom them to being so, to tame them a little, and to see that the hens agree well.

Just before putting the fowls up for exhibition some give them a "sherry or port sop," pretty strong, with their last feed, or some toast steeped in strong ale, which is not a bad plan before sending them on a long journey to shows. Some give a proportion of hard peas with the feeds of corn for months before exhibiting them, and some always feed them in this way.

Game fowls on lonely country walks sometimes become too shy of people for exhibition, the hens being too timid and frightened; but Game cocks being of a bold disposition soon get over this. For this reason lonely walks are, perhaps, bad for exhibition birds, though otherwise good in almost all respects.

Feeding Game fowls too high is a great mistake, and they should forage for themselves as much as possible, but they should have one good meal of solid corn in the morning or middle of the day. In frosty, cold, or snowy weather they should have two or three good corn feeds daily. Young and growing chickens should, however, be always fully fed, though never wastefully overfed. Game fowls are economical feeders. —NEWMARKET.

POSTING LISTS OF PRIZES AWARDED.

"If money were as certain as your waiting,
'Twere sure enough."—*Shakespeare*.

The poultry shows are coming thick upon us. May I ask for a corner in your valuable paper just to state a practical grievance which I am constantly made to feel, but which I think ought not to exist? An instance will explain my meaning as well as a thousand words.

I sent on July 23rd two pens of fowls to Grantham. When I entered the birds I enclosed money for a catalogue with list of awards, and I requested as politely as I knew how, that the Secretary would kindly forward the same as early as possible. This is July 28th, and I have received no catalogue, my birds were returned safely, and in good time and condition, and for this I am thankful. The hampers contained no commendation ticket, and so I suppose I was not among the fortunate exhibitors; but surely it is not fair under the circumstances that I should be kept so long in suspense. The secretary of a show has, of course, too much to attend to on the day of exhibition to send off personally the catalogues which have been ordered and paid for; but it certainly does seem a simple thing to get a sharp intelligent boy who in one hour, and for sixpence, would fold, direct, and post all that were required. This might be done before the early post went out, and thus exhibitors living at a distance would know the next morning how they stood, and much chagrin and dissatisfaction would be avoided. —P. P.

DURHAM COUNTY POULTRY SHOW.

THE twenty-fifth annual Exhibition in connection with the Durham County Agricultural Society was held on the 31st ult., at the ancient borough of Hartlepool, under most favourable auspices, and has proved a highly successful Show. Subjoined is the list of prizes for poultry.

SPANISH.—First, T. Blackburn, Northallerton. Second, — Bearpark, Northallerton. **CHICKENS.**—First, — Bearpark. Second, R. Hawkins, Seaham.

DORINGS.—First, J. White, Waraby. Second, D. Rutter, East Rainton. **CHICKENS.**—First, J. White. Second, G. H. Procter, Durham.

COCHIN-CHINA.—First and Second, G. H. Procter. **CHICKENS.**—First and Second, G. H. Procter.

PRIMA POTRA.—Prize, Mrs. A. M. Burdon, Castle Eden. **HAMBURGERS (Silver-pencilled).**—First, — Bearpark. Second, W. Lawrenson. **CHICKENS.**—First, — Bearpark. Second and Commended, J. White.

HAMBURGERS (Gold-pencilled).—First, J. Webster, Whithy. Second, — Bearpark. **CHICKENS.**—First, J. Webster. Second, — Bearpark. Commended, T. Boddum, Hutton-le-Hole.

HAMBURGERS (Black).—First, T. B. Burdon, West Hartlepool. **HAMBURGERS (Gold-spangled).**—First, — Bearpark. Second, W. Whitfield, Hutton-le-Hole. **CHICKENS.**—First, J. Bell, Thorton-le-Moor, Northallerton. Second, W. Whitfield.

HAMBURGERS (Silver-spangled).—Prize, — Bearpark. **CHICKENS.**—First, Bearpark. Second, W. Munsfield.

GAME (Black-Reds).—First, T. Horne, Tow Law. Second, R. Just. **CHICKENS.**—First, T. Horne. Second, R. Hawkins, Seaham. Commended, T. Blackburn, Northallerton.

GAME (Any other variety).—First, R. Hawkins. Second, J. Wilson, Whitworth Woodhouse. Commended, R. Goldsborough, Hutton. **CHICKENS.**—First, W. Nunningdale. Second, T. Horne. Commended, R. Goldsborough.

GAME BANTAM.—First, J. Gales, Kirby. Second, A. Baglass, Carvill. **CHICKENS.**—First, T. Horne, Tow Law; J. Wilson, Whitworth Woodhouse. Commended, W. Mansfield, Thirsk; A. Baglass; W. Lawrenson.

BANTAM (Any other variety).—Second, R. Emerson, Stokesley. **CHICKENS.** First, A. Baglass. Second, F. Wilson, Hartlepool.

DUCKS (Roman).—First, T. B. Burdon, West Hartlepool. Second, O. Trechmann, Hartlepool. **DUCKINGS.**—Second, P. Easton, Hart.

DUCKS (Aylesbury).—First, Mrs. A. M. Burdon, Castle Eden. Second, R. Just, Staunton. **DUCKINGS.**—First, Miss Smith, Stokesley. Second, J. Storey, Pictou.

ANY OTHER VARIETY.—First, Mrs. A. M. Burdon. Second, Rev. J. G Milner, Bellerby.

BRIDLINGTON POULTRY SHOW.

THE annual Show of this Society took place on Wednesday, the 29th of July, and proved a decided success, the attendance of visitors being more numerous than at any previous Exhibition.

COCHIN-CHINA.—First, Miss E. Croyke, Bridlington. Second, O. A. Young, Driffield.

DORRING.—First, G. Holmes, Driffield. Second, D. White, Driffield.

SPANISH.—First, G. Holmes. Second, H. Merkin, Driffield.

GAME.—First and Second, W. Charter.

POLANDS.—First, Mrs. Procter, Hull. Second, O. A. Young.

HAMBURGERS (Gold-spangled).—First, G. Holmes. Second, J. Blanchard, Driffield.

HAMBURGERS (Silver-spangled).—First, G. Featherstone, Tranby Park Lodge, Hessle. Second, G. Holmes.

HAMBURGERS (Golden-pencilled).—First, G. Holmes. Second, A. Hawe, Barnston.

HAMBURGERS (Silver-pencilled).—First and Second, G. Holmes.

BANTAMS (Any variety).—First and Second, R. Robson, Hull.

BANTAMS (Distinct variety).—**CHICKENS.**—First, G. Holmes. Second, J. Blanchard.

SINGLE COCKS.

COCHIN-CHINA.—First, Miss E. Croyke. Second, W. Smith, Bridlington.

DORRING.—First, J. O. Young. Second, W. Charter, Driffield.

SPANISH.—First, G. Holmes. Second, R. Wilson, Carnaby.

GAME.—First, O. A. Young. Second, J. Woodhouse, Bridlington.

BANTAM (Any variety).—First, R. Robson. Second, W. Charter.

GESE.—First and Second, O. A. Young.

TURKEYS.—First, H. Merkin, Driffield. Second, Mrs. Pepper, North Frodingham. **POULTS.**—First, Mrs. Pepper. Second, Mrs. Brumpton, Mount Pleasant, Muston.

DUCKS (Aylesbury).—First, O. A. Young. Second, J. Smith, Bridlington. **DUCKINGS.**—First, O. A. Young. Second, J. Smith.

DUCKS (Any variety).—First, O. A. Young. Second, G. Holmes.

GUINEA FOWL.—First, G. Holmes. Second, O. A. Young.

PIGEONS.—**CROPPERS.**—First, B. Key, Beverley. Second, W. Stark, Bridlington. **TUMBLERS.**—First, B. Key. Second, H. Payne, Gillingham.

FANTAILS.—First, H. Payne. Second, R. Smith, Bridlington. **JACOBS.**—First, B. Key. Second, H. Payne. **Any New or Distinct Variety.**—First, O. A. Young. Second, B. Key.

RABBITS (Any breed).—First, J. Tucker, Bridlington Quay. Second, W. Charter.

FANCY RABBIT.—Prize, W. S. Hornby, Clifton Garth, York.

The Judges for poultry were—Mr. S. Bailby, Beverley, and Mr. J. Falkner, Hummaby.

GOOLE POULTRY SHOW.

THIS was held July 30th, in a large enclosure known as Lock Hill, whence there was a fine view far down the river and of the hills beyond. The site selected was excellent, for the cooling breeze from the river helped to modify the scorching heat, which otherwise would have been unbearable. The Committee, in addition, had taken the precaution of irrigating the whole of the ground on the day previous to that of the Show, so that it formed on the whole a not-at-all-disagreeable promenade.

Besides the show of Poultry and Pigeons, Rabbits and cage birds were also exhibited, but not having received a list of awards to the last two we are unable to state who were the prizetakers. The attendance of visitors was large, and it is hoped that the funds will in consequence be so much augmented that the Committee will be able to offer more tempting prizes at future meetings. The thanks of the exhibitors generally are due to the Honorary Secretaries, Messrs. Bromley and Sinton, for the great regularity and skill with which the arrangements were carried out.

Spanish, Dorkings, and Cochins were but poor, but *Game* were shown in decent trim, considering the season, and the cap pen of Mr. Julian was well worthy of its position. Excellent *Hamburgs* were shown by Messrs. Beldon, Jessop, and White. *Polish* were faultless, and the *Crev. Crevs* were very fine.

Among single hens Spanish were first, and Golden-spangled Hamburgs second.

The single cocks were not good, and the chickens poor, except the first-prize Spanish of Messrs. Newbitt.

Game Lantuns were but moderate, excepting the first-prize pen, which was perfect. *Geese* and *Turkeys* were good, and some extraordinary *Roman Ducks* and *Guinea Fowls* were also shown.

Among *Pigeons*, the Carriers, Pouters, and Tumblers were very good, but the Barbs were poor. The *Jacobins* were all that could be desired, and an extra-second prize was awarded. The same may also be said of the Trumpeters and Fantails. An excellent pen of Red Turbats was first, and Silvers second. Owls and Nuns had each an entry, but the birds were very poor.

The following is a list of the awards for Poultry and Pigeons:—

SPANISH.—First, T. C. & E. Newbitt, Epworth. Second, J. Thresh, Bradford. Highly Commended, S. Robson, Brotherton.

DORRINGS.—First, H. Beldon, Bingley. Second, Dr. Horsfall, Carlton Grange.

COCHIN-CHINA.—First, H. Beldon. Second, J. L. Williams, Goole. Commended, W. Watson, Howden Dyke; Dr. Horsfall.

GAME (Black-breasted and other Reds).—First, F. Sales, Crawle. Second, E. Aykroyd, Bradford. Commended, W. Hawksworth, Goole.

GAME (Duckwings and any other variety).—First, H. M. Julian, Hull. Second and Commended, J. Remison, Holme-on-Spalding-Moor.

GAME (Any variety).—Cap, H. M. Julian. Highly Commended, F. Sales. **HAMBURGH (Golden-spangled).**—First, H. Beldon. Second, J. White, Whitley, Netherton, near Wakefield. Highly Commended, S. Smith, Northorham.

HAMBURGH (Silver-spangled).—Prize, H. Beldon.

HAMBURGH (Golden-pencilled).—First, J. R. Jessop, Hull. Second, H. Beldon. Highly Commended, S. Smith.

HAMBURGH (Silver-pencilled).—Prize, H. Beldon.

POLISH (Any variety).—First and Second, H. Beldon.

ANY OTHER PURE OR DISTINCT BREED NOT PREVIOUSLY CLASSED.—First and Second, H. Beldon (French and Brahma).

ANY VARIETY.—*Hens*.—First, J. Thresh. Second, T. C. & E. Newbitt. Commended, J. Ellwood. *Cock*.—First, F. Sales. Second, R. Thornton, Goole. *Chickens*.—First and Second, T. C. & E. Newbitt (Black Spanish and Golden-spangled Hamburgs). Highly Commended, J. Kenison, Holme-on-Spalding-Moor. Commended, J. Hirst.

GAME BANTAMS.—First, W. F. Entwistle. Second, W. Clayton, Howden.

BANTAMS (Any variety except Game).—First, T. C. Harrison, Hull. Second, J. R. Jessop, Hull.

GAMB BANTAMS.—*Cock*.—First, A. Braham, Potternewton. Second, H. Beldon. Commended, W. F. Entwistle; W. Clayton; J. Rogers, Goole; S. Smelt, Beverley; T. Scott.

EXTRA.—Highly Commended, J. L. Williams (Cochins).

GREENE.—Prize, J. White, Whiteley, Netherthorpe.

TURKEYS.—Prize, Dr. Horsfall, Carlton Grange.

DUCKS.—Prize, J. White. Highly Commended, T. C. Harrison. Commended, J. L. Williams; — Indie, Sand Hall.

GUINEA FOWLS.—First, T. C. Harrison. Second, C. Hayeroff, Thorne.

PIGEONS.

CARRIERS.—First, J. Thompson, Snaith. Second, J. Hawley. Highly Commended, S. Robson. Commended, H. Strickland, Snaith.

CROPPERS.—First, S. Robson. Second, T. C. & E. Newbitt. Highly Commended, J. Hawley; S. Smelt. Commended, J. Hawley; J. Thompson.

TUMBLERS.—First, J. Hawley. Second, J. Thompson. Extra Second, C. Gravil, Thorne. Highly Commended, J. Hawley; T. C. & E. Newbitt. Commended, P. Cowling, Swinestead.

BARNS.—First, J. Hawley. Second, J. Thompson.

JACOBS.—First, J. Hawley. Second, J. Thompson. Extra Second, T. C. & E. Newbitt. Highly Commended, J. Thompson.

TRUMPETERS.—First, S. Robson. Second, J. Hawley. Extra Second, T. C. & E. Newbitt. Highly Commended, J. Thompson; H. Strickland. Commended, J. Hawley; J. Thresh.

OWLS.—Prize, J. Thresh.

TURBITS.—First, J. Thompson. Second, J. Hawley. Highly Commended, T. C. & E. Newbitt.

FANTAILS.—First, T. C. & E. Newbitt. Second, J. Hawley; R. J. Bell. Highly Commended, J. Thompson; J. Hawley; T. C. & E. Newbitt.

NUNS.—Prize, J. Thompson.

The Judge was Mr. E. Hutton, Pudsey.

HASLINGDEN POULTRY SHOW.

At this Show, held July 30th, there was an increase over other years in every department, the entries being 270 more than any year before. The subscribers are also more, and the visitors were some two thousand more than usual. There were nine thousand people on the ground. The following is a list of the awards:—

COCHIN-CHINA.—First, W. A. Taylor, Manchester. Second, C. Sidgwick, Keighley. *Chickens*.—First and Second, W. A. Taylor. Commended, C. Sidgwick.

COCHIN-CHINA (Any other variety).—First, T. Stretch, Ormskirk (Partridge). Second, C. W. Brierley. *Chickens*.—Cup, J. A. Taylor, Manchester. Second, J. R. Rodbard, Writington, near Bristol.

BRAMMAS (Dark).—Cup, E. Leech, Rochdale. Second, C. Turner, Chester. *Chickens*.—First, G. H. Roberts, Preston. Second, G. Dixon, jun., West strand, Whitehaven. Commended, W. Goulding, Sale, near Manchester.

BRAMMAS (Light).—First, H. Lacey, Hehden Bridge. Second, H. Dowsett, Pleshey, Essex. *Chickens*.—First, J. Pares, Postford, near Guildford. Second, D. Causser, Erdington, near Birmingham. Highly Commended, J. Pares.

DOAKINGS (Any colour).—Cup, J. White, Warlaby, Northallerton (Grey). Second, C. W. Brierley. *Chickens*.—First, D. Gedlaty, Meigle, N.E. Second, Mrs. M. Seamus, Aylesbury. Commended, J. Stott, Bealey, near Rochdale; H. Pickles, jun., Earby, near Skipton.

SPANISH (Black).—Cup, H. Beldon, Goitcock, Bingley. Second, J. Newton, Silsden, near Leeds. *Chickens*.—First, H. Beldon. Second, J. Walker, Wolverhampton.

SINGLE GAME COCKS (Any colour).—First, C. W. Brierley. Second, J. Fletcher, Stonecrough, near Manchester. Third, W. Julian, Hull. *Within four miles of Haslingden* (Any colour).—First, J. Bowdles, Newchurch (Brown Red). Second, G. & C. Furness, Accrington (Pile). Commended, W. Westwell, Baxenden (Brown Red).

GAME.—Cup and Second, J. Fletcher. Highly Commended, L. Biney, Manchester. *Chickens*.—First, J. Fletcher. Second, W. Bourne, Hearnly, near Stockport (Brown Red). Highly Commended, H. Mann, stand (Black Red).

HAMBURGERS (Golden-pencilled).—First, H. Beldon. Second, H. Pickles, jun. *Chickens*.—First, H. Beldon. Second, S. Smith, Northowram, Halifax. Highly Commended, J. Robinson, Fidsworth.

HAMBURGERS (Silver-pencilled).—First, C. Haworth, Holme, Haslingden. Second, H. Beldon. *Chickens*.—Cup, H. Beldon. Second, J. Robinson.

HAMBURGERS (Golden-spangled).—First, E. Brierley. Second, W. Driver, Keighley. *Chickens*.—First, W. Driver. Second, S. & R. Ashton, Mottram.

HAMBURGERS (Silver-spangled).—Cup, H. Beldon. Second, J. A. Taylor, Manchester. *Chickens*.—First, H. Beldon. Second, W. Parr, Patricroft.

HAMBURGERS (Black).—First, C. Sidgwick, Keighley. Second, J. Robinson. *Chickens*.—First, C. Sidgwick. Second, J. Robinson.

ANY OTHER VARIETY.—First, H. Beldon (Polands). Second, L. Biney (Buff Polish). Highly Commended, R. G. New, Rainhill (Sultans).

SELLING CLASS (Any variety).—First and Second, W. A. Taylor.

GAME BANTAMS.—*Cock*.—First, W. F. Entwistle, Leeds. Second, T. W. Morris, Rochdale. Third, J. J. Cousins, Chapelallerton, near Leeds.

GAME BANTAMS.—Cup, J. R. Robinson, Sunderland. Second, G. Charnley, Preston.

BANTAMS (Any variety).—First, T. Burgess, Brighouse, Yorkshire (Pekins). Second and Highly Commended, T. C. Harrison, Hull.

TURKEYS.—First and Second, E. Leech.

GREENE.—First, T. Statter, jun., Whitefield. Second, E. Leech.

DUCKS (Aylesbury).—First, E. Leech. Second, Mrs. M. Seamus, Aylesbury.

DUCKS (Rouen).—First, T. Houlker, Blackburn. Second, E. Leech.

DUCKS (Any other variety).—First, C. W. Brierley. Second, S. & R. Ashton, Roe Cross, Mottram, Cheeshire (Carolinas).

DUCKS (Selling Class).—First, T. Houlker. Second, E. Leech. Highly Commended, T. Wakefield.

PIGEONS.

CARRIERS.—First, J. Hawley, Bingley. Second, G. H. Roberts' Penwortham.

TUMBLERS.—First and Second, J. Hawley. Highly Commended, J. Fielding, jun., Rochdale; J. Bromley, Bolton.

BARNS.—First, G. H. Roberts. Second, W. Hargreaves, Baepn.

OWLS.—Cup and Second, J. Fielding, jun. Highly Commended, F. Graham, Birkenhead.

CROPPERS.—First, J. Hawley. Second, H. Vardley.

FANTAILS.—First, J. Hawley. Second, H. Vardley.

TURBITS.—First, T. Newell, Ashton-under-Lyue. Second, Jesse Thompson, Bingley.

DRAKONS.—First, B. Carlisle, Rishon. Second, F. Graham.

TRUMPETERS.—First, Jesse Thompson. Second, J. Hawley.

ANTWERPS.—First, H. Vardley. Second, J. Hawley.

ANY OTHER VARIETY.—First, Jesse Thompson (Red Jacobins). Second, T. Kenyon, Accrington (Black Magpies).

DRIFFIELD POULTRY SHOW.

THIS Show, in connection with the Driffield Agricultural Society, took place on the 31st ult., when 226 pens of poultry were entered for competition. Notwithstanding the lateness of the season, and many of the birds showing symptoms of moulting, several excellent pens were shown, more particularly in the Game and Polish classes; in the latter Mrs. Procter took all the prizes.

DORKINGS.—First, W. Charter, Driffield. Second, O. A. Young, Driffield. *Chickens*.—Prize, J. Blanchard, Driffield. *Cock*.—Prize, Miss S. E. White, Driffield.

SPANISH.—First, G. Holmes, Driffield. Second, H. Merkin, Driffield. *Cock*.—Prize, G. Holmes.

GAME (Black-breasted and other Reds).—First and Second, W. Boyes, Beverley. *Cock*.—Prize, G. Carter, Bcadle.

GAME (Duckwing and other Greys).—First and Second, W. Boyes. *Cock*.—Prize, J. Laycup, Driffield.

GAME (Any other variety).—First, W. Charter. Second, G. Holmes. *Cock*.—Prize, R. Brown, Pickering.

GAME (Any variety).—*Chickens*.—Prize, W. Boyes.

COCHIN-CHINA.—First, W. Charter. Second, R. Loft, Woodmansey.

Chickens.—Prize, R. Loft. *Cock*.—Prize, R. Loft.

POLANDS.—First and Second, Emma Procter, Hull. *Cock*.—Prize, Emma Procter.

HAMBURGERS (Golden-spangled).—First and Second, T. Holmes. *Cock*.—Prize, T. Holmes.

HAMBURGERS (Silver-spangled).—First, C. Richardson, Cottingham. Second, — Holmes. *Cock*.—Prize, — Holmes.

HAMBURGERS (Golden-pencilled).—First, — Holmes. Second, Ann Robinson, North Frodingham. *Cock*.—Prize, W. Charter.

HAMBURGERS (Silver-pencilled).—First, — Holmes. Second, W. Charter. *Cock*.—Prize, — White.

ANY VARIETY.—*Chickens*.—Prize, — Holmes.

ANY OTHER PURE AND DISTINCT BREED NOT PREVIOUSLY CLASSED.—First, R. Loft. Second, A. Watts, Garton. *Cock*.—Prize, Mrs. Jordan, Elmswell.

FAIRYBIRD.—First, R. Loft. Second, G. Robinson. *Cock*.—Prize, G. Robinson.

BANTAMS (Black and White).—Second, W. Charter. *Cock*.—Prize, J. Bryan, Beelford.

BANTAMS (Any other variety).—First, Mrs. Blanchard, Driffield. Second, T. Holmes. *Cock*.—Prize, W. Laycup.

GEES.—First, G. R. Young, Driffield. Second, R. Brown. *Goslings*.—Prize, J. Nesfield, Buckton, Bridlington.

TURKEYS.—First, Mary Morking, Driffield. Second, Ann Pepper.

Poult..—Prize, B. Pepper.

DUCKS (Aylesbury).—First, M. Harrison, Warton. Second, O. A. Young.

DUCKS.—First, G. R. Young. Second, Mrs. Jordan, Eastburn.

Ducklings.—Prize, G. R. Young.

ANY OTHER VARIETY.—Prize, W. Charter. *Ducklings*.—Prize, Mrs. Jordan.

PIGEONS.—*Croppers*.—Prize, B. Key, Beverley. *Carriers*.—Prize, J. R. Brand, Driffield. *Trumpeters*.—Prize, J. Marshall, Driffield. *Jacobins*.—Prize, C. N. Lythe, Cottingham. *Tumblers*.—Prize, T. Harper, Driffield.

Bars.—Prize, B. Key. *Nuns*.—Prize, J. Marshall. *Any other variety*.—Prize, G. Pickering.

RABBITS (Any Breed).—First, W. Charter. Second, C. G. Pickering, Driffield.

JUDGES.—Mr. T. Challoner, Barlborough, and Mr. J. O. Jolly, Green Hammerton.

CANKER IN PIGEONS.

WITH regard to that part of "A FOREIGNER'S" article upon Pigeons relating to canker, I have found the plan of removing the whole of the growth at once by far the best, and immediately well rubbing over the part the dry powdered sulphate of copper, called by chemists "exsiccated." The bleeding that follows the removal of the exudation is immaterial; in fact, I think it advantageous, as it indicates the complete removal of the growth, and will readily stop after the sulphate has been applied, or if not, the perchloride of iron can be used as mentioned by me when writing about Canaries. If the disease has advanced into the throat and mouth, I should with a feather apply borax dissolved in glycerine, and this I am satisfied would readily cure it.

I confess I am dubious of the efficacy of pulling out the tail

feathers, for as a rule the bird will have been lowered quite enough by the few drops of blood lost at the mouth, and the copper, which with all care can hardly be prevented from entering the stomach.—W. S.

PIGEON-JUDGING.

IN Pigeon-judging "A FOREIGNER" says no dealer ought to judge, and in this I quite agree. If committees would ask for advice from any of the columbarian societies as to what fanciers or breeders are competent to judge, then we should profit by experience. Many gentlemen from all parts of the country would come forward as judges.

Again, take the way in which the Judges were appointed at the last Birmingham Show. At the eleventh hour, or shall I say as the two Judges were proceeding to their duties, another gentleman being of opinion that they had more work to perform than their time would allow of, asked them to go to the Committee, and say he would withdraw his entries, and help them to judge, if they would allow him to do so, which the Committee did. Is this fair? I think the fairest plan would be to have one judge from London, one from Lancashire, and the other a local gentleman, and let each take a certain number of classes, according to what variety of birds he has kept, and judge them on his own responsibility; then when an exhibitor asks the judge why he has passed over such and such birds, there would be no cause for the oft-heard remark, that "Mr. So-and-So was with me, he would not give way, and I was obliged to do so."

Now, with regard to the small number of the entries at some of the shows, the reason, in my opinion, is because dealers are allowed to exhibit with fanciers. What fancier has a chance with a dealer? Look at the last Bath and West of England Show; two of our largest dealers took seventeen out of twenty-eight prizes. Again, take the "Any other variety" class at the last Birmingham Show; one dealer exhibited no less than twelve pairs of recently-imported birds. Has any fancier a chance? In all columbarian societies there exists a rule to the effect that no dealer shall be admitted a member; could not a similar regulation be framed for the principal exhibitions? Why should the dealer and Pigeon-fancier be placed on equal terms in exhibiting, when the nurseryman and amateur flower-grower have separate classes? If a fancier go to a dealer and buy his best pair of birds to exhibit, he is compelled to give a good price for them. As soon as he is gone the dealer sets to work, and scours the country to obtain another pair as good, if not better, than that which he has just sold, and at the first show at which the fancier and dealer meet, the former is beaten with his own money. Allow me to quote Mr. Fulton (see page 415 of last volume)—"It is a well-known fact that many good fanciers and exhibitors have of late given up the idea of sending their birds for competition" owing to the reason I have just named; and is it not discouraging to exhibit when we are placed on equal terms?

Separate classes could not be formed at all shows, but I think it would be well to make a trial of doing so at one of the principal shows. The summer shows I always consider the dealers' harvest. Look at the columns of "our Journal," and see who are taking the prizes; they speak for themselves, though I admit that no ardent fancier would take his birds from their eggs or young to send to shows at this season.

To carry out such a rule as I propose, the question would arise, Who are dealers? Rather an awkward question to decide; still, if they will not come forward and acknowledge themselves dealers, it would become the duty of all columbarian societies to send up a list of names to the London Society; perhaps, better still, appoint an independent gentleman to decide. I think it is a question of the greatest importance to the fancy at the present time, and the period is not far distant for a great change to take place, for the fancy has the worst of it always.

It is the duty of every fancier now to join a columbarian society, and endeavour to amalgamate the whole of the societies in England and Scotland together, and form a centre in London. Their union would be strength, and our voices would be heard at every Pigeon show throughout the kingdom. I have not raised this subject as a raid against the dealers, but as a question of fairness to the fancier in showing.

Now let me add one word of praise for the Antwerps so ably defended by "A FOREIGNER." Why should they be discarded when they possess a property invaluable to a breeder of Toys

—namely, feeding? They will do anything required of them, and I would advise every fancier to try them. I have done so with the greatest success, and intend to double my stock by next season. At the same time, cannot we improve them? I most certainly say they do not deserve what they have received at the hands of "WILTSHIRE RECTOR," and the author of "Pigeons." What class pays so well at Birmingham? At the last Show there were twenty-two pens entered. In my opinion there ought to be two classes for them—namely, Dun and Dun Chequer, Blue and Blue Chequer. I should like to hear the opinions of Mr. Weir, Mr. Cottle, and Mr. Hewitt as to what an Antwerp should be; then, possibly, some exhibitors of them would be better satisfied than they are at present with the judging of that class, as there is no recognised standard to work to at the present time.—A YOUNG FANCIER.

DRIFFIELD AND HASLINGDEN SHOWS.—We are asked to state that Mr. Hewitt was not present as a Judge at the Haslingden and Driffield Poultry Shows, although under a previous engagement to officiate. He unexpectedly received a subpoena to give evidence on a trial at the same date.

BEE IRREGULARITIES.

FROM one hive I had, on the 19th of June, a first swarm, which was safely hived. The bees clustered about the entrance of the parent hive again on July 4th, as if about to swarm. The same occurred on the 5th, and at two o'clock in the afternoon the bees rose in the air as if swarming; but they alighted on the hive they had just left, and soon entered it again.

In the evening of the 6th, a "lifter" was placed under the hive, to give the bees more room. On the 7th all was quiet. On the 8th they again made an attempt at swarming, and alighted on exactly the same spot that the first swarm had chosen. No sooner had they alighted than they began to fly back to the hive. Indeed, there were two streams of bees crossing each other, the one going from the parent hive to the tree, the other returning from it to the parent hive. It seemed as if it were a race in which all should touch the goal and return immediately. It was all over in about five minutes. On the 9th they again swarmed, but this time they were in earnest; they alighted on a pea rod, and were safely hived. All this puzzles me, and may be of interest to some of your readers.—HENRY CULLIN, *Galway*.

[We cannot account for these erratic manoeuvres. Can any of our correspondents explain them?]

THE BARON VON BERLEPSCH ON FOUL BROOD.

(Continued from page 87.)

MODE OF INFECTION.

THE disease may be communicated—

First, by feeding bees with honey taken from foul-broody hives.

Secondly, by inserting combs taken from such hives, especially those containing honey and pollen.

Thirdly, probably also by the miasma of the surrounding atmosphere.

Fourthly, by bees from healthy stocks robbing or attempting to rob the foul-breeding hive of its stores. This is especially apt to be the case if the robber bees have brood to rear at home.

Fifthly, by the bee-keeper himself, if after opening and examining a diseased hive he proceeds to open and operate on a healthy one without previously washing his hands.

Sixthly, by uniting the bees of a diseased stock with those of a healthy one when there is young brood in the hive of the latter, although the union can be safely effected where there is no brood. Even honey from foul-breeding stocks given to colonies which have no brood seldom does any harm, although it would otherwise certainly introduce the disease. It is usually considered that a queen from a foul-breeding stock introduced alone into a healthy colony will not communicate the disease. Spitzner says, however, that he infected a healthy colony by introducing such a queen into it. The same occurred to Dr. Asmuss in two cases, to Mr. Arnold in one; and in my own apiary in 1867, a colony, certainly healthy at the time, became diseased shortly after I had introduced into it an unattended queen taken from a foul breeding stock. There seems to be no good conceivable reason why a queen should not

thus communicate the disease when it is well ascertained that it is frequently so communicated by workers.

Seventhly, by hiving a swarm or transferring a colony into a hive previously occupied by a foul-breeding stock. Scalding, scouring, and other modes of purification do not always effectually disinfect such a hive, in which the disease may break out again, even after the lapse of years.

Eighthly, by locating a colony on the place or stand which has previously been occupied by a diseased stock. Instances are known where foul brood occurred under such circumstances, although the stand had remained unoccupied for more than a year.

Finally, Dzierzon informed me verbally that the disease may be communicated and disseminated even by the flowers and blossoms frequented by bees from foul-breeding stocks, as those from healthy colonies visiting the same flowers may carry the infection home. He stated that he knew of instances where foul brood was communicated to distant apiaries without a transfer thither of either bees or colonies. Waltzer says he has made similar observations; so likewise Hoffman-Brand. And it appears to be very probable, for at the Apianian Convention at Dresden, a member of a Bee-keepers' Club related one evening that some thirty years ago foul brood became so thoroughly and rapidly disseminated from place to place throughout Saxony, that in a few years nine-tenths of the colonies there were totally destroyed, and bee culture ruined for a time.

MEANS OF PREVENTION.

1. Be cautious in purchasing honey for feeding, and use none for that purpose unless you are certain that it has been procured from healthy colonies. Never feed your bees with West Indian or Cuban honey, as it is a well-ascertained fact that foul brood has been caused by the use of such honey.

2. Be equally cautious in purchasing bees. Introduce none into your apiary that are not free from this disease. The existence of foul brood in a colony can easily be ascertained by the fetid odour diffused in the hive.

This is about all that the bee-keeper can do in the way of prevention. He cannot prevent his bees from carrying in impure or infectious honey, for they will gather it from any source to which they have access. Mr. Stoehr's bees resorted to a neighbouring confectioner's for honey which was there exposed in an open cask. Shortly afterwards foul brood made its appearance in his apiary, and finally ruined all his colonies.

TREATMENT OF FOUL-BREEDING STOCKS.

1. As we do not yet know how foul brood *originates*—that is, we are ignorant of the cause or causes which produce it, but merely know the fact that it is fatal to the larvæ, we can only hope to arrest and cure it by removing the queen, and *preventing the production of brood*—thus literally starving-out the disease by withholding that on which it feeds. One who knows something of the nature of the malady can only smile when he finds various proscriptions and medicaments to be administered to the bees, recommended as infallible cures. Healthy bees introduced into an infected hive soon become diseased, and can we expect that bees already suffering from foul brood can be restored to health while remaining in a hive imbued with the virus, and immersed in an atmosphere surcharged with the infectious miasma, by administering a few drugs? If such remedies ever seem to be of service it must be in cases where the disease would have spontaneously disappeared, thus causing to be ascribed to some quack concoction what was really due to the vivific energies of nature. A colony suffering from foul brood of the first or malignant grade is absolutely incurable. All that can be done is to remove and melt-up the combs, and use the bees for starting an artificial colony, or to strengthen a weak one, after having kept them confined in a well-ventilated hive on a low diet for forty-eight hours; for though the queen be removed from such a colony, and the bees cleanse the cells of all the offensive matter, the disease will certainly reappear, and usually with aggravated virulence, whenever the queen is reintroduced and breeding resumed. The honey, the pollen, the combs, nay, the hive itself, retain the infectious matter. Nothing short of entire renovation will avail aught.

I must, therefore, treat with disfavour all attempts to cure a colony infected with foul brood of the first grade; at least, by no process whatever was it curable in Thuringia when it had once broken out. Even the expelled bees, long kept on "starvation diet," and then placed in a new clean hive, soon became as badly diseased as before. During the summers of 1865 and

1866, being requested to aid bee-keeping friends, I made four attempts to save their bees, experimenting with due circumspection and care, yet without any successful results whatever; and my unhesitating advice now is, to subject every colony so diseased to the brimstone process when all the bees have returned at eve, and thus arrest the spread of the evil, which may otherwise soon extend to every colony in the apiary. In 1864, I communicated to the "Bee Journal," an account of the utter ruin of an apiary of seventy-seven splendid colonies, caused by the introduction of foul brood. Dzierzon, too, seems to have lost all regard for curative processes, for in his latest work he says, "The better course is to make short work of it; turn the contents of the hives into money as best we may, and thereafter purchase healthy stocks."

2. In like manner I would advise resorting to the brimstone-pit whenever putrid cells are observed in a hive, for we cannot say whether this is not the beginning of a rapidly-spreading, devastating, and incurable disease. But if when first discovered a considerable number of hives are already infected, though none extensively damaged, it will be better to watch matters patiently awhile, for in such case we may regard it as most likely to be curable foul brood, or of the second grade.

3. Foul brood of the second grade can be more easily arrested and removed, though not without considerable damage. If the queen be removed, the workers will have cleansed the cells of all infectious matter long before the young queen begins to lay. The cure will be the more effectual if the combs be removed as soon as the brood has emerged from the cells, and a new hive finally given to the colony. As queen cells are among the first to become putrid, all that may have been built in the queenless hive should be destroyed in about a week, and a sealed one inserted from a healthy stock.

4. Examine all the hives thoroughly in the autumn, at the latest in October, when all the brood has matured, and remove any comb that contained or still contains foul brood in any of the cells.

5. Foul brood of the second grade not unfrequently disappears spontaneously; but I would advise no one to rely on that, rather proceed as suggested under the two preceding heads. I have known two instances where the bee-keepers remained unconcerned, doing nothing, and in the following summer nearly all their colonies were ruined by foul brood in its most malignant form.

6. The hives should be well scalded, and then fumigated with brimstone. It is also advisable to burn up any propolis they may contain, by means of a blazing wisp of straw, before scalding the hives. After scalding and before fumigating them, they should be washed with a strong solution of chloride of lime. If the disease was foul brood of the second grade only, hives thus treated may be immediately used again; but if the foul brood was of the malignant type, it will be safest to set them aside for two or three years. The stands on which foul-breeding hives have stood should also be washed with the solution of chloride of lime, and had better be left unoccupied at least one year.

7. As I have no knowledge whatever of the third grade of foul brood, I can only advise treating it like that of the second grade where it is supposed to exist.

8. It has been suggested that colonies infected with foul brood should not be forthwith condemned to the brimstone-pit, but be removed to a distance from the apiary for further observation and treatment. I should not recommend this, unless some isolated spot were available, within a radius of three or four miles of which no other bees were kept; for it would be morally wrong, though, perhaps, not legal felony, thus to carry death and destruction within the range of your neighbours' bees.—A. VON BARLEISCH.

(To be continued.)

THE BEE MOTH.

This insect is justly regarded as one of the worst enemies of the honey bee, as its depredations involve the destruction of combs, brood, and stores. Happy the bee-keeper who knows how to exclude it from his hives or arrest and prevent its devastations.

The scientific name of this pest is *Tinea mellonella*. There are said to be three kinds of it, one of which has been called *Tinea cereana*; but it seems probable that two of these are mere sexual varieties. That of medium size is regarded as the most destructive. The smaller kind is often seen at dusk in summer evenings, hovering about in front of the hives, seeking

entrance. The bees evidently become excited on noticing its approach, and angrily resist it. When successful in effecting an entrance, these moths deposit their eggs in the droppings and refuse matter on the bottom board, if any be found there; and from it the larvæ, when hatched, derive their nourishment. The larger kind does not usually make its way into the hive till after the smaller kind has effectually secured possession and made extensive progress in the work of devastation. The colour of the medium kind is grey. The egg greatly resembles that of the queen bee. The full-grown moth may often be seen sitting quietly on a hive, near its entrance, or on some projecting ledge or corner. It frequently deposits its eggs in cracks or crevices through which the heat and odour of the hive escape.

As soon as the larvæ are hatched, they endeavour to crawl into the hive through some opening or cranny, however narrow; and if successful, at once take post in and live on the offal and particles of wax they may chance to find on the bottom. They grow very rapidly, mount the combs as soon as they can reach them, and enter the cells. Arrived there, they speedily construct their galleries, tunnelling passages along the common base of the cells, and extending their devastating course towards the centre of the comb, in quest of cells containing pollen. These appear to be their favourite resort, whence they advance revelling in the delights of havoc and destruction. Nor do those portions of comb which contain brood escape attack. The defenceless larvæ perish when the side walls of the cells are broken down or undermined; and the ruin of the colony is sure to follow quickly, if the bee-keeper do not come to the rescue. Even though a worker occasionally lays open the gallery, the passage is too narrow to permit her to enter and dislodge the insidious foe, which, moreover, quickly retires to a safe distance.

Since only feeble stocks are overpowered by the worm, or such as, not being very populous, are at the time engaged in rearing a queen, and are consequently daily growing weaker, it occasionally happens that the bees are literally crowded out and constrained to abandon their mansion. The inexperienced and inexperienced bee-keeper, seeing numbers of workers constantly massed at the entrance, fancies he has a strong and growing colony, till suddenly, on some fine afternoon, the bees come tumbling out helter-skelter, and hastily take French leave of their astonished owner. If such absconding colony was well supplied with comb, a strange spectacle of universal ruin will present itself when the hive is opened. A mixed multitude of larger and smaller cream-coloured worms with brownish heads, will be seen hastily wriggling into their hiding place—a dark, web-strung pile of mingled excreta and crumbling comb. Hosts of fluttering moths, too, hover like harpies on dusky wing, and a nauseous odour exhales from the filmy and cocoon-spangled mass. All this is disheartening; but if the dismayed bee-keeper would have his good humour restored, and himself put in the mood of paying more heedful attention to what may thenceforward be going on in his hives, let him carry the non-moth-proof box or basket to his henyard, and present its contents as a *bonne bouche*, or tit-bit, to his Shanghaes and Brahma Pootras, and he will see such an eager rush and scramble and hasty gobbling-up of the multitudinous host that worked him harm, as well may mollify his temper, and restore his equanimity—so far as a hearty laugh can thereto contribute.

Then for prevention.—1, Watch your hives closely, especially those that have swarmed, or what are rearing queens. 2, Frequently cleanse the bottom boards of your feeble stocks, and inspect the combs. 3, See whether there are any black droppings under the combs, or whether the bees are carrying such out. If so, search for and remove the worm.

For preservation of combs.—1, Suspend them singly in a high and airy chamber. 2, Insert them at times for cleaning in the hives of your stronger colonies. 3, Keep them in an air-tight box, and fumigate them every two or three weeks with fumes of burning sulphur.

In elevated mountainous districts, moths are not apt to be troublesome, but in lower level and warm districts they will, without great care, be found a numerous and intrusive pest.—(*Bee Journal*.)

OUR LETTER BOX.

ADDRESS (*A Cheeshire Subscriber*).—We do not know it.

FOWLS PLUCKING EACH OTHER (*G. W.*).—We are sorry to say we can show you a pen of Spanish just as you describe your own to be. If we were always on the spot we believe we could prevent it by keeping them well supplied with a variety of green food. There is, however, at this

time of year a tendency in all cooped fowls to pick feathers. The only remedy we have ever found is a large supply of green food, especially lettuce, and fresh-dug mould.

GROUND OATS FOR POULTRY (*E. M. B. A.*).—Your Hertfordshire millers do not understand ground oats as they are made in Sussex, and your poultry man has never seen them. All the celebrated Sussex fowls are fed on them. When they are ground with properly dressed stones, the whole of the corn, skin and all, is reduced to a fine powder, and mixed as easily and as perfectly as wheat flour. We have tried ordinary oat-grinding, and when slacked with water the result has been such as we should expect if we mixed chaff and sawdust. Nothing is taken from the oat in Sussex, but everything is reduced to powder. This is the great merit. The present price in Sussex is about 18s. per sack, but it is rising. Good barley meal is far better food for chickens than "loppings." Oat theory is, the better and heavier the corn the cheaper it is for feeding.

POINTS OF BRAHMA POOTRAS (*Subscriber*).—In both breeds peacocks are much more considered than single ones. The Light Brahmas should have tails and flights black, the hackle striped black and white, all the rest white, except in the cock some markings on the saddle. The Dark pullet should be pencilled all over, save the hackle, which should be black and white-striped. The cock should have a light baclo and saddle, a broad barred black and white wing, black tail and thighs, accurately spotted breast; white spots on a black ground. Some have quite black breasts, but as a rule the spotted are preferred.

DOCKS OVERFED SUFFERING FROM DIARRHŒA AND CRAMP (*Notice*).—You have entirely overfed your Ducks, and spoiled them with kindness. What can you mean by keeping them warm at night? Our difficulty has been to keep them cool. If they are shut in where there is wood, stone, or brick flooring, that causes the cramp. By dint of meat-feeding you have made your ducklings internally fat. That is of itself an unnatural state, and their vitiated appetites will accept nothing but stimulating food—grasses, worms, and insects. Discontinue everything of the sort. Let them roost on the ground, feed on oatmeal, put in water with sods of growing grass, do not let them out in the morning till the grass is dry, and let them rough it as soon as the diarrhœa and cramp have disappeared.

BRAHMA POOTRAS WITH TWISTED WINGS (*W. B. S.*).—The weight of your chickens is satisfactory. We are well acquainted with the twisted wing, and although in many cases we have seen it less developed as they grow older, we have never known it moulded out nor entirely cured by any process or operation. It is perceptible when they are very young. It is hereditary, and chickens showing it should be immediately got rid of by death or otherwise.

UNITING SECOND SWARMS (*A Stoke Bee-keeper*).—It would probably be well to unite the two second swarms weakened by robbers, by driving, and this had better be done as soon as breeding is over.

WAX MOTH (*J. Gale, Al'ou*).—They are the cuculus and larvæ of *Tinea mellonella*, the wax moth par excellence. This pest, which is fortunately not common in this country, is more plentiful on the Continent, whilst in America, where it is known as "the miller," its ravages are so extensive that they at one time threatened to put a stop to bee-keeping altogether, until checked by the almost universal adoption of moveable-comb-hives. See an article in the preceding page.

NUTT'S COLLATERAL HIVE (*Devonia*).—The best mode of securing the slides or dividers is to make them a little wider than the boxes themselves, and let their edges flange into saw cut in the back of three-quarter mouldings or pilasters fixed to the "pavilion," but projecting so as to overlap and conceal the junctions of the three compartments.

YOUNG CANARIES DYING (*Subscriber*).—Your experience is that of many a fencer, who time after time sees some of his most promising young birds drop off one by one from no apparent cause, except a gradual wasting away. This disease, by whatever name it may be called, is, probably, the result of over-indulgence in the generous diet which is given to young birds just beginning to feed themselves, inducing indigestion and general disarrangement of the bowels. When a young bird begins to mope, feeding by fits and starts, and then very greedily, sitting for a length of time with its head under its wing, with robbled pin nares—blow the down from its breast, and you will find that instead of presenting the full plump appearance which indicates health, it will be much shrunken; the lower part of the body, too, will appear more or less swollen. Various remedies are pre-cited in the Canary pharmacopœia, but ones have been effected by administering a mild purgative in the shape of a few drops of olive oil, feeding on linseed and maw seed, with watercress to make good headway, it is very difficult to ward off the attack. I purchased a small coffee mill this season, in which I grind the common canary seed, and I find that by presenting wholesome diet to the birds in this shape they are able to feed themselves much sooner than in any other way, without the risk of inducing the complaints resulting from enfeebling with rich food.—*W. A. BLAKSTON.*

CANARIES (*W. D. Prosser*).—We cannot tell all the shows you can exhibit at. If you write to the secretaries they will inform you.

PARROTS (*C. M.*).—We do not know of a better book upon Parrots than the one of Sir W. Jardine's "Naturalist's Library," published by Smith and Co., Cornhill. Grey Parrots are usually the best for talking, and they should be obtained about twelve months old. The birds can be purchased of any respectable dealer in birds.

POULTRY MARKET.—AUGUST 5.

It is impossible to give any quotation that can be depended upon. Much poultry arrives in a putrid state, and realises nothing; but a few choice and fresh samples make good prices.

From observations taken near London during the last forty-one years, the average day temperature of the week is 72.7°; and its night temperature 50.0°. The greatest heat was 92°, on the 15th and 18th, 1842; and the lowest cold 36°, on the 18th, 1866. The greatest fall of rain was 1.14 inch.

STRAWBERRY RAMBLES IN ENGLAND.

ON the 19th of June I left this on a visit to old England, with a view to see once more my kind friends in that hospitable country, and at the same time to renew acquaintance with my pet the Strawberry, so successfully grown there.

With us in France the Strawberry season has been the shortest on record, not lasting beyond three weeks, and in consequence of the extraordinary drought and intense heat (no rain having fallen here ever since the end of April, whilst waterings, however copious, had no effect beyond keeping the plants alive), the greater part of the berries were roasted by the tropical sun, without attaining their proper size.

On my arrival in London I hurried off to Kidderminster, upon the invitation of my esteemed friend Dr. Roden. Strawberries there appeared to be in a very advanced state, and many seedlings of his own either past their best or just in proper condition to be seen, which was naturally a matter of great interest to me. There, likewise, the drought and heat were very troublesome, and threatened to annihilate the fine prospect of a fair crop: still the earlier kinds were very fine, and foremost of these was Dr. Roden's wonderful seedling *Early Prolific*, I dare to say the noblest-looking plant of the whole collection, and altogether worthy of the high character which was attributed to it in the columns of this Journal. The plants, forty in number, all last year's runners, were in beautiful health, and literally covered with fruit, though many of the largest berries had already been gathered. This sort will be invaluable as a very early one, nothing in the same way having as yet been raised to approach it. The beauty of the plants and their numerous clusters of fruit, all of the finest shape and quality, were well worth a long journey.

Then comes *Duke of Edinburgh*, a noble and very large kind, of roundish shape, with quite prominent seeds, and a glossy neck. This succeeds *Early Prolific*, and, I am inclined to believe, will be much later in an ordinary season. The same may be said of *Sultan*, a magnificent Strawberry of the largest size, red throughout, and of exceedingly rich flavour.

Dr. Roden has many other promising seedlings which he will be able to speak of next year. All the older kinds which he grows in perfection, such as *Carolina superba*, *British Queen*, *Cockscomb*, *President*, *La Constante*, *Riddleman*, *Alice Nicholson*, and many others were in very fine condition, and had large crops. I fear, however, that, owing to the unfavourable weather, my friend will not have had the satisfaction he was entitled to after so much care and labour that he bestows on his fruit garden during his leisure hours.

Whilst at Kidderminster we went on a visit to W. Lea, Esq., at Droitwich, another keen and successful fruit-amateur, who gave us a regular Strawberry feast, composed of beautiful dishes of the finest kinds, such as *Sir Joseph*

Paxton, *Frogmore Late Pine*, *Dr. Hogg*, *Mr. Radclyffe*, and others, all great favourites, and of these the finest specimens.

During a visit to the Royal Gardens at Frogmore I met with the kindest reception, as usual, from Mr. John Powell: but here, as everywhere else, and in spite of the greatest facilities at hand as regards water, Strawberries were suffering, and by no means so large and handsome as one is accustomed to see here. On the day of my visit the sorts still in bearing were *Frogmore Late Pine*, *Cockscomb*, and *John Powell*, the latter evidently a very useful sort, inasmuch as it seemed to stand the drought better than most others.

Leaving London again, I directed my steps to Eaglescliffe, near Yarm, in Yorkshire, where the widow of my late friend, Mr. Nicholson, successfully assisted by an intelligent gardener, continues the special culture of the Strawberry, always a favourite occupation of her regretted husband. I was much pleased after an interval of six years to find that the usual order and tidiness prevailed, and but for the effects of the long-continued drought an enormous crop of Strawberries would be gathered. I noticed several promising seedlings, one of which seems to deserve particular attention, and which is intended to be called *William James Nicholson*. This is a very large, handsome, late kind, of beautiful appearance, and of the richest flavour, quite distinct from any we already possess.

From the north I proceeded westward, on a visit to my friend the Rev. Dalston Clements, at Warleggon Rectory, in Cornwall, the gardens of which are famous for the large specimens of *Rhododendrons*, such as are not often to be found. Here, owing to the peculiar climate of the country and the neighbourhood of the sea, although the heat was likewise very intense, vegetation did not look so dried up as elsewhere, and my eyes were gladdened by verdure.

Mrs. Clements has always taken a great interest in raising Strawberries from seed, and we are indebted to her for, among others, *Gweniver*, *Sabreur*, and *Her Majesty*, all noble fruits, and quite distinct. As a matter of course, in Cornwall Strawberries were things of the past: still Mrs. Clements managed to surprise me with a fine basketful of *Her Majesty* on the day of my arrival.

Before concluding, I cannot but name a man to whom we fragarians owe a great deal of gratitude—I mean Mr. Samuel Bradley, late gardener to Lady Norton, at Elton Manor, near Nottingham, the raiser of *Oscar*, *Sir Joseph Paxton*, and *Dr. Hogg*, three of the most valuable Strawberries ever raised. I shall here particularly allude to *Sir Joseph Paxton*, one of the greatest achievements in Strawberry culture, and for which, according to my opinion, the British lovers of this fruit ought to grant a national award. With *Sir Joseph Paxton* in our gardens, it will henceforth be no longer permitted to grow *Black Prince*, *Keens' Seedling*, and similar varieties of the past.

On my way home I called upon the Messrs. Rivers, at Sawbridgeworth, and I must confess that my most sanguine expectations were surpassed. I know it is useless to say anything in praise of Messrs. Rivers' establishment, and

I have alluded to it merely to observe that my visit will number amongst the most interesting I made during my happy sojourn in England.—FERDINAND GLOEDE, *Beauvais, France.*

SELECT ZONAL, FANCY, AND FRENCH PELARGONIUMS,

AND THEIR PROPAGATION.

Would you give me the names of eighteen distinct Zonal and Variegated Zonal Pelargoniums for a greenhouse 12 feet long and 8 feet wide? The house being so small, I wish to have in it the best selection I can, and to have each plant as distinct as possible.

I also wish for the names of six or eight of the best distinct Fancy and French Pelargoniums, together with directions as to the time and mode of propagating them by cuttings.—J. L.

[We here publish "J. L.'s" letter and Mr. Wills's answer, because the conditions to which that answer applies being known, it will be useful to many readers who desire similar information.—EDS.]

ZONAL PELARGONIUMS.—The following will be found to possess first-rate qualities, and are quite distinct:—

Lord Derby.—Fine orange scarlet, a large, round, flat flower. The best in commerce.

Beauté de Suresnes.—Bright rose; large, handsome flowers, of fine form and substance.

The Banner (Wills).—The largest-flowered Zonal Pelargonium in cultivation, fine scarlet; good habit, and large truss.

Wills's Magenta Queen.—Splendid, new in colour; good for bedding or greenhouses.

The Clipper.—Dazzling scarlet; large and well-formed flower.

Queen of Roses.—Very bright rose colour, of fine form.

Beauty.—White, with rose centre; good habit, and very free.

To the above the following double varieties should be added. No collection can be complete without them:—

Madame Lemoine.—Neat dwarf habit; flowers borne in large trusses, very double, and of a beautiful peach colour. It flowers quite as freely as Tom Thumb. This is undoubtedly a great acquisition, and will be one of the plants most sought after for conservatory decoration for several years to come.

Triomphe de Thunesnil.—Rosy violet carmine, remarkably large truss of compact double flowers; habit good and very free-flowering.

Triumph.—Fine scarlet flowers, double; habit rather vigorous.

The new double Tom Thumb, *Madame Rose Charmeur*, is also fine, and may be included in the above list.

VARIEGATED PELARGONIUMS.—The following are sure to give satisfaction:—

Florence (Wills).—A splendid Golden Variegated Zonal, having a broad dark zone fringed with crimson and dark maroon.

Lizzie (Wills).—Bright yellow margin with a broad zone of maroon, barred with crimson; a very fine improvement on Mrs. Pollock. Habit stout and vigorous.

Lucy Grieve.—One of the most beautiful; finely-figured with a brilliant surface zone of lake-tinted crimson upon an under bronze zone.

Sophia Dumaresque.—A beautiful variety with robust constitution, habit vigorous and freely branching; the golden margin distinctly defined by a brilliant flame-tinted scarlet zone.

Miss Burdett Coutts.—A beautiful Silver Tricolor with a good habit, the best in this section.

The following three Bronze and Gold varieties must certainly be called variegated, and should be included in every collection—viz., *Beauty of Ribblesdale*, *Beauty of Calderdale*, and *Arthur H. Wills*.

FANCY AND FRENCH PELARGONIUMS.—The following eight are best:—

Charles Turner, scarlet, with pure white centre, orange scarlet upper petals, with shaded maroon blotch, very fine.

Empress Eugénie.—Pure white with rose blotch, flower large. A most beautiful variety.

John Hoyle.—Large flower, light centre; orange red, richly marked with dark red, top petals rich velvety maroon.

Perfection.—A light flower, pretty form; pale violet pink, white eye, with maroon blotch and neat rose margin.

Pescatorei.—Bright salmon, light centre, with deep crimson spots, very fine and free.

Empress.—New large fringed-flowered, in the way of Dr. André; flowers beautiful clear white with a very large crimson

blotch on the upper petals. One of the finest Pelargoniums in cultivation.

The next two are Fancies, and very distinct and pretty.

Duchess of Buccleuch.—Delicate lilac, with white throat and edges, fine form and habit.

Elfie Deans.—Bright crimson, painted white centre, very pretty.

The present is a very good time to propagate the Fancy and French Pelargoniums if the wood is ripe. The best mode is to prick the cuttings out in the open ground, or if there are any spare hand-glasses these may be placed over the cuttings. Any ordinary garden soil will answer for them, and as soon as the cuttings have struck they should at once be taken up, potted singly in small 60-pots, placed in a frame, and kept close for a few days. They will then soon commence rooting very freely. They should be kept in pots of this size till the end of December, when they should be shaken out, potted again in pots of the same size, and as the roots reach the sides of the pots the plants should be shifted into larger ones. During this time abundance of air must be given on all favourable occasions; and as the plants make their growth, and when the shoots have four or five fully developed leaves, the point of each shoot should be pinched out in order to keep the plants compact and stocky. If it is desirable to have the plants in flower early, they must not be stopped nor potted after the first week in February, but should have a little weak manure water given them once or twice a-week. This will cause them to throw up strong flower trusses, and large and bright-coloured flowers.

The spring, when the wood is young and green, is the best and surest time to strike cuttings. Cuttings struck in the spring also make the cleanest and best plants, especially if they are required for specimen plants, or for flowering late in the autumn months. If intended for the latter purpose the growth should be encouraged, and just the same attention paid to them as recommended above for the winter and spring treatment of the autumn-struck cuttings.—J. WILLS.

SHRUBS TRANSPLANTED LATE IN THE SEASON.

Those who planted large numbers of shrubs late in the spring are likely to have much cause to complain of the season, as their losses are serious; whilst of the shrubs which do succeed the growth is so indifferent that the season may be considered as lost to them. A dry spring and hot summer, however favourable to many plants, are not so to newly planted shrubs; and as watering is at best but a poor substitute for showery weather, and cannot always be practised, the appearance of most subjects planted late in spring is far from good, especially that of evergreens. These have seldom had the advantage of a good night dew since planting time. In some cases, however, they do not look amiss, and a few days ago some were pointed out to me which had stood the trial tolerably well, but care and attention had been bestowed on them. No great amount of watering had been afforded, but one or two good soakings had been given at the roots, and the ground was thickly covered with moss, which was retained in its place by pebbles thinly scattered over it, otherwise the birds disturb such coverings very much. In addition, the foliage of the plants had been often wetted over both morning and evening, using no more water than just sufficient to accomplish the purpose. With this treatment most of the shrubs looked moderately well, although many of them were large, and their growth was progressing, which is better than when the plant makes no advance till late in the autumn, and then not in time for the growth to be ripened before winter, as is too often the case when it is retarded at the proper time.

To quote examples of failures in the present year arising from planting late in spring would not be fair, as the season has been an exceptional one; but there are some shrubs which evidently like to be planted earlier, say in midwinter, or even in unfavourable weather, rather than late in spring. The Rhododendron is one, for although it may be safely removed at most times, it does not succeed so well as at other times if planted too late in spring. I believe the losses with it have this year been as great as with most shrubs. That early in autumn is the best time for planting many shrubs is generally admitted, but that numbers of our most useful shrubs may be safely transplanted in April is also a fact established by many examples, and the experience of the past season is not sufficient to disprove it. Where shrubs or trees are transplanted in such

dry weather, and only supplied with a minimum of rain and dew, their success may be doubtful; but even in cases like these, when care in watering and shading their roots has been accorded, as in the example mentioned above, the loss has not been so great—indeed the plants present a fair appearance. As the operation of transplanting is a purely artificial one, artificial means must be adopted for a time to give the plant a fair start. In such cases, therefore, judicious watering may be of service.—J. Ronson.

MR. PEARSON'S NURSERIES, CHILWELL.

HERE are to be seen orchard houses worthy of the name; orchard houses at once grand, commodious, substantial, simple, and useful: orchard house trees—Peaches, Nectarines, Apricots, &c., in pots and planted out in the borders, young trees and old trees (some are in their "teens"), all growing in the greatest luxuriance and laden, yea, heavily laden, with really handsome and delicious fruit. Never was I more delighted than I was with my visit to this fine nursery. We have most of us read Mr. Pearson's treatise and writings on orchard houses. Well and ably written as they are, however, they convey but a poor idea of the really magnificent results achieved at Chilwell. I would advise any who are at all sceptical about the practicability of orchard-house culture, to go and see Mr. Pearson's, and to go at once. The Peaches and other fruits are now ripe and ripening; seeing is believing, and if any one after seeing do not believe in orchard houses, then I pity him.

As orchard houses are becoming more and more popular every year, and are now forming an important feature in the horticulture of the country, I think we ought all to tender our hearty thanks to the able leaders and staunch advocates of this system, Messrs. Rivers, Pearson, and Wilson, who by excellent examples of cultivation in their own grounds, and their able writings and instructions through the horticultural press, have done so much to explode antiquated prejudices, and diffuse genuine information amongst us.

That orchard houses will be more and more wanted now that their construction and the cultivation of the trees are becoming so well understood, is certain; also, that the finest, and best, and cheapest, taking lasting qualities into consideration, that have yet been erected in this country are those of Mr. Pearson, is equally a fact which no one can gainsay who has ever seen them. They were, I was informed, erected by Mr. Foster, of Beeston. The largest house is 100 feet long by 30 feet wide. It is filled with beautiful healthy trees—Peaches, Nectarines, and Apricots chiefly. Some are planted out, and some are in pots, but all are doing equally well. There are numbers of houses, however, and all are full—full yet not crowded, a thing which is too often done, and nothing can be worse than this overcrowding of fruit trees. There is also another feature in these houses to which I wish to direct attention. In some places there is a practice (indeed many places get the credit of "making-up a house" of fine fruiting plants culled from all the others, which is shown to visitors as successful in every way. Now, this is just a mild way of deceiving the public. Mr. Pearson adopts none of these false tactics, all the trees are left in the houses whether bearing fruit or not, to be seen by all, and everyone can judge for himself of the true and actual results.

In one of Mr. Pearson's oldest houses are some really remarkable Peach trees, that have been planted out fifteen or sixteen years. They are grown as standards, the stems some 4 feet in height; the heads are enormous, and in such health! loaded with scores of fine large fruit—indeed, finer could not be desired. I tried, but failed to count the number on one of these trees. These are orchard-house trees in reality. The soil in which they are planted is a rather light yellow loam; the border, Mr. Pearson stated, was never stirred or forked up, only well watered when watering was necessary. This solidifying of the soil about the roots of Peach trees is an important matter; the soil cannot well be made too firm. Mr. Pearson does not adopt a very close system of pinching the shoots; they are allowed to grow rather freely, and are stopped when about 6 or 8 inches in length. That this is the correct system the results themselves best affirm.

In the culture of Apricots Mr. Pearson is especially successful. The variety which he grows most extensively is called the Peach Apricot (or Gros Pêche), an old sort, the stock of which has been kept true in this nursery for many years. The Moorpark is a seedling raised from this sort, and although

larger and a recognised favourite, is in Mr. Pearson's opinion inferior to the old one in flavour and general good qualities. The Peach Apricot ripens better; it ripens all round alike, and is just one ball of melting syrup. It may have been observed that in the Moorpark there is very frequently a portion of the back of the fruit quite hard and fleshy, while the other is rotten ripe. Mr. Pearson works the Peach Apricot on the Brussels stock, which, no doubt, has something to do with the superior melting qualities of the fruit, the Muscat Plum being the stock most commonly used. However or whatever may be the cause, I have never tasted Apricots, excepting from some open standard trees in a garden at Noisiel, near Paris, at all comparable in melting lusciousness to those Peach Apricots grown in pots in Mr. Pearson's orchard houses. I counted the crop on several of the trees (they are but small trees—standards in 10-inch pots), and found an average of about thirty fruit per plant, and all quite first-rate.

Grapes are not grown to such a great extent. There are, however, some very remarkable examples of high cultivation. In one of the houses there are some half a dozen Vines trained to the rafters over the tops of the Peach trees; one of these, a Muscat Hamburgh, is very fine. There are about twenty bunches on the Vines; some of them will weigh quite 4 lbs. I should think; the average weight of the whole will exceed 3 lbs.—i.e., 60 lbs. to the Vine. The berries are large, even-sized, jet black, with a perfect bloom, and not a symptom of shanking amongst them. What a noble Grape this is, grown in this way! For flavour it is well known to be unrivalled, yet how very seldom is it to be seen in presentable condition! The Muscat Hamburgh is of a somewhat weakly constitution, and has been proved by Mr. Thomson, of Dalkeith, and others, to be much improved by being grafted on the Black Hamburgh; yet here Mr. Pearson has it finer than it has ever been seen anywhere, not grafted, but growing on its own roots. It is planted in an outside border, if border it can be called, for anything—any material I mean—more wretched can scarcely be conceived for a Vine to grow in. Yet it does grow, and that in splendid style; and in allowing it to grow as Mr. Pearson does, I believe lies the whole secret of his success. It is but a common-sense practice, yet how very seldom is it followed! Bearing in mind that the leaves are of equal importance to the roots themselves, that through them all the colouring, sweetening, and other matters which go to the formation of the fruit have to pass, Mr. Pearson tries to get as much healthy foliage as possible without overcrowding. The bearing shoots are first stopped at two eyes beyond the bunch until that is fairly set; then the laterals are encouraged to grow, and as great a development of healthy foliage obtained from them as possible. These Vines, to our trim rule-of-thumb gardeners, have a rather untidy appearance; but that is more than counterbalanced by the splendid fruit obtained. I believe that if more attention were paid to the cultivation of leaves, there would be far fewer complaints of bad borders. In the same house there is grafted on the Sarbelle Frontignan another Muscat Hamburgh, which is very inferior. It is scarcely recognisable, so much is it altered; the berries are much smaller, which is evidently inherited from the stock. Buckland Sweetwater looked well here, bearing some beautiful finely-grown bunches weighing from 3 to 4 lbs. each.

Mr. Pearson has some curious and interesting crosses from the Strawberry Grape, a variety almost worthless in itself for eating, although some profess to like it. It is, however, possessed of a strong perfume, resembling that of ripe Strawberries. To communicate this perfume to some of our fine Grapes is a desideratum, and Mr. Pearson has succeeded so far. One, a black Grape, is certainly scented; another, a white one, is of the same peculiar taste as the Strawberry. They require much further trial, however. I shall be curious to watch the result.

One of the largest houses, 100 feet by 30 feet, contains some hundreds—thousands, perhaps—of the finest young Vines for fruiting in pots which I have ever met with. They are a sight worth seeing, well-grown, plump, full-eyed, round canes, many of them as thick as one's fingers. Canes like these cannot but bear fruit. It has often struck me as something wonderful where all the thousands of Vines go to that are raised by the various nurserymen every year. Very few do I ever see that are purchased in the many gardens I visit every year; yet they are bought, and that greedily, the supply of good canes being scarcely equal to the demand.

I observed in one house a number of the Muscat Hamburgh grafted on the Black Hamburgh in pots. Fine plants they are

too, just fit for planting. As this fine Grape is known to succeed so well on the Hamburgh stock, it is an excellent idea of Mr. Pearson's to prepare them in this way.

It is not alone for fruit culture that these nurseries are famed. In the ranks of the most popular flowers of the period, the Zonal Pelargoniums, in which competition is more keen than in any other line, Mr. Pearson comes well to the front as one of the most successful cross-breeders. I have only to point to his William Underwood, which when it left Mr. Pearson's hands some years ago, if it had been exhibited in London would have created quite a furor. Lord Derby, the best of its class, is not such a vast improvement on it; yet now we have Chilwell Beauty, a fine Nosegay, most excellent for early pot cultivation; Bayard, a free-blooming, crimson scarlet Nosegay with a fine large truss; and Pearl, a fine creamy white variegated kind. These have all received first-class certificates, but here is a lot not yet out which, if I am not mistaken, will make their mark when they do come. All Mr. Pearson's plants are planted out in the open borders, not drawn up under glass, and there are some thousands of them.

In the tricolor class, Duke of Wellington is one of the very "fiest" of colours imaginable, more so than any exhibited at the great tricolor Show. Mrs. Reynolds Hole, selected and named by Mr. Hole as first-rate, is certainly very beautiful, the colours bright and vivid, the markings distinct. It has the whitest outline to the leaf of any, and with a peculiar bluish shade over the whole plant. Nankeen is another peculiarly distinct sort. I scarce know what colour to call it. It has a sort of buff shade in the distance, and will be very telling. Lady Adoliza Norman is another fine tricolor variety. Of the Nosegays, Septimus Thornhill will be a fine acquisition; likewise William Hill and Thomas Speed, besides many others which it would be impossible to notice here.

Lastly I must not omit a few words on the Long Gun Cucumbers. Mr. Pearson cultivates this variety exclusively, and in quantity, principally for the seed. No other variety is suffered to be near it, so that all the seed thus saved can be depended on as pure and true. It is an old and well-known sort to which Mr. Pearson's name has become attached simply through the exceeding purity of his stock. Like all good Cucumbers it seeds but sparsely, and in consequence is rather scarce. It is an excellent variety; a free bearer, the fruit growing from 18 to 24 inches in length, slightly spiny, and handsome. Mr. Pearson cultivates it in a low span-roofed house, trained to a trellis overhead. It is a fine sight to see a house of Cucumbers like Mr. Pearson's, with the scores of club-like fruit hanging from the roof.—ARCHAMBAUD.

NEW ROSES.

Will "D." or some other of your contributors or correspondents, tell us which are the best Roses of 1867—I mean 1867 according to the Royal Horticultural Society's rule? An article on these describing their form, colour, and growth would, I am sure, be heartily welcomed by many a rosarian, who, not being able to attend the shows and judge for himself, is yet anxious to secure anything that is really new and good.

Will "D." also say whether he still thinks highly of Miss Ingram? I do not like to state what I have always thought of this Rose, as I yet hope I shall prove to be mistaken.

I see Mr. Radclyffe says he has not grown Marie Baumann. He has then missed one of the very best of the Hybrid Perpetuals, not excepting Charles Lefebvre and Alfred Colomb. It will please him greatly. My friend Mr. Cant and his clever foreman Nevard tell me Mlle. Jeanne Marix is really first-rate. Mlle. Rady, too, Mr. Radclyffe may depend on as good. I have also heard Francois Trevey highly spoken of, and indeed saw it in really good form at Mr. W. Paul's in July last. Felix Genero was very much praised by Mr. W. Paul and his Rose foreman.

I am sadly plagued this season by white mildew. The man who could give us a recipe for curing, or, better still, preventing this pest, would deserve, and doubtless get, something more solid than thanks from every true—ROSARIAN.

DUC DE MALAKOFF STRAWBERRY.

I HAVE forgotten what Mr. Douglas said of the Duc de Malakoff, but I am inclined to think from the description given by Mr. Biggs that he has not the true sort. The late Mr.

Nicholson sent this Strawberry with others to me some years ago. It is a very large round Strawberry, much like Ajax that came with it. It has wide-spread bold crowns, and very large, coarse foliage. Its flavour is juicy and vinous, and very good for so large a Strawberry. Ambrosia is also like it, but Duc de Malakoff is much better than either of the kinds like it. Mrs. Nicholson and Mr. Rivers have the true sort.—W. F. RADCLYFFE.

DELL'S BEET AS AN ORNAMENTAL PLANT.

I LATELY spent a few very pleasant hours in the gardens at Blenheim with Mr. Albert Moor, who is there laying a good foundation for the future. "In eight years' time," to use Mr. Moor's own words, "he hoped to succeed in completing arrangements as he had moulded them in his own mind." Truly it will be a long and an arduous work, but such is the tone of our Oxfordshire gardeners. When I was at Nuneham Mr. Stewart pointed out to me the improvements which he had already succeeded in carrying out there, and said it would take him ten more years to achieve the objects he had in view, and then "he feared his age would have so increased," as not to allow him to continue to enjoy the results of his enterprise and handiwork. I hope and think differently, seeing that Mr. Stewart has not yet a grey hair on his head. But to my subject.

I think I never saw anything of such striking effect as the planting of the ribbon borders which skirt the walks in the kitchen gardens at Blenheim, and which effect is chiefly attributable to Dell's Beet. These borders are a mile in length, and the view of them is quite unobstructed. They are thus planted:—Tom Thumb Scarlet Pelargonium, Dell's Beet, Mangles' Variegated Pelargonium, Brillante de Vaisee Verbena, and Lobelia speciosa (blue). Certainly Dell's Beet partakes of all the good qualities ascribed by Mr. D. Thomson (see vol. xiv., page 385), to Barrett's Crimson Beet; and, unless my eyes for once deceived me, I thought the bronze tinge on the leaves of Dell's Beet exceeded anything I ever saw in any Beet—even too much so, it occurred to me when I passed it in the twilight. I feel it is very rash in me to set up my own in opposition to Mr. Thomson's judgment, but as I saw it Dell's Beet really did not lack the bronzy lustre of Barrett's. I quite agree with Mr. Thomson that wherever these handsome-foliaged Beets are planted they produce a good effect. More particularly are they adapted for places of great extent. What a relief they are in many senses of the word! They are easy of cultivation, no incumbrance to houses, and if they are not of quite so dark a crimson in their flesh as some kinds when used for culinary purposes, still they appear of a very respectable hue at table, and are of good flavour, which is of more consequence to many than colour without it. Again, flanking one of the geometrical designs near the Palace, Dell's Beet shows finely in a ribbon, with my especial favourite Osborn's Brilliant Pelargonium on its right and left.—UPWARDS AND ONWARDS.

P.S.—At page 74, for "equally objectionable from the same defect are Old Betty and Early Ten-week," read "similar in cultivation I conclude to be Old Betty and Early Ten-week," &c.

THE MUSCAT HAMBURGH GRAPE.

I WISH some of your readers, who think I have always over-estimated this Grape, would come and see mine. One bunch was cut to exhibit at a flower show, and there are nineteen bunches on the Vine now, weighing in all about 60 lbs. The berries are regular in size, and there is no sign of shanking.

This Vine is growing in as poor a border as it is possible to find anywhere—indeed, it could hardly be worse, unless it were in a wet undrained situation. It was made of strong soil without a bit of turf, soil almost strong enough to make bricks, and mixed with Derbyshire lime and a little manure. The soil is so unfit for the growth of Vines, that it takes two or three years for them to get into healthy growth, and I believe the roots have to find their way into the common soil of the garden before the Vines can make strong wood. In such a case one would expect plenty of shanked berries; and there were so many at one time that I intended to remove the Vines and make a fresh border. By encouraging more foliage the Vines have attained their present healthy condition.

The shoots are stopped one leaf above the fruit, and every time they grow are allowed to make two leaves, so that there are six or eight above the bunches on every shoot, and to this circumstance the healthy condition of the Vines may be attributed.

When the Muscat Hamburg was in bloom it was dusted with a large camel-hair brush, and the berries set like Black Hamburgs.

When we know how to treat it, this fine Grape is just as easy to grow as the commonest variety, and is, I think, quite the finest flavoured Grape in cultivation.

It will ripen with less heat even than the Black Hamburg. In my large orchard house, where no heat is employed, the Muscat Hamburg is colouring, whilst the Black Hamburg is still green.—J. R. PEARSON, *Chilwell*.

ROSES AND OTHER THINGS MERITORIOUS AT OKEFORD FITZPAINE AND SALISBURY.

I do not put these two places together simply because I visited them both in one day, but because I consider their owners may be very fairly taken as types of the amateur and public grower, and that therefore I might expect to see how they had fared during this terribly trying season. Mr. Radclyffe is well known for his scientific treatment of the Rose; and Mr. Keynes has left his mark in most of our public exhibitions this year, as he has, indeed, always done of late years; while naturally one would expect to see a different state of things, inasmuch as the private grower can always give more attention, time, and thought to his few hundreds than the grower for sale to his tens of thousands. Yet there is one point which I have conclusively settled in my own mind after seeing them, and that is, that for general use the *Briar* is doomed. Mr. Radclyffe has not one; and in Mr. Keynes's quarters of the stocks planted in autumn for budding this season, it was melancholy to see how many gaps there were, owing to the *Briar*'s never having started at all, and yet I believe Mr. Keynes has suffered far less than some have done. We all remember what havoc the severe winters made with the *Briars*; and now, as it will neither stand severe cold nor extreme drought, and the *Manetti* will do both, it is time to think seriously of discarding it. Exhibitors will not do so, I believe, for the maiden blooms from a *Briar* are superior to those from *Manetti*; but for the general grower this will not be a matter for consideration, as almost anything can be done with the *Manetti* stock.

Mr. Radclyffe has been, we know, a strong and consistent upholder of the *Manetti* against all opponents, and not unnaturally appeals to his own experience in confirmation of the soundness of his views. All Rose-growers know what a terrible season for mildew this has been, and what incessant care it has required. Now on all Mr. Radclyffe's Roses there is no mildew, or very little to be seen. There is not an aphid, I truly believe, in his garden; and this is how he has managed:—He has cut off and cut out every piece of affected growth as soon as ever it appeared. He has washed his trees, has put a large quantity of good well-rotted stable dung round each plant, and has given each Rose tree a gallon of water every second day. It is manifest that he must have had a fine growth to be able to do all this; and so he has—shoots 6 and 7 feet long, foliage large and glossy, and heaps of young shoots all ready for a start if they can get a good rain, so that in September there will be such a bloom as few will be able to show. The first bloom was magnificent, I hear on all sides, and I can readily believe it; and with the care taken it would be indeed a sad piece of ingratitude on the part of the Roses if they did not make a good return.

But as the Roses are well managed, so also are the Strawberries and fruit trees. Of the former Mr. Radclyffe has this year taken up most of his large beds and made fresh plantations. These were already made, and notwithstanding the excessively dry weather, were doing well; but then, such care as they had—such preparation of the soil, manuring, &c.! It is useless with us in our climate to leave anything to Nature—we cannot do it; and skill and liberality in the use of means must make up for those general climatic influences which other people possess.

With regard to kinds, Dr. Hogg, Mr. Radclyffe, Eliza, Cockcomb, Lucas, and Royal Hautbois were, I think, the favourites, and deservedly so. Dr. Hogg and Mr. Radclyffe approach one another very closely, both of British Queen race, the former inclining to the heart shape, the latter to the cockcomb shape. They are both delicious Strawberries, hardy, and good bearers, and no Strawberry grower will consider his garden complete without them. Rivers's Eliza is an old but most useful sort, a seedling apparently from Myatt's Eliza, but more hardy, and a very abundant cropper. It hardly ever fails in the most

untoward season. Lucas is another favourite of Mr. Radclyffe. It is a seedling of M. De Jonghe's, of Brussels; the foliage is large and handsome; fruit fine, and of good flavour. Cockcomb is a large, and, as its name implies, flat-shaped fruit, but rich in flavour. Some of those grown in Mr. Radclyffe's garden measured 10 or 12 inches round. There are some people who imagine that if a Strawberry be large it must be deficient in flavour. With some kinds this is the case, but, on the other hand, some of our largest fruits are also some of our highest-flavoured ones. Of Perpetual Pine, of which much has been said, neither Mr. Radclyffe, nor, I believe, Mr. Rivers, has any very great opinion. Royal Hautbois is a rich and highly flavoured fruit, prolific, and well worth cultivating. These, with some Alpines, would form a good selection for any garden, while from my own experience I would recommend for the borders of kitchen gardens, and, indeed, for any place where quantity is desired, Trollope's Victoria. Nothing fills a basket sooner; and although too soft for market purposes, I do not think its flavour at all bad.

Since my last visit Mr. Radclyffe has added another wall to his garden, and his fruit trees presented that appearance of health and vigour which characterises all his produce. Here again, manure, watering, and syringing, are brought into great request; while that without which fruit-growing in the open air in England is, I am sure, a lottery—protection, is carefully used. It was this that was one of the secrets of his great success with the three famous trees at Rushton, and I doubt not ere long he will have as fine a wall of fruit as can be anywhere seen. The value of protection is abundantly seen in the case of two espalier Pear trees in the garden, both Marie Louise. One was protected, the other not; one had five Pears on it, the other a hundred. The protection was of the simplest kind: a sort of crate was made of rough wood, and over this a sheet was thrown at night and taken off in the day. Surely, where such a difference can be made by so slight a method, we may well wonder that it is not more generally adopted. Mr. Radclyffe's answer to a lady who said she could not grow Roses in her soil, "Give them plenty to eat and drink, and they will grow anywhere," is the clue to his success. He possesses no advantages of soil or situation, but he feeds everything well and works hard. I never saw until here in any perfection the deciduous Cypress. There is a fine tree here, and what lovely foliage it has! Why is it not more grown?

I had intended to have said something more of Mr. Keynes's Roses, but reserve that for another time.—D., *Deal*.

HOW TO DISPOSE OF FRUIT

You and your interesting correspondents often tell us how to produce fruit, and it is to be hoped that many amateurs and others profit largely by your good advice; but I expect there are many besides myself who more than supply their own wants, and would be glad if they could make their gardens pay for some of the labour expended upon them. Possibly like myself they look at the prices of fruit given in your paper, which somebody is supposed to pay at Covent Garden, but if they fondly imagine that they can get any such prices for their fruit, they are sorely mistaken. From about one-half to a third of the price quoted is generally all I have been able to obtain, and the worst of it is, there is the greatest uncertainty about getting this within any reasonable time. Those who live in the country, and at some distance from town, cannot send up their fruit by private hand, or take it themselves to market; they are obliged, therefore, in most cases, to trust to a salesman, and I should like to know how others are satisfied with this process. I will just state how I have fared. I was recommended to a Mr. —, as a most respectable man, and to him, therefore, I have confided my forced Peaches and Nectarines.

To make sure of the fruit travelling safely, I went to the expense of some nice boxes with false bottoms, but these I cannot get returned; of course, all the packing material, silver paper, &c., disappears; and worst of all, I never can get an acknowledgment that the boxes have been received, so that to this day I do not know whether some thieves on the railway, or some *bona fide* purchasers have eaten my fruit. I have written several times to remonstrate, but I get no answer, so I really think it right to warn others of this way of doing business, and I should be very thankful if you, or any of your correspondents, would tell me the best way to dispose of fruit. I have often thought that instead of giving large profits to salesmen and

others, those who have large gardens might just as well supply some of our large charitable institutions, such as hospitals, &c., at a very cheap rate. As it now is, everyone must be aware that a vast deal is wasted, which many poor creatures would be most thankful to have; and really if there is no better way of getting rid of one's fruit than that which I have unfortunately hit upon, it takes off the edge of one's delight in growing it not a little.—HENRY NICHOLLS, M.A., F.R.H.S.

[We must leave the salesmen in Covent Garden Market to defend themselves; but we can give our testimony that at least 50 per cent. ought to be deducted from the retail prices on account of loss by decay, non-sale, &c. Messrs. Webber, fruiterers, Central Avenue, Covent Garden Market, could give information on the subject.—EDS.]

VINE MILDEW.

POSSIBLY the best means to resist the ever-present, invisible, and multitudinous sporules gaining entrance to the plants either by the spongioles of the roots or by the stomates of the leaves, is to preserve a just equilibrium of moisture and temperature between the roots and leaves—that is to say, to keep the Vines in the best possible degree of health. Their susceptibility to injury from an attack of mildew may thus be supposed to be reduced to a minimum. But this state, even, is not always a perfect security against the inroads of mildew. Some localities appear to be peculiarly favourable to mildew. A gardener writes me:—"I have lived in England, Ireland, and Scotland, but here alone am I called on to wage war against the insidious enemy. My opinion, then, is that it is atmospheric, and that some localities are more congenial to its spreading than others." My own experience is the same.

For twenty years I have lived under Vines, but here alone has the mildew made its unwelcome appearance. The Vines which are, or were, attacked are in sound health, bearing fine crops of Grapes, and carrying an expanse of fine leathery foliage which, though never syringed, seems proof against the attacks of insects of any kind. The border is sheltered from winter rains by shutters. The Vines are subjected to no forcing, but are allowed to start naturally. Giving air and maintaining the proper temperature in the house, are carefully attended to. The ventilators are open all night, securing a constant circulation of air, which is increased with an increasing and reduced by a declining sun, closing at 80° or 85° early in the afternoon. This applies to the period after the Grapes had set, and when struck by the mildew. A genial moisture is kept up by sprinkling the paths, &c.; but anything like stagnation is avoided by letting the house become quite dry at least once during the day. The minimum night temperature is 60°. The young growth is kept duly pinched-in, not taken out by a barrowload at a time.

Such is briefly the treatment which the Vines received up to the time they were attacked. I purposely give it, in order that anything which may be favourable to the spread of mildew may be pointed out for the benefit of myself and others who are interested in this subject. Not only every bunch, but I may say almost every berry became, as it were, mysteriously infested with the parasite.

Of the several remedies applied, the old application of sulphur was the most effectual. Morning by morning, and week after week, were the berries carefully scanned and each fresh outburst duly dusted. This, with a high, dry, and equable temperature, gave a check to the spread of the mildew. But this arid atmosphere was prejudicial to the well-being of the Vines; the Grapes refused to swell, or the leaves to expand, except in a very stubborn manner. An increase of moisture or a reduction of temperature accelerated the growth of the mildew. Excessive transpiration was undoubtedly telling injuriously on the Vines, and as I could not use atmospheric moisture as a compensation, I resolved to give moisture in extra quantity to the roots. The border was forthwith thoroughly watered with guano water, 2 ozs. to the gallon, at a temperature of 100°. The effect was striking and beneficial. The watering was repeated, this time with the addition of 1 or 2 ozs. of salt to the gallon. The beneficial effects of this application were still more apparent. The Grapes commenced swelling, and the mildew appeared to gradually die away.

Whether there was anything in the fertilisers which destroyed the vitality of the mildew, or that the more rapid growth of the Vines (and the consequent increased thickness of the cuticle of the berries affording a greater resisting

medium to the penetration of the fungus), produced these results, is to me an open question. Possibly both theories are applicable. Salt is a direct enemy to fungi, while Grapes which are far advanced in swelling when attacked by the mildew, are not susceptible of such great injury as when overtaken in a younger state. Vines under the same roof and growing in the same border, but on which the Grapes were near the colouring point when attacked, have given little trouble in comparison with the later ones, but notwithstanding the ordeal the latter have undergone, they are making a good show, and the berries are colouring and ripening well. Neither is the crop disfigured to the extent of a single bunch being unfit for table, but the berries are not so large as they otherwise would have been had they received no check.—J. W.

ORNAMENTAL AND FLOWERING SHRUBS.

(Continued from page 96.)

RHODODENDRONS being the finest of flowering shrubs deserve more than a passing notice, more especially as there are gardens in which they are not so generally planted as they ought to be. Some persons do not plant them owing to their soil being unsuitable, and this is a wise course to adopt, for of all plants there is none which looks worse than a Rhododendron in bad condition, and unless they are well grown it is far better not to employ them but plant other shrubs. There are, however, very few soils and situations that will not grow Rhododendrons well, and on these exceptions I shall remark hereafter.

Rhododendrons are generally divided into sections, and to this arrangement I propose to adhere.

Section I.—This consists of the hardy, late-flowering, hybrid scarlet, crimson, pink, rose, white, and other coloured Rhododendrons of English or continental origin. The varieties are very numerous; I will, therefore, notice only a few of the best of those flowering from the middle of May to the end of June, and which are hardy, good in foliage, and free in growth.

Alama, centre white, edged with pale scarlet, very fine habit and foliage; *Angiola*, ruby; *Archimedes*, bright crimson rose, very fine; *Atrosanguineum*, blood red, splendid; *Barclayanum*, reddish rose, large truss, good; *Baron Cuvier*, lilac, chocolate blotch, showy sort; *Blanche superbe*, waxy white, green eye, perhaps the best white, a ladies' Rhododendron for colour and loveliness; *Blandyanum*, deep reddish crimson, truss fine; *Blandyanum superbum*, light crimson, very bright, very free blooming, and of dwarf compact habit; *Blattenum*, rosy lilac, finely spotted; *Braynum*, rosy scarlet, centre paler, fine; foliage splendid; *Brilliant*, crimson scarlet, free bloomer, and of dwarf habit; *Bylsianum*, white, margin crimson; *Californicum*, rose (this is the hardest Rhododendron I have met with, standing wind well, which is more than can be said of many sorts); *Candidissimum*, whitish and pale pink, spotted with yellow, showy and large; *Chancellor*, purplish lilac, finely spotted, large, perhaps the largest of this section; *Chloe*, crimson lake, and *Comet*, scarlet, both remarkably fine:

Concessum, rosy pink, centre paler; Currieannum, rosy lilac, centre paler, truss large; Dorkinsii, pale, very free bloomer; Duke of Cambridge, bright light crimson scarlet, centre paler, truss large, a showy sort; Duke of Norfolk, bright reddish rose, fine; Faust, pale lilac, splendidly blotched; Gem, pale rose, deep-coloured towards the margin, showy; Guluare, bluish, of fine form; Hogarth, rosy crimson, fine; Ingrami, bluish, blotched with lemon colour, fine; John Waterer, crimson, splendid, free blooming, but the habit needs improvement; Lady Dorothy Nevill, purple, spotted with black, very fine; Lefevreannum, purplish crimson; Lewinham, bluish or purplish white, deeper at the margin, large and good; Leopardi, lilac, covered with chocolate spots; Lord John Russell, rose, splendidly spotted; Londinense, crimson purple, form good; Maculatum grandiflorum, purplish rose, large; Maculatum purpureum, purplish rose, much and finely spotted; Metaphor, rose, form and truss fine; Ne Plus Ultra, rosy purple; Papilionaceum, pale lilac, changing to white, good; Reedianum, cherry red; Schiller, light purple, shaded dark spots, showy; Towardi, rosy lilac, an old sort, for shape unsurpassed; Venusius, crimson scarlet, with a few black spots, truss large; Victoria, plum, free blooming and fine; Victoria (Pince's), claret, very fine; and William Downing, dark purple, blotched, very fine.

In addition, I would mention as desirable, though I have not sufficient experience of them to warrant my placing them in the foregoing list—Bride, white; Due de Brabant, yellowish white, spotted with red, semi-double; Lady Lopes, waxy rose, dark spots; Lord Clyde, deep crimson; Lucy Neal, claret, spotted; Madame Miotan Carvalho, white; Neilsoni, rosy lake; Ochroleucum, centre lemon, shading off to straw, brown spots; Prince of Wales, rose, shaded purple, black spots; Princess of Wales, magenta edge, white centre, primrose flake on upper petals; Sir Thomas Archd, shaded rose; Standish's Perfection, white, shaded with pinkish lilac, blotch greenish yellow; Sydney Herbert, bright crimson, with a blotch of black spots.

Section II.—This consists of the early-flowering hybrid Rhododendrons. They flower early—in April and the beginning of May—and on that account are liable to injury from frost. In sheltered situations, however, they succeed very well, especially when protected from the north and east winds by trees at such a distance as not to overhang the Rhododendrons. In such situations they seldom fail to flower finely. They are the best of all Rhododendrons for forcing, and it is surprising they are not more extensively used for conservatory decoration, as they only require a sheltered situation in winter, and need but a slight amount of heat to bring them into bloom. Indeed, if merely placed in a cool house and allowed to come forward naturally, I know of no plant that will afford such a gorgeous display with so little trouble, whilst for forming groups in the flower garden, to be succeeded by bedding plants, they are unequalled. Of these Rhododendrons I would recommend the following:—

Altacereuse, scarlet; Altacereuse coccineum, scarlet, but richer in colour; Barbatum, deep rose; Broughtonianum, rosy red, splendid truss and foliage; Campanulatum, creamy white; Campanulatum hybridum, white; Cartoui, scarlet, spotted with black; Caucasicum album (Canaingham's Dwarf White); Caucasicum punctatum, creamy white, spotted with brown; Lady Duckworth, pink, very fine; Leonis Philippe, scarlet; Mars, vivid scarlet; Mariar, shaded pink with dark spots, very fine, of dwarf compact habit, and a very blooming sort; Nobleannum vars., scarlet, rose, and other shades of colour, all dwarf, early, and free bloomers; Nobleannum superbum, scarlet, being the best in colour and of dwarf habit; Perspicuum, white, large; Rosamond, rose, dwarf, free blooming; Russellianum, crimson scarlet; Russellianum superbum, deep scarlet, large truss; Smithii coccineum, bright scarlet; Stamfordianum, rosy scarlet, showy; Vivid, rose; and Wellsianum, scarlet, fine.

Section III.—Catawbiense varieties. These are the hardiest of Rhododendrons, having fine foliage, good trusses of bloom, of good form and substance. They flower in May or later, according to season.

The best are Album elegans, waxy white; Album grandiflorum, bluish white, green spots, fine; Azareum, bluish lilac; Carnilescens, bluish purple, large, and very fine; Eminent, rosy lilac, good; Everestianum, pale lilac, finely fringed and spotted; Fastuosum flore-pleno, double-flowered, lilac, splendid truss; Giganteum, light rose, fine; Glenyanum, bluish white, of dwarf habit; Grandiflorum, deep rose, very fine; Purpureum elegans, Purpureum grandiflorum, both good purples; Roseum elegans, rose, fine; Roseum magnificum, rose, large; Roseum pictum, rose, spotted, fine; Splendens, rose, good; Standishii, rosy purple, spotted; and Superbum, deep rose, very fine.

Rhododendron catawbiense, from which the above varieties have sprung, is vastly superior to R. ponticum, and its colour is a bright light rose. It succeeds tolerably well under the shade of trees, and is excellent for planting in shrubberies, withstanding drought better than most Rhododendrons.

Section IV.—Varieties of Rhododendron ponticum. These have fine dark foliage, and are very hardy. The species thrives fairly under the shade of trees, and on that account is extensively employed for cover. In town gardens I consider them indispensable; they ought to take the place of the common Laurel, and be made the principal evergreen, just as the Laurel is in country gardens.

The varieties are Album, white, good; Atro-purpureum, dark purple; Aucubifolium, flowers lilac, leaves finely blotched with yellow, not unlike the old Aucuba, and it thrives in smoky town gardens much better than the Aucuba, and ought to supersede it; Blandum,

blush, foliage very fine; Guttatum, white, finely spotted; Hyaciathiflorum, lilac, double-flowered; Malmaculatum, white, prettily spotted, very fine; Nivaticum, white, green blotch, habit close and good; Lowii, white, spotted, large; Punctatum, lilac, spotted; Roseum, rosy lilac; Silver-striped, flowers lilac, leaves striped, not so fine as Aucubifolium in the variegation, yet distinctly striped; Vervaekeum, lilac, double.

Section V.—The very late-flowering Rhododendrons. These are not particularly desirable except for their late flowering. Maximum, white, shaded with pink; Maximum album, white with green spots; Maximum purpureum, purplish; Wellianum, pink, fine truss, foliage and habit good, the best of this section, which is deserving of extension.

Section VI.—Dwarf Rhododendrons. These are desirable for small clumps and narrow borders, and for edgings to clumps of the large-growing kinds. They are likewise pretty for rockwork, on which they thrive well if moisture is afforded them in summer.

Rhododendron amomum, rose, does well under trees, especially under those with stems of some height, so as to admit light; R. azaleoides odoratum, white, shaded with purple, sweet-scented, fine for pots for conservatories on account of its fragrance, and its blooms being good for cutting; R. chamaecistus, very dwarf (6 inches), flowers pink, an alpine succeeding in limestone soil; R. ciliatum, white, faintly shaded with rose colour, sweet-scented; R. daphnoides, rose-colored, fine; R. danicum, purple, early flowering; R. ferrugineum, rose, dwarf, an alpine succeeding on rockwork; R. gemmiferum, shaded crimson, white centre, a gem in every way, fine for pots; R. fragrans, rose; R. Goveanum, light purple, sweet-scented; Hammondi, purplish rose; R. hirsutum, rose, similar in habit to R. ferrugineum (the variegated form of R. hirsutum is pretty; both are alpine, succeeding on rockwork, in peat and grit on sunny slopes, and in fissures when kept moist); R. myrtifolium, rose; R. myrtifolium hybridum, pale rose; R. ovatum, deep rose; R. tucellum, lilac; R. Tortoniannum, pale purple; and R. Wilsonianum, rose. For the base of rockwork and the open borders, where there is a dry subsoil or well-drained soil, the dwarf Rhododendrons do well, and are very pretty.

Rhododendrons and all American plants are seen to most advantage in groups. In large gardens a group of each of the best kinds may be planted, whilst in smaller ones a clump of the best sorts of each section may be planted together, and will be found far more effective than a large number of the varieties forming the various sections mixed in one group. They do not flower together, the foliage is different, but the varieties in six groups may be harmoniously arranged.

Clumps have the best appearance when on grass or surrounded by it; single specimens are not good, excepting as standards, which are always fine objects in places sheltered from wind. All the varieties, however, do not form bushy, close, handsome heads. A few of those forming handsome heads are Atrosanguineum, Barclayanum, Blandyanum, Blatteum, Bryanum, Congestum roseum, Erectum, Lady Dorothy Nevill, Lefevreannum, and Sandlefordianum, rose, finely marked; Everestianum, and Grandiflorum. Standards should have clean, straight stems from 1 to 5 feet in height. Half standards in my opinion are not handsome, being simply leggy dwarfs.—G. ABBEY.

(To be continued.)

GIANTS OF THE VEGETABLE WORLD.

WITHIN a day's journey of the metropolis of Victoria, there grow the loftiest trees of Australia, and, perhaps, of the world. In the back gullies of Dandenong on the Black Spur, and near the sources of the La Trobe river, as well as in some of the remoter valleys of the upper Yarra, a kind of Eucalyptus, botanically known as E. amygdalina (Almond leaved Gum Tree), attains such a marvellous height, as to rival at least in this respect, the Wellingtonia Pines of California. The stems rise as straight as masts, but with a height far exceeding the masts of any naval structure. The height of the loftiest ranges from 400 to 500 feet. A fallen tree on the Black Spur measured 480 feet in length. Another in Dandenong showed a height of 295 feet to the first branch, the height then extended 70 feet further in ramifications to the broken top branch, which here still measured 3 feet across. A still larger tree at Berwick, measured 81 feet in circumference, at a distance of 4 feet from the ground. The stems, with exception of the base, are beautifully smooth, and of an ashy colour. The wood is excellent for shingles, and splits with facility. Like many other Eucalypti, this huge species grows with celerity, far more so than the Californian Wellingtonia, and the minute seeds germinate with the utmost facility. Eucalyptus amygdalina is restricted to Victoria, New South Wales, and Tasmania.—(The Builder.)

[We have often heard of the remarkable size attained by some of the native trees in Australia, as well as in Tasmania, but we are not certain we ever heard of a height of 500 feet being reached. We hope, however, some of our readers in the colony of Victoria will be good enough to forward us any information they can on these vegetable wonders, as well as on

other subjects connected with that remarkable land; and if the measurements just given prove correct, what will our consins on the other side of the Atlantic say to their much and deservedly-extolled Wellingtonia being obliged to take second place in the list of vegetable giants? If this should be the case it will in no way diminish the value we place on the Mammoth Tree of the far west, which makes its home amongst us, and grows with all the vigour of an indigenous tree. The Australian Eucalyptuses are, however, another class, and we have no hope of their withstanding our winters excepting in a few sheltered places, as at Plymouth, and other parts of Devon and Cornwall, where we are told some have withstood several winters with impunity.—EDS.]

NEW ROSE LA FRANCE.

THE first two or three blooms of this variety were indifferent and thin, doubtless owing to the severe trial Roses and all plants have had to endure this season, but I have just now sent a perfect flower, and a very beautiful one it is. La France may be described as a large and full Rose, the outer petals slightly but gracefully recurved, silvery white, tinged with pale pink, and having a deeper centre. The whole flower is almost spheroidal. The petals are of good substance, well coloured throughout, thus indicating endurance; it is also powerfully fragrant. Other blooms will shortly be expanded, which will, doubtless, fully verify the above. The plant grows vigorously, and is freely remontant; it bids fair, therefore, to be one of the best Roses of the year.—ANDRÉ H. KENT.

PEARS.

14. AMIRAL.—Fruit large, a little uneven in its outline. Skin very much covered with rough ashy grey russet, exhibiting here

Amiral.

and there small patches and mottles of the yellowish green ground colour. Eye small and open, with short horny segments set in a slight depression. Stalk three-quarters of an inch long, slender, brown, and woody, fleshy at the insertion. Flesh tender, buttery, juicy and very melting, sweet and sugary, with a fine anise aroma.

A very fine Pear which ripens in the last week of September, and then bleets very rapidly.

This is Amiral of the old pomologists, and is quite distinct from Arbre Courbé, which is sometimes made synonymous.

15. ANANAS.—Fruit medium size. Excellent for dessert late in September, but does not continue good long.

Ananas.

The Passe Colmar is sometimes called by this name, but is an entirely different variety, and so is that called by the Belgian pomologists the Beurré Ananas.

A NEW PEACH.

WE have just received from Mr. Pearson, of Chilwell, a seedling yellow-fleshed Peach, ripened in one of his orchard houses, which is deserving of notice. Yellow-fleshed Peaches, which are so greatly esteemed in America, have not found much favour in this country. They are much inferior as a rule to the white-fleshed sorts, yet there is something very pleasing and warm-looking about them quite in contrast to the others. Mr. Pearson's seedling is one of the best we have tasted, of large size, the flesh deep orange yellow, very melting, juicy, and pleasantly flavoured, and the fruit is exceedingly handsome in appearance. It is a variety of decided merit.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

PLEROMA MACRANTHUM (Large-flowered Pleroma). *Nat. ord.*, Melastomaceae. *Lim.*, Decandria Monogynia.—Very fine both in flower and foliage. Native of St. Catherine, Brazil. Flowers purple.—(*Bot. Mag.*, t. 5721.)

PRIONUM PALMITA (South African Palmita). *Nat. ord.*, Junceaceae. *Lim.*, Hexandria Monogynia.—Native of rivers in South Africa.—(*Ibid.*, t. 5722.)

NANODES MEDUSÆ (Medusa's-head Orchid). *Nat. ord.*, Orchidaceae. *Lim.*, Gynandria Monandria.—Native of Ecuador. Introduced by Messrs. Backhouse, of York. Flowers green, lip dull reddish purple.—(*Ibid.*, t. 5723.)

MONIZIA EDULIS (Eatable Monizia, Cenoula da Rocha, or Rock Carrot). *Nat. ord.*, Umbelliferae. *Lim.*, Pentandria Digynia.—Native of the Great Desert, one of the Madeiran Islands. Although the root is eatable when boiled, it is only equal to a bad stringy Parsnip.—(*Ibid.*, t. 5724.)

ONCIDIUM MARSHALLIANUM (Mr. Marshall's Oncidium). *Nat. ord.*, Orchidaceae. *Lim.*, Gynandria Monandria.—Native place not stated. Introduced by Messrs. Low & Co., of Clapton. Flowers yellow and crimson.—(*Ibid.*, t. 5725.)

IRECINE LINDENI.—“Of the several species of the Amaranthaceous order which furnish highly-coloured leaves for flower-garden decoration, the plant we now figure promises to be one of the most useful. Its habit is dwarf and freely branched, producing an abundance of twiggy shoots, which are clothed

with lance-shaped leaves of moderate size, and of a deep blood-red colour, the midrib appearing as a broad purplish band. This colouring, M. Van Houtte observes, is varied as the foliage is moved by the wind, so that the plant presents different shades of violet, purple, and deep rose, a deep red hue predominating. It is said to grow from about 1½ foot to 2 feet high, and the leaves, as will be seen by our figure, have this great advantage over those of *Iresine Herbstii*, irrespective of their better colour, that they present a clean, flat, even surface, instead of one which is so concave as to appear distorted.

"*Iresine Lindenii* has been quite recently introduced from Ecuador by M. Linden, by whom it was exhibited for the first time at the great Ghent Show in April last. It has subsequently passed into the hands of M. Van Houtte, of Ghent, by whom it is now being distributed."—(*Florist and Pomologist*, 3 s. i., 169.)

PALMS.

MANY species of this genus are the best possible for in-door decoration, and in a small state particularly so. No plants are more easily grown, and none are more tenacious of life than the Palm, enduring alike dust, and cold and heat from open windows and gas-heated air. Who will not say that a small Palm of any species, with the top of the pot covered with *Lycopodium denticulatum*, is anything but an ugly object in a lady's boudoir, or anywhere else? Where one plant is grown for this purpose in Britain, a thousand are grown on the Continent, and why? because foreigners appreciate their beauty and gracefulness, and a great demand is at once raised. Nurserymen alive to their own interest build houses expressly for their culture, import seed, and raise them by the thousand, and in three years they are sold to the plant-loving community of Paris for 5, 20, or 30 francs each, as the case may be. Belgium supplies large quantities, and even sends them to the Paris market. Such species as *Corypha australis*, *Oreodoxa sanchona*, *Latania borbonica*, *Areca rubra*, and many others, are sold to those wishing to grow on their own plants, in a small state, at from 8 to 20 francs the dozen. Who, then, would be without a Palm in their houses when they can be got so cheaply?

We have all been in the habit of looking to the botanic garden at home for a sight of a Palm, but nowadays our enterprising nurserymen are bringing Palms within the reach of everybody, and in some private gardens they may be counted by the dozen, and still the wish is for more. What looks neater than a few dwarf Palms dotted through a vinery or Peach house? They give at once a furnished and elegant appearance to the houses; and they get at the same time ample room to develop their handsome persistent leaves. No more attention is paid them than three or four waterings a-week with warm water, and a slight addition of soil in a larger pot every other year. This, with a sponging once a-month with rain water, maintains them in health and vigour, in a small state for a number of years. Sandy peaty soil is the best for Palms, lightened and enriched with very old leaf soil, and all warm and dry previous to use. A loamy cold soil, and applied in large quantities, is a sure way of having weak yellowish leaves, instead of dark-green leathery ones.

A common practice with many on receiving a Palm from the nursery is to pot it immediately in a larger pot, and to give it altogether a different soil to what it has been accustomed to, before even studying its proper wants, or the time of year it came to hand. May is the best month to apply additional food to Palms; and July and August the best months to get them from any distance.

The French and Belgian gardeners adopt the following mode of culture. The houses are low, flat-roofed lean-to's, 12 feet wide or so. The first 3 feet from the front forms a table, the next 3 feet the pathway, and then a bed of tan or leaves, 6 feet wide, wherein are plunged the young Palms. From the moment the young seedlings are transferred from the seed-pan to a 3-inch pot they are kept plunged in a tan bed, in order not so much to supply them with heat, as to keep the soil moist and healthy without water till the roots are in activity. Moistening the leaves with warm water twice a-day is sufficient for them for months. While in a young state they require more heat than when older. Sorts such as those already indicated, with *Sealorthis elegans* and robusta, *Phoenix dactylifera* and reclinata, *Caryota Cumingii* and excelsa, several *Chamærops*, *Thrinax parviflora*, *Zalacca Wagneri*, *Cocos coronata*, *Caryota soubolifera*, and many others, will thrive and look robust in any house kept a little close and moist. Although

in French nurseries they are accommodated with tan beds, it is not absolutely necessary when they are four or five years old, and the pots well filled with roots. The front 3-feet shelf is generally filled with *Dracænas* and *Pandanuses*, and, altogether, the house has a very fine appearance.—H. K. (in *The Gardener*.)

THE POTATO DISEASE.

IN the year 1817 I was drawn into a paper controversy on the Potato disease, that year being the third in which it had made its appearance. The theory I advanced was founded on some experiments I had made, and which this season has verified—namely, that the disease cannot exist in "a dry and high" atmosphere. In ordinary seasons in this district (North Devon), the disease has usually shown itself from the first to the middle of July, but up to this time (August 10th), it is neither to be seen nor heard of.

Those who have watched the many peculiarities of this disease will, no doubt, be on the alert to see what effect this unusually dry and hot summer may have upon the constitution of the Potato. Possibly a couple of such summers following one another would tend to stamp out the disease.

For the last ten days complaints are very common in this neighbourhood that the tubers in the ground are shooting. Where this is found to be the case with early and second early kinds, they should be lifted at once.—A. McKELVIE, Torrington.

NOTES AND GLEANINGS.

WE understand that the bulb-growers of Holland have intimated their intention of offering prizes, open to all growers, for distinct kinds of HYACINTHS at the First Spring or Hyacinth Show of the Royal Horticultural Society in 1869. The prizes intended to be offered amount to £45 3s.

WORK FOR THE WEEK.

KITCHEN GARDEN.

WHILE the hot weather lasts but little can be done in this department, except keeping the ground clean and trenching it as crops are cleared off. *Cauliflowers*, make arrangements to sow seed thinly about the middle of the month and again in the first week in September. The former sowing will supply a few early heads, but they will require a considerable amount of protection. The September sowing is chiefly to be depended upon. Plant out a good breadth of the June and July sowings. They will be more thought of, if they can be protected during the winter, than Broccoli of any kind. *Carrots*, sow a small bed now and at the end of the month for drawing young in winter and spring. *Lettuces*, sow now and at the end of the month for winter and early spring supply. For this purpose the Brown Dutch and Hardy Hammersmith are the best Cabbage Lettuces. The Black-seeded White and the different varieties of the Brown Bath are the best Cos varieties. Continue to plant out successional crops. *Mushrooms*, collect horse droppings and cow dung for beds in sheds or houses. Where there is a deficiency of shed or house room, and there is a scarcity of materials for a large bed in winter, it will be a good plan to make a slight bed or two in a sheltered place now. For this purpose nothing is preferable to the half-reduced dung from an old lining. If the bed be built in the ridge form, from 2 to 3 feet in width at the bottom, carried to the same height, firmly beaten together, and defended from heavy rains, it may be spawned, earthed, and in bearing before a larger bed could be safely covered in. *Spinach*, Winter Spinach is always sown at the same time as Cauliflowers for spring planting. *Onions*, *Savoy*, *Red Cabbages*, and two or three other sorts are, or used to be, sown also at the same time.

FRUIT GARDEN.

The bunches of out-door Grapes may be protected in half globes of glass, which may be obtained at any glass-blowing establishment, and any spare lights from frames or Peach houses might now be profitably fixed against favourite Vines or Peach trees. Where wasps or flies are troublesome the fruit may be defended with gauze or thin bunting; but where much attention to ripening the wood is necessary, nothing is better than covering each fruit very thinly with cotton wadding.

FLOWER GARDEN.

Flower gardening in the autumn may appear an easy matter,

the plants having all filled their allotted places; but in a large flower garden containing a great variety of plants more delicate work is now required than at any other time in the year. Take a bed of Petunias, for example. As soon as the plants begin to run over the sides of the bed a man must begin to cut all the leading shoots just inside the edges of the bed. In three days more the same work must be repeated, and in three weeks the sides of the bed form a regular bank 5 or 6 inches high, while the plants in the middle of the bed are from a foot to 18 inches high, with a surface as even as any part of the surrounding grass, yet no one can see that a shoot has ever been touched. The bed is kept nearly at that level throughout the season by close pruning, and beating down by rain is almost impossible. Now, how different is this from the old system of cutting the sides of the bed with shears and allowing the strongest plants to tower here and there all over the bed, the first heavy rain, perhaps, levelling them to the ground. Managed properly, the Petunias make the best of rows for circular beds or along a walk.

GREENHOUSE AND CONSERVATORY.

To do proper justice to forced Hyacinths expected to bloom at Christmas, they ought to be potted not later than the middle of August. They may be flowered as early as Christmas if potted as late as the end of September or beginning of October; but this is too much for the bulbs, the flowers are not so fine as from early potting, and it takes two seasons' good nursing to bring the bulbs round again, so that they will make their appearance among the early spring bulbs in the beds and borders of the flower garden. They manage differently in Holland, where they know the nature of the Hyacinth much better than we do. There, from time out of mind, the first crop of forced Hyacinths is potted about the first week in August. They provide against exciting the foliage till the pots are full of roots, by a thick covering of tan, leaf mould, or something of the kind. In about six weeks the pots are full of roots, they are then taken to cold frames and kept close to the glass, with plenty of air, and the natural warmth of the latter part of September and the whole of October is sufficient to bring up the foliage and flower-buds very gradually, with the least possible injury to the bulbs. Indeed, as compared with our practice, the bulbs can hardly be said to be forced at all, and after one season's nursing the same bulbs are fit to be again forced, or exported in the usual course of business. It is now high time that the Narcissuses which were taken up last June, to make room for other plants, were now planted where they are to flower next April and May, and as they do not push up till after the present crops are over, or are killed by the frost, they will be no eyesore in that respect. Meantime, their roots will push deeply into the soil, and be better able to supply the requisite nourishment at the proper time than if left out of the ground till October. Narcissuses that are left in the ground from year to year are now making fresh roots actively, though no signs of vegetation are apparent in the bulbs. This shows plainly enough that we should not put off planting them till the time of planting Tulips. One of the best autumn plants for the conservatory is *Lisianthus Russellianus*. It does best when treated as a stove biennial and sown about this time. The varieties of *Thunbergia alata* sown last February are now, and will be for a long time, very beautiful trained on trelliswork. *Vinca rosea* and *alba* make admirable plants for the conservatory in autumn. *Allamanda cathartica* in a pot is also well suited for this purpose, but being of a succulent nature it should not be kept here late in autumn, but should be removed to the coolest part of the stove. All these plants require now less air and water, and the house to be kept somewhat drier. No two greenhouses are managed anywhere alike in summer. Where Vines are on the rafters, the house should now be kept more close to ripen the fruit early before the time of housing the plants for winter; and where plants in flower are the chief study, a drier atmosphere, more air, and attention to cleanliness are requisites to be attended to.

STOVE.

There is a large number of stove plants that might now be propagated from, and the old plants thrown away after they have done flowering between this and Christmas: such, for instance, as *Clerodendrons*, *Justicias*, *Roellias*, *Vineas*, &c. Young plants of these might easily be nursed through the winter in 60-sized pots, and as soon as they begin to grow freely in spring they may be shifted into pots a size larger, and when the roots are fairly through the fresh soil they will be in a condition to stand the one-shift or any other system. This

would give more room to woody plants in winter, and the younger the plants of softwooded species are the better they always flower. If any of these are too small to form fine specimens singly, propagate more of them, and plant half a dozen of them in a pot at the final shifting.

PITS AND FRAMES.

If *Acacias* intended for forcing next January are huddled together in some out-of-the-way corner, they will not flower well next spring. Other useful plants would now be better along with them in the open sun. If your plants of *Coronilla glauca* are planted out in a border to make them fine specimens, the sooner you take them up and pot them the better, as they go on making young wood till overtaken by frost, without ripening wood for producing bloom. If they are full-grown specimens cramped in pots, give them plenty of water, and expose them to the sun in the open air.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

At length on the 6th we had a few showers, and early in the morning of the 7th we had the best rain for an hour that we have had for nearly four months, with slighter droppings during the forenoon, all of which, though not penetrating deeply enough to reach the roots of established plants, did much to benefit those which were newly planted, washed the foliage, refreshed the earth, and gave an agreeable coolness, which to vegetables and animals was a pleasant relief from the arid heat which oppressed everything, and seemed like a heavy load resting on our spirits and our actions. For our own part we were just on the point of the dilemma we were in four years ago, when the only chance we had of preserving many pot plants was to cover them up in a wood until better days should come.

Owing to a lull in our laundry work our house sewage had failed us, and we had not more than an inch of water above part of the mud in the only pond of water left us, and that we were pumping and using as if every pailful were as valuable as gold dust. Our deep well has long been confined to domestic purposes, and when the rain-water tanks failed it had to be used for the laundry and stable yard. This water is very hard originally; but when it all collects in the sewage tank at a considerable distance, what from the soda, the soap, and the fatty matter, &c., it has never injured any plants out of doors to which it has been applied; and of course after such a rain as that on the 7th, much would find its way from the gratings of yards, &c., that would make the sewage all the more soft and pleasant to plants. We have for want of better used it freely to our fruit trees in pots, and without any apparent injury, and if we could have obtained enough we would have used it to our bush and pyramid fruit trees in the open air. All these were mulched early in the season, but we would have liked to have given them six pailful of water each, and then the fruit would have been larger. For months neither from rain nor dew has the foliage been thoroughly damped, and yet on established trees it looks well; but we have a good idea of the reason why under such circumstances the foliage is so healthy, and that is simply because in self-defence the roots have gone deeper in search of moisture than we would wish them to do; and we see in the recurrence of such seasons the necessity of lifting and replanting, or the cutting of the lower roots, all of which work might be avoided could we only entice the roots to remain near the surface.

But for the burning heat and the depredations of the fly on all the Cabbage tribe, established vegetables would have suffered comparatively little from the drought, as their roots, like those of trees, were induced to go deeper. It is succession crops with roots near the surface that have chiefly suffered.

In such seasons as this the mode of conveying water becomes a matter of importance. A barrel-drain takes all the superfluous water from the mansion here. It has been built of soft bricks and mortar, and as the drain is a good way from the surface, farther than the loss of water in a dry season the drain answers its purpose well enough, as besides the loss of the fluid from passing through the bricks and joints, no other prejudicial effects result. Owing to the slimy matter that in time will collect in all drains at the bottom, we lose little of such water in ordinary circumstances; but we have always noticed that after a flooding rain we never get water from that main drain in proportion to the rainfall, as after the water rises to a certain height in the drain so much escapes through

the bricks and joints into the earth. For securing as much as possible of the water when necessary, it would be economical in the end to use hard bricks and cement joints, or large, hard-burned, glazed earthenware pipes with cement joints. For clean water we would recommend large metal, and, better still, glass pipes; but unless the pipes were large we would not recommend iron pipes for sewage, as when of small size they soon become furled and closed up wherever dish-washings and soap water form a chief part of the sewage.

In taking rain water from sheds and glass houses to a considerable distance to tanks, &c., nothing is better for carrying the water underground than iron pipes cemented at the joints, provided the pipes are deep enough to be beyond the reach of frost. Next, we prefer hard-burned, strong, glazed earthenware pipes, with Portland or Roman cement joints. Contrary to our wish, we had a portion of such connecting piping below the ground done with common earthenware drain pipes and cement joints, but we know we lose a good deal of water by them, as they become softer and more porous when laid in the ground. These little matters become of considerable importance when every gallon of water has its value. From a similar amount of hard surface, as slate or glass, there is a great difference in a heavy shower in the quantity of water that at once reaches the tank when conveyed by such earthenware pipes, as contrasted with iron or those that are hard and glazed.

Tiles in proportion to their thickness, if not glazed, are bad roofing when the rainfall is to be depended on. We have known cottages roofed with tiles, the water falling on which was conducted to tanks in order to serve for water supply, and unless in a very fast or continued rain hardly any water would reach the tank, whilst from a similar roof slated the tank would be nearly full. In drizzling rains soft tiles will absorb the rain nearly as fast as it falls.

Our turned-up ground in the kitchen garden has not been wetted enough for general purposes, but we have sown a piece of Turnips, well soaking with the rain water the opened drills before sowing. We also sowed a piece of Spinach in the same way. We hope these sowings will do, as the weather promises to be much cooler. We cannot say much for our success, though adopting the same mode previously, and covering carefully, leaving dry soil on the surface, and even sprinkling with a little litter to break the force of the sun's rays. The air was so arid that in spite of everything it would suck up the moisture, and what green leaves appeared were pounced upon by myriads of the fly. We will follow with main crops of Spinach, watering the rows before sowing, and will sow more than usual, in case Winter Greens should not be so large and plentiful as in the generality of seasons. We will also make our first sowing of Onions, and will sow more in a fortnight, as these Onions when established are nearly as independent of a hot summer as a crop of Wheat sown in autumn. Spring-sown Onions will not be of the usual size this season in our district. We will water Coleworts with manure water as soon as we can, and give a good position to more young plants for winter and early spring supply. A fine lot of these may be obtained by planting in rows a foot apart, and about 9 inches from each other in the row.

We can only say what we should like to do with our main plantations of Cabbages planted last autumn, and which, in spite of the drought and heat, have furnished repeated cuttings, and that all the more from the larger lower leaves falling off, and almost covering the ground, and thus so far arresting radiation and evaporation. We would fork over the ground, give a good soaking of sewage, and then cover the ground with a mulching of half-rotten dung. Thus treated, we would have good gatherings until the spring Cabbages came in; and in this district green vegetables will have their value during the coming winter. Thus treated, old Cabbage stumps will yield a supply as juicy and succulent as the best young Coleworts. As previously stated, we have sown Lettuces, Endive, and the Cabbage tribe under old sashes, as we very nearly lost them all in the open air. Since the rain on Friday the dreaded jumping fly has become more scarce.

FRUIT DEPARTMENT.

Wasps, as usual, have appeared in strength in August. Until the beginning of the month we scarcely saw a single specimen all the season. They were very small and thin at first. On close investigation we never found so many nests, especially in the pleasure ground, and the cracking of the turf gave them great facilities for burrowing, and this, combined with the hardness of the ground, made it more difficult to dig them out and

destroy the nests. In most cases, when we did so, we buried a bottle with enticing liquid in it, leaving only the rim of the mouth above ground. From some such bottles we have since plunging them taken a pint of wasps, and in others that had become dry they had actually commenced forming cells for a fresh habitation.

One of our young men tried a simple mode, that would be very useful where it would not be convenient to dig out the nests, which, however, well done, always leaves some wasps at liberty, and these when deprived of a home are apt to be more predatory than ever. The top of a hand-light was firmly placed on the ground over the nest after dark, a plate with burning sulphur was quickly shoved inside the glass next day, and very shortly the myriads that filled the glass had finished their existence. This repeated several times would destroy the most prolific community of wasps.

As yet wasps have done little harm in the garden, but have just begun to taste the ripest Peaches and Nectarines in the orchard house, but even there to a trifling extent. We were forced to let them and armies of large flies have more than their share last year, and we resolved to keep them under this season. Our front ventilators are of wood, and we covered all the openings with netted gauze, through which a fly of any size could not pass. We had a little more trouble with the top ventilators of glass, that are merely hung by a screw on each side, as a pivot, and which for such a purpose answers well enough. To leave the ventilators when open we should have to make a sort of bag of netted muslin for each ventilator, which would take up a great deal more material, and occupy time to do it. We therefore unscrewed and took out all the ventilators, and then covered the spaces with the gauze, using a piece of common twine drawn tightly over the gauze, and keeping it tight with a few tin tacks. The gauze lets plenty of air through, and therefore all air-giving is now avoided.

There will be plenty of heat to ripen Peaches, Nectarines, Plums, &c., as soon as we want them. Our only drawback is as respects the Vines in one house. Less air would have enabled us to have ripened them earlier in the autumn; but when the Peaches, &c., are all gathered we can replace at least a portion of the ventilators. This is the penalty we must pay at times for having so many things in one house. But for keeping the Peaches back instead of forwarding them, the same treatment would have suited both crops. Now the Grapes will receive a little check to do what is desirable with the Peaches. The second crop of Figs would have come on all the sooner in a closer, warmer atmosphere at night. Before the rain of Friday, which put a good many gallons in our tanks, we began seriously to think that we should have to place a foot of litter over all the pot plants in these houses, and cover the ground in the later house to keep moisture in. This would not have contrasted well with the heavily-loaded trees, and we are glad that for the present we shall not be under any such necessity.

All trees in pots from which the mulching had disappeared were fresh mulched, and those who have never tried it would be surprised to find how much this mulching saves watering, whilst the water that reaches the roots is more fertilising. Some people pretend to laugh at all surface-mulching and manuring. "Put the manure in the ground," say they, "if you wish to see fine luxuriant results." One man told us not long ago, "Why, you are as stupid as some of your farmers, who cart out their manure on their land and allow the air to take away its best properties for weeks, plough it in when as dry as fresh-made hay, and then expect a fine crop of succulent large-sized Turnips." Well, let them laugh who win. If we wanted fine Turnips and huge Cabbages we would turn in the well-made moist manure as soon as possible, and grudge every ounce the air took away; but if we wanted masses of bloom and plenty of fruit rather than over-luxuriant shoots and foliage, then we would have our manurings near the surface, even if the atmosphere should rob us of a little of its fertilising influences.

In the open air took a few hours to free our dwarf trees of laterals and superfluous shoots, being rather behind in this work. All spurs and shoots to bear next season should have all the sun possible now. A gentleman complains that his Peach trees grow vigorously, but he obtains little fruit, and no wonder; his trees now are like a thicket, the summer shoots luxuriant and weak, all standing out in bold relief from the wall; and he drags in our authority for his practice by telling us he read something to the effect that Fig trees did better when allowed to grow somewhat naturally than when close-trained to the wall; and if this was the case with Fig trees.

why would it not answer with the Peach? Now, Fig trees will do admirably when not too closely trained, and we are indebted for the idea to that clever gardener Mr. Tillyard; but the system would be ruin to Peach trees. The season is yet before our correspondent, but let him not lose an hour in cutting out all very luxuriant shoots, removing also all the weaker ones, and laying in close to the wall all the middle-sized shoots about the thickness of a quill, and as closely together as will cover the wall with shoots at from 4 to 5 inches apart, and if these are ripened by the autumn in his climate we will guarantee he will have plenty of fruit buds, and flowers and fruit too next season. If these shoots exceed 18 inches in length he may nip the point out of each if the trees are vigorous. If the trees are old, until he brings them round to fruitfulness, it will be well not to stop until he sees triple buds on the shoot to cut back to. It will be as well, after the thinning of the shoots, to defer stopping those left for a week or two, as doing both operations at once would be too great a check to the energies of the tree.

ORNAMENTAL DEPARTMENT.

Our walks, though clean, were becoming rough from the long drought, and therefore, on the afternoon of Friday, we had them swept to fill up the cracks, and well rolled before the moisture had evaporated. A few weeds that showed were pulled out in sweeping. We dislike walks which will try the feet of those using thin-soled boots, but for two months ours were rough, and we could not help it; now they will be tolerably comfortable for some time. How few men there are who can sweep a walk, so as to leave all uniform and not a mark or a trail of the broom behind them. This can only be done by sweeping right on, and using no side or back strokes. It is quite a treat to see some men clip edgings and sweep walks, whilst others, with excellent intentions, can never avoid leaving marks behind them. Just as in watering, some men seem to know all about watering as if by instinct, in-doors or out of doors, others will never water a plant properly, except by chance more than judgment. With them it is of no use detailing plain signs. The very simplicity of some things seems to act as a deterrent to right practice. In this simple matter we have found men who could scarcely read, far more to be trusted with the watering pot than other really clever intelligent men; yet all general intelligence ought to make a man more conversant and attentive to simple matters.

In consequence of using sulphur, as lately described, Lobelias are looking up after the depredations of the rabbits, and with that exception and the Calceolarias, far from being so fine as they were a month ago, the flower garden would, in spite of the dryness, look well if the lawn were only green, and there is a greenish tinge stealing over it since the rain of yesterday. We have had it knifed several times, to cut down plantains and other weeds, and let the sun dry them up out of sight. A figure of this knife appeared in a previous volume, and recently Mr. Galward, of Hitchin, an energetic ironmonger and machinist, has had it over as a pattern, as he thinks it will not only be useful for lawns, but also for farmers for cutting charlock and all other weeds that appear above the corn early in the season. We know that even with our long handle it answers well for quickly going over a field, and with the least possible trouble to the workman.

We have machined round the heds where there was anything to cut. With another shower or two we think we shall be all right for the autumn. With the little water at our disposal, we have used it exactly as described previously.—R. F.

COVENT GARDEN MARKET.—AUGUST 12.

OUR quotations remain much the same as last week, and there is little or no alteration worth notice in the general features of the market, the chief supplies, both home-grown and foreign, being Apples, Pears, and Plums. The last cargo of West Indian Pines has arrived in very bad condition.

TO CORRESPONDENTS.

.. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (S. Morgan).—If you send your address and eleven postage stamps you can have, free by post, from our office, Nos. 354, 354, and 355, New Series, which contain the information you desire. We know of no English handbook published on the subject of late years. (*E. T. Norwich*).—The "Cottage Gardener's Dictionary," a new edition of which has just been published, furnishes all the information you require as to the native countries, &c., of the plants, and much more besides, together with directions for the culture of each genus, and of the most important species, but there is no work giving the culture of each separately. You can have the work named free by post from our office for 7s.

SEEDLING GLOXINIA (*J. Darson*).—It is pretty—all Gloxinias are; but there are many like it. Much depends on the habit of the plant, and of this we know nothing.

LILIAN ACRATUM (*Mrs. K.*).—Your plant, nearly 3 feet high, with twenty blooms, crowning its single stem, is very fine. We do not remember to have seen quite so many on a single stem.

HANUM (*G. S.*).—We have inquired respecting the seeds mentioned by Mr. Wauklyn (vol. x., p. 126), but find that the papers relating to them have been mislaid. It is stated that they were not Melon seeds, but we are promised further information respecting them shortly. The Gooseberries were deliciously flavoured.

MIGNONETTE FOR WINTER FLOWERING (*A Novice*).—Mignonette for blooming in winter should be sown at once in pots filled with good light soil, putting a few seeds in the centre of each pot. When the plants appear they may be singed out to three in each pot. When the roots fill the pots the plants should be shifted into the next size, and so on, until they are in 6-inch pots. They should be kept on a shelf near the glass in the greenhouse. A light fibrous loam with a free admixture of sand, and good drainage, are essential. Be careful not to overwater in winter, nor to give any water until it is required.

STUCKS FOR SPRING FLOWERING (*Idem*).—Seed of the Intermediates may now be sown, but no time should be lost. The seed should be sown in good light soil in the open ground, and when fit to handle potted-off singly in small pots, and wintered in a cold frame, protection being given from frost.

SEEDLING ARBOR-VITÆ MANAGEMENT (*A Subscriber*).—The seedlings having been raised under glass, it would be well to keep them during the winter in a cool airy house or cold pit, affording them abundance of air, but protection from severe frost. In spring we would plant them out in the open ground, after well hardening them off.

HOLLYHOCKS (*An Old Subscriber*).—An article will shortly appear on the subject.

KEEPING SWEETWATER GRAPE (*J. H. Watford*).—Your Grapes will keep best on the Vine. There is no mode of prolonging the keeping period, except preserving a cool and dry atmosphere.

DESTROYING WORMS IN POTS (—).—The worms in the pots may be destroyed by stopping-up the holes in the pots with corks, and watering with lime water until it stands on the surface. The lime water may remain for an hour, then on removing the cork it will pass off. The lime water may be made by pouring thirty gallons of water over 10 lbs. of fresh lime. Stir well up and allow the whole to stand two or three days, then employ the clear liquor. Placing a little soot over the corks would have prevented the worms entering through the holes in the pots, but we should not advise such a proceeding for Ferns. Probably there were worms in the soil when it was used. See that the drainage of the pots is good.

WATERING PEACH TREES (*C. E. S.*).—Your tree has upon it too many fruit by half. You will not improve the tree much by allowing the fruit to remain until it is fit for a tart, as it will be nearly ripe by the time this

appears. To have cased the tree the fruit should have been removed when the stoning was complete. The syringing may be continued until the Peaches begin to ripen, and a good watering should then be given, and watering must be continued until the fruit is ripe, then syringe for a few days, but discontinue doing so by the middle of September. The watering may cease when the fruit is ripe.

PROTECTING PEACHES FROM WASPS (New Forest).—We have not found anything equal to the old plan of trapping them in soda-water bottles about half filled with beer sweetened with treacle. A number of these bottles suspended from the wall by a string tied round the neck, will keep the wasps from the fruit, and the destruction of the nests is the best of all remedies. You are quite right as to covering the trees with hexagon netting; it does impair to some degree the flavour of the fruit.

COMPOST FOR FUCHSIAS AND PELARGONIUMS (A Lover of Flowers).—A compost of two-thirds loam from rotted turves, and one-third old cow dung and leaf mould in equal quantities, with a free admixture of sharp sand, will grow them well. The plants now in small pots should be potted as soon as they reach the sides of the pots, and before they become closely matted. The Pelargoniums should be repotted up to December, and then shifted into their blooming pots if for an early bloom; but if intended for flowering in June the final shift may be given in February. The shoots should be stopped and tied out, so as to produce good specimens. The Fuchsias should be potted and kept slowly growing over the winter, and be stopped frequently as required to secure good habit.

SELECT FUCHSIAS (Idem).—Queen of Whites, Diadem, Labriette, Palmaris, Hercules, Sunshine, War Eagle, Elegansissima, Rose of Denmark, Enoch Arden, Bauks's Beauty, Catherine Parr, Conquest, and Blanchette.

SELECT PELARGONIUMS (Idem).—Show Varieties.—Belle of the Ball, Charles Turner, William Hoyle, Selina, Mary Hoyle, Elegans, Lady of Quality, Marian, Lord Canning, Conqueror, Beauty of Reading, and Golden Hue. Fancy.—Clytie, Eleanor, Silver Mantle, Undine, Lady Towers, Eulalie, Godfrey Turner, Roi des Fantaisies, The Rover, Mrs. Turner, First Favourite, and Delicatum. French and English Spotted.—Calypto, Egérie, Gustave Malet, Rubens, Margaret, Madame Charles Keteleer, Victorine Pingard, Numa, General Fleury, Celine Malet, Duchesse de Moray, and Berenice.

PELARGONIUMS AND FUCHSIAS UNHEALTHY (R. A. S.).—Your pump water with which the drains communicate would have done no harm to the plants if exposed for some hours in a tub before using it. The want of water is, we presume, what has injured your plants on stands out of doors. If the drought continue, we would advise taking them from the stands and plunging the pots in earth and shading.

HEATING A SMALL HOUSE WITHIN A CONSERVATORY (S. J. B.).—There is no objection whatever to the small house which you propose erecting for Ferns, &c., inside the lofty one, only we would advise you to have a spun-roof, if a foot or two higher, in stead of the flat one, as the latter will be more apt to shower down condensed moisture on the plants. The lamp will do for extra heat if the products of combustion go off. Are there no other modes of securing additional heat? How is the house heated now, the large one?

FLUE-HEATED PIT FOR BEDDING PLANTS (H. T.).—As a means of lessening damp in winter it will be well to have the bottom of your pit on the level, or rather a little above the level of the surrounding ground. It will be most convenient to have sliding frame sashes. A good pitch for lights, 7 feet by 4, would be to have the back wall $3\frac{1}{2}$ feet in height, and the front wall from 20 to 24 inches high. The above size would be good for sashes. In such a pit we would like the flue round the wall instead of along the centre of the pit, as that would interfere with your setting the plants. A small flue, say 5 inches clear inside, would be sufficient. We would say in addition, that if you wished your pit to be used for many purposes, and for taller plants than would stand in the above, you might have the outside heights the same, but you could sink the pit from 18 to 24 inches—say 20 inches, and then at 24 inches from the sunk level, leave a ledge of bricks inside the walls, and on these ledges, back and front, you could have boards laid across, so as to permit of shorter plants standing on them, and when the boards were removed the pit would do for taller plants. For general bedding plants, however, it will be best that the ground should not be sunk at all. The walls will form one side of the flue. We have had the flue formed in the wall, but then there was heat lost outside.

MANURES FOR ROSES (W. H. M.).—If you have decayed manure I advise you to put it to the depth of 2 inches over the roots. All my Roses were so served some time ago; the operation was costly, but it was absolutely necessary to prevent the surface roots from being burnt up. This, with a gallon of water to each Rose (1500) every other day, has preserved my Roses. Mildew, and red fungus, and black blight have been prevalent, but the foliage of my Roses is quite clean. I began early in the year cutting out with scissors every sign of fungus, which spreads rapidly. As regards salt, 4 cwt. an acre would be a dressing. Three cwt. of guano would be a good dressing. Nitrate of soda at the rate of 3 cwt. per acre is better than salt, it produces healthy foliage. The best time to put on guano, salt, and nitrate of soda is during stormy weather in winter or spring. When guano (sifted) is put on it should be mixed with three or four times its quantity of sifted coal ashes. If sown by itself the person should take up small handfuls and sow it thinly. A clod-hopper has no idea of its power. It is the cheapest of all manures. If you have no decayed manure, perhaps you have wood ashes; these are a good manure and attract and retain moisture. I gave my Roses some guano water some time back, at the rate of one handful of Peruvian guano to three gallons of water. You had better put it on in like manner during dry weather.—W. F. RADCLIFFE.

ROSES AND THEIR MERITS (Devonensis).—"You are quite right in supposing that I am 'always ready and willing to benefit the public by my experience in the cultivation of the Rose—that most beautiful flower.' Duchesse de Caylus here is in the Manetti, and grows well and blooms abundantly. It is a first-class Rose of medium size. Briar Roses here bear no relation to Manetti Roses, except the Tea-scented Noisettes, which do well on the Briar, also on the Manetti stock, and on their own roots. I would not accept one hundred Hybrid Perpetuals on a Briar if they were offered to me. I am persuaded that the days of the Briar are over 'D. Deal' in his last letter says the same. Still it is useful for uncultivated places, where the plant is watered by capillary attraction, and also for such sorts as do not flourish on a Manetti stock, or such as are too delicate to do well near the ground. This summer one nurseryman

has lost 27,000 Briars out of 40,000; another, I hear, has lost 20 per cent. I am not quite sure it was not 80 per cent. If many saw my Roses, about 1700 ground plants, in full health, and now blooming in their second series, I am persuaded that they would soon discard their poor Briar Roses. It is impossible to conceive or describe the grandeur of the first series here, and in a little time they will be nearly as good, and will go on till frost stops them; but observe, they have had all fungi cut out, and have been mulched, watered, and had the ground around them moved with Parkes's fork. Unless people will take these pains, which so well repay, the sooner they give up Roses the better. With regard to Mrs. George Paul and Monsieur Hall, I saw them lately in a garden where they had had no water, and the flowers were bad. Charles Verdier is a full and fine Rose, and blooms freely here; but I saw a line of it last week in another place, where from want of water all the blooms appeared to have stood still. I bought four of them, and brought them home; and I shall buy twelve more, as it is a very good Rose, and of a light colour. I also bought at the same time all the plants of Monsieur Nonan, seven plants of Abel Grand, which I thought good, ten of Merveille d'Anjou, twelve of Reine du Midi, twelve of Madame Croix, besides a few others in smaller quantities for trial. Thirty-seven of them were in dormant bud, budded six weeks before; the others were plants. I cut those in dormant bud down to near the point of union at once, and expect to bloom the greater part of them this season. Last year I planted a large number—now splendid plants—on the 6th of August. This year I have planted on the 6th of August the above fifty-three plants. Most of my satirical visitors ask, as soon as they come, 'Where are the plants of the 7th of August?' expecting to find them dead. I may observe, in passing, that August, September, and October, if you are near the nursery and take care of the plants for a few days, are the best times to plant Manetti Roses; but I do not advise inexperienced or inattentive persons to do so. Any time from November till May, when the ground is open, will do for planting Manetti Roses. I see one writer talks of the 'much-valued' Manetti Rose! It is utterly impossible to overvalue it. With regard to Thoria, a robust grower on the Manetti, it has not yet been quite full. It is, however, a fine Rose, and promises well. I shall know more of it before the year is out. I have seven strong plants of it. With regard to Mias Ingram, it is growing very freely, and has narrow but hard fungus-resisting leaves. In respect to the habit of Roses and general excellence, I know of none superior to Charles Lefebvre and Jules Margottin among Hybrid Perpetual kinds; nor any superior for habit and general excellence in any family to Gloire de Dijon, Triomphe de Reims, and Celine Forestier. When my plants are stronger, I shall be able to add glorious Marchal Niel, which is by far the best of the yellow Roses. The Briar suits it well. I have some on Manetti, growing finely and beginning to bloom. I believe I have now answered all the queries of 'DEVONENSIS.' W. F. RADCLIFFE."

INFLUENCE OF CHARCOAL IN HEIGHTENING THE COLOUR OF ROSES (G. H. M.).—"I wrote to an old friend, a distinguished chemist, for an opinion. He replies—There is no doubt of the favourable influence of charcoal on the vigour, and, therefore, on the colour of all flowers; so marvellous is the power it possesses of condensing atmospheric gases in its pores." Nitrate of soda or saltpetre tend to produce good green foliage.—W. F. RADCLIFFE."

A READER OF THE JOURNAL.—There can be no question that what you enclosed is an advertisement of a medicine. We know nothing of it.

MOULE'S EARTH CLOSETS (A. Page).—Apply at 29, Bedford Street, Covent Garden, London, W.C.

OBTAINING BOTTOM HEAT FOR FORWARDING AND PROPAGATING (Amateur).—As you have two vineries and a greenhouse, the simplest plan, in a small way, for propagating would be to have in your greenhouse a small box covered with glass, and an iron or tin box below it 2 inches deep, which you could fill with hot water, and empty when cold as desired. A good second mode—if you had a fire nearly constantly in one furnace—would be to place a small boiler over the furnace, or a bent pipe of iron in the furnace, and take the two ends into a small tank in one of the houses, over which you would have your propagating place. You could do all your work more easily than in a pit out of doors. A third mode has been carried out several times successfully. In a greenhouse heated by a flue, the flue entered at one end, and went round at least a part of the house; but as heat was only wanted at times, the flue as constructed would not do for bottom heat. At the end where the flue entered, a close damper was inserted in the flue 6 feet from the end, and the flue turned upon itself there, and communicated with the chimney, without going round the house. On the flue, partly double at the end, stones, &c., were placed, and then sand, covered with a box and light, and this place could be heated without much heating the rest of the greenhouse. In cold weather the damper was pulled partly out, and the rest of the house heated. For the purposes you want, we have no faith in either a garden frame or a pigeon-holed brick pit heated by dung linings. You can only manage such a pit in winter by having ample command of dung, and the means of preventing any steam or vapour from the dung finding its way into your pit. In such a case, we would either have a solid bottom, with a chamber below, or a solid wall and no pigeon holes. We think a brick pit heated by hot water or flues would suit you best. We need not say anything about heating bottom and top, by hot water, as that is so often adverted to. As you seem to have flues for your other houses, there is no insuperable objection to have flues for this also. Suppose, then, we had a pit from 5 to 6 feet in width, from $3\frac{1}{2}$ to 4 feet high at back, and from 2 to $2\frac{1}{2}$ feet in front, we would run a flue and return it, say 5 or 6 inches inside measure, building it above the level of the floor. Then as to the bed, the best would be one bottomed with slate, going from back to front, 3 inches above the top of the flue. If three-fourths of the width formed a bed, and one-fourth of the slate were left exposed, the latter in general would be enough for top heat. Various other modes, as covering with slates, could be resorted to, but far enough above the flues to be safe. The most economical plan of all, would be to fill the place between the flues, and flues and wall, as roughly and openly as possible with stones, bricks, &c., making them almost as open as a chamber, raising them to a height of 2 inches over the flues, next adding small washed gravel, and then some inches of sand or ashes for plunging in. By inserting some small upright pipes in the stones, you may pour water down among them without touching the flue, and if these pipes are supplied with wooden plugs, you can let heat into the air of the pit when you like. With all our love for hot water, we would wish nothing better than such a flue-heated

pit for general purposes. On the subject of your other query, we shall have some remarks next week.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

POSTING LISTS OF PRIZES AWARDED.

ALLOW me to offer a suggestion regarding the posting of prize lists of poultry. Being myself an exhibitor, I have several times waited for the receipt of the Journal to know whether my birds were successful, when I have been obliged to send poultry without my poultry man. If the secretaries of shows would have the kindness to forward with the entry papers a sheet of paper suitable to fold round catalogues, with lines for an address to be written by the exhibitor requiring a list of prizes, and stamped by him, the amount for the catalogue might be named in the list of rules, and forwarded with the entry fees. These directed papers would take little time to paste round the catalogue, and could be posted as soon as the prize lists were published, with no anxiety and little trouble to the secretaries. —B. B.

KETTERING POULTRY SHOW.

THIS was a first attempt to establish a poultry show at Kettering, and under the able management of the Secretaries it was certainly a great success. The grounds on which the Show of the 6th inst. was held are very well adapted for the purpose, and there was no lack of effort to add to the general attraction by the introduction of banners, evergreens, &c. The arrangement of the birds in Turner's pens was as perfect as could be desired, and the entries included both poultry and Pigeons from many of the principal breeders in the kingdom. There was also a very well-filled class for foreign birds of any description. A show of flowers and fruits was likewise held. We have not as yet this season seen such good Black Red Game, Grey Dorking, and Game Bantam chickens as those exhibited at Kettering.

The following is the prize list:—

DORKINGS (Any variety).—First, H. Warner, Loughborough. Second, T. Burnaby, Pipewell. Highly Commended, R. Wood, Clapton. Commended, H. Wyman, Kimbolton, Hunts. *Chickens*.—First, R. Wood. Second, O. E. Cresswell, Hanworth. Highly Commended, R. Sykes, Geddington. Commended, H. Warner. *Hens*.—First, R. Wood. Second, J. Sheffield. Commended, T. Burnaby; L. Richards, Glendon Lodge; R. L. Garratt, Thorpe Malser.

GAME (Any variety).—First, F. R. Hall, Cambridge. Second, Capt. T. Wetherall, Loddington. Highly Commended, Capt. T. Wetherall.

COCHINS (Any variety).—First and Second, J. N. Beasley, Chapel Brampton.

BRAHMS (Light or Dark).—First, R. P. Wakefield, Wellingborough. Second, G. Chettle, Kettering.

SPANISH (Any variety).—First, W. R. Bull, Newport Pagnell. Second, C. Wright, Northampton.

HAMBURGHS (Gold and Silver-pencilled).—First withheld. Second, W. Nottage, Northampton.

HAMBURGHS (Gold and Silver-spangled).—First, J. Laming, Cowburn, Spalding. Second, A. Stowar, Peterborough.

ANY OTHER DISTINCT VARIETY NOT PREVIOUSLY MENTIONED.—First, Capt. T. Wetherall, Loddington (Crève-Cœur). Second, A. S. Roe, Ely (Silver-spangled Polish). Commended, Capt. T. Wetherall (Crève-Cœur).

ANY VARIETY.—*Chickens*.—First, H. Warner (Game). Second, Capt. T. Wetherall (Crève-Cœur). Highly Commended, T. Dadford, Northampton (Dark Brahma). Commended, H. Wyman (Gondans); O. E. Cresswell; J. N. Beasley (Cochin-China).

GAME BANTAMS.—First, J. R. Robinson, Sunderland. Second, Capt. T. Wetherall.

BANTAMS (Any other variety).—First, H. Draycott, Humberstone. Second, Hon. Mrs. H. Hambrough, Pipewell Hall.

SELLING CLASS.—First, W. Nottage, Northampton (Spanish). Second, H. Warner (Dorkings).

SWEETSTAKE FOR GAME COCK.—Prize, H. Warner, The Elms, Loughborough.

DUCKS (Ronen).—First, T. Burnaby. Second, R. Burnaby. Highly Commended, R. Booth, Glendon Hall. Commended, J. S. Calthorp, Sutton. DUCKS (Aylesbury).—First, W. R. Bull. Second, J. J. Sharpe.

DUCKS (Any other variety).—First, Duke of Buccleuch and Queensbury, Loughborough House. Second, Withheld.

GRESE (Any variety).—First, R. Sykes. Second, J. J. Sharp.

TURKEYS (Any variety).—First, J. N. Beasley. Second, M. Kew. Market Overton.

RABBITS.—*Lap-Eared*.—Prize, S. Arch, Kettering. *Fancy Variety*.—Prize, J. Rowe, Thorpe Malser.

PIGEONS.

CARRIERS (Any colour).—First, J. Hawley, Bingley. Second, A. Stowar. Highly Commended, H. Yardley, Birmingham.

POULTERS (Any colour).—First, R. P. Payling, Peterborough. Second, S. Horn, Kettering. Highly Commended, J. Hawley; H. Yardley.

TUMBLERS (Any variety).—First, J. Hawley. Second, S. Horn. Commended, E. Norman, Northampton.

BAILES (Any colour).—First, J. Hawley. Second, H. Yardley.

JACOBS (Any colour).—First, H. Yardley. Second, J. Hawley.

FANTAILS (Any colour).—First, O. E. Cresswell. Second, H. Draycott, Humberstone. Highly Commended, J. Hawley; H. Yardley; R. F. Payling. Commended, J. Rowe.

ANY OTHER DISTINCT VARIETY.—First, H. Yardley. Second, H. Draycott, Humberstone (Toys). Highly Commended, J. Hawley. Commended, W. Nottage, Northampton; R. F. Payling; E. Norman, Northampton.

SELLING CLASS (Any variety).—First, H. Yardley. Second, H. Draycott (Yellow Magpies). Highly Commended, E. Norman (Yellow Antwerp). Commended, R. F. Payling (Almond Tumblers); W. King, Wellingborough.

CAGE BIRDS.

CANARY (Clear Yellow and Buff).—First, W. King. Second and Highly Commended, Toon & Cleaver, Kettering.

CANARY (Variegated Yellow and Buff).—First and Highly Commended, Toon & Cleaver. Second, A. Heath, Desborough.

AVIARY OF SMALL BIRDS.—First, Toon & Cleaver. Second, E. Robinson, Kettering.

LINNET, GOLDFINCH, OR OTHER ENGLISH FINCH.—First and Highly Commended, J. Wallis, Kettering. Second and Highly Commended, J. Yeomans, Rothwell.

BLAC D. THRUSH, STARLING, LARK.—First, W. Bailey, Kettering. Second, Harrison, Stenton. Highly Commended, W. H. Tomlinson. Commended, T. Harrison.

PARROT, PARAKEET, LORRY, OR OTHER FOREIGN BIRDS.—First, W. King, Wellingborough. Second, G. Pell, Kettering. Highly Commended, J. Wallis; W. Duckby, Kettering. Commended, J. Barber, Bank, Kettering.

Mr. Edward Hewitt, of Birmingham, was the Judge.

ALLERTON POULTRY SHOW.

THIS year's meeting, held at Allerton on the 8th inst., was a far more decided success than any of its predecessors at the same place; indeed, it is stated in a local paper that ten thousand visitors were on the ground, and that the money received for admissions was upwards of £200, although the Show continued open only during a single afternoon. It is certain that such a show of poultry and Pigeons of really first-class character throughout rarely occurs, the *Humberstons* of all varieties being such, as no amateur had previously witnessed; and the *Game* and *Game Bantam* classes were scarcely less commendable. The pens used were those commonly known as Turner's, of Sheffield; and the arrangements were such as reflected much credit on the management. A very high wind prevailed, which, though it had the effect of keeping off rain, proved a great annoyance to the poultry and Pigeons so long subjected to its influence.

The following is the list of awards:—

GAME.—*Cock*.—First and Second, J. Settle, Marnham. Third, J. Spencer, Queensbury, near Halifax. *Pullet*.—First, H. Jowett, Idle, near Leeds. Second, H. Jennings, Stream Head, Allerton. Third, J. Fell, Adwalton. Highly Commended, J. Mason, Worcester; E. Aykroyd, Bradford; Fittou & Redman, Holmfied, Ovenden; T. Barker, Holmfied, Ovenden; J. Smith, Allerton. Commended, H. Jennings; J. Fortune, Norton Banks; G. Noble, Staincliffe, Batley.

HAMBURG.—*Cock*.—First, W. Clayton, Keighley. Second, H. Eeldon. *Gilt-cock*, Bingley. Third, J. Preston, Allerton.

SPANISH Black.—First, H. Eeldon. Second, J. Thresh, Bradford. Third, J. Newton, Silsden, near Leeds. Highly Commended, W. C. F. Pickard, Thorne, near Leeds; T. C. & E. Newbitt, Hepworth, near Batley. *Chickens*.—First, H. Eeldon. Second, J. Walker, Wolverhampton. Third, J. Thresh. Highly Commended, J. Berry, Silsden; J. Newton. Commended, T. C. & E. Newbitt.

COCHIN-CHINA.—First, H. Beldon. Second, T. Stretch, Ormskirk. Third, L. Biney, Manchester. Commended, C. Sidgwick. *Chickens.*—First and Second, C. Sidgwick, Ryddlesden Hall. Third, J. J. Booth, Silsden.

HAMABRON (Silver-pencilled).—First and Second, H. Beldon. Third, H. Pickles, jun., Earby, near Skipton. Commended, R. Longbottom, Bingley; W. M. Mann, Kendal; Miss A. Robertshaw, Allerton. *Chickens.*—First, H. Beldon. Second, R. Longbottom. Third, H. Pickles, jun. Highly Commended, T. Hanson, Keighley; R. Longbottom; H. Smith, Morton Banks.

HAMBURGH (Silver-spangled).—First and Cup, and Second, H. Beldon. Third, H. Pickles, jun. Commended, T. Fawcett, Baildon; J. Walker, Knaresborough. *Chickens.*—First, H. Beldon. Second, T. Fawcett. Third, H. Pickles, jun. Highly Commended, T. Blakey, Silsden; J. Pearson, Allerton; T. Robinson, Baildon; Ashton & Booth, Broadbottom, Mottram; T. Fawcett.

HAMBURGH (Golden-pencilled).—First, J. R. Jessop, Hull. Second and Third, H. Beldon. Highly Commended, H. Pickles, jun. *Chickens.*—First, H. Beldon. Second, E. Moore, Cottingham, Bingley. Third, J. Pearson. Highly Commended, H. Pickles; H. W. Illingworth. Commended, J. Preston, Allerton, near Bradford.

HAMBURGH (Golden-spangled).—First, H. Beldon. Second, J. Newton, Silsden. Third, H. Pickles. *Chickens.*—First, H. Beldon. Second, W. Driver, Keighley. Third, S. & R. Ashton, Mottram, Cheshire.

HAMBURGH (Black).—First and Highly Commended, C. Sidgwick, Keighley. Second, H. Beldon. Third, J. Preston, Allerton, near Bradford. *Chickens.*—First and Third, C. Sidgwick. Second, J. Dixon. Highly Commended, J. Preston.

POLANDS (Any variety).—First and Second, H. Beldon. *Chickens.*—First and Second, J. Bowker, Keighley. Third and Highly Commended, H. Beldon.

DORKINGS (Any variety).—First, Hon. W. H. W. Fitzwilliam, Wentworth Woodhouse, Rotherham (Silver-Grey). Second, Miss H. Jennings, Allerton. Third, H. Pickles, jun. *Chickens.*—First, H. Pickles, jun. Second, J. Stott, Healey, near Rochdale. Third and Highly Commended, Hon. W. H. W. Fitzwilliam.

GAME (Red).—First, J. Fletcher, Stoneclough, Manchester. Second, L. Biney, Manchester. Third, T. Bottomley, Shelf, near Halifax. *Chickens.*—First, Cup, and Third, H. Jennings, Allerton. Second, H. Jowett. Highly Commended, W. Spencer, Harworth; S. Spencer. Commended, T. Bottomley.

GAME (Any variety).—First, E. Aykroyd, Bradford. Second, H. Jowett, Idle, near Leeds. Third, W. Fell, Adwalton, near Leeds. *Chickens.*—First, E. Aykroyd. Second, G. Noble, Staincliffe, Batley. Third, W. Fell. Commended, Miss S. Jennings, Allerton.

GAME BANTAMS.—First, W. F. Entwistle, Elenheim Place, Leeds. Second, Miss Charlton, Bradford. Third, L. Biney. Highly Commended, J. Blamires, Horton, near Bradford. Commended, G. Noble.

BANTAMS (Any variety).—First and Third, T. Burgess, Brighouse. Second, S. & R. Ashton. Highly Commended, J. R. Jessop, Hull. Commended, O. E. Cresswell, Hanworth, Hounslow. *Chickens.*—First and Second, W. F. Entwistle, Leeds. Third, W. H. Robinson, Long Lee, Keighley.

ANY OTHER VARIETY.—First, E. Leech, Rochdale. Third and Commended, H. Beldon. Second, R. Loft, Woodmansey, near Beverley. Highly Commended, Col. Stuart Wortley, London (French Fowls); Hon. W. H. W. Fitzwilliam.

DUCKS (Rouen).—First, J. Dixon. Second, T. Dean. Third, E. Leech. Highly Commended, H. Beldon.

DUCKS (Any variety).—First, E. Leech. Second, J. Dixon. Third, H. Beldon. *Ducklings.*—First, E. Leech. Second, H. Beldon. Third, J. Firth, Greentop, Allerton.

PIGEONS.

POUTER OR CROPPER.—Cock.—First, H. Beldon. Second, R. Fulton, Deptford. Third, J. Hawley, Bingley. Commended, J. Hawley; H. Yardley, Birmingham; R. Fulton. *Hens.*—First, R. Fulton. Second and Third, J. Hawley. Commended, H. Beldon; R. Fulton.

CARRIERS.—Cock.—First and Third, R. Fulton. Second, J. Hawley. *Hens.*—First, J. Hawley. Second, R. Fulton. Third, H. Yardley.

TUMBLERS (Any variety).—First, Second, and Third, J. Hawley.

OWLS.—Cup, First, Second, and Third, J. Fielding, Rochdale.

TURBITS.—First, Second, and Fourth, J. Thompson, Bingley. Third, J. T. Lishman, Gillington. Fifth, W. Lund, Shipley. Sixth, J. Wade, Ovenden.

JACOBS.—First, J. Wade. Second, J. Thompson. Third, J. Hawley. **PANTAILS.**—First, J. Hawley. Second, J. T. Lishman. Third, T. C. and E. Newbitt, Epworth, near Batwry.

BARES.—First, J. Fielding. Second and Third, J. Hawley.

DRAGONS.—First, J. Deakin, Sheffield. Second, H. Yardley. Third, J. Thompson.

TRUMPETERS.—First and Second, J. Hawley. Third, J. Thompson.

ARCHANGELS.—First and Second, H. Yardley. Third, J. Booth, Oaks, Allerton.

ANY VARIETY.—First, J. T. Lishman, Gillington. Second, H. Yardley. Third, F. Graham, Birkenhead.

Mr. Hewitt, of Birmingham, and Mr. Cannon, of Bradford, were Judges for Poultry; and Mr. Hutton, of Paisley, for Pigeons.

REMARKS ON THE DIFFERENT VARIETIES OF PIGEONS.

IN continuation of my remarks on the present state of the Fancy Pigeons, I shall next notice the Turbitts. These I find tolerably numerous at most shows and of fair quality, although there seems to be a growing tendency to foul thighs, especially in Reds and Blues. This need not be, and need not to be. I have had several pairs of both colours with clean thighs, and fanciers should remember when showing that they thus lose a point.

Owls, I think, were never shown in such perfection as at the present time. The foreign birds are truly beautiful, and

so are the English Powdered Blues. One never sees Reds and Yellows now. This, I think, is a pity, as I have seen exceedingly good birds of these colours. It would be well, I think, if a separate prize were offered for these colours, otherwise they will be utterly lost.

Nuns, I am sorry to say, are not in the ascendant. Very few of the birds shown have not undergone the process of a very severe trimming. A friend of mine bought a first-prize pair, and when they moulted he was amazed at the different appearance of the birds. The vendor, on being written to, acknowledged the trimming, but said everyone did it with Nuns, so he was not worse than other people. The judges would do well boldly to disqualify all such birds, and even the whole class if necessary. I think these birds are more tampered with than any other variety shown.

I should like to see a good class of Flying Baldheads with all the colours represented. I mean clean-cut birds, ten of a side, clean thighs, and good in colour, size, and carriage. I remember many years ago Mr. Juniper had a flight of these birds, and very beautiful they were. One only sees a pair or two of such now at the shows, as there is not a separate class for them. I think there might be one with advantage. They were always great favourites of mine, as also with many of my friends.

I think Beards, Long and Short-faced, keep their position well and find many admirers, as the strength of the class indicates. I am glad to see the pepper-throated heresy is entirely swept away, and the true legitimate Beard reigns supreme.—HARAY.

PIGEON-JUDGING.

IN your last impression "A YOUNG FANCIER" takes up the subject of the fairness or otherwise of dealers being allowed to exhibit in competition with fanciers. I think that dealers have a perfect right to show against fanciers. In my opinion it would be unjust to exclude them from competition, as the fact of a dealer being able to win against good fanciers is his best advertising medium; and when a man is dependent upon his business, whatever it may be, no man has a right to injure his chance of making a living by vexatious restrictions.

"A YOUNG FANCIER'S" proposition to make separate classes for dealers is quite impracticable, as no committee, I think, would be bold enough to try the experiment.

There is one part of "A YOUNG FANCIER'S" letter which I fully endorse, and which strengthens my case—viz., the difficulty of deciding who are dealers, as all fanciers are dealers to a certain extent. There are few men in the fancy who do not buy and sell, and it would be a difficult matter to say to what extent this buying and selling should be carried before a man becomes a dealer.

He quite misinterprets what Mr. Fulton says at page 415. Mr. Fulton attributes the reluctance of many good fanciers to exhibit their birds to the inability of the judges, and not to the fact that they have to compete with dealers, as "A YOUNG FANCIER" implies.

There has been much said (with most of which I agree), about the scarcity of able judges, but nothing about the want of honesty in exhibitors themselves. My object at present is to call the attention of fanciers to the extensively-prevailing custom of showing two cocks in a pen or two hens of the Toy varieties. This dishonest practice is committed at all shows, large and small, and it has become so common that it appears to be considered quite *en règle*.

It is quite useless to say the judges should disqualify the offenders, as it is very difficult for the judges to feel convinced that both birds are cocks or hens, as the case may be. The only effective remedy is to appeal to the honour of exhibitors, and I now beg of my brother fanciers to raise the status of the fancy by setting their faces against this dishonourable practice.

I have been beaten in this way, and have been in a position to prove it, but have hitherto refrained, although I have felt it very hard; but after this warning, if the practice should be continued, I shall feel it a duty to honest exhibitors to expose such cases as I may be able to discover. I contend that a man who does this thing knowingly, defrauds the society at whose show he wins.—J. FIRTH, JUN., Webster Hill, Dunsbury.

CANARIES LAYING SOFT EGGS.

"C. A. J." in your Journal of July 30th complains of his Canary laying soft eggs. I should recommend him to discon-

tinne the rape seed, and supply the hen with good canary seed, chopped egg (shell to be cut up with it), bread crumbs, and a liberal supply of green food. Rape is by some fanciers considered too heating and liable to cause inflammation.—L. B.

THE BARON VON BERLEPSCH ON FOUL BROOD.

(Continued from page 105.)

HOW DOES FOUL BROOD ORIGINATE?

This question is still involved in the greatest obscurity, and the opinions of bee-keepers differ extremely. My own conviction is, that it arises from causes as various as the phenomena it presents, and the character it assumes. I can hence do little more now than restate briefly the views entertained of it by the most prominent writers on apiculture.

First View.—It is believed by some that a minute black fly, the *Phora incrassata*, enters the hive and deposits its eggs in the brood, selecting as the nidus the unsealed but most advanced larvæ, and depositing in each only a single egg. The *Phora* larvæ hatched from this egg parasitically consumes the viscera of the bee larvæ which it inhabits, just as the larvæ of the ichneumon fly lives in or on the common cabbage caterpillar. Maturing in the course of five days, it then leaves the carcass of the bee larvæ by an opening visible to the naked eye, and perforating the cap of the cell, falls to the bottom of the hive, and either spins its cocoon among the refuse found there or passes out to undergo its further metamorphoses in the earth. So long as the *Phora* larvæ inhabits the bee larvæ, the latter, according to Dr. Dohoff, remains alive, but finally perishes in consequence of the abstraction of its internal fatty substance by its parasitic foe. Decomposition is thus already virtually begun whilst the larvæ is yet living, although running into putrescence only after death.

Dr. Asmus states that he has found many *Phora* larvæ in the larvæ of bees, and says that in order to see them it is only necessary to decapitate a bee larvæ in which the first symptoms of foul brood are exhibited, and carefully press out the juices of the body. By repeating this process several times the operator can scarcely fail to detect one or more *Phora* larvæ. Or if the body of a bee larvæ be held before the light of a candle in a darkened chamber the motions of the contained parasitic larvæ will be plainly perceptible. But, according to Dr. Asmus, *Phora* larvæ are not found in all bee larvæ, but only in comparatively the smaller number. Yet by the miasma diffused in the hive by the putrid larvæ, others not thus parasitically affected also become infected, die, and putrefy. Thus while a portion only of the brood perishes, and another portion develops in health, the case is analogous only to what occurs in other pestilential diseases, such as peripneumonia, rinderpest, &c., whereof of animals similarly exposed some are infected while others escape, owing, perhaps, to a peculiar habit of body at the time. The like is often observed when contagious diseases such as plague, cholera, typhus, scarlatina, &c., to which the human system is subject, prevail. Numbers are stricken down while others remain unattacked even in the most infected districts. This is the view of Dr. Asmus, as presented in his treatise on the parasites of the honey bee; and it must be admitted that the *Phora* as figured in his plates has a decidedly Mephistophelian appearance and expression.

Against this view it may be urged—

1. That the *Phora incrassata* abounds everywhere and is bred in every hive containing dead bees. Yet there are numerous districts totally exempt from foul brood. This, as Mr. Kleine remarks, could not be the case if such were its origin—for the same cause should in like circumstances produce the same effect, if Nature designed that the *Phora* should lay its eggs in the larvæ of the honey bee.

2. The *Phora incrassata* does not lay its eggs in *living*, but only in *dead* organisms.

3. If, as Dr. Asmus seems to have found in microscopic examinations, the *Phora incrassata* does, in exceptional cases, lay its eggs in bee larvæ, it would be in the highest degree singular that the result should be the putrid decomposition of such larvæ—a result never produced in other analogous cases. Why do only larvæ thus destroyed by the *Phora* diffuse a putrid miasma, such as is not diffused by decomposing larvæ which have died from some other cause?

4. If Dr. Asmus's views were correct, the pupæ of *Phora incrassata* would be as numerous in foul-breeding as in other

hives containing dead bees in which the *Phora* had laid its eggs. This, however, is not so.

5. Parasites do, indeed, prove destructive to insects designed by Nature to be their prey, but must never be assumed to become the cause of the destruction of the entire race, which would in effect be warring against their own kind and kin.

6. I have examined nearly a hundred bee larvæ "by holding them before the light of a candle in a darkened chamber," but could never detect the motions of a single *Phora* larvæ.

7. Professor Leuckart examined microscopically a great number of foul-broody bee larvæ in the summer of 1860. Some were dead and some still living. He found neither *Phora* larvæ nor any other animal parasite in any of them. Notwithstanding all this, it is my impression that foul brood of the first and second grade or form is, at least occasionally, and probably more frequently than we suppose, caused by some parasitic insect, even though it be not the *Phora incrassata*.

In the first place Dr. Asmus has ascertained the presence of animal parasites in still living bee larvæ from foul-breeding hives; and as against clearly ascertained facts, I hold mere scientific inferential and negative proof as of small account.

Secondly. The minute holes observed in the caps of foul-broody cells indicate that some living creature either there entered or came out of those cells; but of the fact that it comes out thence, I think I have conclusive evidence. In the summer of 1861, Mr. Henry Keil, a bee-keeper in Dettelstadt, near Gotha, brought to me a foul-broody comb from one of his hives. I examined it minutely, and observed small holes in the caps of seven of the cells. I then placed the comb under a glass cover, and on examining it again nine days after found that the number of holes had increased to twenty-four. The additional seventeen, it is apparent, could only have been perforated from within and outwards. Nor could they have been produced, as Scholtz supposed, by the bees "in order to ascertain the contents of the cells after having in vain awaited the development of the larvæ."

Thirdly. This view of the matter accounts plainly for the spontaneous occurrence of foul brood in places where no obvious cause is known to exist. It is probable that the insect makes its appearance only temporarily and in limited areas, though occurring in greater or less numbers at different periods. This, too, would account for the fact that at times one or two hives are attacked in an apiary where no vitiated or noxious honey has been given—a circumstance otherwise inexplicable.

Second View.—Foul brood may be caused by feeding the colonies with fermented or acidified honey. Fermentive matter, even though not derived wholly or in part from foul-breeding stocks, would cause fermentation in the brood fed therewith, and thus produce foul brood. President Busch, however, states that he has often given such honey to his stocks without injury. I have myself in former years given tons of Cuban honey to my bees—honey having a nauseous disagreeable taste and smell, with no bad effect whatever. But this is inconclusive. That which was in ten cases harmless may prove destructive in the eleventh. I think the positive evidence here shows that fermented or acidified honey can produce foul brood.

Mr. Kalteich states that "honeycombs of the previous year emitted a fetid odour, their surface was damp, and the pollen mouldy. I gave these combs to three populous stocks, all of which became foul-breeding and perished, as did likewise a fourth, the bees of which had appropriated some of this honey, and several others also into which I had introduced such combs before I knew they were contaminated."

Mr. Hermann says, "In two instances foul brood was produced by feeding bees with honey kept in a vessel in which veridigris had been formed."

Mr. P. J. Mahan, a highly intelligent bee-keeper from Philadelphia, told me when here that he had formerly spent some time on the island of Cuba, and had observed that it was a common practice in the apiaries there, after suffocating the bees, to press out the liquid from the commingled mass of honey, pollen, brood, and dead bees, and run it into casks as the product of the bee. This nauseous mixture speedily undergoes fermentation, especially if the combs were not previously heated and contained much young brood, the rich juices of which readily ferment. Foul brood is sure to be produced when bees have access to such food; and he knew of many instances in the United States where the disease originated from this cause, though it was almost unknown in Cuba. The bee-keepers there are well aware of the noxious quality of such honey, and are careful that their bees shall not have access to

it. So long as this admixture, called Cuban honey, has not undergone fermentation, it may be safely given to bees; and its pestilential quality depends entirely upon the fact whether the pressing took place when there was much unsealed brood in the cells. Usually the pressing was done when the combs were free from brood, but occasionally the want of empty hives to accommodate all the numerous swarms, constrained the owners to be less particular in that respect. Bee-keepers in the United States, taught by experience that Cuban honey is a dangerous kind of bee food, avoid it altogether, and would not accept it for that purpose as a gift. Thus far Mahan. Polish and other foreign honey of commerce is of nearly the same character.

In corroboration of this view, I quote also the observed fact that such honey does not directly, but only indirectly produce foul brood. It gradually contaminates the air in the hive, developing a fetid odour, and thus causing disease, which always breaks out six or eight weeks after the noxious honey has been administered. This is also confirmed by Dzierzon's experience, who made all his stocks foul-breeding in 1848 by feeding with Cuban honey.

Third View.—It is believed by some that if brood which has died from any cause is not removed by the bees it will become putrid, and produce a contagious disease—that is, non-contagious foul brood may under certain circumstances become contagious. This, I conceive, is only too likely. In 1855 I discovered a highly fetid foul-breeding hive in the apiary of Mr. Oscar Ziegler, in Schleusingen, which was forthwith condemned to the brimstone-pit. Mr. Ziegler bought this hive in the neighbouring village, and the bees were suffocated while it was being transported to his home. About eight days after a swarm was put in it, and, thereupon, the non-contagious foul brood immediately assumed the contagious form.

Fourth View.—The disease may be caused by noxious dews which sometimes occur while the fruit trees are in blossom. This is a very old opinion. Hoffer said in 1660—"In some years the blossoms of trees are literally poisoned by dews and mists, so as to make bees sick." In a conversation with Dzierzon in 1855, while he was on a visit to Seebach, he said he was inclined to accept this view. "I think," said he, "I have frequently observed this in my own neighbourhood while fruit trees were in blossom. Foul brood may originate thus, although to these noxious dews is attributed the disease more commonly known as vertigo." Were, however, such the case, would not all the stocks within a certain range or circuit be simultaneously and similarly affected? Hoffman Brand states that in his foul-breeding hives the pollen was slimy, and apparently undergoing a kind of fermentation; which he ascribed to the noxious qualities of the dew.

Fifth View.—The fungus called *Mucor mellitophorus*, which is often found in the chyle stomach of bees, it is alleged, exerts a deleterious influence on the preparation of the jelly, so that the brood is not furnished with a properly-digested pabulum, and hence becomes diseased, dies, and putrefies. The fungus is supposed to be thus the indirect cause of the disease; but this fungus is often found abundantly in colonies entirely healthy, and Dr. Asmuss never found it in bees of foul-breeding stocks.

In addition to all this, we find many other conjectures offered in bee books and by correspondents of the bee journals, none of which seem to have any substantial basis. Mr. Kritz supposed that foul brood may be caused by some unhealthy effluvia emanating from the bee-keeper himself. Dr. Alefeld thinks it may arise from a diseased condition of the sexual organs of the queen bee. Semlitsch imagines it may result from the dust blown into the hives from the streets and highways; and even the position assumed by Director Fischer in an article on "The Origin, Nature, and Cause of Foul Brood," published in the "Transactions" of the third meeting of German Agriculturists in 1865 is of no account, being manifestly based on erroneous premises.

In conclusion, I believe, as I have already stated, that foul brood as it presents various phenomena and assumes various forms or grades, so it may arise from various causes. At present, however, we possess no tangible knowledge respecting it. Bee-keepers should therefore be careful to ascertain, and note the facts and circumstances whenever the disease comes under their observation. Nor should they be in haste to form

or propound theories. Above all, they should not neglect to submit foul-broody combs when practicable to the examination of some competent naturalist. I do not think it at all likely that inexperienced bee-keepers unversed in physiology and unpractised in the employment of the microscope will ever advance as much in this direction unless aided by men professionally prepared to prosecute scientific investigations, to whom carefully observed facts would be invaluable. Only after ascertaining the true nature of the disease may we hope possibly to devise methods for its prevention and cure.—A. VON BERLEPSCH.

THE GERMAN CENTRIFUGAL HONEY EXTRACTING MACHINE.

I FIND that Mr. James Lee, of Windlesham, Surrey, has undertaken the manufacture of these machines, which are similar in every respect to the one described by me in page 465 of the last volume of "our Journal." Although Mr. Lee supplies his machines at so moderate a price as to bring them within the reach of all classes of bee-keepers, he warrants them in every respect as perfect as that which I originally imported, and which is now in his possession.—A DEVONSHIRE BEE-KEEPER.

LARGE HONEY HARVESTS IN LARGE HIVES.

It is, I believe, nearly if not quite a quarter of a century since Mr. A. Pettigrew, of Rusholme, near Manchester, first advocated the use of hives, for first or top swarms, of "from 20 to 24 inches wide, and from 12 to 15 inches deep." This veteran apiarian has favoured me with a sight of the following letter recently received by him from an old correspondent residing in his native village of Carluke, in Lanarkshire, which in its details of results speaks strongly in favour of large hives. Mr. Pettigrew says, that "it should be noted that at Carluke, bees are kept on the swarming system, and that these heavy hives are swarms of this year. I expect," he says, "they will be 200 lbs. each ere the season ends."—A DEVONSHIRE BEE-KEEPER.

Carluke, 4th August, 1868.

"My dear old Friend.—When you wrote your last note to me about the bees they were in very bad trim, but ever since they have got on well. There are many "tops" (first swarms) above 100 lbs. each. Mr. H., one of my neighbours, has one estimated at 150 lbs.; it was 117 lbs. more than three weeks ago, and if it has gained as much since as some others standing beside it, it will be 150 lbs. They are standing at Newbiggin, a better place for clover than this. My heaviest one was only 88 lbs. when I sent it away to the heather; I expect it is above 100 lbs. now. They have been on the heather for a good while; here about ten days ago they were making weight from it, but the drought is very severe here now. I do not think the heather can last long unless we get rain; we have scarcely had a drop since I wrote to you last.

Your friend S. told me his stock was not heavy this year, but they had plenty of bees and combs. He has three or four about 90 lbs. each. S. D., a man that goes to the heather along with S., had one 120 lbs., but it stood at Thankerton—the clover has been better there also than here. Our clayey soil is very hard. We had not much clover this season."—Yours truly, "R. R."

SILKWORM-REARING IN ENGLAND.—No. 15.

PREVENTING DISEASES.—Various ingredients and methods are recommended as cures for the different complaints of silkworms; but it is not my intention to bring them into notice, my motto being that "Prevention is better than cure." Indeed, silkworms generally speaking, do not give time, nor is it easy to administer medicines for the cure of diseases which often are not discoverable until too far confirmed. The most natural medicines are pure air, cleanliness, wholesome food, consisting of fresh-gathered good leaves, and the continual maintenance of the requisite temperature of about 70°. For promoting the ventilation of the rearing room, it is useful sometimes to burn a handful of straw, shavings, or other light material in the fireplace, especially when the worms are becoming large; it puts the air in gentle motion.

There is a custom among the Italian peasantry of fumigating the room by burning pieces of juniper, sweet herbs, &c., but this practice I believe productive of no good; on the contrary, I think the smoke does harm.

A few drops of vinegar falling on a red-hot dustpan or iron will cause an agreeable vapour, which is said to sharpen the worms' appetite when they are slow at eating.

* Mr. Fischer has since protested against the adverse verdict pronounced by the Baron, declaring that he can "cause the best colony to become foul-breeding in a few months, and cure a diseased colony in a still shorter time." I can only hope that he is right, and that if so the means of cure will soon be made public.—A DEVONSHIRE BEE-KEEPER.

One of the most potent articles for correcting putrefaction is charcoal, which I find is used in China, being sifted over the worms. Another powerful agent is chloride of lime, and this at the present day is becoming more generally used, since atrophy appeared among silkworms, but it must not touch the worms.

In general I have found that well-directed ventilation, good food, cleanliness, and diligent care in removing from among the healthy any infected worms, will prevent most of the complaints to which the insects are subject, although sometimes insufficient, especially when the worms increase in size after their fourth change of skin.

The atrophy and calcine diseases of silkworms seem to be hereditary, and contagious also, for when the infection is not in the eggs it may be brought to the worms even from a distance. Various species of caterpillars in the open country are stated to be attacked by the calcine disease, and they may even communicate it to silkworms—at least, this is stated by several Italian authors.

When eggs are suspected of being infected, the use of spirits of wine and water in equal quantities, in which to soak them before detaching them from the napkin on which they have been laid, is said to prevent any evil effects. I have never tried this, but I think it an unnatural process.

When a silkworm house has been infected, it is a good plan, before using it again, to clean or disinfect it, and everything connected with it should be placed in the air. The walls of the room might be whitewashed, and the stages and other materials, having been thoroughly cleaned, should be placed in the sunshine, and then kept in an airy situation till March. They may then all be placed in the rearing room, and be disinfected by fumigating with flowers of sulphur, mixed with a tenth part by weight of nitre. Having secured the windows and closed the chimney, ventilators, &c., the mixture is divided into six or eight parts, and placed in earthen pans in different parts of the room. Having placed some shavings on the mixture they are to be set on fire, and the room immediately left, closing the door and all holes to render the fumigation more complete. The room may thus remain from twelve to twenty hours, after which door and windows are opened to admit the air.

Young silkworms should be observed attentively, and if any are found affected with the calcine disease they should be removed. If its extinction is not effected, the removal of all dead worms must be continued, putting them in a vessel half full of unslacked lime, or the caustic lye of potash, and afterwards burying them together in the earth. If after the fourth sleep the quantity of dead worms be more than can be collected before calcination, then, in order not to spread the infectious powder about, it is advisable to remove the beds from the stages only after the healthy worms have all repaired to spinning quarters, which should be done by lightly rolling up all in the papers, and transporting these from the room.

It has been recommended some time before hatching silkworms' eggs to prepare a solution formed of a hundred parts of water and five of the sulphate of copper, in which to dip everything which is to be used during the rearing, washing well with the same solution all the woodwork, &c., in the rearing room.—LEONARD HARMAN, JUN., *Old Cotton, Norwich.*

MANAGEMENT OF FERRETS.—No. 1.

Most persons residing in the country have either a hobby or some sort of pet. If a lady can pet a snake, why may not ferrets be petted? I have seen persons turn from them as if they were too horrible to be looked at, and call them "disgusting creatures," but the same individuals would not approach a harmless toad.

Now, I am not ashamed to acknowledge that I am very fond of these little creatures, and as I have heard they are difficult to rear, I offer a few remarks on their management. They are as easily reared as kittens, and very free from disease if properly treated.

Avoid breeding from relations, as this will make them less hardy. The breeding hutch should be roomy, and well made to resist the weather. They will do well out of doors, even in winter if sheltered from cold winds. The hutch should measure at least 3½ feet by 2½ feet, and be nearly 2 feet in depth. The roof should slope toward the front, to allow the rain to run off, and if long-continued rains penetrate, the top may be protected by some waterproof material. The back and front should have a few holes bored near the top for ventilation. The floor should also have two or three holes to allow water to

run through, as ferrets require to be kept dry. A portion of the front of the hutch may be wired to admit light and air, both being essential to their well-doing. The floor should be littered with clean straw, and soft oat straw is better than hay for their sleeping boxes in summer; in winter I prefer hay, as they can get under it, and lie snug and warm. I put a little clean straw on the floor nearly every day, that the feet of the young may not get damp, and the hutch should be frequently cleaned, and washed out. I believe the diseases to which ferrets are subject arise from dirty hutches and damp litter. They are naturally very clean animals, and it is cruel to keep them in confinement and neglect them.—LOUISA E.

OUR LETTER BOX.

JAPANESE BANTAMS (*Inquirer*).—Truly-bred Japanese are of various colours, one of the most usual being a generally light-coloured plumage all over the body, but marked, exactly as Light Brahmars are, on the necks and tail feathers. Another variety is entirely Cuckoo-coloured; and, again, a third is precisely like a dark-feathered Indian fowl in feather. The birds of both the last-named colours are usually by far the most heavily-feathered on the legs and thighs, which makes them appear much closer to the ground than they really are. The feather itself of a true Japanese Bantam is similar to that of fowls in general, the feathers not being at all broken up as in the Silky fowl.

LA FLÛCHE COCK'S COMB (*Lemon Buff*).—The comb of a La Flèche cock should have but two principal points or spirals in front. Embryo points between them are unimportant, but a third as large as the other two would be a decided disadvantage, if not a disqualification. If the bird is a chicken, we should remove it.

GAME BANTAMS' LEGS (*Subscriber*).—No. The colour of the legs of Game fowls is immaterial, but no rule in judging is so imperative as that which makes it necessary for all in a pen to be of the same colour. Yours would be disqualified anywhere, and they do not form a pen.

CROSSING BLACK SPANISH AND SPECKLED HAMBOURNS (*E. A. S.*).—We do not think the cross would be a good one. We should rather advise you to keep *Crève-Cœur*. Their eggs are as large as the Spanish.

HENS PECKING THEIR EGGS (*Amateur*).—The habit is supposed to arise in the first place from the lack of the necessary material for forming the shell of the egg. It is in that case prevented by supplying their run or house with plenty of bricklayers' rubbish, such as old ceilings, mortar, &c. If they have this and still peck their eggs, it is from a bad state of the body. The only cure we know, is to put some very hard composition eggs in the nest. They peck them till their beaks are sore, and become tired of it.

FOWLS OVERFEAT (*Brazilian*).—When fowls are very fat, and begin to fall away, the flesh disappears first. There is bad food. Feed on oatmeal and whole corn, but, above all, let them have plenty of green food and fresh earth. We should think, from your description, you fed them on Indian corn. That makes fat, but no flesh. When you say that a fowl of 6 lbs. becomes less than 4 lbs. when cooked, you mean perhaps that the comparison is made between the fowl as it is when first killed, and as it is when dressed or trussed for dressing. If so, that explains itself. The head, neck, and inside, that are removed in the operation, will make more than that difference. Do not over-feed.

GAME FOWLS NOT DIGESTING THEIR FOOD (*F. R. K.*).—There seems to be nothing in your feeding to cause the appearances you name. They will not thrive while they have no appetite. Discontinue their evening meal, also the potatoes altogether. Give them their bread dry. Feed often, and give very little at a time.

TURKEYS SUFFERING FROM COLD (*Constant Subscriber*).—Your Turkeys are sniffling from cold, which if neglected will probably end in roup. It has been thought when following the hen about in the early dew. A hen Turkey is not fit to be trusted with her brood. She will leave ten behind and go contentedly on with three, or will drag them through high wet grass on the first appearance of day. Wash the eyes of the patients with vinegar and cold water. Feed them on bread steeped in strong beer. Keep them in a dry place, on loose sandy flooring, and do not give them their liberty till the sun is up, and vegetation is dry. The cold of which they are now feeling the effects was probably caught some weeks since.

HAMBOURN COCK ROUPY (*Frank*).—It is incipient roup. We do not dread it as we used to do, and we are not bent on separating every sickly bird, neither do we ever allow it to go on. We treat bad cases most successfully with Baily's pills. Milder forms are cured by washing the face with vinegar and cold water, feeding on stimulating food, as bread and ale, and keeping the patient as much as possible on dry ground, and in a dry atmosphere.

REMOVING BEES (*Constant Reader*).—If the hives are well stored and populous there is no especial risk of the bees dying merely because they have not swarmed this year. You should select a cool evening for removing them, and take care that the cloths used are of open texture—cheesecloth is the best. If you want to keep both colonies you must not meddle with their stores, nor should you drive them unless with the view of transferring them to frame hives. A flat stone is a bad floor-board.

UNITING SWARMS (*H. C., Ripley*).—We should expel the bees by driving about the beginning of September, if there is no late pasturage near, such as heath, by which they might yet increase their stores, and in such a season as the present should expect by that time, little or no brood remaining.

COMMUNICATIONS BETWEEN HIVES AND SUPERS TOO SMALL (*E. Leech*).—"It is evident that the communication afforded by Mr. Pettitt's gratings is too restricted, and that large numbers of bees have perished from not being able to find their way through them. I have known the same thing occur when communication with a super has been by a central aperture of unusually small dimensions. Honey can only be prevented from crystallising by being kept in a warm place.—A DEVONSHIRE BEE-KEEPER."

From observations taken near London during the last forty-one years, the average day temperature of the week is 72.4°; and its night temperature 49.2°. The greatest heat was 89°, on the 25th, 1859; and the lowest cold 31°, on the 26th, 1861. The greatest fall of rain was 0.95 inch.

THE HOLLYHOCK, AND ITS CULTURE.

OR the summer and autumn decoration of the flower garden Hollyhocks are of great value, and prove very effective; no garden of any pretensions ought to be without a collection of select varieties. The Hollyhock has been in our gardens for nearly three hundred years, having been introduced from China in 1573. Many years, I may say centuries, it was treated as a biennial, and no pains were taken to perpetuate the improvements or variations that were produced, excepting by saving of seed and sowing it, cross-breeding being then unknown. The result was very little variation, and but small improvement on the flower of the original *Althæa rosea*, a biennial, in colour of a bright rose. Since the late Mr. Barron, of Saffron Walden, attempted the improvement of the flower, the Hollyhock rapidly advanced toward the florist's standard of excellence. So rapid, indeed, was the transformation that the improvements were soon in the hands of Mr. Chater and Mr. Bircham, both of whom effected further variations and improvements, and since then Mr. Roake, Mr. W. Paul, and others have so advanced the flower, that it claims a place at the exhibition table. To the late Mr. Barron, however, we owe all our improvements in Hollyhocks; he was the first to raise and perpetuate variations in colour, likewise improvements in the form and substance of the flower. It was he who first perpetuated the improved varieties by division and cuttings. In his time, no doubt, the Hollyhock survived, as it does now, several winters in dry well-drained sandy soils; but it would seem, from propagation being confined to seed-sowing, that the idea of the Hollyhock being a perennial had not occurred to its cultivators: to him, therefore, we must give the credit of first making the Hollyhock perennial.

Although the Hollyhock is perennial when propagated by cuttings and other modes, also when raised from seed in some soils, yet those possessing a fine selection, acting on that principle in the same sense as with most other perennials, will in the course of a few years lose their best varieties, and find their collection fast disappearing. The system of planting a border, and allowing it to remain so for years, does not apply to Hollyhocks. In that or some other unaccountable manner many gardens once gay with this noble flower are so no longer. Perhaps the present, I may say late, rage for dwarf plants in flower gardens has driven this and other equally fine summer and autumn flowers beyond the flower-garden boundary, where they may perchance still hold a place. At exhibitions, too, no very great impression is produced by a stand of spikes or blooms of Hollyhocks, for these afford no just idea of the plant's stateliness of growth and splendid display of bloom at home. Those according the Hollyhock a good situation, though outside the flower-garden boundary, where, in good soil and with proper care, it grows so tall and blooms so well, may see the plant when at its best; but this is rare, for they do not care to show to visitors anything beyond the best part of the grounds, to which it is seldom admitted,

and when it is seen by the proprietor or his friends it is often when the plant is at its worst, when a high wind or some accident has brought them past the Hollyhocks.

Some object to the Hollyhock in flower gardens on account of its height, and there is good reason for doing so, if in a garden of dwarf plants it is placed in front of these, instead of the tall plants at back and the dwarf in front; but unquestionably it is a noble plant at the back of borders, whether wide or narrow, by itself or in beds, and the grandest of all for shrubby borders, whilst it cannot be too extensively cultivated as a flower. A garden without a collection of select Hollyhocks is destitute of one great attraction.

VARIETIES.—The following are some of the most useful:—

Alexander Shearer, crimson.
 Advancer, shaded rose.
 Black Prince, black.
 Countess Russell, rosy peach.
 Comet, purplish crimson.
 Competitor, deep purple.
 Decision, salmon flesh, shaded with rose.
 Electra, yellow, chocolate base.
 Fearless Improved, creamy buff.
 Gem of Yellows Improved, deep yellow.
 Hebe, creamy flesh, peach centre.
 Hon. Mrs. Ashley, bright peach.
 Memnon, bright crimson.

Mrs. Roake, blush.
 Mrs. Chater, carmine, tinted rose.
 Mr. Roake, pale yellow.
 Lady Braybrooke, lemon, tinted fawn.
 Lady Middleton, rosy salmon.
 Lilac Model, shaded lilac.
 Pericles, chrome yellow.
 Queen of Whites, white.
 Reine Blanche, white.
 Rev. H. Dombain, rosy salmon.
 Syrian Prince, purple.
 Walden Masterpiece, gold and scarlet.
 Warrior, bright crimson.

PROPAGATION.—Hollyhocks are propagated by seed in order to raise new varieties, or where plants are required for extensive planting in borders; also by cuttings, division, and eyes.

Propagation from seed is only time, labour, and ground lost, unless the seed has been carefully saved, and from the finer sorts only. The seed may be sown as early as March, and from that time to July or August. I prefer to sow in June, and not later than July. Spring-sown plants become so strong by autumn that much room is taken up in wintering them, and except for being planted out in autumn, or remaining, transplanted, in the bed to bloom, are not desirable. I may, however, treat of sowing the seed in spring, in summer, and as soon as ripe.

Sowing in spring may take place at the end of March or early in April. An open situation out of doors should be chosen, and the ground well dug and pulverised, working in a liberal dressing of leaf mould. The soil most suitable is a sandy loam; if heavy, it may be improved by a free admixture of sharp sand. The surface having been made fine, place seeds about an inch apart, and cover them with fine soil. All weeds must be removed, and in June the plants will be fit to turn-out in beds. Plant in beds 4 feet wide, five rows in a bed, and the plants 6 inches from each other in the rows. If the weather be dry, give the seed bed a good soaking before taking up the seedlings, which must be done with a fork. The bed for planting ought to be well and deeply dug, adding leaf mould or rotten manure liberally. Water well at planting; and if dry and hot, shade with mats over hoops for a few days until the plants recover. Occasional waterings will need to be given in dry

weather, and the bed must be kept clear of weeds. In October the plants will be strong, and fit to plant out in their blooming quarters, or they may be left where they are, only every alternate row and plant must be removed, and either planted in the borders or in another bed, which will, of course, be equal in extent to that of the bed in which the plants are left undisturbed. Between the rows a mulching of half-rotten leaves or manure should be given early in November, and in spring fork that neatly into the soil, if the plants are left to bloom in the beds; or the plants may be taken up carefully, and planted out.

Seed sown during June requires the same treatment—*i.e.*, to be sown in the open ground, and when the seedlings have two rough leaves, take them up, and plant-out 6 inches apart every way in beds, shading and watering until established. The planting-out will cause the production of fine fibrous roots for taking up early in October, and the plants should then be placed in pots large enough to hold the roots without cramping. The pots ought to be set on coal ashes in a cold frame, giving abundance of air, and protection from frost and heavy rains by drawing on the lights at such times, with an occasional covering of mats in severe frost. The plants should be shifted into larger pots as may be necessary—that is, before they become potbound, and being well-hardened off, may be planted out in April.

The seed may also be sown as soon as ripe in pans of good light soil, and be placed on a mild hotbed of from 70° to 75°. When the seedlings appear, keep them near the glass, and give air plentifully. When they have two rough leaves pot them off singly in 3-inch pots, in a compost of light turfy loam two-thirds and one-third leaf mould, keeping them close in the frame with proper moisture and shade till established, and then harden them off, and remove them to a cold frame, where they are to remain during the winter, being shifted into larger pots as may be necessary, and planting-out at the end of April.

The seedlings will bloom in the year following the sowing of the seed, and should have proper care with respect to staking, tying, and watering. The object being to preserve good varieties and to discard the bad, remove every single or semi-double flower, and pull up the plant unless a new colour or something worth perpetuating be seen, also every plant with thin-petalled flowers. By discarding worthless seedlings as soon as they bloom you prevent the flowers of the good kinds being impregnated, for these, as a rule, come last. Any thought worth propagating should be labelled, and if seed be saved remove the pods as they become brown, cut the stalks off to within 2 or 3 inches of the ground, and stir the soil about them with a fork, but not so deeply as to injure the fibres. This will encourage growth for propagation, which may be effected by eyes or by division, and the plants obtained in either way will the following year show whether the flower is worth adding to the general collection, or does not maintain its character.

Cuttings may be taken off at almost all seasons. Those put in during the spring afford a late bloom, and those plants propagated from cuttings in summer and autumn flower early and late in summer. The young shoots when from 2 to 3 inches long are to be taken off close to the old root, and after paring the base of each cutting smooth with a sharp knife, pot them singly in 3-inch pots, using a compost of two-thirds sandy fibrous loam and one-third leaf mould, with a liberal admixture of sharp sand. Pot firmly, give a gentle watering, place them in a cold frame, shut it up closely, and shade them from sun. In the course of a week or ten days according to the time of year—a week in summer, ten days in spring and autumn—a little air may be given, but not much until the cuttings are rooted. Avoid excessive watering, but keep the soil moist, and when the cuttings have rooted well admit air freely, and expose them fully when the weather is mild or not excessively wet. The plants should be potted as they require more room, and should be wintered in a cold frame as described for seedlings.

Cuttings put in from September to April should have the benefit of a bottom heat of about 70°, and should be kept close and shaded. Care should be taken not to overwater, and to prevent damp a little air may be given. The cuttings rooted, they must be well hardened off and removed to a cold frame.

Propagation by division is performed in autumn after flowering, generally in September or early in October. The root should be dug up and divided into as many pieces as there are shoots, and these pieces ought to be potted singly in 4½-inch pots. Any shoots without roots may be potted in 3-inch pots

and treated as cuttings, they and the divisions being wintered in a cold frame.

Eyes are the side shoots taken from the plants close to the roots as soon as they begin to become firm (which will be the case in July, August, or September, according to the forwardness of the plant), cut into pieces with an eye to each. The knife should be sharp, at least the cut must be clean so as to give 1 inch or 1½ inch of shoot to each eye. The leaf should be removed with exception of the leafstalk, and the pieces or eyes should be inserted in sandy soil as for cuttings, placing them vertically, and covering them with an inch of fine sandy soil. It will answer as well if the eyes are placed horizontally. Cover them with a hand-glass after giving them a gentle watering, and shade from bright sun. When struck, as will be known by their growing strongly, pot them singly in 3-inch pots, and place them in a cold frame.

SOIL AND SITUATION.—The most suitable soil for Hollyhocks is a rich sandy rather than a heavy loam. In the former the plants are more hardy, but do not grow so strongly. The ground intended to be planted in spring should be trenched in autumn, and thrown up as roughly as possible, in order to expose it to the action of frost, and a good dressing of manure should be forked-in. In February or March the ground should be forked over, and if no manure was afforded at the time of trenching, it ought to be given now. If the soil is heavy leaf mould will help to lighten it, and so will sharp sand. The situation should be open, free from the drip and shade of trees, and if sheltered from wind all the better. The more sunny and open the situation the better will Hollyhocks grow and bloom.

PLANTING AND AFTER-TREATMENT.—From the middle to the end of April is the best time to plant for the general bloom, whilst for a late bloom planting may take place a month later. The distance apart may be 3 feet in beds, and in borders a like distance may be allowed from plant to plant every way; but in the latter case I generally have the lines 4 feet apart, and put in the plants at 3 feet from each other. In planting make a good-sized hole, and fill it up, or nearly so, with a compost of two-thirds loam from turves, and one-third rotten manure or leaf mould. Put in the plants from pots in the centre, lightly scratching the sides of the ball, so as to disentangle the roots a little; but if the size of the pots has been sufficient, this will scarcely be necessary. Make the soil firm about the plant, and give a good watering, and if the nights are frosty cover the plant with an inverted flower pot, taking it off in the morning and replacing it at night until all danger from frost is over. In dry weather water must be liberally supplied, especially in May and June, when the leaves are very actively catering for the coming display. When the plants are advancing towards flowering and are in flower, thorough waterings in dry weather are also necessary.

Too many flower spikes should not be retained. Two or at most three flower spikes are all that should be allowed on strong plants, whilst one will be sufficient for a weak plant. All the others, or side shoots, should be cut away as they appear. The staking of the plants must be attended to early. Stout, but at the same time neat stakes must be driven into the ground close to each plant, and ought to be about 3½ feet out of the ground, and to these the flower spikes must be tied as they advance. When the spikes have reached a height of 7 or 8 feet cut off their tops if you want them for exhibition, and thin the flower buds, so that when expanded there will be no more flowers than enough to cover the spike; and if blooms or spikes are wanted for exhibition they must be protected from rain and sun ten days before the show. If not wanted for exhibition the flower spikes may be allowed to grow as tall as they will, and the blossoms need not be thinned; but I like to thin the flowers a little, even in gardens, and to have there as good blooms as are seen in stands at exhibitions, cutting off the tops of the spikes at some height.

After flowering cut down the spikes to within 3 or 4 inches of the ground, and at the end of October take up the roots, pot them, and winter them in a cold frame. In sandy, well-drained soil, however, they may be left in the ground, and this being lightly forked over, put a dressing round the plants of leaf mould, not very rotten, or short littery manure, and point it neatly into the ground in spring. In winter the pots of plants, whether from seed, cuttings, divisions, or eyes, should be plunged to the rim in coal ashes, the plants being kept near the glass, and afforded plenty of air in favourable weather, with little or no watering at the roots—indeed, the soil should not be more than moist. If fine flowers and large spikes of

bloom are desired, the plants ought to be well cared for in potting, never allowing them to become pot-bound, and the greatest possible encouragement should be given to them in May and June, by watering, and supplying them with liquid manure once a-week, also during any dry periods that may occur afterwards until the flowering is past.—G. ABBEY.

MELON-GROWING IN GROUND VINERIES.

For several years I grew Melons in pots in a partially heated orchard house. The fruit was small but of first-rate flavour. The leaves, however, were so infested with red spider that in order to do justice to the proper occupants of the house, I felt it necessary to find the Melons some other home. With this view I purchased 28 feet of ground vineries, 42 inches broad, and as I wished to have something out of them during the spring months, I proceeded as follows:—Last June a Strawberry bed was marked out, 20 feet by 42 inches, and in the centre of this two rows of Strawberries were planted. They had just fruited in the orchard house, and were turned out of their pots. At the end of February in the present year they were covered with 21 feet of the vineries, which remained on till the 18th of May, ventilation being given when necessary by a few bricks being put under the frames. In the meantime the remaining length of 7 feet, blocked up temporarily at the ends, was used for Mustard and Cress, &c. The Strawberries were a capital crop, the first fruit being gathered on the 25th of May.

As soon as the Strawberries were uncovered, the entire 28 feet-length was laid on a border fronting the orchard house. A piece of frigi domo of the exact length of the glass, and broad enough to cover it to the ground (after being sewn at the two ends to prevent fraying), was used to cover the glass every night. Four bricks, one at either side of each end, kept the covering quite steady. The heat thus accumulated from the 18th to the 27th of May appeared sufficient to warrant the planting of the Melons, one to each light. They were small plants, stopped at about the fourth leaf. Two were planted in the earth of the garden, and two in Sea-kale pots half sunk in the ground. I need not detail the cultivation, as there was nothing peculiar in it. The first Melon was cut on the 8th of August, and hung up in the orchard house till the 12th. It weighed 5 lbs. 2 ozs., the sort being Windsor Prize. In quality it would be called good, but lacking the rich saccharine juice of those grown in pots in the orchard house in former years, though the foliage of the latter was meagre and yellow with spider, while the leaves under the ground vinery were beautifully green. Had there been less moisture under the vineries the flavour would probably have been better, but it would have been unwise to sacrifice the well-doing of the future crop in order to perfect one specimen. I am aware that this is an unusually favourable year for attempting to grow Melons without bottom heat, but I give you the result of my experiment, nevertheless.—G. S.

PALMS.

In your last number there is an interesting article from "The Gardener," signed "H. K." on Palms. In his second paragraph "H. K." says, "But now-a-days our enterprising nurserymen are bringing Palms within the reach of everybody." Who and where are the said nurserymen? I have been for years on the look-out for Palms for room-decoration, and some of your correspondents may remember my letters on the subject, pointing out how far behind our neighbours we are in the use of plants for house adornment. Now it appears Palms are to be had at a reasonable price here in England, I do hope we may learn where. I cannot afford three guineas a-plant. I want three for a guinea.—PATELIN.

NEW ROSES OF 1867.

AN answer, in part, at least, to "ROSARIAN," will be found in another column. I have had but very few opportunities of seeing new Roses this year, having only been at one Rose Show—the Crystal Palace, a press of business matters having kept me at home. From personal knowledge I can say I think *La France* a beautiful Rose, and quite distinct; *Mademoiselle Marie Larpin*, a beautiful Bourbon; and *Reine de Portugal*, a rich-coloured Tea. I grow besides *Lisette de Beranger*, a Rose in the style of *Madame Gustave Bonnet*, &c., *Curée de Charen-*

tay, *Enfant d'Ameugny*, *Ernest Boncenne*, and *President Willemoz*, but have not been able to distinguish any special merit in them. As I have said elsewhere, Mr. Keynes speaks well of *Elio Morel*, *Louis Bulliat*, *Madame Girodte*, *Madame Rothschild*, *Merveille d'Anjou*, and *Reine du Midi*. I have only seen *Madame Rothschild*; it is very beautiful if full enough. Miss Ingram I have not seen this year, so can neither add to nor diminish what I said of it last year. Mrs. John Berners will be a good useful Rose; and, as far as I could judge, *Duchesse d'Aoste* is worth keeping.

I fear this will be considered meagre, but I do not wish to go beyond personal knowledge; tastes differ, and circumstances lead people to form various opinions.—D., Deal.

GOLD AND BRONZE PELARGONIUMS.

BRING present at the special Show of Pelargoniums at South Kensington a few weeks ago, my attention was turned more particularly to what are called the Gold and Bronze varieties, and I asked myself, What properties should these possess to make them a really useful class of plants? While some contend most strongly and properly for a flat circular leaf with a clear and well-defined zone, &c., I find that some varieties, which may in these respects be almost all that can be desired, are, nevertheless, apt to become bleached miserable-looking objects when exposed to too much sunlight. On the other hand there are some, of which *Beauty of Oulton* may be taken as a type, which, under ordinary circumstances, are far too green to have any just claim to be called Gold and Bronze, and are of no greater value as bedding plants than ordinary Zonal Pelargoniums. For kinds really useful for bedding we must look to what is called the light Gold and Bronze section, and of this I think, we may place some confidence in *Luna*, which has stood the test of several seasons, and may, I think, be regarded as an established favourite.

As to which of the more recent varieties are the best as bedders it is difficult to decide, though *Kentish Hero* is spoken of as being the best at Chiswick. Of those at present in commerce, Countess of Kellie occupies the front rank, being the brightest and most distinct of the whole lot exhibited, and it possesses another good quality, constancy of character. I maintain that Gold and Bronze varieties should retain their colours under ordinary circumstances for at least eight months out of the twelve, and this, unfortunately, few of them do. I forbear to say anything of varieties at present not in commerce.

The following are what I consider the principal points:—

First and most important, constancy of character in colour.

Secondly, flat leaves with clear zones and large centres; for the larger the centre of the leaf is, the more effective will the plant be for bedding purposes.

In the event of another show of the same kind being held, I would suggest that at least two or three months beforehand rules should be drawn up and published, in order to guide the judges in their decisions, and that exhibitors may know what the different standards of merit are by which their specimens will be judged, for at the last show it was quite obvious that the different sections had in some instances been judged from different standards of merit.—W. D. G.

PORTULACA THIELLUSONI.

THIS is a plant which I expect to hear has done good service during the present season. It is a well-known old favourite, but in some cases and seasons is shy-flowering. There are purposes, however, for which I think it may always be employed to advantage, as even in dull or wet seasons it would most likely succeed well. In window boxes in the sun, vases, baskets, and dry sunny spots at the base of trees or buildings where but few subjects will grow, except *Sedums* and other dry rock plants, the *Portulaca* will succeed remarkably well, and I know of no plant that can vie with it in the variety and brilliancy of its colours.

A dry sandy soil would seem to suit this *Portulaca* best, but it is occasionally found doing well in one of an opposite character. If a good bed of it is visited during the early part of the day, when the flowers are fully expanded, nothing can have a richer appearance. In the latter part of the day its flowers close, but even in that condition it looks well. As a vase plant it deserves to be more generally grown.

A small packet of seed will furnish a number of plants, and these transplant well. The seeds ought to be sown in a slight

hotted early in the spring, but I have seen as good a result as could be desired from self-sown plants; for where the ground suits it, it perpetuates itself almost as well as Mignonette.—J. ROBSON.

THREE USEFUL HARDY HERBACEOUS PLANTS.

SEASONS like the present are not likely to pass away without some one noticing how certain plants appeared to withstand the unusual heat and drought which prevailed throughout the growing part of the summer, and it will be easily seen what plants suffered or the contrary by the almost tropical heat they have been subjected to. In making notices of this description it is, of course, necessary to specify whether the plant has been assisted by artificial watering or not, as when this is done the plant ought no longer to be regarded as one capable of enduring much heat and drought, unless the amount of such watering has been very small. In the case of the three plants which I shall mention no artificial watering whatever has been afforded, and their appearance has been in every way satisfactory; besides which they have claims to attention beyond the mere fact of withstanding hot dry weather.

The failures in a trying season like the present will no doubt lead many to condemn more plants than they ought to do, while they may give a more than due importance to those which withstand the sun well; but the three plants to the merits of which I seek to call attention have done as well with me in damp seasons as in the present year, and consequently no one need be afraid of trying them. They are not the uncertain creatures of a hot season, but long-tried friends, displaying their beauties alike in a hot season and in a wet one. They all belong to those useful plants which are again fast making their way into public favour—namely, hardy herbaceous plants, and I have long regarded them as amongst the most ornamental of that highly interesting class of plants. Not one of them has any claim to rarity, and yet they are more rarely met with than they ought to be, possibly from their great beauty and their capabilities of withstanding heat not being known, although so many Phloxes, Pentstemons, and other plants have succumbed to the heat and lack of moisture.

Taking the three plants in the order in which they flower, I shall first begin with—

TRACHELIUM CERULEUM.—This, although allied to the Campanulas, does not much resemble any of the ornamental kinds with which I am acquainted. Its flowers are individually small, but are so numerous, and collected in such mathematical order in umbels of from 2 or 3 to 4 or 5 inches in diameter, that their heads look in the distance like florets. The flower stem is much branched, each branchlet supporting its umbel of flowers, which in ordinary seasons are pale blue, but this year they have darkened into a good purple, being when in a body and viewed at a distance of a darker and better purple than Purple King Verbena. The flowers, too, are produced in great abundance, and although the plant is from 2 to 3 feet high they require no tying-up, standing much better than Phloxes; and in consequence of the stem branching near the ground, flowers are produced all the way up. The plant produces its exceedingly small seeds freely, and these if sown in heat early in spring afford plants which flower the same year. It may also be propagated by cuttings taken off any time during the summer or autumn; and it is advisable to strike some, as very hard winters kill the plant. A row of it surrounding a bed of shrubs has been one of the most ornamental we have had here, a silver-edged Pelargonium being in front of it. It remained in full flower throughout July.

STATICE LATIFOLIA.—This is also an herbaceous plant of great beauty. Its broad overlapping foliage is scarcely less ornamental than some of the Lomarias or Scolopendriums; and the flower stem, much branched, is upwards of 2 feet high, and is so rigid and its branchlets so wiry, that tying of any kind would only injure it. The flowers when fully expanded are of a pretty pale blue, hardly inferior to the exotic species *Statice Holfordi*, while in point of habit the plant is much superior. It produces its flowers in the greatest profusion, the stems branching out and interlacing each other, so as to form a compact head or bush of 3 or 4 feet in diameter in a full-grown plant, and perhaps 2½ feet high or more. It is, however, for the utility of the flower spikes just before they are fully expanded that I claim for it the greatest merit. At that time the small but numerous flower buds present a shining mass of a rich silvery grey tint, and if then cut and dried they retain

their colour, and the stiff wiry stems of the plant support them in due order. Amongst dried flowers, therefore, this plant is of the greatest importance. Its feathery appearance and distinctness from all others entitle it to a high place in such collections, apart altogether from the display it makes in the flower garden, where it continues in bloom a much longer period than most other plants; and even in its decay its sturdiness of flower stem and the small petals of the individual flowers preserve it from ever appearing rubbishy. The ever-green character of its foliage also imparts an amount of beauty to it which few plants possess. I believe the plant is met with under other specific names, but that which I have adopted seems applicable to it. It propagates much less freely than the *Trachelium*, not seeding, so far as I am aware, in this country, and furnishing but sparingly short tufty offsets or cuttings much like those of the double Chinese Primrose. These cuttings in a cold pit, with no other care than shading and watering, make plants in time. The plant, too, is in other respects very hardy.

ACONITUM VIRGINICUM is a useful and ornamental herbaceous plant, more hardy than most of those which I know, and not particular as to site. This season, to my surprise, it has flowered well, although growing immediately in front of shrubs whose roots, I expect, intermix with its own, and on the other side a strong hedge of *Dielytra spectabilis* has several weeks the start of it every season, but this highly ornamental Monks-hood invariably makes itself seen by the 1st of August, and this season it was much before that time. The foliage and flowers did not show that distress which might be expected from the confined position of the plant, and the total absence of rain for so long a period. It usually attains a height of 4 feet, produces a spike of blue and white flowers, and well deserves a place in an herbaceous border, where something of a lower growth can be placed in front of it.

As a plant capable of withstanding heat I was agreeably surprised with *Aconitum virginicum* this season, as it never appeared to be suffering as some of the Delphiniums, Phloxes, and similar plants did, for its foliage and flowers presented a freshness of aspect which was seen in few plants this season, consequently its merits in this respect deserve to be known. It is propagated with tolerable freedom by division of the root. In very wet places I believe slugs are rather fond of it, but I have always found it very hardy, capable of taking care of itself, and furnishing plenty of flowers.—J. ROBSON.

ROSES, AND OTHER FLOWERS AT MR. KEYNES'S NURSERY.

I THOUGHT to have included my notice of Mr. Keynes's in my last paper, in which I coupled it with Mr. Radclyffe's at Okeford Fitzpaine, but my space came to an end; and so I add this brief notice, first saying that I made one omission in my list of Strawberries—viz., Frogmore Late Pine, which is a great favourite with Mr. Radclyffe, and which I have more than once spoken of from my personal experience as a fine variety. It is of a good pine-like flavour, and comes in well after some of the others have finished bearing, but we still want some late sorts of this delicious fruit. If we could have a season as prolonged with good kinds as with the *Fraise des quatre saisons* it would be a great result achieved.

And now as to Mr. Keynes. His nursery is remarkable, not so much for the general stock as for the manner in which a few things are grown, especially Dahlias, Roses, and Vines. For many a long year has John of Salisbury held his ground as a grower of the first flower. Many have been the races that he has run with Mr. Turner, of Slough; varied their results, but never, or rarely ever, has he allowed any other competitor to snatch the laurels of victory from him—sometimes first and at other times second, but descending no lower; and now that Mr. Turner has given up exhibiting he holds the first place, probably doing more with new Dahlias on the exhibition table and in the market than all other growers. It has been a sore time for him this year; notwithstanding that a fine river runs at the bottom of his grounds, and of course an unlimited supply of water, it has cost him a larger sum than people would be inclined to believe to keep his plants going. At one time they were completely covered with black fly, which all, however, after giving a world of trouble, disappeared in one night. At the period of my visit the plants looked well, and some promising seedlings were developing themselves; but the Roses were the chief attraction, although it was just between the two

seasons, and owing to the intense heat very few flowers were to be seen.

There were, however, two rows of *Maréchal Niel* worth going a hundred miles to see. They were two-year-old plants budded as half-standards on the Briar, the branches tied down to a sort of rough framework, and from one end to the other dozens upon dozens of brilliant blooms in all stages. Away with those who babbled about its being the worst introduction for many years. It is the grandest Rose we have had introduced to English gardens for many a year, and I have never seen it necessary to abate one jot of the praise I gave to it when Eugène Verdier first showed it to me in Paris, if only it fulfilled conditions as to growth, &c., of which I could not then speak, but which it most certainly has done. At any time during the summer, Mr. Keynes said, he could have cut dozens of blooms from these two rows. On young plants it may, from its very free growth, be shy of blooming, although I have not found it to be so, but afterwards it is one of the freest of bloomers, and certainly one of the very finest Roses we have.

The very exceptional season which we have had told upon Mr. Keynes's Roses as upon those of everyone else, mildew being prevalent; but at the same time I never saw a finer-looking lot of plants, whether on Briar or Manetti stocks. About 50,000 on the latter were especially fine, and great care had evidently been taken to cut out the eyes of the stock under ground, for there was scarcely a Manetti shoot to be seen, and all who have grown Roses on this valuable stock know what a boon this is.

With regard to sorts, I had a long chat with Mr. Keynes, and our opinions on the older varieties were very much in accord. With regard to the new I could not say much, as my opportunities for seeing them had been but few. Those that he had marked as especially good were *Elie Morel* (Liabaud), rosy lilac; *Louis Bulliat* (Gonod), bright crimson shaded with violet black; *Madame Girod* (C. Verdier), clear rose, extra good; *Madame or Baronne de Rothschild* (Pernet), bright rose shaded with white: it has been exhibited this year, and was certainly very beautiful; the only doubt I had was as to its being full enough. *Merveille d'Anjou*, splendid bright red, large and full: this is highly thought of. If good it is, I think, the first Rose of first-class merit *Touvais* has raised. *Reine de Midi* (Rolland), delicate rose. *La France* was not so highly thought of, having too much of the Tea Rose in it, but I am inclined to think it will be a good and useful Rose and bloom very constantly.

Who has seen *Comtesse de Jaucourt* this season? Many were the sly shakes of the head, in the true Lord Burleigh style, as to what a grand stroke they would make who propagated it. Nobody, or next to nobody, knew anything about her; but she was a star. It might be so, and like the Unknown Knight in "Ivanhoe," she might vanquish all comers; but I doubted, and I could not learn anything about her here. Not so a Rose which seems unaccountably in its year of introduction to have escaped notice, but is now unquestionably in the front rank—*Marie Baumann*. Mr. Keynes considers it even superior to *Alfred Colomb*—one of our very best Roses, as I predicted it would be. Again, another Rose of which I would say a word, and which many saw this year—*Monsieur Noman*—when I last mentioned it I was under the impression that I had hastily condemned it last year, and made my *amende* accordingly. It was not so, however. The Rose I condemned was *Madeleine Noman* raised by Gonod, and not *Monsieur Noman*, which was raised by Guillot père. Another Rose much valued here is *Hippolyte Flandrin*; it is evidently not a very free bloomer, but the flowers are magnificent. I was glad to find that my judgment with regard to another flower, *Madeleine Marguerite Dombrain*, was fully confirmed here; and the fact that Mr. Keynes took the second prize with it at Birmingham in the stand for the best twelve blooms of any Rose which has been sent out, the first being taken by *Alfred Colomb*, speaks volumes in its favour.

Fisher Holmes is another good flower that does not receive generally the favour it deserves. It is very brilliant in colour, and the form of the flower is excellent. Horace Vernet is regarded as too rough, a fault it certainly has; while *Napoleon III.*, although brilliant in colour, is too uncertain. *Felix Genero* is regarded as a beautiful rose-coloured flower, with a dash of violet in it; and *François Treyre*, a bright scarlet, large and well-formed, is also highly thought of. I do not remember to have seen either of these, but I have not been much at exhibitions this year.

Mr. Keynes's houses were full of splendid-looking Vines in

pots raised from eyes, and his house of Tea-scented Roses looked vigorous and well; in fact, the same might be said of all the stock. There can be no question that the *Salisbury Dahlias* and *Roses* are destined for more triumphs—a return they are bound to give for the care which they receive.—D., Deal.

DUC DE MALAKOFF STRAWBERRY.

IN answer to Mr. Radclyffe's letter in the Journal for August 13th, and to that of Mr. Biggs in the previous number, concerning *Duc de Malakoff Strawberry*, I received the plants from Mr. Rivers, of Sawbridgeworth, exactly four years ago, and have no doubt as to their being the true sort. The fruit is large, roundish; flesh deep red throughout; the foliage soft and rather downy, and the whole appearance of the plants, as well as of the fruit, quite distinct from that of any other variety which I have.

I did not allow the plants to bear any fruit the first year, and only saved one runner from each—fifty in all, which I fruited in pots. More plants of it were barren the first year of its fruiting than I liked to see, but it ultimately improved in that respect, as the runners were carefully selected from the fruiting plants. It is now discarded, because the fruit spoils almost as soon as it ripens. Mr. Biggs cannot have the true sort. I would have sent him runners, but have destroyed all the plants.

Would Mr. Radclyffe be kind enough to say if he would grow *Duc de Malakoff* as one of eight varieties? And he would confer a favour on myself and others if he would give the names of the best four Strawberries to ripen with *Frogmore Late Pine*.—J. DOUGLAS.

WORK NEEDED ON SUNDAYS.

ARE gardeners generally required to water greenhouse plants on Sunday? I have a new man who thinks that plants ought to take care of themselves on that day; but he says he will water them or do any other work I order (in reason), provided I take the moral responsibility on my own shoulders. I tell him that so long as plants are grown in pots it is an act of necessity to water them on Sunday during the hot months.—AMATEUR.

[There is something very entertaining in the proposition of vicarious moral responsibility. Some ill-natured people would be apt to say in the present case, that the tender conscience of the servant was very much akin to mere personal ease and convenience; but there seems to be such a kind desire in the employer to meet as far as possible the conscientious scruples of his servant, and in the servant there seems to be such a willingness to oblige, combined with honest simplicity and a regard to religious principle, that we would be slow to think that in the present case conscience was made a plea for bodily ease.

The subject is one that has several times come before us, and that not always in such pleasing aspects as the present.

On one side it has been contended that growing plants in pots is no work of necessity, and that therefore watering them could form no work of necessity. We can enter into no serious discussion on this point, for on the same ground we might contend that as a horse kept for pleasure is not a necessary, therefore it is objectionable to feed it or water it. A plant in a pot must have sustenance when it needs it, or it may suffer proportionally with a horse left without sustenance on a Sunday. Men who resolve to do nothing except what is in the highest sense a work of necessity, should confine themselves to trades in which nothing is required of them on that day. The gardener who has religious scruples about watering a flagging plant in a pot on a Sunday may retain his scruples, but he should take to another occupation. He could not, with advantage to himself or to his own satisfaction, fill the situation of gardener in the smallest place where plants are grown in pots.

On the other hand, few men more deserve the Sunday's rest than gardeners. Employers should exact as little from them on that day as possible. We know that in some places it is the most harassing day of the seven. Employers—often, it may be, as a mark of mistaken kindness—will take their gardeners along with them over the demesne, and plan future arrangements with them, totally oblivious of the fact that the gardener has had enough of walking for six days already. Others have a habit of giving orders for hampers and packages

chiefly on that day. In many cases the man who attends the house finds it the worst day of the seven.

Now in the one case, whilst the gardener must see his plants do not suffer on Sunday, he, in our opinion, would be quite right if he courteously declined to enter on mere matters of business on that day. We have known cases of the ablest men of the day leaving their places because they found themselves unable to prevent the Sunday being made the chief business day. We believe that such Sunday work is anything but a benefit to all the parties concerned. In supplying the establishment there need be no difficulty in getting most of such work done in the morning, if the head of the establishment would make a few simple arrangements accordingly.

Then as to the case in hand, we shall never be able to make plants in pots so intelligent as "to take care of themselves" in all cases on Sunday, and just as we would feed a horse when he needed it, so would we without hesitation give a little water to a drooping plant; but though we should never question this as a work of necessity, if not of mercy, we would on the other hand never allow the principle to be made the excuse for keeping the man in charge on Sunday, or the gardener in a small place, almost if not as much employed on Sunday as on other days. Whilst a dry plant is not to be left dry, we think it wrong, unless in extreme cases, to require a gardener to water as much, if not more, on the day of rest as he would require to do in one of the regular six working days. In fully one-half of the year very seldom will a plant in a pot need watering, and even in the height of the summer such watering will be little needed if the plants are looked over in the last working hours on Saturday afternoon or evening. By such a simple arrangement we think our correspondent and his gardener may work comfortably together without any wounding of a tender conscience on the one hand, or taking undue moral responsibility on the other.]

ROYAL HORTICULTURAL SOCIETY.

AUGUST 18TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. At this meeting there was a long schedule of prizes offered for various kinds of fruit, which produced a larger exhibition than ordinary, and brought out some very fine dishes, particularly of Plums, Pears, and Melons. A large and valuable collection of Figs from the Society's garden at Chiswick contributed much to the interest of the meeting.

For Plums there were seven competitions, all of which were good. After a careful examination the first prize was awarded to Mr. Whiting, of The Deepdene, for Jefferson, Miss Bardett Counts, and Washington; the last remarkable for size, colour, and flavour. The second prize was obtained by Mr. Tillery, of Welbeck, for splendid samples of Jefferson, Kirke's, and Cox's Emperor, all of which were fine, but the flavour of the latter two was not equal to that of the fruit in Mr. Whiting's collection. The other competitors, all of whom made most creditable exhibitions, were Mr. Cox, of Redleaf; Mr. S. Ford, of Leonardlee; Mr. Miles, of Wycombe Abbey; Mr. Beach, St. Julien's, Sevenoaks; and Mr. Smith, Manor House, East Acton.

For Melons there were five competitors. Mr. Goldsmith, of Polesden Lacey, Dorking, sent a scarlet-fleshed Melon, which was not considered worthy of a prize; but his Marquis of Ailsa, green flesh, was very good. Mr. Earley, of Digswell, exhibited the same variety also good. Mr. Whiting, of The Deepdene, sent a hybrid green-flesh, with firm flesh and good flavour. The first prize was awarded to Mr. Goldsmith for Marquis of Ailsa, and the second to Mr. Whiting, of The Deepdene.

In the competition for early Apples Mr. Cox, of Redleaf, exhibited Kerry Pippin; Mr. Ford had Devonshire Quarrenden; Mr. Earley, of Digswell, Sugarloaf Pippin and Duchess of Oldenburgh, both of which were over-ripe. Mr. Miles, of Wycomb Abbey, sent fine specimens of Cellini nurple; and Mr. Beach, of St. Julien's, sent Devonshire Quarrenden. The first prize was awarded to the Kerry Pippin of Mr. Cox, and the second to the Devonshire Quarrenden of Mr. Ford.

For early Pears there were three competitors. Mr. Smith, gardener to C. Walton, Esq., East Acton, exhibited Windsor under the name of Jargonelle. Mr. Roberts, Holwood, sent Jargonelle, which received a second prize, there being no other dish to which a first prize could be awarded. Mr. Ford sent Williams's Bon Chrétien, which was unripe.

For the best Peaches grown on an open wall Mr. Beach sent Royal George; and Mr. Cox, of Redleaf, sent Noblesse, Early Mignonne, Acton Scott, and Red Magdalen. The first prize was awarded to Mr. Cox for Noblesse, and the second to Mr. Beach for Royal George.

For the best dish of Nectarines grown on an open wall, Mr. Beach sent Elruge; Mr. Smith, East Acton, sent a mixed dish of Elruge and Pitnaston Orange; Mr. Roberts sent the New White; and Mr. Cox sent Elruge. The first prize went to Mr. Roberts; no second was awarded. From the Society's garden at Chiswick came the Balgown, which far exceeded all the others in flavour.

In Apricots, Mr. McIndoe, gardener to the Archbishop of York, sent a dish which was very rich in flavour, and apparently Moorpark or Peach, to which the first prize was awarded.

For the best dish of Peaches grown in an orchard house, Mr. Goldsmith sent Noblesse, Mr. Ford sent Malta, Mr. Tillery, Barrington, and Mr. Douglas, Loxford Hall, Iford, sent Bellegarde under the name of Triton de Venus. The first prize was awarded to Mr. Douglas, and the second to Mr. Goldsmith.

For the best dish of Nectarines grown in an orchard house, the exhibitions constituted the most attractive and best part of the subjects produced. The Elruge of Mr. Ford, and the Rivers's Pine Apple of Mr. Douglas, were especially attractive. Mr. Ford also sent Violette Hative, Mr. Miles sent Elruge, and Mr. Tillery sent Violette Hative. The first prize was awarded to Mr. Douglas for Rivers's Pine Apple; the second to Mr. Miles. The Stanwick came from the garden at Chiswick, and was pronounced remarkably fine.

A collection of Peaches was sent by Mr. Rivers, Comice de Bonrbourg was not ripe. The others were Golden Rathripe, an American variety, similar to Crawford's Early; S 18, a seedling from the Snow Peach of America, with little flavour; S 55, a seedling from the White Nectarine, was very rich in flavour, having a rich saccharine juice; S 191, a seedling from Cooleedge's Favourite, was of delicious flavour, and was awarded a first-class certificate; S 74, a seedling from Montagne précieuse and Madeleine Blanche, of rich flavour. Reine Claude Bodaert is a large round Plum, in appearance like Haling's Superb, and of rich flavour. Reine Claude rouge d'Altham is remarkably rich in flavour.

Mr. Carmichael, of Sandringham, sent a seedling Grape, raised from the Black Hamburgh, and which was said to be superior in colour, more round in berry, and distinct in foliage from that variety. The bunch exhibited was of good size, the berries quite round and jet black, the skin thick, and the flesh tender, juicy, and sweet.

Mr. Melville, of Dalhousy Park, Edinburgh, sent a small piece of a bunch of a seedling Grape of very early character, which has all the appearance of Early Kienzheim, but with a fine flavour of Mosello wine. Mr. Melville was invited to send a complete bunch, so that the Committee might be enabled to form a better opinion of its value.

Mr. Fleming, of Cliveden, sent fruit of a Fig from Spain, of delicious flavour, which was highly approved by the Committee.

Mr. Pearson, of Chilwell, sent two seedling Grapes, raised from the Strawberry Grape; one with a round black berry with a fine bloom, thick skin, and firm, fleshy, and somewhat mucilaginous consistency, like the American Grapes; the other, white, is a long oval berry, raised from a cross between the White Muscat of Alexandria and Strawberry. This is the more remarkable Grape of the two, and one which may be in many respects considered one of the most remarkable of Grapes, inasmuch as the flavour is entirely new, differing very materially from that of the Strawberry Grape, and the flesh possesses none of that mucilaginous character found in the American Grapes; the consistency is, in fact, as tender and melting as in the Black Hamburgh.

Mr. Muir, gardener to Sir Philip De M. Grey Egerton, sent two Melons, named Prince of Wales and Green Gage, but neither of them was in condition. Mr. Cox, of Madresfield Court, sent handsome bunches of Madresfield Court Grape, but they were scarcely ripe, though exhibiting all the evidences of being an excellent Grape.

Mr. Francis Dancer, of Little Sutton, Chiswick, made an extraordinary exhibition of Plums, which were shown in branches, like ropes of Onions. The varieties were Poupard's and Mitchelson's, besides Small's Admirable Apple and Jersey Gratioli Pear, which were also shown in immense clusters of ten together. The Committee unanimously awarded a special certificate to Mr. Dancer for this wonderful collection.

FLORAL COMMITTEE.—Considering the season, the exhibition of Gladioli this day must have given much satisfaction. It was the first attempt at bringing together collections of this interesting flower, and we hope next year to find still greater encouragement for exhibitors to compete. Everyone will be willing to admit that the collections exhibited conducted very much to the interest of the meeting. Various other plants were sent, and some of them from continental growers and exhibitors. M. Van Houtte, of Ghent, was awarded a first-class certificate for Iresine Lindenii, a new and promising bedding plant, but until tested as an out-of-doors plant it would be hazardous to speak too highly of it. M. Linden, of Brussels, exhibited Cattleya Eldorado splendens, a fine flower, which was awarded a first-class certificate; also, Cattleya Wallisii rosen, which received a first-class certificate. Messrs. Rollison sent Pteris straminea leptophylla, which was awarded a first-class certificate; Gymnogramma chrysophylla cristata, not equal to similar varieties; and Pteris cretica daucylifera in the way of crispia. Messrs. Kelway exhibited a variety of Scolopendrium called Kelwayii, very similar to Scolopendrium Morganii—first-class certificate. Mr. Tircback, of the Nurseries, Linton, sent several seedling Nosegay Pelargoniums, but not better than nor equal to many in cultivation; there was nothing new in them, but they were not bad flowers. Mr. W. Bull sent Eranthemum elegans, a neat and pretty flower, in shape much resembling an Orchid, and having white flowers minutely spotted. It received a first-class certificate.

Mr. Fry, Manor Nursery, Lee, Kent, sent seedling Fuchsias very far behind the present leading varieties, also two seedling Nosegay

Pelargoniums—namely, Lady Northbrook and Grand Master. Mr. G. Smith, Hornsey, brought his superb hybrid Nosegay Masterpiece. This plant was exhibited at Leicester with only one truss of flowers. On this occasion three specimens were sent, and it proved itself one of the best varieties yet seen. A first-class certificate was given it. The size of the truss and shaded rosy purple flowers cannot be surpassed. It is a flower of great merit. Mr. Green, gardener to W. W. Saunders, Esq., brought three interesting plants—viz. Agave dealbata latifolia, or pendula, which received a first-class certificate; *Ponretia argentea*, a very curious plant—first-class certificate; and *Trichocentrum coccineum*, a small but beautiful Orchid—second-class certificate. Mr. Walsh, gardener to J. Hawkshaw, Esq., received a first-class certificate for a seedling *Habrothamnus elegans*, with beautiful white-variegated foliage, and named Hawkshawii. Mr. Tanton, of Epsom, again brought *Allamanda Wardleana*. The Committee was of opinion that this was identical with *Allamanda Hendersonii*, which in 1866 received a first-class certificate, and could not recognise it by its present name. The various and conflicting opinions on this plant led to the following result. The Rev. M. J. Berkeley and Mr. T. Moore were requested to examine this and other *Allamandas* botanically, and to report thereon. Mr. Tanton, at the suggestion of the Committee, kindly permitted three cuttings to be taken from his specimen *Wardleana*, and Mr. Standish three cuttings of his plants of *A. Schottii*, exhibited at the same time. These were handed over to Mr. Barron, the Superintendent of the Chiswick Gardens, and were directed to be cultivated and subjected to the same treatment and temperature. This, with the report of the botanical referees, will, we trust, finally settle this much-vexed question, and we shall soon learn whether *A. Hendersonii* ever did exist, and if it did we shall hope to discover what has been done with it. Nothing can be fairer than the present proposed settlement of the question. Time and patience will unravel the mystery. It is most desirable to discover how and where the confusion first arose, and why *A. Wardleana* has been shown under three different names.

A fine collection of seedling *Caladiums* was sent from the Chiswick gardens. Two of them, No. 1 and No. 2, were of great merit, and first-class certificates were awarded them.

Messrs. Paul, Chesnut, sent specimens of a new Tea Rose of bronzy hue, Queen of Portugal, a very pretty flower, and a first-class certificate was awarded. A special certificate was also awarded to Messrs. Paul for two boxes of very fine Roses, among which *Marcehal Niel* was very conspicuous. Mr. Parker, Tooting, was awarded a first-class certificate for a hybrid seedling *Echeveria*—glancea metallica, a very promising and useful variety. Messrs. Lee, Hammersmith, sent *Coleus Carteri*, very similar to *C. aureo marginatus*. Messrs. Smith, Dulwich, received a special certificate for their fine collection of Balsams; good as these were, they were not at all equal to the specimens usually grown by this firm. Messrs. Downie, Laird, & Laing received a first-class certificate for seedling *Hollyhock Sovereign*, a rich crimson flower, compact, and perfect in outline.

There were five collections of *Gladioli*. Mr. Kelway received a first-class certificate for three seedlings: *Julia*, a magnificent flower; Lord Napier, very fine, and *Formosa*, very beautiful. *Ulysses*, one of M. Sonchet's varieties of 1868, received a first-class also; these were shown in the stand of twelve, which received the first prize. J. Stadden, Esq., of Ash, Kent, was awarded the second prize, and the Rev. H. H. Dombain the third prize. Messrs. Bunyard, of Ashford, Kent, sent a stand, also Messrs. Paul, of Chesnut. The weather has completely baffled all skill in producing fine spikes, and with the exception of Mr. Kelway's, which were truly grand, the spikes of flowers exhibited were not equal to the average. Notwithstanding this, they were specimens of first-rate varieties. Mr. Sladden had some fine seedlings. In his collection we noticed seedlings *Aphrodite*, *Champion*, and the Rev. M. J. Berkeley as good; *Noma*, *Princess Clotilde*, and *Etendard* were very fine. In Messrs. Paul's collection *Thunberg*, *Milton*, and *Raphael* were good. The collection from Messrs. Bunyard contained some excellent flowers, but out of condition; *Fulton*, *Titians*, *Janire*, *Flora*, *Belle Gabrielle*, *Jenny Lind*, and *Mozart* were good. In Mr. Kelway's collection we admired *James Veitch*, *Frederick David*, *Etendard*, *Leonora*, *Norma*, and *Madame Basseville*.

Messrs. Downie, Laird, & Laing received the silver Flora medal for the best twelve *Hollyhocks*, which were grown in Edinburgh, and were of first-rate quality. Mr. Chater also exhibited a very select and good collection. In Messrs. Downie & Co.'s collection we noticed Mr. Anderson, Mrs. Thorn, James Taylor, R. G. Ross, Mrs. Hastie, The Prince, Princeps, Mr. Marshall, Mr. Downie, and the seedling *Sovereign*. In Mr. Chater's collection were *Willingham Defiance*, *Lady of the Lake*, *Gloria Mundi*, *Walden Queen*, *Lord Napier*, *Searlet Gem*, and *King*, all flowers of first-rate quality, but bearing evidence of the season. Two better collections as to varieties were never exhibited.

GENERAL MEETING.—W. Wilson Saunders, Esq., in the chair. The business of the Meeting was confined to the announcement of the awards of the Committees. The Rev. J. Dix directed attention to a terra-cotta plant label forty years old, and which would, if improved in shape, be very useful on account of its great durability. The Chairman then referred to the fact of foreign nurserymen having sent their

plants to be submitted to the decision of the Floral Committee as a very good testimony of the high estimation in which the Society's awards are held abroad.

ENTOMOLOGICAL SOCIETY.

THE July meeting of this Society was, according to the new regulations, the last of the present season, and was held at Burlington House, the President, Mr. H. W. Bates, being in the chair.

Mr. McLachlan exhibited some fine bred specimens of the rare *Hypercallia Christiernana*; and Mr. E. Bond two singular varieties of the Moths *Setina irrorella* and *Arctia villina*, in the latter of which nearly all the black markings are wanting. It had been reared from the caterpillar. He also exhibited a specimen of the large unwieldy female of *Drilus flavescens*, captured by Mr. Rogers in the Isle of Wight, together with two males, and mentioned that Dr. Knaggs had seen two males of different species of Moths, *Tortrix viridana* and *T. heperana*, under similar circumstances with *T. viridana*.

Mr. F. Smith exhibited specimens of the very large Ichneumon-parasite, *Ophion macrurus*, a North American species which infested the fine Moth, *Saturnia cecropia*, but which had been reared from cocoons of the Chinese *S. cythra*, sent from New York, the eggs of which had been introduced from Europe for experiments of silk growth, the latter being the species which feeds upon the *Ailanthus*. The Ichneumon had severely stung Mr. Smith. Mr. Moore stated that it had also been reared from the fine *Saturnia Polyphemus*.

Mr. Jenner Weir exhibited a large exotic species of *Longicorn* Beetle, which had been caught flying into the Custom House of London, most probably imported in foreign timber.

Mr. Butler exhibited a variety of *Geometra Vanaria* and its parasitic Ichneumon; Mr. Pryer a monstrous specimen of *Haliax querana*; Mr. Davis a series of the skins of caterpillars of *Lepidopterous* insects carefully preserved and dried; and Mr. Dunning, the nest of one of the Solitary Wasps, probably an *Odynerus*, placed in a cavity formed by the limbs of a wooden spring letter-clip found in an open box on a writing table in Hampshire.

Mr. Wood exhibited a series of drawings of exotic *Saturniæ* made from living specimens, showing the different modes in which the insects hold their wings in repose, some keeping them flat, whilst in others they are more or less elevated. He also pointed out a curious comb-like apparatus attached to the fore leg of some of the species, which is used for cleaning the antennæ. Mr. Blackmore exhibited a large miscellaneous collection of the insects of different orders made at Tangiers, including many fine and beautiful species. The neighbourhood is rich in entomology, as many as 2700 species of *Coleoptera* having been captured by Mr. Rolfe.

Professor Westwood exhibited specimens and drawings of various exotic species of *Chalcididae* of large size and singular structure, of which he gave a verbal description. The species were mostly unique in the Oxford Museum.

A paper by Sir John Lubbock, Bart., was read, containing a description of the singular larva of the genus *Miropeplus*, which was thereby proved to belong to the *Necrophaga*, and not to the *Staphylinidae*, with which it has hitherto been placed. Also, "Descriptions of a new genera and species of *Heteromerus* insects, chiefly from New Holland," by Mr. F. Bates; "Reports of the Commissioner for investigating the ravages of the Borer Beetle (*Xylotrechus quadripes*), in the Coffee Plantations of Mysore and Coorg," by Dr. G. Bidie. "A Comparison of some representative species of *Diurnal Lepidoptera* in Europe, India, and North America," by Mr. W. P. Kirby; and "On some points in the anatomy of the immature *Coris macrura*," one of the *Ephemeride*, by Mr. A. E. Eaton, who exhibited a carefully prepared series of preparations under the microscope.

The meetings, which during the past season have been eminently successful, were then adjourned till the beginning of November.

BATTERSEA PARK.

HOWEVER splendid the display of bedding plants has been in previous years, however magnificent the subjects grown in the subtropical department, never has Battersea Park in all its features presented such a degree of perfection as in the present season. The great attraction of the place, of course, is the subtropical department, in which Mr. Gibson, the talented Superintendent, has, by simple means skilfully applied, been successful in achieving results which have rendered it famous. There, just now, may be seen noble-leaved Bananas and Palms, Indianrubber plants and Indian Shots in profusion, Coral plants, *Dracenas*, *Caladiums*, and groups of handsome Tree Ferns, whose thick black trunks offer a unique feature in an out-door garden in this country. Then there are rich masses of the different kinds of *Coleus*; *Aralias*, *Castor-oil* plants, and *Wigandias*, forming a variety of beautiful combinations in conjunction with ordinary bedding plants. The luxuriance of growth which the more tender exotic plants exhibit this year is remarkable; they are no starvelings, but tall specimens, some of them, the Bananas for instance, with leaves 8 or 10 feet

long; indeed, persons who have seen them in their native countries affirm that for beauty the specimens at Battersea are much superior, and for size nearly equal, to those seen in the natural habitats of the plants. The extraordinary heat of the summer has no doubt had a great effect in promoting their growth; but on the other hand that heat was accompanied by an equally extraordinary degree of dryness, not only dryness from want of rain—to that tropical plants are accustomed—but dryness in the atmosphere as well, and to that many of them are not accustomed. Mr. Gibson, however, has an excellent supply of water, which, being conducted in pipes to certain points, is distributed with the greatest ease by means of hose on small wheels, in the same manner as in the public gardens in Paris. The water is thus supplied in a fine shower close to the ground, so that the surface is not beaten down as in most ordinary watering. The effect of this abundant supply of water, and of the facilities for its distribution, is nowhere more apparent than on the grass, which, instead of having a scorched appearance after the late hot dry weather, is almost as fresh and green as in ordinary years.

Dismissing for the present all other parts of the Park, and confining ourselves to the centre of interest, the subtropical department, we shall now proceed to notice the planting of some of the principal beds. These Mr. Gibson intends to have all numbered before the end of the season, and this will be a great convenience to those who wish to refer to any particular bed, its situation, or contents. It may also be remarked that the majority of the plants used have the names attached on neat deal labels, and in characters sufficiently large to be seen from the walks.

Passing in by the main entrance from the north side, the first plant which claims attention is *Uddea pyramidalis*, a tall-growing composite plant, forming a pyramid 14 feet high in a single season, but of which there are better specimens in other parts of the ground; on each side are Castor-oil plants in pairs, and *Caladium esculentum*. Taking the right-hand walk, on one side is a noble plant of the old *Strelitzia augusta*, on the other a group of the Bird's-nest Fern, looking as fresh and healthy as possible, fine plants of *Dicksonia antarctica* making their young fronds, and *Monstera deliciosa*, or *Philodendron pertusum*, as it is sometimes called, a plant frequently shown at exhibitions in collections of fine-foliaged plants, and which produces fruit of excellent flavour, but objectionable on account of the pricking sensation caused in the throats of those who partake of it by the numerous sharp-pointed crystals it contains. On the opposite side of the walk is a fine bed of Cannas, consisting of *Van Houttei*, 8 feet high, with very bright scarlet flowers, one of the best varieties, with *Canna Selovii* in front. The roots stood out all winter under a covering of dry leaves. Another bed on the same side consists of *Urania speciosa*, surrounded with the handsome *Coleus aureo-marginatus*, *Lady Plymouth* variegated *Pelargonium*, and *Robert Fish* outside. In front of this is a pretty feathery-looking bed of the variegated *Acer negundo* and *Begonia ricinifolia*.

In a half-moon bed on the left *Hibiscus rosa-sinensis* is very fine, producing an abundance of its large and showy but short-lived flowers; in front of the *Hibiscus* is a row of Gamboje trees, with *Coleus Veitchii* as a groundwork. On the right again there is a fine bed of Indianrubber plants from 6 to 8 feet in height, with *Amaranthus melancholicus ruber* as a ground, and a broad edging of a golden variegated *Majoram*. In a composite bed near this is a pretty *Perilla*, named *cripa*, having leaves resembling those of some Ferns, and not so dark as those of the common *Perilla*. Another half-moon bed, facing the west, is planted with *Coleus Verschaffeltii*, surrounded by *Centaurea candidissima*, edged with *Sempervivum californicum*. There is also near this a pretty circular bed with *Zamia Lehmanni* in the centre, and *Dracena terminalis* dotted over a groundwork of the variegated *Dactylis glomerata*.

In a serpentine bed fitting a recess on the right there is a fine mass of *Canna purpurea spectabilis*, having broad, dark-purplish bronzed leaves, with a wavy outline, and in another bed on the same side *Canna Prémice de Nice* is noticeable for its fine yellow flowers and soft green leaves. This variety resembles *Canna Annei* in general appearance, but its flowers are very much larger and of a brighter yellow. *Canna nigricans* is used as an edging to this, and the whole is surrounded by *Veronica incana*, a very compact, hardy, frosted-leaved plant. On the opposite side of the walk, dotted over the lawn, are nice plants of *Seafortia elegans*, *Aralia macrophylla*, *Astræa Waltichii*, and some other plants of large growth, whilst nearer the eye there is a long oval bed filled with

Coleus aureo-marginatus in the centre, having a very rich appearance, the other plants employed being *Golden Fleece Pelargonium* and *Centaurea candidissima*, with a very effective margin of *Sempervivum californicum*. An adjoining circular bed is occupied by a splendid group of *Erythras*, the well-known *E. crista-galli* being in the centre, and *E. ruberrima* outside. Both are in fine bloom, but the latter for size and colour of flowers is the more conspicuous. Some plants of the variegated *Acer negundo*, 6 or 7 feet high, form with their snowy foliage a pretty background.

Turning to the other side of the walk we find in front of a bed of Cannas a small circle of the variegated Japanese Honey-suckle edged with a new *Tropæolum*, which, whether from the heat of the season or other causes, has not been successful, and surrounded with *Gnaphalium lanatum*. Another circular bed near the last-named has in the centre a plant of *Musa ensete*, the ground being carpeted with Ice plant, surrounding which are rings of *Lantana Faviola* and *M. Rougier-Chauvière*, the one pink and white, the other red and orange, the whole having a margin of *Alternanthera paronychioides*. The *Lantanas* just mentioned are two of the best for bedding purposes, and there can be little doubt that those who have seen these and other fine *Lantanas* well bloomed will be inclined to employ them more extensively than hitherto in their bedding-out arrangements. They certainly deserve to be more generally grown. We next come to a long bed of Cannas, consisting of *C. peruviana*, one of the best of the large-flowered kinds, about 8 feet high, with the dark-leaved *Canna expansa* in front, the whole being very prettily edged with a bright silvery variegated Ivy. The variegated New Zealand Flax is growing close by, and is remarkable for the beauty of its variegation and the lines of intense orange on the margins of the leaves and the under sides of the midribs.

The next bed we come to is an oval, planted with the variegated *Vitis heterophylla*, edged with the Japanese Honey-suckle. The highly ornamental character of the latter plant is well known, but the *Vitis* deserves to be employed for ornamental purposes much more generally than it now is, not only on account of its variegated foliage, but the light elegant appearance which it presents. This bed, it may be remarked, was not in such good condition as it had been some time before, but now that the drought has passed away it may be expected to resume its former aspect.

(To be continued.)

ORCHARD HOUSES.

I suppose by this time all intelligent gardeners have about made up their minds that Peaches ought, except in the most favoured situations, to be grown under glass.

There are a few who do not believe it possible to grow good Peaches in pots. I wish they had been here this season and seen mine. I would have shown them both Peaches and Apricots that would have rather astounded them. Mr. Barron, of Chiswick, said when he saw them that he never ate such Apricots in his life, and that the Peach trees were superb. Well, I must say this was very agreeable to hear; I felt flattered; as people say, "it felt to go down warm and make one feel comfortable." And really when I looked at young Apricots with an average of from twenty to thirty fine fruit, and many Peaches with fifty or sixty, I felt a little proud of my cultivation.

Alas! all this self-complaisance was destined to be quickly taken out of me. I received a letter from Mr. A. Baas, Moat Bank, Burton-on-Trent, to say he could challenge all England with his orchard house. I started at once to see them, and was obliged to acknowledge myself beaten. I never saw so regular a crop or one so regularly good. In passing the door of the butler's pantry I saw a great meat dish covered with Peaches, which, if a fair sample of the crop, was a tolerably good intimation of what I had to expect. In the orchard house was Mrs. Baas gathering a large basket of the finest Peaches to send to her friends, and really it was worth going a long way to see such a houseful of fruit, and the perfect satisfaction of the owners. "It is such a pleasure," said Mr. Baas, "to give away such fruit." What a pity we do not all seek pleasure in this manner, thought I to myself. The trees were perfect pictures; there was not one with too large a crop, and there was hardly one you would have wished fuller; and when I looked at the size of the fruit and the regularity of the crop I was obliged not only to confess myself beaten, but to say it was the best crop I had seen. "I am glad to hear that," said

Mr. Bass, and then he quickly added, "but we are your pupils, Mr. Pearson, you know, and you may tell anyone to come and see our orchard house who would like to see it."

Those who have seen the mixed expressions of vexation and pride depicted in the face of the old man when beaten at draughts by his grandson, will understand my feelings. If I do not beat him next year it shall not be my fault.—J. R. PEARSON, *Chilwell*.

NEW AND NOTABLE FRUITS.

MR. RIVERS, who has added so largely to our collections of new fruits, has forwarded us specimens of some seedling Peaches and Nectarines which have not yet acquired publicity. Unfortunately when they arrived they were a good deal bruised outwardly, so that we are somewhat in doubt as to the exact colouring of them. The flavour of all was excellent, that of Peach S. 89 unapproachable. They are all decided acquisitions. We append the following brief descriptions of each:—

Peach S. 42.—Fruit of medium size, round, flattened; skin light and delicate, with slight flushes of pink; flesh exceedingly white, juicy, tender, rich, and pleasant. Raised from Belle Deauce Peach, and ripening ten days before Grosse Mignonne. A very excellent Peach. The flowers are large, and the glands round.

Peach S. 187.—Fruit of medium size, roundish; skin soft, of a pale yellowish colour; flesh yellowish white, very tender, melting, and juicy; flavour peculiar but surpassingly rich and luscious, a combination of the flavour of its parent, Rivers's Orange Nectarine with that of a Peach. Flowers large; glands kidney-shaped. This is the richest-flavoured Peach we have ever tasted. A very decided acquisition.

Nectarine S. 189.—Fruit of medium size, of a pale greenish colour like the Stanwick; flesh yellowish, tender, and juicy; flavour rich but peculiar, partaking of that of the Peach. Flowers large; glands small, kidney-shaped. Raised from Early Albert Peach.

BENTLEY PRIORY.

This magnificent place was at one time the residence of the Marquis of Abercorn, and is now that of John Kelk, Esq. Around it there is much to interest not only the townsman bent on a few hours' rural enjoyment, but also those whose lot is cast amid the pleasant scenes frequently to be met with within a few miles of our great metropolis. Strolling through the cool and pleasant groves of Bentley, one calls to mind that it was here the good Queen Adelaide spent some of the later years of her life, and that here, amid noble scenery, she breathed her last. Her kindness to the poor is still recounted by many of the aged people in the neighbourhood, who remember with pride and gratitude her virtues and the benefits which she bestowed. The present owner, too, as if inspired by the spirit of the place, is ever ready to relieve distress with a liberal hand, and to promote with his influence and purse every scheme likely to conduce to the advancement of his poorer neighbours.

To one who, like myself, has known this fine old place both before and since Mr. Kelk became its owner, a visit is doubly interesting and instructive. I hope, therefore, to communicate to the reader a portion of the pleasure and interest I felt on visiting the beautifully kept gardens, which, by the liberality of Mr. Kelk and his taste for horticulture, have within the last ten years been brought to their present state of excellence. Much credit is also due to Mr. Rutland for the care and thought which he has bestowed upon their improvement during the last three years.

I was much gratified on a late occasion to find the Priory looking so well in such a trying season as the present. The terraces presented a mass of floral beauty (but of these I shall speak more fully hereafter), the crops in the kitchen gardens were looking remarkably well for such a hot, dry season, the houses were also in keeping with the rest of the place. All this is owing to the forethought displayed by Mr. Rutland in providing an ample supply of water for all purposes; this he did by making last winter a large reservoir at a considerable elevation above the gardens. From this reservoir pipes are laid to convenient parts of the gardens, and thus an abundant supply of water has been obtained throughout the late excessively dry weather. Had it not been for the forethought of providing a supply of water to meet any requirement that

might occur, the consequences would have been disastrous; for the greater portion of the magnificent evergreens, such as Rhododendrons and Portugal Laurels, which give such character to this fine old place, must inevitably have perished. As it is, many of them looked in a very deplorable state; and had the Priory been in the hands of any one who had not sufficient means to constantly employ a large number of labourers in watering during the long drought, the general appearance of the place must have been spoilt for a great number of years. It was also threatened with another danger, which appeared likely to at one fell stroke to have swept away all the beautiful trees and shrubs on the north-east side of the house. As we pass up the main road from the romantic village of Stanmore, towards Bushy and Watford, after ascending a very steep hill we come upon a level piece of road, bounded on the north by a considerable extent of waste land, called Stanmore Common, which is thickly covered with large patches of furze, and many of the spaces not clothed with furze are in summer occupied by gipsies. Nothing but the turnpike road divides this mass of furze from the wooden park fence which encloses the Priory on the south side of the road, and which is surrounded both inside and out by large masses of inflammable matter, such as dry fern and dead brambles for nearly a mile. This state of things existed until a late occasion, when the furze on the north side was found to be on fire, and in consequence of the excessively dry weather was being consumed with great rapidity. Fortunately the wind was blowing from the south at the time, for nothing else could have prevented the destruction of the magnificent trees and shrubs which cover some scores of acres on the north side of the Priory. Such a disaster would have completely spoilt this noble place, and robbed it of its shelter from the north-east winds, which sweep with such force across Stanmore Common; but, as I have remarked, the wind blowing from the south, and prompt measures being resorted to, the fire was soon subdued. How it originated no one could tell, but it was conjectured that the furze had been set on fire by the carelessness of the gipsies, who were encamped close at hand at the time. Every means has been resorted to both before and since to prevent these people from encamping there, but without success.

The Priory when seen from the London and North-Western Railway, shortly after leaving the Harrow station, has a most beautiful appearance. The building, with its magnificent conservatories, is seen just in the eye of the south, and surrounded by large masses of fine trees, giving at once an idea of affluence, peace, and happiness. Directly opposite, and on the right of the railway as we journey from Harrow to London, is to be seen the beautiful church and spire of Harrow-on-the-Hill and its classical surroundings, the scenery on every side being all that an admirer of Nature could desire.

Bentley Priory is situated on the south side of a beautiful range of hills about twelve miles from London, and is well sheltered from the east, west, and north by slight projections of the hills on each side, thickly covered with great masses of trees. From the high ground on the north-west of the Priory a splendid view is obtained of the fertile grain-growing county of Herts. From this point of view, as on every other, the view is extremely fine. Beyond, in a westerly direction, a fine view is obtained of Windsor Castle in clear weather, the towns of Watford, Elstree, and the neighbourhood of Moorpark, Cashio-bury Park, The Grove, and many other places of interest to the lover of horticulture and of fine natural scenery.—J. WILLS, F.R.H.S.

(To be continued.)

NOTES AND GLEANINGS.

J. RUSSELL REEVES, Esq., F.R.S., of Woodhayes, Wimbledon, has presented the following valuable works to the LINNÆAN LIBRARY—viz., Thornton's "Philosophy of Botany," four vols.; Curtis's "Flora Londinensis," five vols.; Kiemper's "Amoenitatum Exoticarum," one vol.; Nees Von Esenbeck, "Genera Flora Germanica," seven vols.; Thornton's "British Flora," five vols.; Withering's "Botanical Arrangement of British Plants," four vols.; "Flora Medica," two vols.; Siebold's "Synopsis" (Japan), one vol.; Raspail, "Physiologie Végétale et Botanique," one vol.; Gartner, "De Fructibus et Seminibus Plantarum," four vols.

—THE GARDENS of the ROYAL HORTICULTURAL SOCIETY, at South Kensington will be open free on August 26th, from 10 A.M. to 6 P.M., as usual, in commemoration of the anniver-

sary of the late Prince Consort's birthday; but in consequence of disorderly persons abusing the privilege on former occasions, the Council have decided on reserving to themselves the right of excluding any persons from entering the Gardens whom they think it would be undesirable to admit. The Council appeal to the visitors on this occasion to assist them in preserving order and preventing destruction to the Society's property.

— MR. RICHARD PEARCE, formerly one of Messrs. Veitch's botanical collectors, and the discoverer of many of the plants introduced by that firm, died of fever at Panama on the 19th of July. He only arrived there with the view of collecting objects of natural history, on the 7th of the same month, and a week afterwards was attacked by the malady which proved fatal to him, thus adding one more to the long list of those who have lost their lives in enriching our natural history collections. He had married just before leaving England.

— It is our painful duty to announce the death of MADAME ELIZA VILMORIN, widow of the late M. Louis Vilmorin, and mother of the present M. Henry Vilmorin, of Paris, which took place at the family château at Verrières, on the 3rd inst. For upwards of a century the name of Vilmorin has been closely associated with the rise and progress not only of the horticulture but the agriculture of France. At an early age it was her lot to become the wife of one of the most accomplished of that talented family, and the readiness with which Madame Vilmorin at once identified herself with the scientific pursuits of her husband, enabled her to contribute in no small degree to the success of the numerous experiments carried on at Verrières. Of late years the Strawberry formed her more particular subject of study; and numerous articles from her pen were supplied to illustrate the plates of that splendid work of M. Decaisne, "*Le Jardin Fruiter du Muséum*." Since the death of her husband Madame Vilmorin was the head of the extensive and widely-known house of Vilmorin-Andrieux, et Cie., perhaps the most extensive in Europe. Those whose privilege it was to know this highly-gifted and accomplished lady will regret to read this announcement, and those whose advantage it was to enjoy her friendship will keenly feel the loss of one whose friendship was of no ordinary kind.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Asparagus, this is now swelling-off a heavy crop of seeds, which cannot fail to exhaust the plants very much. If attempts were made to clear off the fruit, the chances are that more harm than good would be done by breaking and bruising the young shoots and leaves. The next best plan, therefore, appears to be to soak the beds well with rich liquid manure three or four times before the growth is over. *Celery*, earth-up the plants as they advance in growth, but leave the hearts uncovered until the final soiling. In the case of the early plants this should be applied about a month before they are wanted for use. Earth-up only when the plants are dry. Some growers defer earthing-up until the plants have nearly attained their full growth, and complete the work at once. I prefer doing it at intervals as the plants advance, believing that this renders the crop more tender and crisp. In earthing-up hold the leaves carefully together to prevent the soil getting between them. *Cardoons*, these must be blanched before they are fit for use, and the early crop should be tied and earthed-up as soon as the plants are sufficiently strong. This is usually done by gathering the leaves together, winding haybands closely round the stems, and then covering with soil. *Onions*, as soon as the bulbs are properly matured, which will be known by the decay of the foliage, take them up, spread them out in an airy shed, or sunny situation in the open air, until thoroughly dried, and then store them in a dry, cool place till wanted for use. The Lancashire method of wintering Onions is, perhaps, the best. There the bulbs are tied up in what are called ropes, and hung on an outside wall not facing the sun, and protected from wet by placing a board against the wall overhead. They keep sound longer by this than in any other method. It is a never-failing rule to keep the ground well stirred between rows of young crops. *Spinach*, *Peas*, dwarf *Beans*, and late-planted *Cauliflowers* are the only young crops now to be looked to in this respect.

FRUIT GARDEN.

Peach trees now ripening their crops stand as much in need of water as *Asparagus*, but pond water is strong enough for them. Fork the border as far as you expect the roots to reach,

pour a dozen or so of large watering potsful all round, according to the size of the trees, and then put over the roots a thin layer of short grass. The old wood of the Raspberry may be cut out as soon as the fruit is off, and also a few of the weakest of the young shoots; this will strengthen the roots and let the air have free access to the next year's canes. From this time to the middle of September is the best time to prune Currant and Gooseberry trees, by thinning and topping the branches, to allow a free circulation of air, and, indeed, all sorts of fruit trees that are at all unhealthy or of a tender constitution; it is also a good preventive against canker. The reason is that late autumn growths are avoided, and then no unripe wood remains to be injured by frost; the buds on the remaining branches will be more prominent by the force of the ascending sap being thus checked, and the edges of the wounds made by the pruning knife are healed over before winter. For these reasons and others which might be adduced, September is the best time to cut hedges. Proceed with making fresh plantations of Strawberries, choosing well-rooted runners, or such as have been taken up and pricked out in beds previously. It matters little whether they are planted in beds or in rows, provided the plants have sufficient room. The ground should be well trenched and manured, and if the soil is of a stiff nature, the addition of a considerable quantity of gritty matter will be of advantage by keeping it open, as no spade ought to be inserted among Strawberry plants until they are finally dug down.

FLOWER GARDEN.

Before the propagation of bedding plants is proceeded with to any material extent, it is as well that proper arrangements should be made as to what number of plants will be required next season. To keep up the interest of a garden, especially if planted on the grouping system, some considerable skill and forethought are requisite, so as to vary the scene in each succeeding year, and prevent the arrangement becoming monotonous. Thus, if warm colours prevail to any material extent this season, it would be as well to introduce a majority of cold colours next season, and to edge each bed of the latter with its complementary warm colour. Indeed, the system of edging beds with contrasting colours imparts a highly interesting feature to the flower garden, and more especially to such beds as may be distributed over the lawn without any methodical arrangement. For these purposes no plants are so well adapted as those which have variegated foliage, and for that reason a large stock of variegated *Pelargoniums* should be provided. The best of these are Mrs. Pollock, Mangles's Variegated, the common and Golden varieties, and the different Ivy-leaved *Pelargoniums*.

GREENHOUSE AND CONSERVATORY.

Pelargoniums that have been struck from cuttings early last March, and planted in the reserve garden early in June, should now be fine plants for flowering late in autumn. Their first attempt at blooming in the open ground has been checked of course, and now, as their second flower buds are well formed, they may be taken up carefully and repotted. Some people commit a great error at this stage, by placing such plants in heat at once. This should never be done; the great point is to keep the leaves as free from excitement as possible until the roots take hold of the new soil. A cool close frame covered with canvas is the best place for them, but in the absence of this the north side of a wall or hedge will do. Sprinkle them over the leaves twice a-day, and in ten days they recover from the check without losing a leaf. *Chrysanthemums* and all other plants that are planted out for a summer's growth—a very excellent practice, should be treated in this way, and should not be allowed to remain in the ground too late. The different species of *Begonia* are well suited for flowering in the conservatory and in rooms through the summer; they are enabled to resist the dry atmosphere in such places by the succulence of their stems and foliage.

STOVE.

Almost all the softwooded stove plants that can be formed into large specimens by one or two seasons' growth, like *Pelargoniums*, may be conveniently treated like that popular tribe of plants. Cut them back after they have ceased flowering, keep them dry for a week or ten days, and then shake them out of the soil, shorten their larger roots, and pot them in light rich compost in as small pots as their roots can be got into. This is a good time to look over a collection for this purpose. Where a large conservatory is to be kept gay all the year round, this class of stove plants is the most useful to cultivate, as you can always winter them in little room, whereas fine woody plants

will soon become too large, and take some years before they are fit to appear in a good conservatory. Another great advantage is that as soon as these plants are established in the new pots they will require only to be kept in that condition throughout the winter, and therefore will not require more than 50° of heat for three or four months.

PITS AND FRAMES.

There are many of the new Verbenas that will force admirably through the winter with a little heat; this is the time to procure a supply for the purpose. The Veronicas force well for early spring, and although nearly hardy will stand as much heat as *Ixoras*. *Pentas carnea* and *Manottia bicolor* will answer likewise, and all lovers of the lovely Chinese Azaleas who can afford it ought to have the new varieties of them. The old *Luculia* is as much sought after as if it were a plant of recent introduction. It flowers freely in loam, but for pot cultivation and, by beginners, hardly any loam should be used. Equal quantities of good leaf mould, peat, and sand will keep it in good condition for many years.—W. KEANE.

DOINGS OF THE LAST WEEK.

We have since writing last had several refreshing showers net enough to wet our much-dried soil, but enough to refresh the foliage and cool the atmosphere, doing great good to Dwarf Kidney Beans and Scarlet Runners, and enabling us to sow Turnips, and plant out young plants and Cauliflowers with better prospects of success. But for the dread fly we might go on better, but that has sadly riddled all our young plants, except the last or rather the first sowing of Cabbages, which was protected until the showers came with old sashes. The fly has made such a wreck of some crops, that we dug down several pieces of Turnips, as there was not enough of green foliage to feed the roots, and planted with Lettuces and Endive. In sowing the Turnips the ground was still so dry that we drew drills and soaked the rows before sowing, and if untouched by the fly and other enemies the crop will yet be useful.

We find that, contrary to expectation, many fields sown with Turnips, and which have looked like a desert for the last six weeks or two months, are now showing plenty of young plants. Some farmers are becoming convinced almost against their will, that even the quickly-germinating Turnip seed may remain a long time safe in the ground if not presented with a sufficiency of moisture to swell it, and thus induce the first processes of germination. Early-sown Turnips have less chance of coming up now, as there was then almost enough of moisture to cause them to germinate, though not enough to give them strength to show themselves much, and if they did appear the fly pounced on them and had them at once. Even green tops without large tubers will be a blessing. It is disheartening to manure land well and obtain nothing in return. Could Wheat be sown on the land intended for Turnips, the crops next season might be expected to be better than those of this season, for the quantity and quality of which in general we have reason to be grateful. There is a vast amount of happiness within the reach of the man who has learned to look on the bright side of all things.

The work in the kitchen garden has been so much a repetition of that performed in previous weeks, and doing what the weather would allow us to do, that we shall advert to two things as connected with the prime necessity of water in gardening.

One of our best kitchen gardeners, even though not destitute of water supply, but having it in abundance, was forced to come to the conclusion that watering as generally practised was next to useless. The fly having been more merciful to him than some of his neighbours, he had better and stronger plants of winter vegetables than were common in his neighbourhood, and anxious to get them into the ground occupied by Peas, &c., he did not wait to dig or trench, but marking out the rows, made holes with a crowbar the day previously, and filled them with water, which softened and mellowed the ground a little round the holes. The plants were put in firmly in the usual way and watered again, and then left to themselves. He insists there is no better plan of obtaining fine Broccoli, &c., than planting them in this manner, as the roots delight to penetrate into soil that rather resists their progress. We could bring to our recollection many facts as corroborative of this. What say some of our more experienced practical men? We never thought of the matter much before, but it is just possible that we may stir the soil too much for some kinds

of autumn-planted crops. We are aware that for putting leggy vegetables well into the ground in such a season as this, the crowbar will be a great assistant.

In order to give somewhat stunted Cauliflowers a better chance, we will prick them out before transplanting into rich soil, leaf mould, &c., and then plant with the trowel.

The other matter we would refer to is the means of securing a water supply for garden and farm purposes. We have frequently alluded to saving all water that comes from clean roofs, and adverted last week to the best means for conveying that to reservoirs. We also instanced cases where water was very scarce, and had been made plentiful by taking the drainage of parks and fields into large reservoirs. We have just been told of a simple yet most effective mode of securing a good supply of water. A mercantile firm had a brickmaking yard as part of their business, and this being situated on rather high ground, the procuring and carrying of water in summer cost them between £100 and £200. They no doubt calculated how many inches of rain fell in a season on a given spot in ordinary years, and on these data they proceeded to secure water in an economical manner. They set apart half an acre of ground, had it levelled and firmed, with a regular descent to one end, and at this end they dug out a pond or reservoir. The ground was roughly asphalted with coal tar and gravel, and left with a smooth surface through which the water would not percolate. The sides of the reservoir, sloping obliquely so as to stand well, were first puddled with its own clay, and then covered with a home-made asphalt of tar and gravel; and during the whole of this hot summer the water collected on that half-acre of ground has kept the firm well supplied. Our informant stated the rough asphalted did not cost much, and therefore we cannot say how much the outlay would be for tar, gravel, and labour; but these once secured, the annual outlay for a good supply of water would only be 15s., the usual rental of land being 30s. per acre.

It would be some time before water thus collected would be fit for gardening purposes in-doors, or even for the supply of cattle, but the effects of the tar might be much modified by a rough concreting on the surface, or even by a slight surfacing of fine gravel firmly rolled. Even from that amount of ground well levelled, sloped, and gravelled, with a little powdered lime or fine clay mixed with it, and firmly rolled when wet, a great quantity of water could be obtained without any unpleasant taint whatever, as we know from one of our reservoirs, which is chiefly supplied from what falls on a piece of hard road, which we had levelled to suit our purpose. The simple fact of this brickfield may serve in many ways as a hint to gardeners and farmers. We would have passed an easier summer had we had such a reservoir to fall back upon, as even a little tar scent would do little or no harm to plants out of doors, whilst it would keep grubs and other enemies at a distance. A farmer who keeps a large head of stock has his chief reservoirs of water supplied from what falls on a neighbouring road, and he could easily have much more if the water did not overflow into the adjacent ditches. What would be the expense to him of the loss of half an acre, or even an acre of ground, and the rough-forming of a larger reservoir, compared with the pound a-day which it has cost him for months in driving water three miles or so from his homestead?

FRUIT GARDEN.

The work has been much the same as in previous weeks. Apples are swelling better than we expected, though some continue to fall before they are ripe. Wasps and flies have not troubled us much as yet, and all nests known have been taken. The gauze netting has kept them out of our orchard houses, and until we can exclude them thoroughly we give little front air to our vineries.

Most of our dwarf fruit trees have been deprived of superfluous shoots, as now the chief things are to let the sun to the fruit, and sun and air to the wood and buds for next season. There is more danger of having too much than too little. In thinning it is a mistake to leave Apples and Pears too much exposed. It is apt in such a season as this to render them hard and dry, and if sweet, rather sweet than juicy. Even as respects Peaches and Nectarines, a little shade from leaves is rather in their favour until they are swelling freely and beginning to colour, when the removing of laterals, placing leaves aside, and even cutting them in two so as to admit more light, does much to give high colour and flavour. We have not unfrequently found, however, that a Noblesse comparatively colourless from being slightly shaded was more rich in flavour than one well coloured from full exposure to a bright sun.

Grapes will generally be best flavoured when slightly shaded by their own leaves, and when the rays of light reach them in a broken and flickering manner rather than directly. This season Grapes out of doors are generally good, and may be expected to ripen for something better than inferior wine. The abbots and friars of the olden time must have been cleverer than we, or had better seasons, though even then we suspect their best wine was imported from the more sunny south.

Strawberries.—Proceeded with placing Strawberries in their fruiting pots. We should have liked to have been a fortnight earlier, but before the showers came we felt it was useless to pot unless we could hope to water, and that we saw no prospect of doing. If we had waited until we had rooted runners we could not have potted now. As to layering in pots the little runners that showed themselves, that would have been next to useless, as watering them thus scattered would have been out of the question. All our pet theories about second runners being more fruitful than the first-formed ones had also to go to the winds. We were glad to secure even a semblance of a runner. We will enter into some details respecting these Strawberries as a guide to others as much dried-up as we were.

As soon as we could take hold of some runners not rooted, but just having formed the joint with a few little leaves, and showing where the roots would come from on the lower side of the runner, we cut the little new plant off with about 4 inches of the runner attached; that part of the runner being useful to hold by, and fix by, and also for a short time, from the sap contained in it, acting as a wet nurse to the young plant. Part of these small runners, the best of them, were fixed in small pots (60's), in rich lightish soil, and were set closely together in a frame with some old sashes over them, and were watered, shaded from the brightest sun, and syringed overhead two or three times in the hottest days, giving them only a little air at night. These pots are now filled with nice healthy roots, the plants are vigorous, and being fully exposed for some time have been turned into 6-inch pots and placed on a hard bottom fully exposed to the sun.

To save the time of thus potting in small pots, a good many were pricked into a bed in rich light soil, the connecting stem of the runner helping, as above, to hold them more securely; and these, too, were assisted with shading, syringing, &c. We could thus manage to keep these little plants growing with very little water; in fact, a pint syringed over them would do as much under these circumstances as a gallon would have done in the open air if the little runners had been layered in pots there. We felt the more anxious to forward these plants, as observing how late and how small the runners would be with us, we had resolved to pot over again some old plants in pots not turned out, but we found they were too much injured by want of water, even though we had partially shaded them with dry litter. The pricked-out plants may now be lifted with good balls, and will be just a little behind in point of time those potted at once in small pots.

It may be only a prejudice of ours, but we have a partiality for this sort of double-potting. Some people secure very fine plants by layering the runners in the open ground in 6 or 7-inch pots at once, and only cutting the thread of the runner when the plants are well established, and then removing them to a suitable place to become matured. We ourselves have had fine plants and fine returns from plants so treated; and in ordinary seasons, besides the moving of the large pots there is not so much trouble, as the very size of the pot and the bulk of the soil render the young plant more independent of the water pail. With the drought and the scarcity of water, we could not have managed these so well as by having the young plants all put closely together, and then depending more on the syringe than on the water pail. Our prejudice, however, was not solely owing to the scarcity of water supply. In layering in a large pot at once the roots have a tendency to run to the outside of the pot; and we have frequently noticed that when the rootlets have matted there the inside of the ball was comparatively free of rootlets. Now we like the ball to be firm with rootlets—a mass of them, in fact, right through, so as to occupy every portion of the soil; and this we think is more effectually secured by using a small pot first, having that well filled with roots, and then, after ruffling with the hand the outside of the ball, to let the roots freely progress, transferring the ball to a larger pot in which to produce fruit. Many of our readers may judge this to be mere fancy, but others may think over the reasons given, and then act according as their own judgment prompts.

Having said so much we may add a few words more. First,

as to pots: These should be washed clean, inside and outside too, but especially inside, and nothing is better than warm water. Nothing thrives well in a dirty pot, and even dry rubbing will bear no comparison to the water pail, or rather tub, or barrel, for it is as well to fill the tub and let the pots soak before scrubbing them. The hotter the water the sooner the pots will dry, and they should be quite dry before being used. Then as to size: For small sorts we prefer large 48-sized pots, and for very early work we prefer what are called 40's, as these are sooner crammed with roots, and the buds are, consequently, sooner matured. For general crops under glass we prefer pots (32's), 6 or 7 inches across, and provided we could obtain runners early and good, we would not have many in smaller pots, as the size renders them convenient for watering. When we use larger pots, as 24's, we generally have two plants in a pot. The size of the pot is of less consequence than the maturing of the buds, and just sufficient strength to cause the production of good trusses of fruit. Great luxuriance is not to be aimed at, as that with immature buds will be anything but an advantage.

Then the potting, though simple, is a matter of importance. We seldom use much drainage to take up the room of the pot. One crock over the hole, two or three little pieces above it, then a sprinkling of moss, and on that a slight sprinkling of soot, a small handful of rough pieces of fibrous loam—say from the size of a bean to that of a walnut, with as much of the soil as will enable the ball to stand high enough for the collar or bud to be about level with the rim of the pot. We then fill round with rich fibrous loam, rather stiff than otherwise, and make that as firm as possible, not only with the fingers but with a blunt stick as a rammer, to within half an inch or so of the rim of the pot. That will allow of free watering, and permit of top-dressing afterwards. This firm potting does much to secure the whole of the soil being filled with rootlets.

After potting the best position is a hard bottom fully exposed to all the sun that will come, and if flagging threatens at first, that must be prevented by shading or syringing to arrest evaporation. Plants prepared as above generally manage to hold their own.

Then as to watering. That is not done so as to saturate the new soil before the roots fill it. Before the roots reach the sides of the pot we think it best to use common soft water; after that we prefer manure water, and that to be varied, and if not suitable then we sprinkle the surface of the pots with soot, superphosphate, guano, or any sort of dung, renewing it as it is washed away.

Watering when required will be nearly all the plants need, except giving them room and taking off all runners and weeds that appear, until it is time to secure them for the winter, after the buds show they are tolerably well matured.

ORNAMENTAL DEPARTMENT.

The slight showers have given a greenish tint to the brown lawn, so that in a week or ten days we expect the lawn will add to instead of detract from the beauty of the flower beds. The *Coleus* has done well with us this season. We have several times alluded to the fine bed at Woburn. Mr. McKay, jun., reminded us of what we first heard alluded to by Mr. Chater, of Cambridge—namely, the exceeding brilliancy of the colouring of the plant after a thundershower. No other watering would produce nearly the same gorgeous colouring as that which the plant exhibited under such circumstances. We have noticed the same phenomenon the only day in which we had a little thunder this season. Have others observed the same striking result? On that day the *Coleus* had a beauty all its own.

We must begin propagating for next season; but we are unwilling to interfere with the fullness and uniformity of the beds, and more especially as but for thick planting the plants would not have been so close together as usual. However, with little water and all drawbacks they have done better than others we have seen and heard of, and might have been better still if all seed and decayed flowers had been more constantly picked off. Many forget that even Scarlet *Petargoniums* are more distressed by allowing large heads of seed to swell and ripen than they would be by producing three or four times the number of trusses of flowers. If time cannot be spared to pick beds over, this furnishes a good reason for having fewer beds to manage. A large garden is often a large mistake. A single flower bed well managed is more satisfactory than a dozen or a score in a tawdry state. We could specify scores of flower gardens and pleasure grounds where it would be a comfort and a source of

pleasure to all concerned were the attempt at good keeping confined to one-half or one-third of the space.

Many of the hardier stove plants, as Begonias, &c., that do well in a conservatory, may now be propagated and kept in small space during the winter. In such cases as the Coleus, intended for the flower garden, it is best to keep a few plants in a warm place during the winter, and then propagate in a hotbed in March.

Proceeded with propagating, pricking-out, potting, and fresh arranging houses, as detailed in previous numbers. Dentzias and other plants intended for early forcing should now be exposed to the sun, and the sooner the earliest bulbs are potted the better.—R. F.

TRADE CATALOGUE RECEIVED.

William Paul, Paul's Nurseries, Waltham Cross, London, N.—*Bulb Catalogue.*

COVENT GARDEN MARKET.—AUGUST 19.

We have now a fair supply of Peaches and Nectarines from the open walls, the flavour of which is good, but the fruit generally small. Plums are also sufficient for the demand, but good vegetables are very much in request and command high prices. Several cases of Potato blight have come under our notice.

TO CORRESPONDENTS.

*. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Books (R. S. S.).—You can have the new edition of "The Cottage Gardeners' Dictionary" free by post from our office for 7s. in postage stamps. (J. Anderson).—Rivers or Pearson on Orchard Houses would suit you. The former may be had free by post from our office for 3s. 6d. in postage stamps, the latter for 1s. 7d.

BACK VOLUMES (Maria).—Vol. II. is the only volume of our new series which you cannot obtain complete. All the rest may be had for 8s. 6d. each, with the exception of Vol. III., which is 12s.

AMERICAN AGRICULTURE (J. Walker).—Apply to Trübner & Co., Paternoster Row, London.

GLASS (A Subscriber).—Small-sized panes for hothouses may be pro-

cured from the glass merchants who advertise in our pages. We cannot recommend one dealer in preference to another.

CUCUMBER (Tuesch).—Your Cucumber, which is of the smooth Sion House section, although very good and useful, has no particular merit attached to it. It is inferior to others that are already in cultivation—namely, Pearson's Long Gun and Robinson's Telegraph. It is too long in the neck, nearly one-fourth of the largest fruit being uneatable.

PLANTS GROWING WHEN INVENTED (B. B.).—It is quite true that vegetable tissue permits either gases or liquids to pass through with equal facility upwards or downwards, so the tissue offers no impediment to a cutting being planted in an inverted position. Why that cutting at once proceeds to emit roots and to establish a movement of the sap in the direction contrary to that of its original growth is one of the phenomena of vegetable life as unexplained as is the phenomenon that you may turn a Polyus inside out, and that it adapts itself to the revolution as if no such change had taken place.

SOIL FOR ROSES (R. S. S.).—"I rubbed into powder the specimen of loam sent, and there seems to be much sand in it. If it were highly manured with decayed manure, and a Turnip crop sown and dug in, it would probably grow Roses. Manetti Roses are best for poor soils. A fine clayey Rose soil looks brownish and is greasy after rain. Perhaps the best of all soils is calcareous clay, which we here call 'white land.' There are only two small patches of it in this county. I never saw a failure of any crop in this soil. In calcareous clay I mean half chalk and half clay. Unless the clay from which parti-coloured bricks are made is marly, I should not think it good for Roses. It might do good to sandy land by making it more retentive of moisture.—W. F. RABCYFF."

FORMING A COLLECTION OF ROSES (G. H. M.).—"I advise you to accumulate good sorts rather than purchase five hundred varieties, as they are called. One hundred sorts will comprehend all that are really good. Forty-three Roses are named for me to approve of or reject. I will first name those which you may buy. These are:—Alfred Colomb, Charles Lefebvre, John Hopper, Leopold Premier, Madame Victor Verrier, Marie Baumann, Mrs. C. Wood, Senateur Vaisse, Annie Wood (shows an eye), Antoine Ducher, Black Prince, Charles Verrier, Francois Treve, Abel Grand, Horace Vernet, Thorin, Charles Rouillard, Miss Margaret Delobrain, Prince de Portia, and Marguerite de St. Amaud. With regard to the others, I do not know them, or they are bad. If Mlle. Jeanne Marx opens well it will be a good Rose. It is not yet fully proven. I had Sophie Coquerelle when it came out; it did not grow well. Madame Derreux Douville is worthless. Try in its place Madame Alice Dureau. Among the Roses that I do not know, I should think Mlle. Marie Rady, Hypolite Flandrin, and Frederick Bibord likely to be good.—W. F. RABCYFF."

ROSE FOR A LONDON GARDEN (A New Subscriber).—We think Gloire de Dijon would be one of the most suitable for a garden within two miles of the General Post Office. It has a good constitution, flowers at intervals throughout the season, and is deliciously scented; but do you only require one Rose?

CLIMBERS FOR A LONDON GARDEN (Idem).—The best climbing plants for your south wall would be the Wistaria sinensis, the Virginia Creeper, and Aristoclia siphon.

TREATMENT OF LILUM LANCIFOLIUM AFTER FLOWERING (Idem).—Keep your Liliums in any shady place; do not allow them to suffer from want of water, and as soon as the flower stems dry off, the bulb should be repotted and placed in a cold pit or frame.

TURF PITS (H. V.).—As you have no grass land or common from which you can take turf, we can only recommend you to apply to some one in your neighbourhood who deals in turf, loam, and gravel, who will know where to go. Fine turf, such as is used for lawns, is not required.

INSECT (M. H.).—From your insufficient description we suppose it possible that the caterpillars on your Scotch Firs are those of Noctua piniperda, which sometimes does much mischief in young plantations.—W.

CUCUMBER BED (W. S.).—A depth of 12 inches of soil will be sufficient, putting a layer of sods, grass side downwards, over the rubble. A moist bottom heat is most suitable, but the moisture must not be excessive.

FORCING STRAWBERRIES (Idem).—To ensure success in Strawberry forcing, secure plants with good crowns, and well established in pots by autumn. The plants should be kept in a cold frame or cool house after the middle of October, until they are required for forcing, which may be in January or February, introducing them into a cool house, and placing them on shelves near the glass. Water should not be given too liberally until the plants are coming into flower, then water freely. They cannot have too much air, and the temperature until they come into bloom should not exceed 50° or 55° at night. When the fruit is set and swelling well, give water freely and weak liquid manure copiously; they can hardly have too much water at this stage. The temperature may be from 55° to 60° at night; that of a vinery in which forcing is commenced at the same time as the Strawberries are put in will answer well.

KEEPING PASSION-FLOWERS OPEN (A Constant Reader).—We do not know of any other means of keeping the flowers open except placing the flower stalks in water.

ORANGE TREE MANAGEMENT (H. D.).—Your present mode of treatment could not be improved upon, only after the tree has been in the frame in spring and a good growth has been made and well hardened off, it might be placed out-doors at the end of June, to be taken to the hall window about the end of September. This will be more suitable than keeping the outside matted up, which we do not think good or safe. Placing the tree out of doors in summer will destroy the scale and black fungus. Your plan of washing the leaves is good. The plant should have a shift into a larger pot next spring before being placed in the frame. Good drainage should be given, and a compost of loam from rotted turves is suitable, adding sand liberally if the loam does not contain it in sufficient quantity.

DESTROYING INSECTS (C. A. J.).—You would see an advertisement in last week's number.

PRUNING VINES (W. H. G.).—Those advising you to prune your Vines as soon as the Grapes are cut, in order to swell the eyes, know nothing of what they advised. Let the Vines remain as they are until the leaves

have all fallen, or are in such a state that their removal by hand will do no harm—that is, when they are quite brown, and within a fortnight you may prune to one or two eyes. The only thing you can now do is to thin and shorten the laterals, and by degrees remove them; and by thus exposing the wood to increased light its maturity will be promoted.

RAPHANUS CAUDATUS COOKING (E. S.).—The pods require to be gathered when about 9 inches long, and boiled in the same manner as Asparagus. They are boiled until tender, and then served on toast with melted butter.

RED SPIDER ON VINES (Idem).—Yours is a bad case, but the wood being ripe we do not think any serious damage has been done. When the Grapes are cut, syringe the Vines with 2 ozs. of soft-soap to 1 gallon of water at a temperature of 140°, which will be reduced to about 120° by the time the solution reaches the foliage. Repeat the syringing, and give all the air you can, keeping cool and dry. Do not prune until the usual time. After pruning give every part of the house a thorough cleaning, and dress the Vines with a composition of 8 ozs. of soft-soap to a gallon of tobacco water, which may be made by pouring the water on 4 ozs. of the strongest tobacco; then cover, and let the liquor stand until cool; strain, and bring the tobacco water holding the soft-soap in solution to the consistency of paint by adding flowers of sulphur. With this mixture paint every part of the Vines, rubbing it well into the cracks and corners, but take care not to rub off any of the eyes.

CULTURE OF MARÉCHAL NIEL, NARCISSE, AND GLOIRE DE DIJON ROSES (An Ignoramus).—They all succeed against a wall with a south or south-west aspect, the latter being the best situation. The best time to plant them is in November. Let the soil be composed of two-thirds loam neither very heavy nor light, but intermediate between the two. If the top 3 inches be taken from a pasture all the better. Chop up with a spade, and well mix a third of rotten manure with the loam. The soil should be taken out to a depth of 2 feet, and to a distance of 3 feet from the wall. A little finer soil may be used to plant in, and after planting and watering mark the ground about the plants with 2 or 3 inches of short littery manure. Do not prune them at all in autumn, but in spring, if the shoots are long, cut them to within 1 foot of the soil. In summer train in the shoots at 9 inches or 1 foot apart on the wall, removing those not wanted. Water copiously in dry weather, and syringe with water in the evenings of hot days. They will need a top-dressing of manure in autumn, which should be neatly pointed-in with a fork during the spring, and in March merely cut off the points of the strong shoots, and remove any weak shoots where they are too close together.

GALVANISED WIRE FOR ROSE ARCHES (M. A. P.).—We have used galvanised wire extensively for arches, and have not found any injurious results from it. The kinds you have are not probably climbing Roses. Wells's White or Madame d'Arblay and Rivers's Queen, hybrid climbing Roses, will probably suit you.

CLIMBERS FOR SUMMER HOUSE UNDER TREES (J. W. K.).—We fear none of the plants you name will succeed under large Sycamore and Elm trees, except the Virginian Creeper. Roses are out of the question, and the others need sheltered situations. No plants that we know will suit so well as the Ivies, and these are what we advise.

VINES INFESTED WITH SCALE (A Subscriber).—The leaf sent us was smothered with brown scale. Dryness at the root has nothing to do with it. Your only remedy this season is either to pick off the insects with the point of a knife, or paint the leaves where the insects are with gum water, using 8 ozs. of gum arabic dissolved in a gallon of water, and applying it with a brush. It should be allowed to dry on the leaves, and must be syringed or washed off with a sponge within forty-eight hours. Then the leaves as they become yellow and fall off ought to be gathered and burnt. Then strip off the loose bark and wash the stems and every part with a brush, using soft-soap and water at a temperature of 140°; 8 ozs. of soft-soap should be employed to one gallon of water, and the house ought to be thoroughly cleaned.

PINE APPLES (Idem).—It is now too late to put in Queen Pine Apples for fruiting this season, as they would not fruit until late. We should keep them back for early summer fruiting.

KEEPING SEED POTATOS (W. Turner).—We shall have some remarks next week.

COVERING THE BACK WALL OF A VINERY (Sutton).—Your clothing the back wall with Muscat Vines, Peach trees, or anything else will depend on the light you allow to reach the back wall. If there is an opening between every two Vines up the rafters, the Muscats, Peach trees, or Fig trees will do tolerably well, but not if the roof is thickly covered with foliage.

PINE PIT AND CUCUMBER HOUSE COMBINED (Jersey Subscriber).—There is no difficulty to your proposed arrangements, only that the main flow and return pipes must pass under the pathway of the house so as to present no obstruction. For this purpose, the boiler must be placed sufficiently deep. We would advise two 4-inch pipes for each bed, and two pipes on each side for top heat. The two pipes below each bed will make the bed equally heated, but it will be advisable by means of valves to give bottom heat and top heat independently of each other. For a house 120 feet long, it would be best to have the boiler in the centre of the house; then take your piping right and left, and make one end the Pine house and the other the Cucumber house. We have often said how that may be done. Two pipes, one from the top and one from the bottom of the boiler, will enable you to give bottom and top heat as desirable.

GRAPES SHRIVELLING AND SHANKING (A Subscriber, Thornhill).—We have no doubt that owing to the age of the Vines the roots have either gone down too deep, or the border is in an unhealthy state from defective drainage. For another year, we would try what opening a deep drain in front would do. We would remove all the surface soil that could be removed, and add a few inches in depth of fresh manure covered with a little horse dung; and if the fibres rose we would add more fresh compost. We would, as you propose, force little next season; and we would by litter, thatching, or other means keep most of the winter rains off the border. As the Vines are fair for strength, we think you will overcome the shanking if you take a moderate crop.

FRAME FOR PROTECTING BEDDING PLANTS (J. J.).—Your narrow frame would make from 20 to 24 inches high at back and 12 inches high in front. This, made of 1½-inch timber, will keep out as much frost as a brick wall; but in severe frost neither is to be trusted, and the safest plan is to place an inch in thickness of straw against them, or let mats hang down over the walls. Of course you must protect the glass. We approve of your firm bottom of coal ashes higher than the surrounding ground. No doubt the 6-feet wall behind will so far protect your frame. Why not make that wall the back of your frame, or make a brick pit at once? Then you might have a stove or a fire in winter, and save trouble in covering. However, the frame will do well if looked after in bad weather. Spill as little water as possible all the winter.

FUCHSIAS LOSING THEIR LEAVES (Joshua).—We can only suppose your plants have lost their leaves through an attack of red spider, which is very prevalent this season, many plants besides yours having lost their foliage from the same cause. The only preventive is to keep the plants well supplied with nourishment and water at the root, and to frequently syringe the foliage.

BLAIND ROSE NOT FLOWERING (H.).—We think it has not been sufficiently vigorous for blooming. It is of vigorous habit, well adapted for pillars, and as a standard should be trained as an inverted cone, which will generally ensure an abundance of bloom. Pruning should be confined to thinning out the old wood and slightly shortening the shoots that are left.

BARKING LARCH TREES (F. B.).—If the trees are small, or such as two men might carry, we do not think removing the bark can do any harm, but, on the contrary, it may do good, when the timber is used for outdoor purposes, by the wet running off much more easily; but for large timber trees a more qualified opinion must be given, as it is possible the tree may part with more resin when cut in the full flow of the sap than when cutting is done in midwinter. We know that there is some difference of opinion as to the propriety of taking the bark off; but of late years, in consequence of the small price given for Larch bark, it has not repaid the removal. It would appear to us that stripping off the bark of small trees would be amply repaid by the better appearance they have when used for fencing or other purposes, but for large trees intended to be cut up for building, the difference of winter and spring-cut timber ought to be taken into consideration—still we believe this difference to be much less than many believe.

CONIFERS FOR QUEENSLAND (K. M. H.).—We hardly expect the Pines of Northern Europe and America will endure the droughts of Darling Downs, as we have seen more than one place where the Wellingtonia has shown signs of distress during the present dry season in England. You might try most of the Araucarias, as Bidwilli, exelsa, Cunninghami, brasiliensis, lanceolata, Rulci, and others, some of them no doubt natives of Queensland. Thujaopsis borealis, Thuja gigantea and Leddi, the Cryptomeria, Pinus insignis and others, Picea Webbiana, most of the Dammars and Decrydiums, Torreya grandis and humilis, Retinospora leptoclada, pisifera, and obtusa; Cedrus deodara, the Cedar of Lebanon, and many other plants. Most of the Cupressus as well as Abies family like a moist soil. The common Yew, however, might be tried, and some other trees. Seeds of most if not all of the above are supplied by the seedsmen advertising in our pages.

BIGARREAU CHERRY APPARENTLY DYING (Jaconis).—Your Cherry tree, like many other fruit trees, is probably suffering from the extremely dry weather, but we do not think any good will arise from cutting it in any way. If the tree is not too old, it may possibly become healthy when rain sets in, but in the meantime if you could give it a good sound watering—that might do much good; and by-and-by, as the summer advances, you will be better able to judge what it is best to do with it. In general the Cherry is very impatient of the knife, and we would not advise any mutilation until the dead parts (if there be such) fully show themselves. In looking over an extensive orchard of mixed trees a few days ago, we saw Apple, Plum, and Pear trees apparently suffering from the continued drought, the fruit being exceedingly small and the foliage shrivelled up, while close to them were other trees in tolerably good condition.

ROSE DUST (Idem).—Manure-dealers and many nurserymen supply this, or you might inquire of those who deal in silver sand, peat, and similar substances. If you have any dealings with a nurseryman, most likely he would obtain it for you if he does not keep it in stock.

DYING EVERLASTINGS (S. B. W. B.).—The flowers should be gathered before they are fully expanded and kept in a warm dry room.

LIGHTED ROSE TREES (C. B., Godalming).—Your question was answered by the Rev. W. F. Radclyffe in page 594, and again in page 461 under the initials "C. L."

BACK NURSERY (W. W.).—Being incomplete they would not be saleable.

SEEDLING NECTARINE (Major-General Studt).—Your Nectarines when they reached us were so much bruised and decayed that no correct opinion could be formed of their merits. A small portion of one only remained which tasted somewhat austere. They were well packed.

NAMES OF FRUIT (J. Cuthbert).—Chapman's Prince of Wales Plum. (L. S. W.).—Duchess of Oldenburgh Apple, suitable either for kitchen or table use.

NAMES OF PLANTS (F. D.).—A plant was named under your initials in the number for July 9th, as Stachys betonica, and this, as far as we recollect, was the same as that to which you refer. The slice of Gourd arrived during a short absence from London, and on our return presented anything but an inviting appearance. (C. Hall).—It is impossible to name plants from such dried-up scraps. We could just make out the leaf of the well-known Japanese Houey-suckle, Lonicera brachypoda reticulata, and barely that. (J. Earle).—1, Gymnogramma ochroleuca; 2, Polypodium punctatum; 3, Onycheum japonicum? (too young); 4, Polypodium rugulosum; 5, Gymnogramma tartarea; 6, Blechnum occidentale; 7, Cystopteris fragilis; 8, Pellaea rotundifolia; 9, Nephrolepis cordifolia; 10, Pellaea hastata. (F. E. H.).—4, Asplenium (Daria) Belangerii; 5, Nephrodium odoratum. (E. A. L.).—Diplazis glutinosus.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending August 18th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

THE WEATHER AND OUR CHICKENS.

THAT "preux Chevalier," Sir Roger de Coverley, drew many and admirable morals from things that in the lives of ordinary men appeared trifles. His lessons were good and to the point. To us individually and collectively the break in the weather is all-important. To some of us who live at a distance from cab-stand, omnibus route, or Underground, it brings an *argumentum ad hominem* in the shape of the necessity of umbrella or light waterproof according to choice. To others who rejoice in a garden large enough for a croquet ground, the rainfall is a subject of pleasant conversation, and engagements are made for future contests, that hitherto had been postponed until next season on account of the drought. As we honestly believe all men to be more or less selfish, we will at once admit that the tender point as regards the weather and ourselves was, the relation in which the change stood to our chickens—the chickens which would, we fondly hoped before the drought, add honour to our name; the hope died when summer heat became our ordinary temperature. The rain when it came, and the appearance of our gravel paths as it fell, brought to our remembrance the medalion and motto of the Royal Humane Society, and the faint spark of hope was rekindled. Fancy a poultry-yard of one-fourth of an acre well peopled with well-bred, fast-growing chickens. Visions we have of first and second prizes; third and highly commended we do not care for. The sale of our extra stock we look forward to. But the heat! It continues! it increases! Our chickens flag; in spite of extra care, extra food, and much vexation of spirit on the part of the feeder, they seem to grow lighter, the feathers do not form and harden, and any progress they may make is, as Pat has it, backwards.

But there is, at last, a change in the weather. The atmosphere becomes heavier, and by instinct the chickens begin to peer about, in and among the hedges and bushes, for the gnats and insects that they know should be there before a shower. Whether they are successful or not we cannot say, but the first two or three heavy drops seem to startle them and they scatter for shelter. Soon the sweet, fresh, earthy smell arises from the parched ground, and some adventurous chicken tempted by it ventures forth. The example is contagious, the others follow and enjoy it, and when feeding-time comes they return draggled and dirty; but, as the man says who looks after them, "They be more piert," and their appetites show that they, in common with everything, benefit by the change. They come down from roost in the morning fresher, brighter, end earlier, and spread over the extent of their range hungrily, eagerly, and with a spirit that has long been lacking. We now look at them again with complacency, and while thinking at which show we should most wish to distinguish ourselves, we mutter, "Ah! the rain was just in time for the chickens!" We may all hope and think, that it came just at the right time for farmer, gardener, and fancier.

HESSELE POULTRY SHOW.

(From a Correspondent.)

THE third annual Exhibition took place at Hessele, near Hull, on the 12th inst. The entries for poultry and Pigeons were numerous. Great praise is due to the Honorary Secretary, Mr. Hood, for the way in which the arrangements were carried out. There was some dissatisfaction as to the judging. The most noticeable misjudging was in the *Spanish* and *Silver-pencilled Hamburg* classes. In the former the first-prize pen contained a cock with a drooping comb; and although

art had left its mark in trying to improve upon nature, it had not succeeded in the attempt. The best pen in the class was unnoticed. In the *Silver-pencilled Hamburg* pen the cock had a comb that should prevent him from taking a prize at any show.

Some excellent *Pigeons* were exhibited, and I noticed in more than one prize pen the prevailing fashion of showing two cock birds instead of a cock and hen. The following is a list of the awards:—

GAME.—First, W. Boyes, Beverley. Second, H. M. Julian, Hull.
 SPANISH.—First, G. Boyle, Hessele. Second, G. Holmes, Driffield.
 COCK.—Prize, G. Holmes.
 DORKING.—First, D. White, Driffield. Second, A. Hopper, Tranby.
 COCK.—Prize, O. A. Young, Driffield.
 COCHIN-CHINA (Buff, Cinnamon, or Partridge).—First, R. Loft, Woodmansey. Second, G. Holmes, Cock.—Prize, R. Loft.
 ANY OTHER VARIETY.—First, S. Smelt, Beverley. Second, R. Loft.
 COCK.—Prize, R. Loft.
 GAME (Black-breasted or other Reds).—First, H. M. Julian. Second, W. Boyes. Cock.—Prize, G. Holmes.
 GAME (Any other variety).—First, W. Boyes. Second, H. M. Julian.
 COCK.—Prize, H. M. Julian.
 POLAND.—First and Second, E. Procter, Hull. Cock.—Prize, E. Procter.
 HAMBURGS (Golden-spangled).—First, G. Holmes. Second, O. A. Young. Cock.—Prize, G. Holmes.
 HAMBURGS (Golden-pencilled).—Prize, G. Holmes. Cock.—Prize, G. Holmes.
 HAMBURGS (Silver-spangled).—First, G. Holmes. Second, C. Richardson. Cock.—Prize, G. Holmes.
 HAMBURGS (Silver-pencilled).—First, O. A. Young. Second, G. Holmes.
 COCK.—Prize, D. White.
 GAME BANTAMS.—First, R. Robson, Wold Carr. Second, Mrs. Wilde, Hull. Cock.—Prize, W. Hardy, Hessele.
 BANTAMS (Any other variety).—First, Miss E. Rudston, Hull. Second, Mrs. T. Wilde. Cock.—Prize, Mrs. T. Wilde.
 EXTRA STOCK (Any distinct variety).—First, R. Loft. Second, H. Lawson, Spring Cottage Farm. Cock.—Prize, R. Loft.
 DUCKS (Aylesbury).—First, O. A. Young. Second, H. Lawson.
 DUCKS (Dutch).—First, O. A. Young. Second, G. Holmes.

PIGEONS.

CROPPERS.—First, F. Key, Beverley. Second, A. Rannister, Hessele.
 DRAGONS.—First, H. Taylor, Newland. Second, J. W. Thompson, Wellington Lodge, Hull.
 TRUMPETERS.—First, Messrs. Pickering & Marshall, Driffield. Second, C. Lythe.
 JACOBS.—First and Second, C. Lythe.
 FANTAILS.—First, R. J. Bell, Hull. Second, H. Payne, Cottingham.
 TUMBLERS.—First, F. Key. Second, S. Ellington, Woodmansey.
 BARBS.—First, N. Key. Second, G. W. Cawson, Hull.
 NUNS.—First, Messrs. Pickering & Marshall. Second, R. Moll, Hull.
 ANY OTHER VARIETY.—First, Messrs. Pickering & Marshall. Second, J. W. Thompson.

RAEBITS.—Lop-Eared.—First, P. Ashton, Drypool, Hull. Second, P. White, Hull. Any other variety.—Prize, G. Tennyson, Hessele. Heaviest.—Prize, Miss Herbert, Hull. Young.—Prize, J. Fletcher, Hull.

BADMINTON POULTRY SHOW.

THIS Show was held on the 7th inst., in connection with the Badminton Farmers' Club and for the first time was under the direction of the General Committee, to whom and their able Secretary Mr. Lloyd great praise is due for the completeness of all arrangements connected with the Show. There was a good collection of birds, but they did not show to that advantage we should like to see, the pens being far too small and not nearly high enough. We believe this is to be altered another year. The following is the prize list:—

DORKINGS (Any variety).—First, Rev. A. K. Cornwall, Enecombe, Uley. Second, G. Hanks, Malmesbury. Chickens.—Prize, Rev. A. K. Cornwall. Highly Commended, G. Hanks.

GAME (Any variety).—First and Second, G. Hanks. Highly Commended, J. S. Maggs, Tetbury; J. Goulter, Acton Turville; T. Arnold, Wickwar. Chickens.—Prize, Duke of Beaufort, K.G., Badminton. Highly Commended, J. S. Maggs. Commended, A. Whiting, Badminton.

BRAMMAS (Any variety).—First, J. S. Maggs. Second, G. Brown, Badminton. Chickens.—Prize, J. S. Maggs.

COCHINS (Any variety).—First, J. S. Maggs.
 SPANISH (Any variety).—First, Messrs. Tonkin & Tackey, Bristol. Second, G. Brown, Badminton. Chickens.—Prize, W. Parsley, jun., Bristol. Highly Commended, Tonkin & Tackey.

HAMBURGS (Any variety).—First, Rev. R. H. Mullens. Second, J. S. Maggs. Chickens.—Prize, J. S. Maggs. Highly Commended, J. Ashbee, Hillsley.

BANTAMS (Any variety).—First, Tonkin & Tuckey. Second, W. Parsley, jun., Bristol. Highly Commended, J. S. Maggs.
DUCKS (Aylesbury).—First, Duke of Beaufort, K.G. Second, Rev. G. F. Le Mesurier, Tormarton. *Ducklings*.—Prize, G. Hanks.
DUCKS (Rouen).—First, G. Hanks. Second, Rev. R. H. Mullens. *Ducklings*.—Prize and Highly Commended, Rev. R. H. Mullens.
DUCKS (Any other distinct variety).—First, Second, and Highly Commended, Rev. R. H. Mullens.
GEESE.—First, G. Hanks. Second, J. Thompson, Badminton.
TURKEYS (Any variety).—Prize, Rev. G. F. Le Mesurier.
GUINEA FOWLS.—Prize, Rev. G. F. Le Mesurier.
PIGEONS.—*Carriers*.—Prize, T. Jones, Maluesbury. *Dragoons*.—Prize, Tonkin & Tuckey. *Pouters*.—Prize, T. Jones. *Fantails*.—First and Second, Tonkin & Tuckey. *Tumblers* (Short-faced).—First, T. Jones. Second, Tonkin & Tuckey. *Tumblers* (Baldheads).—Prize, T. Goulter. *Barbs*.—Prize, S. Summers, Didmorton. *Runts*.—Prize, J. Goulter. *Jacobins*.—First and Second, Todkin & Tuckey.

Mr. H. Lane, of Bristol, was the Judge.

HETTON POULTRY SHOW.

THE Hetton Collieries Horticultural and Poultry Society held its ninth annual Exhibition on the 12th inst., in the Hetton Hall grounds, the seat of Lindsay Wood, Esq.

The show of poultry was not large. Mr. G. H. Procter, of Durham, deservedly gained the first and second prizes for a *Cochin-China* cock and two hens, and also for a *Cochin-China* cockerel and two pullets, and Mr. J. Harrop, of Bishopwearmouth, Mr. W. Whitfield, and Mr. T. Rodham, exhibited some very fine birds. The *Pigeons* were a fair average class.

SPANISH.—First, J. Harrop, Bishopwearmouth. Second, J. Cain, Harrington Hall. *Chickens*.—First, R. Hawkins. Second, J. Harrop.
DORRINGS (Coloured).—First, D. Rutter, East Rainton. Second, J. Bell, Hetton-le-Hole. *Chickens*.—First, D. Rutter. Second, T. Rodham.
COCHIN-CHINA.—First and Second, G. H. Procter, Market Place, Durham. *Chickens*.—First and Second, G. H. Procter.
HAMBURGHS (Silver-pencilled).—Prize, W. Whitfield, Hetton Station. *Chickens*.—First and Second, W. Whitfield.
HAMBURGHS (Golden-pencilled).—Prize, J. Pearson, Elemore Cottage. *Chickens*.—First and Second, T. Rodham.
HAMBURGHS (Silver-spangled).—First, T. Rodham. Second, W. Whitfield. *Chickens*.—First, D. Cheyne, Redlington. Second, T. Rodham.
HAMBURGHS (Golden-spangled).—Prize, W. Whitfield. *Chickens*.—First and Second, W. Whitfield.
POLANDS.—First and Second, W. Whitfield. *Chickens*.—Prize, W. Whitfield.
GAME.—(Any variety).—First, R. Just, Middlesborough. Second, H. Hawkins, Seaham Harbour. *Chickens*.—First, B. Hawkins. Second, J. Bell.
GAME BANTAMS (Black-breasted and other Reds).—First and Second, J. Harrop.
GAME (Duckwing and other Greys).—Prize, J. Harrop.
BANTAMS (Any variety).—Prize, R. Hawkins.
ANY VARIETY.—First, D. Hunter, Sunderland. Second, J. Harrop.
DUCKS (Aylesbury).—First, R. Just. Second, T. Rodham.
DUCKS (Rouen).—First and Second, T. Rodham.
PIGEONS.—*Carriers*.—First, A. Buglass, Carville. Second, W. Williamson, Belmont. *Pouters*.—First, W. Whitfield. Second, W. Williamson. *Tumblers*.—First and Second, W. Williamson. *Fantails*.—Prize, A. Buglass. *Trumpeters*.—First, A. Buglass. Second, W. Whitfield. *Barbs*.—First, W. Williamson. *Turbits*.—First, W. Williamson. Second, A. Buglass. *Jacobins*.—First and Second, W. Williamson.

ALDBOROUGH AND BOROUGHBRIDGE POULTRY SHOW.

THE eighth annual Show of the Aldborough and Boroughbridge Floral and Poultry Society took place on the 14th inst. on the grounds of Aldborough Manor, by the kind permission of Mr. Lawson. The show of poultry was larger than on any previous occasion, there being 193 pens. Every class was well represented, especially *Duckings*, *Spanish*, and *Hamburgs*. There was a large collection of *Pigeons* of every variety. The weather was all that could be desired, and there was a large attendance of visitors. The Committee and Secretaries have all done their duty in a manner which cannot but result in increased patronage to this thriving Society. The following is a list of the awards:—

DORRINGS.—First, G. Holmes, Driffield. Second, H. S. Thompson, Kirby Hall. *Chickens*.—First and Second, C. Triffitt, Cattal.
SPANISH.—First, G. Holmes. Second, W. & F. Pickard, Thorne.
GAME.—First, C. Triffitt. Second, J. Watson, Knaresborough. *Chickens*.—First, J. Watson. Second, G. Carter, Aiskew, Bedale.
COCHIN-CHINA.—First, J. Malthouse, Ripon. Second, Rev. J. G. Milner, Bellerby. *Chickens*.—First, W. Barnes, Thirsk. Second, J. Malthouse, Ripon.
BRAMA POOTRA.—First, J. Walker, Haya Park, Knaresborough. Second, Miss Graham, Aldborough. *Chickens*.—First, — Taylor, Langthorpe House. Second, Miss Graham.
HAMBURGHS (Golden-spangled).—First, J. Walker. Second, W. Bearpark, Ainderby Steeple.
HAMBURGHS (Golden-pencilled).—First, F. Horsman, Boroughbridge. Second, W. Bearpark.
HAMBURGHS (Silver-spangled).—First and Second, J. Walker.
HAMBURGHS (Silver-pencilled).—First, J. Walker. Second, W. Bearpark.
POLAND.—First, C. Walker, Boroughbridge. Second, W. & F. Pickard.
GAME BANTAMS.—First, J. Walker. Second, W. Shaw, Boroughbridge.
BANTAMS (Any variety).—First, C. Andrews, Aldborough. Second, T. Bally, Sowerby.

ANY OTHER VARIETY.—First, J. Walker. Second, Rev. J. G. Milner.
FARMYARD CROSS.—First, I. Moorey, Mulwith. Second, C. Triffitt.
TURKEYS.—Second, I. Moorey. *Poultis*.—Prize, J. Walker.
GESE.—First, J. Walker. Second, Mrs. Smith, Humberton. *Goslings*.—First, Mrs. Smith. Second, G. Renton, Ox Close, Ripon.
DUCKS (Aylesbury).—Prize, J. King, Boroughbridge. *Ducklings*.—First, J. Stubbs, Boroughbridge. Second, J. Culbertstone, Aldborough.
DUCKS (Rouen).—First, Miss Graham. Second, J. Nason, Rooker Hill, Boroughbridge. *Ducklings*.—First, Miss Graham. Second, A. S. Lawson, Aldborough Manor.
DUCKS (Any other variety).—First, J. Walker. Second, N. Taylor, Norton-le-Clay.
GUINEA FOWLS.—Prize, J. Mason, Rooker Hill.
SELLING CLASS.—First, G. Carter, Aiskew, Bedale. Second, M. & R. Gray, Boroughbridge.
PIGEONS.—*Pouters*.—Prize, G. Sadler, Boroughbridge. *Carriers*.—Prize, G. Sadler. *Trumpeters*.—Prize, J. Mason, Rooker Hill, Boroughbridge. *Jacobins*.—Prize, T. Rutherford, Thirsk. *Fantails*.—Prize, T. Rutherford. *Tumblers*.—First, J. Walker. Second, G. Sadler. *Barbs*.—Prize, F. Horsman, Boroughbridge. *Nuns*.—Prize, J. Mason. *Turbits*.—Prize, G. Sadler. *Any other Variety*.—First and Second, J. Mason. *Selling Class*.—First, H. J. Farish, Boroughbridge Hall. Second, M. & R. Gray.
RABBITS.—*Back*.—First, W. Wilson, Middlesborough. Second, T. Slade. *Doc*.—First, W. Wilson. Second, I. Slade, Boroughbridge. *Heaviest*.—Prize, The Masters Lawson.
EXTRA STOCK.—First, H. S. Thompson. Second, C. Andrews.
JUDGES.—Mr. E. Hutton, of Pudsey; Mr. G. V. Darby, of Derby.

ANTWERPS: THEIR POINTS AND TRAINING.

SINCE writing my last article respecting Antwerps, which appeared in the Journal of July 30th, I have been requested to give a further exposition of my views on the subject. I have been a fancier of Pigeons of all kinds for at least twenty-seven years, and during that time I flatter myself I have gained some knowledge of their habits, breeding, training, and other matters concerning them.

I have kept Antwerps about twenty-three years. The strain of birds which I obtained have often returned from Goole to Antwerp. The first I received were young, but when moulted and a few months old had, as "A FOREIGNER" describes, heads like the Bullfinch, with the carriage of a Dragoon. There is another class of Antwerp fancied—the Long-faced birds, rather longer in head, with the bill not so thick, and with the eye a nice distance from the latter.

My opinion as to classing Antwerps is as follows:—The Dunn and Red Chequered, the Blue and Blue Chequered. Offer these two classes prizes, and it will be found that in a short time the Antwerps will form the best entries at any show in the Pigeon classes; the above colours, also, will be found in numbers and match equal to any other kinds shown.

Of late years I have had too much upon my hands to give proper attention to the training of Pigeons. In 1850 we formed a club in this town (Wakefield), for the purpose of training Pigeons to fly from the Great Exhibition of 1851, I being the only keeper of Antwerps at that period. My brother fanciers had the Long-faced Beard, the Dragoon, Horseman, and the Long-faced Baldhead and Beard crossed with Dragoons, and any kind of mongrel Pigeons suitable for flying. I had but few pairs—say ten, and six of the cock birds belonging to each party were marked at the commencement of our training, none other being eligible to compete. The birds were to be tossed up in July in Hyde Park, to fly for a sweepstakes. Several of the parties were in the habit during training of sending their birds in numbers, and few returned. As the time advanced, and though only 114 miles had been completed, all the birds were lost, with the exception of four out of a batch of sixty; the four consisting of two Red Chequered Antwerps, a Blue Beard cock, and a Beard and Dragoon cock. Three of these were sent from Peterborough to Hitchin, and were all lost. Thus the only bird left in the club was my Antwerp cock, which was sent to Hitchin, and returned; he was, however, afterwards sent to within twenty miles from London, but was lost: therefore not one bird out of the sixty returned from London.

In practising Antwerps to fly I never allowed them to alight upon the roof of a house or cote, but kept them flying until they alighted upon the landing board; if they attempted to alight upon the roof I had a supply of round sticks, about 18 inches long, which I threw at them until they alighted on the landing board and took the bolting wires. I only flew about six or eight birds at a time; part of them, young to practice, returned to the cote quickly. Evening is the best time. I practised flying young birds when eight or ten weeks old to learn them the locality, about an hour being so occupied every morning. You might see them go miles both east or west, north and south. I afterwards practised them in homing by sending them off a few miles at a time. I have had young

birds with nest-feathers upon their heads and neck, which came thirty or forty miles. Young birds on their return should not be allowed to remain on the roofs, but must be driven in as soon as possible. If, however, there is any difficulty in doing this, turn out an old bird or two, and the young birds will follow their example, and enter the cote immediately. After the birds are all well practised never let them out more than once a-day, as thus treated trained birds will return home much more quickly for forty or fifty miles, although they may not have been let out for weeks.

I have described the favourite colours of the Belgian Smerle, there being two varieties as stated; I always found as a rule that the short thick-headed birds when turned up rise in the air the highest, and take the best way home. The long-headed birds seldom rise so high, and in windy weather skim in their flight much like the Dragoon, and waste time on their way by plunging and rising.

Some fanciers consider flying long distances a matter of instinct; this I hold is not correct, homing and flying being, in my opinion, simply a question of training and observation on the part of the birds. If you send a young bird fifty miles you seldom see it again; they must be trained to fly from short to long distances gradually, as a bird thus trained will not alight until it reaches its own landing board, unless benighted. I never yet tossed up a properly-trained bird that attempted to alight either in town or country. I should recommend birds not to be flown any long distance from October to March, as the best-trained birds have been lost in foggy weather.—JOHN CROSSLAND, JUN.

THE KOEHLER SECRET REVEALED—A NEW MODE OF PROPAGATING LIGURIANS.

[MR. KOEHLER has recently made his process public in the following article, which appeared in the German Bee Journal.—A DEVONSHIRE BEE-KEEPER.]

Now as to the operation itself. It is founded on my observation, that during many fine forenoons and afternoons the air is still warm enough for queens to fly out when drones usually have not commenced flying, or have ceased to take wing. Until, therefore, the young queens become fertilised we must compel the Italian queens and drones to go forth at such times as the German drones cannot possibly be abroad. The time during which drones are on the wing seldom extends with us to later than 4 or 5 o'clock P.M. If, therefore, we have one or more colonies, with young queens which we know to a certainty have not yet been fertilised, we place these hives for three, four, or five days in a perfectly dark and cool cellar, and with them also the stock which contains the Italian drones. Whenever a very warm and sunny day occurs we watch the German stocks until the drones have ceased their flight. As soon as this occurs we restore the hives containing the Italian queens and drones to their accustomed stands, and set them at liberty after giving to each a cupful of their liquid honey. The queen and drones being ardent, and having been unable to fly for days, the bees excited by the honey and their previous confinement, become so eager after flight, that all play as if mad, and fertilisation follows. We must, however, be careful to return to the cellar in the evening every colony the queen of which has not been seen to return with the sign of fertilisation, and repeat the process until it is certain that the desired result has been attained. This is essential, because it is well known that under ordinary circumstances some queens take flight several times before they succeed in meeting with a drone. How much more, therefore, must this be the case under the foregoing management, whereby the number of available drones is limited to those only which exist in the few Italian stocks?

You will, even before testing it, be satisfied as to the efficiency of this process; but as practice surpasses precept, you will, doubtless, try the experiment and report the result. No one to whom Italianising his stocks is of consequence but will willingly contribute half a florin* in order to avail himself of a process which promises him such great advantages and so much pleasure.

But now I will make a second communication, which will certainly also be agreeable to you. I do not know whether you give the preference to natural or to artificial swarms. My practice combines both, as by it I obtain natural swarms by an artificial process, and can at the same time with one good Li-

gurian stock Italianise a dozen colonies with the least possible trouble. The process is as follows:—We take a hive from which a swarm has just issued, and put it in the place of another very populous colony. After nine days, by means of the population received from the removed hive, it will certainly swarm again. If it is now shifted to the stand of another strong stock it will, after two or three days, swarm again. We continue this process as long as we can hear queens piping in the hive of an evening. Under favourable circumstances we may in this way obtain ten to twelve swarms, as the first hive supplies the queens and the others the bees. If, therefore, we have one or two Italian stocks, and feed them well early in the spring, say from the 20th of March, especially if they are well supplied with pollen, we may be sure that these hives will swarm first. By transposing them in this way with German stocks we shall obtain swarms with Italian queens and German bees.

The advantages offered by my system are very great. In the first place we secure early swarms with young queens, and these queens are generally larger and better than those which bees hatch by compulsion. How quickly also can we Italianise a hive; for it is only changing places with two hives and the work is done. We can also put the swarms in any place we choose, which is less trouble than with artificial swarms, which we cannot always establish where we would wish to have them. We know also the day and the hour in which to expect a swarm, for the second appears in nine days after the first removal, the third three days after this, the fourth on the next day, and so on. If we still hear queens piping after the last removal, the stock will swarm to-morrow, and if we convey it into a dark cool cellar in the evening, we can cause it to swarm at any hour we please by bringing it out into the light and sunshine, and feeding it moderately.

It follows, as a matter of course, that the foregoing method can only be practised with single hives, which can be moved from place to place although they may have fixed combs. Those who have bee houses can, however, adopt it, because they can transfer their hives from one place to another.

I have still to add one remark:—The process for securing pure fertilisation can only be relied on early in the season, and not towards the end, for it often happens that certain stocks which have hatched young queens will as soon as they are fertilised begin to expel their drones, as I have observed to be the case this year. In such instances the drones do not cease flying so punctually as usual, but often continue on the wing from early in the morning until quite late in the day. We must not, therefore, be too late in breeding Italian queens, and liberal and judicious feeding is and will be the surest means of expediting it.

In the hope that you will be enabled to make experiments, the results of which may not be marred by any unforeseen accident, and desiring that you may be satisfied by experience of the value of my method.—I am, &c., KOEHLER.

HONEY HARVEST IN THE NORTH.

Our Northumberland general flower-honey harvest is at an end, and a poor one it has been. The few swarms we have will mostly be required to make up our store stocks, and few bees have put anything in their supers; but now all are out on the moors; the hives are about one-fourth of the usual number, and only about five to the score are young hives. There is a fine bloom on the heather, and the weather being fine, our prospects are good for the heather-honey harvest. On the return of our hives the bees will not be much troubled with their enemy the wasp, as I cannot hear of a single wasp's nest in the neighbourhood, although queen wasps were numerous in the spring.—G. WILSON, *Whalton*.

ECCENTRIC SWARMING.

A BUTT of bees in this neighbourhood swarmed last June in the following manner:—On the first day a swarm issued from the hive in the usual way, and alighted in an orchard about 20 yards off, but returned to the parent stock before it could be shaken.

On the second day another swarm issued and went to the same place as before. When the woman who was watching it returned to procure a hive in which to shake it, she was shown another swarm which had issued subsequently from the same hive and had settled outside the garden hedge. Both were

* About eighteen-pence English.

afterwards shaken. No. 1 was a good swarm, but in the evening the hive was found deserted. No. 2 was very small; it remained, however, in the hive, and has done tolerably well since.

On the third day another swarm issued, went again to the orchard, was shaken as usual, and has since done well.

The two swarms on the second day must have been from the same stock, as there was but this one stock in the garden, and a swarm was seen to come out from that stock by a person standing near.—S.

[The following is the probable explanation of the eccentricities described by our correspondent:—

The first swarm either issued without a queen, or that indispensable functionary fell on the ground and was lost. The second issue owed its dual character to the bulk of the bees clustering, as if from habit, on the spot where they had settled before, whilst the minority with the queen sought a new resting place. The third issue would under these circumstances be in reality an unusually strong second swarm. It is almost unnecessary to add, that a queenless swarm returns to its parent hive.]

BEEES IN AMERICA.

It would seem that swarms have been quite as scarce during the past season in America as in this country, for the Rev. L. L. Langstroth, in a letter which I have recently received says:—"This season in the Ohio valley has been a poor one for swarms. Some apiaries of nearly a hundred colonies have not had a single swarm." Mr. Langstroth also states that he has used indiarubber bands for fastening combs into frames for nearly two years.—A DEVONSHIRE BEE-KEEPER.

MANAGEMENT OF FERRETS.—No. 2.

THE female Ferret (or gill as I believe she is called), should be put into the breeding-hutch before she brings forth her young, in order that she may become settled.

The time of gestation is six weeks, and during that period she should be supplied with milk morning and evening. If milk cannot be had, water may be substituted. Some people think that Ferrets do not require drink, but I find they will drink very freely. Mine much enjoy a little new milk given warm from the cow.

The number of young produced at a birth varies from one to eight. I think nine has been the largest number mine have had, but I have been informed that the mother will sometimes have twelve and rear them all. They are very small at first, and quite blind, but rapidly increase in size. When they are about nine days old they begin to crawl from the nest into the hutch. At three weeks they begin to eat, and it is very amusing to watch them running about eating their food and lapping milk with their eyes closed.

At the end of the fourth week, or the twenty-eighth day, the eyes begin to open, and by the thirty-fifth day are fully open. The young Ferrets should now have nice sweet bread and milk twice a day, or if much meat is given, milk alone. The vessels used for food should be of earthenware and kept clean, and the milk should not be left to become sour.

As regards food, small pieces of meat, dead chickens, Pigeons, Rabbits, or an old hen now and then, will be very good diet. Where there is not a poultry-yard, more bread and milk may be given. I never give stale food of any description. They should be accustomed to the voice of the person who feeds them, and will then always come when called. The mother is always looking out for nice little pieces to store up for her young. From their birth she carries food into their nest-box, and places it in one corner of the compartment. This should be frequently removed until the young ones can eat. The little creatures squeak and grow, the noise resembling that of mice. The mother will provide for them for many weeks, and as soon as food is put into the hutch will continue to carry it away.

The young Ferrets are easily tamed, they may be called, taken out, and allowed to run on the grass. They soon detect the difference between the hand of the feeder and their food. It is best to handle them early and they will become very gentle.—LOUISA B.

OUR LETTER BOX.

HASLINGDEN POULTRY SHOW.—I advertised a pen of my Light Brahma chickens as being highly commended at Haslingden, from the fact that I

received a card to that effect with one pen of my birds when returned, and a second prize with the other. In your report of the Show and prize list, I saw that the second pen of Mr. Pares was highly commended. Having ascertained from the Secretary that the honour belongs to Mr. Pares and not to me, I trust you will give this a space in your Journal, as I do not for a moment wish to mislead any one. My pen was advertised as highly commended on the faith of the card I received, evidently by mistake.—D. CAUSER, Erdington, Birmingham.

AN ADVERTISER'S GRIEVANCE.—"I wish all advertisers would agree to let it be understood that, except in known cases, no answer would be returned to letters of inquiry unless accompanied by a stamped directed envelope. I find that no sooner does one advertise any stock than a host of letters pour in, asking all sorts of questions, many of which are often already answered in the advertisement; and you are put to the inconvenience as well as expense of answering these, or else are likely to appear wanting in courtesy. I am sure I am within the mark when I say that two-thirds of these inquirers never mean to be purchasers. They all seem to want you to let them have a bird that has perhaps cost you three guineas, for half-a-crown or thereabouts. Pray give these people a hint through your columns that it would be well to enclose a stamp, and that no letters are likely to be noticed that do not contain one.—T. C. HOSE."

BLACK POLAND COCKEREL WITH CROOKED TAIL (*St. Edmunds*).—Crooked spines are common to all Polands, both cocks and hens. A crooked tail sometimes exists with a perfectly straight spine. From whatever cause the defect may arise, we strongly advise you not to breed from him.

POINTS OF GOLDEN-PENCILLED HAMBURGS (*An Old Subscriber*).—In hens and cocks it is essential to have perfect combs—well shaped, firm on the head, and the pike turning up behind. The cock's tail should be well bronzed, but the bronzing should not predominate. The hen's hackle must be as clear as possible, and the tail well marked in every feather. The pencilings should be distinct on every feather, in order that patches of colour, or, as they are called, "mosses," should not appear. They should have blue legs.

GOLDEN PHEASANTS AFFECTED WITH ROUP (*Thaumalea*).—Stimulants will best answer your purpose, and you may feed on bread and ale. Golden Pheasants are subject to roup, but they get over it. Put wormwood in their water, and camphor. Peas and small Heligoland Beans are excellent for the plumage. Canary, hemp, and Indian corn are all bad, as they make soft feathers.

SEPARATING CHICKENS OF DIFFERENT BREEDS (*H. C.*)—It is difficult to lay down one rule applicable to all. Cochins-Chinas and Brahmas will require to be separated earlier than Dorkings and Spanish, and autumn chickens may run together longer than those hatched in the spring. Where there are conveniences for it, the easiest plan is to make two runs, putting the pullets in one, the cocks in the other, till the time that the walks are made up. As a rule, Cochins and Brahmas should be separated at four months old, and other breeds at five, if they are March, April, or May birds; if they are autumn birds they may remain longer together.

JACOBI'S EYES (*A. A.*).—Jacobins should have pearl eyes. Both cocks and hens should be alike, and it is not well to breed from old birds. Buy them wherever you can obtain them good.

CANARIES PLUCKING EACH OTHER (*S. D. K.*).—"I said in my notes on Norwich Canaries that it did not take long to reduce a well-feathered young bird to a state of nudity if the old ones were disposed to pluck it. You will be able to endorse this. The young birds in question have been plucked by their parents. Take them away, and hang them in a nursery cage in front, and allow the old ones to feed them through the wires, or their nice little juicy tails will go next. Give plenty of green food.—W. A. BLAKSTON."

CANARIES DYING (*Whitey Brown*).—"I have never met with the symptoms mentioned. Have you not mistaken that swelling which we all like to see, a full crop, for some unfavourable sign?"—W. A. BLAKSTON." With regard to the Red-collared Bengalis, we are promised some information next week.

SAFFRON FINCH.—"What is a Saffron Finch? I can find no description in Bechstein or in any other ornithological work. I have one which I have been trying with a Canary hen, or rather half a dozen, for he does not stand upon trifles as to the number of his mistresses, but there is no issue in any case. Can mules be bred from one? If so, with what?—GINGER."

DESTROYING BEES (*L. M.*).—Much depends upon the locality, but we should think that in most districts no further increase of stores can be looked for. We are not acquainted with the best mode of killing bees, but this we do know, that it is very easy to drive and unite them to other stocks in the way described in page 60 of the seventh edition of "Bee-keeping for the Many," just published at this office, price 4d., and that they will well repay any little extra trouble which may be caused by the operation.

FALLEN COMB (*J. G. A.*).—We do not deem the accident of much importance, but it would be well to replace the comb as soon as you can manage it.

POULTRY MARKET.—AUGUST 19.

IN our quotations this week we shall have to mention Grouse, an annual remembrance that another season has arrived. According to present appearances they are unusually scarce. The early parcels made 9s. each. We are unable to average the prices till our next number.

From observations taken near London during the last forty-one years, the average day temperature of the week is 72.1°; and its night temperature 48.1°. The greatest heat was 87°, on the 27th, 1861; and the lowest cold 32°, on the 29th, 1850. The greatest fall of rain was 1.50 inch.

BEDDING PELARGONIUMS.

EW varieties of bedding Pelargoniums, as well as of other flowers, are being continually introduced, and it is well to pause occasionally, and calmly endeavour to ascertain what progress is being made, and what plants of recent introduction are really superior to older and well-tried varieties—in a word, to see if novelties have anything beyond the fact of their being such to recommend them.

How frequently do we find that the plant whose qualities have been set forth in such glowing colours proves on trial to be very poor indeed. Now, when this happens it is certainly to be deplored, for the effect on the mind of the disappointed cultivator must be one of disgust, and these disappointments must act as a check to horticulture. Still, despite such drawbacks as this, great advances have undoubtedly been made in all classes of bedding Pelargoniums; for, from amongst hosts of second-rate Pelargoniums, there will now and then crop up such "joys" as Stella, Cybister, Mrs. Pollock, Rebecca, and Flower of Spring, varieties that will hold their own against all comers for many a day.

The season through which we are now passing has been most trying for all classes of bedding plants, the dry heat causing some plants, after a faint attempt at display, to gradually pine away, and this even when regularly assisted by water; but although this has been the case in some instances, it has not been so with the Pelargonium; on the contrary, the intense heat and long-continued drought have only tended to establish all the more firmly its superiority as a bedding plant over all others.

Nearly all kinds of Pelargoniums have done well this year, and although the summer has undoubtedly been in favour of the stronger-growing kinds, yet many varieties of less growth have been most beautiful, and have almost "bloomed themselves to death." *Minima Nosegay* was never so good, the beds of it have been one blaze of bloom, so beautiful and so even; yet at what a cost has this display been obtained! Now that the mass of blossom is passing away, and the plants themselves are once more becoming visible, it is perceived that they have made hardly any growth, but I have no doubt the refreshing showers now falling will encourage them to make fair growth yet. The blossom of *Christine* was tolerably good in the earlier part of the season, but it has suffered much of late; the trusses have come small, and the colour has been very pale. In pleasing contrast to this sad behaviour of our excellent old favourite, *Rose Rendatler* has been very beautiful, its large and abundant trusses rendering it a very conspicuous object.

Amongst *SCARLET NOSEGAYS* *Cybister* has shown forth pre-eminent, a bed containing about two hundred plants of it has been such a gorgeous mass of rich colour as to be quite dazzling, and so far as I can see, the only merit which *Lady Constance Grosvenor* possesses over *Cybister* is in having a somewhat better habit of growth. Its flower trusses are certainly not larger—in fact, I should say they

are hardly so large. Of other varieties in this class, *Christine Nosegay* comes quite up to the description under which it made its appearance last year; it is of very compact growth, and produces its bright cheerful blossoms most abundantly. *Waltham Seedling*, though darker than *Black Dwarf*, is not so compact a plant; both are excellent varieties. Then, again, *Magenta Queen* is of a brighter shade of colour, and its individual blossoms are more elegantly shaped, but it has not so large a truss, nor does it form so good a mass of colour as *Amy Hogg*.

Of *SCARLET ZONALS*, *Lord Derby* is very beautiful in pots, nothing can be finer than its exquisitely-shaped petals of rich glowing scarlet, but I have not seen enough of it planted-out to be able to form an opinion. The *Chipper* is good, both in pots and in the open beds. *Dr. Lindley* is also a splendid pot kind. *Provost*, described as a salmon rose scarlet, is a magnificent bedder, and has been most beautiful. *Rebecca*, too, is a most beautiful and distinct sort, but unfortunately the intense heat has caused the delicate shading of its petals almost entirely to disappear. *Adonis* is rightly named, both as regards its foliage and flowers, and its dwarf and very compact growth renders it useful for many purposes. *Glow* is also a very good sort, having well-shaped scarlet blossoms produced in the greatest profusion.

Gloire de Nancy is a good double kind, and this dry season has well suited its strong growth and peculiar blossoms, but it is to be feared that it would not be so good in a damp moist summer, as its crowded trusses would be very apt to rot off if subjected to a continuance of wet.

Amongst *VARIEGATED* sorts, *Flower of Spring* is one of the best; its habit of growth is very compact. Its handsome trusses are of a soft and pleasing shade of scarlet, and the broad creamy margin of its foliage has a most beautiful effect, especially when viewed from a distance of a few yards. An entire bed of it offers a warmth of colour to the eye that is unsurpassed by any other variety in its class. *Italia Unita* is good, and the foliage has retained its colour well, but it is rather a slow grower.

GOLDEN TRICOLOURS.—Perhaps no Pelargoniums have suffered so much from the effects of the combined heat and drought as the *Golden Tricolor* varieties; the leaf tints of *Mrs. Pollock* have not been so bright as usual. This variety is not so effective in a mass as some of the *Gold-leaved* kinds. I have frequently heard it remarked that *Golden Chain* is very much brighter and more effective when thus planted. *Lady Cullum* has borne the heat tolerably well, better, in fact, than most other sorts; but *L'Empereur*, fine as it is when grown in pots, has lost much of its rich markings in the open border.

Of the *GOLD AND BRONZE* section, some kinds have suffered very much from the effects of the burning sun. Of those which I have found to be really good for bedding, *Vandyke*, with its shaded white and salmon or pinkish blossoms, is a useful kind. It bears the heat well, and is a compact plant. *Bronze Shield* is a fine robust variety, with a good bold truss of scarlet flowers. I have not grown more than eight or nine varieties of this section, and out of these have only found four worth keeping for bedding par-

poses. I hope soon to see some notes from others who may have cultivated this class more extensively, as I believe it contains many excellent sorts well worthy of cultivation. Before leaving this part of my subject I may add that Luna is a charming variety; very bright, and of an excellent dwarf spreading habit.

L'Elegante, a white-variegated IVY-LEAVED kind, is very useful; it also forms a handsome object in a pot when well trained.

Of GOLD-LEAVED kinds, *Crystal Palace Gem*, with its fine, bold, handsome foliage, and sturdy compact growth, will, I hope, quite take the place of *Cloth of Gold*, which, though very good in the shade, cannot be depended on when fully exposed to the sun.

Having thus particularised a few of the most notable varieties, I will now proceed to add a choice list of sorts which I have found to possess many superior qualities over other varieties in each of their respective classes.

SELECT BEDDING PELARGONIUMS.

SCARLET.—Lord Derby, The Clipper, Etna, Dr. Lindley, Faust, Herald of Spring, Provost, Empress of the French, Rebecca, Roi d'Italie, Indian Yellow, and Rubens.

DWARF SCARLET.—Adonis, Glow, Little David, President, and Revell.

PINK.—Christine, Rose Rendatler, Helen Lindsay, still unsurpassed for the decoration of vases or for bouquets, Maid of Kent, Mrs. W. Paul, and Wiltshire Lass.

SALMON AND WHITE.—Amelina Grisan, and Madame Rudersdorff.

NOSEGAYS.—Stella, Cybister, Lady Constance Grosvenor, St. George, Salamander, Le Grand, Minimum, Duchess of Sutherland, Lord Palmerston, Amy Uog, Magenta Queen, Black Dwarf, Waltham Seedling, Christine Nougay, and Orange Nougay.

GOLDEN TRICOLOURS.—Mrs. Pollock, L'Empereur, Lady Cullum, and Howarth Ashton.

SILVER TRICOLOURS.—Italia Unita. Several varieties of this class under trial, I hope to notice on some future occasion.

GOLDEN VARIEGATED.—Golden Chain, and Crystal Palace Gem.

SILVER VARIEGATED.—Flower of Spring, Bijou, Jane, Perfection, Alma, Lady Plymouth, Manglesii, and Stella albo-marginata.

GOLD AND BRONZE.—Beanty of Oulton, Luna, Vandyke, and Bronze Shield.

IVY-LEAVED.—*L'Elegante*, *Peltatum elegans*, and Old White, good, but rather a shy bloomer.

The foregoing list may, perhaps, be considered by some to be too extensive, and yet how small it is in comparison to the number of kinds one is obliged to grow in order to arrive at a proper understanding as to what is good, bad, or indifferent. I venture to hope these notes will induce others to take up this subject, for I believe I am right in saying, that no class of plants is more popular at the present time, and none more justly so, for what would flower gardens have been without the *Pelargonium* in the dry hot summer of 1868.—EDWARD LUCKENST, *Egerton House Gardens, Kent*.

THE GOOSEBERRY.

The observations made by Mr. Robson, in page 71, on this popular fruit are interesting and well deserving of consideration.

The present season has truly been a dry and scorching one, and is, therefore, excellent for testing the capabilities of certain plants and fruits as to their powers of endurance of heat and dryness. "What, then, has been its effects on the Gooseberry?" Mr. Robson asks. "Has the fruit been deficient in flavour?" Mr. Robson believes it has. I am inclined to think not. No. I have fancied that Gooseberries have been even higher-flavoured than usual, and the reason I had assigned for this was the brighter and more pure and bracing air that we have been favoured with this season, with an absence of that heavy mugginess of the atmosphere which, I think, is more prejudicial to the Gooseberry than anything else; and, lastly, the greater dryness of the soil, which prevented the fruit from becoming gorged with too much water, as they generally are in this district, which is near London. Yes, I am of opinion that the Gooseberries of this season in the south were equal to the average as regards flavour. The crop was abundant, the fruit smaller than usual, and they ripened early—much earlier than in ordinary years. They were, in truth, soon ripe and soon rotten. During the time that the Gooseberries were ripening, up to the second week of July, the day temperature, although high, was not very exceptionally so, and the nights were often cool, just such weather as we like for the ripening process. The fierce sun heat was at times too strong

for the fruit; some were almost parboiled on the plants, and the whole soon became "ceddled" and sour; yet with all this hastening to maturity and decay, I am sure I tasted sweeter Gooseberries this season than usual.

It is a well-known fact—well known, at least, to all "northerners" who have come south—that the Gooseberries of Scotland are far far superior in flavour to the same varieties when grown in the south of England. The difference has even been noticed as far as Yorkshire; midway in distance, midway in flavour. Probably the finest districts for this fruit are those of Perth and Aberdeenshire. Aberdeen is also famed for its Strawberries; immense tracts of land are devoted to the cultivation of this fruit for the supply of the London and Dundee confectioners, some hundreds of tons being sent to London every season. Gooseberries are, however, the popular fruit of the district. They are known there and spoken of as "the berries," just as if there were no other berried fruits in cultivation, the Strawberry being quite in the background. In London just the reverse of this is the case; the Strawberry is the favourite, while the Gooseberry is voted a coarse fruit, and is mainly used for tarts, &c.

Now, let us consider what is the reason of this superiority in flavour. Is it owing to the climate, soil, or cultivation? To the climate chiefly. The air of Scotland is of a much more bracing character. The sun may be powerful and hot during the day, yet the nights are generally cool, although in summer very short, and there is an absence of that close moist mugginess of the atmosphere which is so oppressive here, but which is so beneficial to vegetation in general, although not to the Gooseberry. Then soil and cultivation have some influence as well. The richest Gooseberries that I have ever tasted have been grown on very poor sandy soil not more than 6 inches in depth; the subsoil, if it can be called so, the rotten granite stone. From 6 to 12 inches is the average depth of the cultivable soil in many parts of Aberdeenshire, below that it is either clay or stone. Now, in soil like this it is easy to understand that there very seldom is any superabundance of moisture; in fact, it is there nearly always what it has been here in the present summer—that is, the ground is dry and parched. The Gooseberry there makes very little young wood. It is pruned on the close-spur system, all the young shoots being cut closely in to the old stems, on which are situated the buds which are to bear the next season's crop, very little fruit ever being produced on the young shoots. Now, if we here prune the Gooseberry after the same fashion we obtain no fruit, nothing but a forest of leaves and shoots. The Gooseberry with us bears best on the young shoots, so that all we dare do is to thin-out these shoots in order to secure a full crop. I believe that we err by growing the Gooseberry in too rich soil; we strive too much for size of berry, forgetting that that is generally obtained at the expense of flavour. Plant the Gooseberries in poorer soil, in any exposed situation; keep the shoots thin, and allow the wind to whistle through them, and I think it will be found that the fruit will be improved in flavour, although the sun may be a trifle too hot for them at times.—ARCHAMBAUD.

HYACINTHS.

The announcement that the Dutch growers have offered special prizes to be competed for at the Spring Exhibition of the Royal Horticultural Society will, doubtless, give a stimulus to Hyacinth-growing; and it is to be hoped such an equitable arrangement of the prizes shall be made as will make it acceptable to all classes of amateurs and growers for sale. It may be as well, then, to say a few words as to varieties, which may be a guide to some who may wish to compete. An erroneous notion prevails with some that it is absolutely necessary to have the high-priced varieties. A reference to the prize lists at any of our exhibitions will show how unfounded such a notion as this is. Of course exhibitors like Mr. Cutbush and Mr. William Paul can and do exhibit these high-priced varieties, but by the amateur they are unneeded. This mistake is somewhat fostered by the injudicious plan of offering prizes for new Hyacinths. Nothing can possibly be more fallacious; for if the variety is worth anything the price immediately is raised by the Dutch raisers, and for years no more is heard of it—and, indeed, in nine cases out of ten it would be of very little consequence if they were never heard of.

I have for a good many years had the opportunity of carefully going through the collections of some of the largest growers when in bloom, and have also grown for the same length of

time a collection of the best varieties, and give the result of my own experience. I have divided the selection into two classes—the higher-priced, varying from 2s. 6d. up to 7s. 6d. each, and the lower-priced ones, which can be procured at 10s. or 12s. a-dozen.

FIRST SERIES.

DOUBLE RED.

1. Noble par Mérite 2. Prince of Orange

DOUBLE BLUE.

3. Van Speyk

SINGLE RED.

4. Cavaignac 8. Macaulay
5. Florence Nightingale— 9. Madame Van Tuyll
This is not the same as 10. Mrs. Beecher Stowe
a poor variety of the 11. Princess Charlotte
name which appears in 12. Princess Clothilde
some lists. 13. Solfaterre
6. Howard 14. Von Schiller
7. La Prophète

SINGLE LILAC.

15. Haydn

SINGLE WHITE.

16. Alba Maxima 18. Paix de l'Europe
17. Mrs. James Cutbush 19. Snowball

SINGLE BLUE.

20. Argus 22. Marie
21. Bleu Aimable 23. Pieneman

SINGLE BLACK.

24. Due de Malakoff 25. Ida

SECOND SERIES.

DOUBLE RED.

1. Duke of Wellington

DOUBLE BLUE.

2. Garrick 3. Laurens Koster

SINGLE RED.

4. Amy 9. Ornement de la Nature
5. Cosmos 10. Princess Beatrice
6. Duchess of Richmond 11. Sultan's Favourite
7. Lady Sale 12. Victoria Alexandrina
8. Madame Hodgson 13. Von Schiller

SINGLE WHITE.

14. Elfrida 18. Grand Vedette
15. Gigantea 19. Princess Helena
16. Mont Blanc 20. Queen of the Netherlands
17. Grandeur à Merveille 21. Tabitha

SINGLE BLUE.

22. Baronne Von Tuyll 26. Leonidas
23. Charles Dickens 27. Lord Raglan
24. Couronne de Celle 28. Raphael
25. Grand Lilas

SINGLE BLACK.

29. Mimosa 30. Prince Albert

SINGLE YELLOW.

31. Anna Carolina 32. Heroine

It will be seen that there are very few double varieties named, and for this reason, that the single are greatly to be preferred both for decorative purposes and for exhibition.—D., Deal.

THE MANETTI STOCK FOR ROSES.

HAVING adopted this excellent stock for the last three or four years, I am induced to give a short account of my experience of it during this exceptionally dry summer, and I hope it may serve as a hint to young amateurs like myself.

At the end of April I wrote to a nurseryman in Sussex, to ask him if he could supply me with two hundred Manetti stocks for budding this summer. His reply was, that he could do so with young plants struck last autumn, but would advise me to wait two or three weeks till they were better rooted. The plants arrived packed in damp moss on June 7th, and were immediately planted out, and watered once daily for ten days. The intense sun had then completely shrivelled and dried up nearly every leaf. I then left them to their fate, but to my great satisfaction, a short time afterwards they recovered, and began to grow so rapidly, that on August 7th I commenced budding them. In a few more days the budding of the whole of them will be finished, and there are not ten out of the whole number which have not proved to be admirable stocks. Such

I consider is another striking instance of the superiority of the Manetti stock.

Mr. A. H. Kent has been to see them, and expressed very strongly his confidence in the result. He will probably adduce some further evidence regarding this stock in due time. I might also mention that my first experience of the Manetti stock was in Mr. Kent's garden, at Bletchingley. He induced me to try it, and I have now discarded the Briar, except for a few Tea and Noisette Roses. That the Briar was doomed was not unknown to myself and other readers some time ago, and Mr. Kent and the Rev. W. F. Badelyffe were those who took the lead, and they deserve the thanks of amateur Rose growers.—A. B.

THE EARLY PEACHES OF 1868.

The crop of these in our orchard houses is quite at an end, and the midseason and late varieties alone remain. As the open wall furnishes an abundance during parts of August and September, it is only a waste of space to have such in our houses. The early crop has been immense, and very remunerative.

Of course in such a season where water was tolerably well at command, a general advance in the periods of ripening was to be expected. In some cases, for no visible reason, this has not been the case. Why some late Peaches bloom before some very early ones is a question to be asked. How is it that, in a climate like this, one of whose characteristics it is that the range of the night temperature is so little comparatively below that of the day, mildew should appear repeatedly during tropical nights on even third growths? Only when these last rains had lowered the whole scale, and introduced humidity into the atmosphere did these attacks of mildew cease on Peach trees in the open air. On the other hand—owing here, I think, to the current of air—mildew has somewhat increased on glandless varieties in-doors. I greatly doubt if we really know much as to the causes of this disease, perhaps only so far, at least, that any unequal balance between the moisture at the roots and that about the leaves seems always to promote mildew. An abrupt diminution of heat may in either case add materially to the danger. The application of powdered sulphur as an efficacious remedy for this vegetable parasite requires faith on the part of the grower. It is quite as easy, and somewhat more favourable to appearances, to wipe off the fungus as soon as it appears on such parts as we cannot remove. Of course the mildew generally shows on the tender shoots and leaves, which can be readily pruned away. A thin wash of some kind of size, or even of oil with a very little white lead, to thicken it only, will give a thin coating which evaporation will shortly remove, leaving no clog or trace. Wiping the stems of in-door trees after syringing them I always found very useful. Mildew is a very disagreeable check to trees. Only vigorous growers recover if no notice be taken of this pest.

As to aphides we never saw less, and of red spider remarkably little. In fact, the trees are pictures of fertility and health.

Our earliest Peach ripened on the 5th of July. As Early Beatrice has done as much for several seasons at Sawbridge-worth. I expect it to become ripe here soon after midsummer. It did not fruit here this season from accident.

A seedling Nectarine ripened on the 8th of July, being the earliest on record here. It was extremely high-colored, like Liver's Orange, but mottled.

Some of my old favourites—Canary Peach, for instance—have not reached a high standard for two seasons. Perhaps the safest to cultivate of these earlier yellow-fleshed fruits is Early Crawford. It is not very early, but generally colours well, and has the Apricot aroma, which is the most striking good quality of yellow Peaches, without the too often bitter reminiscence which such kinds leave on the palate.

I am a great admirer of distinctness of colour in Peaches and Nectarines: such kinds, too, are generally well flavoured. Sorts of which the ground colour is a clear green, melting under the sun into a bright yellow, mottled and speckled with brown, are always pungent and aromatic, and, when well matured, first-rate. The Stanwick Nectarine and its numerous descendants are examples. Other Noblesse kinds which have a regular pale pink skin delicately starred with rose spots, are juicy and rich. The Royal George colours almost to a black brown in favourable localities, and, though coarse, is yet a great favourite with many. The Peaches whose flesh is of a dark purple are also juicy and piquant in general. A bright uniform yellow also indicates a racy fruit. Pavie de Tonneux is a

magnificent specimen of colour, and very good of its kind. The same holds good as regards Nectarines, as is well known.

But here let me protest against too many sorts whose merit consists entirely in their extreme juiciness. This juiciness, though a necessary good quality, is not by any means the chief excellence in Peaches or Nectarines. Indeed, to find little but the stone remaining between our fingers, with, perhaps, a spoonful of juice in the mouth, while the rest has slipped to the ground, is an unsatisfactory ending to a year's expectations. Why should this melting flesh be so valuable in these Peaches? Some of our most highly prized table fruits—the Pine Apple, for instance, are firm in texture and highly aromatic in flavour. What Nectarine surpasses the Red Roman, which is a firm-fleshed clingstone, not always, however, easy to ripen well? In certain soils clingstones are preferred by the best judges. The Stanwick is a Nectarine of well-known excellence. The flesh of this sort has a certain delicious fibrousness, which holds the rich juice well, and allows its flavour to be realised slowly. This is a model Nectarine, and well deserves the use made of it by that most judicious raiser of new sorts, Mr. Rivers.

Among early Peaches the Early York is still a standard. One like this, not more melting, as well coloured, but of full size, and even earlier, we may yet obtain by crossing. Early Rivers is much praised. My own tree here was accidentally prevented from ripening its fruit this year.

It is to a race of these very early fruits that we must look for the best future orchard-house culture. They are for many reasons by far the most remunerative when no fire heat is used. Whenever, however, pipes are employed to hasten the ripening, slow-growing and large varieties generally afford us better results. The absence of the sun's rays at an early season requires that the growth should not be unduly promoted, or flavour must suffer. There are well-known sorts which force well, and which in consequence are generally depended on for early exhibitions.—T. C. BRIDGEMAN, *Richmond House, Guernsey.*

CONVOLVULUS MAURITANICUS.

I HAVE great pleasure in seconding the recommendation of this plant which the Rev. H. Harpur Crewe has given in page 97. With me *Convolvulus mauritanicus* has done well all through the dry weather, and promises to continue in good condition for some time. It is quite hardy, having withstood the winter of 1866-67, as well as that of 1867-68, and by its habit I should think it an excellent basket or vase plant, but it appears to be also good for covering a bed, being compact, of a uniform height of about 8 inches, and the flowers all appearing at the top, and when expanded being of a pretty pale blue colour. Even when closed they have a less crumpled appearance than those of the annual *Convolvulus*. As a plant for decorative purposes it certainly deserves more attention than it has yet received.—J. LONSON.

ROOT-PRUNING VINES.

IN answer to your correspondent "C. B. R." who asks for my opinion, I may say I do very little root-pruning.

If a fruit tree grows so vigorously that it makes no fruit-bearing wood, as is often the case with a Pear tree on the Pear stock, it may be advisable to cut its roots. If a tree is planted over a bad subsoil, and is likely to suffer when its roots have descended into such soil, it is quite necessary either to prevent their descending or to cut them off.

If a tree is required to bear fruit in a small space, or earlier than it would naturally bear, it may be advisable to cut its roots. In nature, to grow first and bear afterwards is the rule. If we wish to check growth and hasten fruit-bearing we must bring a tree into the state it would naturally attain when the powers of growth are weakened by age. Such a result may be attained by root-pruning.

Like many other fashionable customs, root-pruning seems now to be carried to a ridiculous extent. Trees which do not grow too fast—which are, in fact, not vigorous enough to bear well-developed fruit, are root-pruned without mercy, as if roots were unnecessary appendages. Vines growing above good dry subsoils are prevented, at great expense, from making roots where they would naturally form them. Trees which have borne a good crop of fruit are removed or root-pruned for fear they should not bear again. To grow strongly and yet be fruitful is perfection. Why not let well alone? If a Vine makes a great deal of wood, let it carry a heavier crop of fruit

next season, at the same time encouraging plenty of foliage, and taking care that the young growth is well ripened. A well-ripened Peach tree will bear fruit, at any rate blossoms. Keep its shoots thin enough, stop those inclined to be too vigorous, and keep the soil in which it grows firm and solid, and it will require all its roots to provide for the crop it will carry.

The border in which my best Peach trees are growing has neither been dug nor forked for ten or twelve years, and is as hard as a garden path. To prepare a rich border for Vines, and then cut their roots to prevent them occupying it, would be very stupid practice. Is it not equally stupid to manure highly a piece of land, plant it with Raspberries, Strawberries, &c., and then every year destroy as many roots as possible by digging amongst them?—J. R. PEARSON, *Chilwell.*

POTATO CULTURE.

WOULD "UPWARDS AND ONWARDS" give us his experience on the following points?—

Will Potatoes that have speared in the ground be fit for seed, and will they keep? What would be the best way to treat them?

What is the best method of preparing seed in ordinary cases when spearing has not taken place?

As we have been so far wrong about the lifting, perhaps we may be also wrong in exposing to the sun Potatoes intended for seed, or in greening them in the shade.

What is the influence of the size of the sets?

Which is the best system of planting as to depth, distance, earthing or not earthing, taking different kinds of ground into consideration?

What is the best time of planting? How should manure be applied? These points have already been discussed in the Journal, but I should like to have the opinion of such an experienced grower as "UPWARDS AND ONWARDS."—H. C., *Ripley.*

[With regard to the first question, I know a man who a few years ago made a large sum of money by keeping for seed Potatoes which had supertuberated. He left them in the ground to take their chance, they ripened, were separated at the lifting, and all that required it were "spurred." They answered well for seed in the following season. This year his Potatoes are supertuberating, and he intended to adopt the same practice. Not so the Potatoes; they are throwing up green tops by way of a change, and the grower will lose £30 in consequence, unless he immediately disbud and unspear them, and then they would keep perfectly, and answer for seed next year by being spread out very thinly in a dry, rather dark place, having a temperature of about 40° during the winter, and never allowed there to sprout and exhaust themselves. In the end of March they would have to be deprived of their buds, or eyes, by scooping these out to their very foundations with a penknife, with the exception of one, or two at the most on the strongest tubers. Never cut these tubers into sets. The immature tubers that I dug up on the 11th of July, 1867, to exhibit as young Potatoes in my collection at the Royal Horticultural Society's Show at Bury St. Edmunds, had their skins so tender when taken from the ground that they would scarcely bear handling without disfigurement. I brought them back with me, and gave them the treatment just described, and noted particularly when I planted them amongst the sets dug at a more matured stage, and they are bearing quite as good crops as these, if not, in fact, a little better.

Experimentally I am led to conclude that Potatoes reared from whole sets produce a greater bulk of crop, and are more able to contend against all evils than those raised from cut sets. I always procure my seed Potatoes from light land of a different nature from my own soil, which may be termed an artificially-made, dark-coloured loam, and I take care that they are selected from healthy crops. I choose middling-sized sets at taking-up time, and since I have been thus particular I find my permanent sorts considerably improved in constitution. A medium-sized Potato when taken from the soil may be termed scarcely ripe, which is a great recommendation to it as a set for planting. Again, my seed may be spoken of as undergoing a perpetual preparation, although causing comparatively little trouble, for as soon as it is taken out of the ground it is laid in the sun for a day or two at most, and turned. Never allow seed Potatoes to lie exposed to the sun longer, otherwise they will become blackened, blistered, and affected with a sort of dry rot, which will completely destroy them. This I have

frequently proved. I always prefer to green my seed Potatoes slightly, but it is not absolutely necessary, and they are then disposed in single layers upon shallow wooden trays, made of slabs or old doors, with a rim of wood tacked all round, and are placed secure from damp or frost in an underground cellar having a temperature of about 40°. A fair twilight is admitted through a dirty glazed aperture measuring 3 feet by 1 foot. I take especial care that the first shoots which push from the sets are not maimed or bruised, and according to the size of the set I allow one or two eyes to grow. If an excess of these form they are rubbed off in their first stage, and I follow up this disbudding process till, by planting time, the proper number of shoots which were allowed to remain have become robust, sturdy, and strongly attached to the tubers, plainly pointing out the advantage gained over the old enervating method of allowing shoots to be produced merely to be cut off. Nothing is lost to the Potato; whatever nourishment has been taken from it remains stored up in the strong young shoot or shoots, and the seed Potato is ready to be committed to the soil with its energies unimpaired, with incipient leaves ready to expand and compete for the light of day, and which begin to exercise their functions immediately.

It should be remembered that each succeeding series of shoots consequent on disbudding is weaker than its predecessor, and that when disbudding has been done three or four times the leaf buds are destroyed. Who, then, can wonder at the constitution of the Potato having become weakened, and at the great loss of crop likely to ensue through the destruction even of the first shoot? But, as I have stated, it is not the top of the young shoot alone, but with it goes a quantity of food intended to nourish the sprout until roots are emitted to cater for it. Besides, it is tolerably well understood that the crown of the Potato bears the shoots which produce the heaviest produce, and this end generally buds first. The consequence is, that instead of one or two original stems, we have in their place a host of sprouts of inferior powers, and the result will be that in lieu of a superior produce, there will only be a very inferior weakly sample. Under the system of carefully protecting the one or two first shoots, in all probability these will become monopolisers, and the result will be that the weaker eyes will not be able to push, and, consequently, a superior-sized even quality of tubers, not only for the market and home consumption, but also for feeding pigs, which, I imagine, will prefer and thrive better on good, sound, fair-sized Potatoes than on those which are watery and undersized.

Having thus disposed of the second question, under which I have included my answer to the third, I will now endeavour to take collectively the other points on which my opinion is asked.

With regard to planting, the good old plan like the "good old times," I have my doubts about. I never adopt it now. This is how I used to plant Potatoes:—The whole of the ground was entirely dug over about the beginning of May, and a line stretched between its extremities from north to south. The soil was next cast out about 4 inches deep with a spade, which was made to bear against the line longitudinally, then raw manure was placed in this narrow trench, and the cut sets were put, about 9 inches apart, immediately on the top of the dung. The line was then shifted 2 feet, or 2½ feet at most, and the soil removed was cast over and made to cover the first row of sets, and so on. "Cauliffs," or hoeings, and right-angled mouldings-up followed in due time, mangling the roots, and served to cast off the moisture from their remaining fragments. It was a very expeditious plan, and served to destroy the stamina of the Potato about as effectually as any that could have been adopted, especially taken in conjunction with the previous treatment of the seed, which had probably been kept in masses, heated, forced into vegetation, and deprived of the long premature shoots over and over again, till almost all the strength of the tuber was sacrificed, and then the seed Potato was cut to pieces, and placed in a mass of dung as above. Avoid the practice as you would the plague.

My present system of growing Potatoes in this garden, and I have pursued it for about fifteen years (I have cultivated the Potato on the same site twenty-two years), is on what I call the ridge-and-trench plan. It is admirably adapted for rich soils, and more especially for mine, as this ground is very much overshadowed by trees, which have been very badly managed.

In the first place I never use raw manure at the planting of Potatoes. I prefer quicklime, wood ashes, or mortar rubbish spread over the ground, and slightly worked in just before planting, at the end of March or the beginning of April, according to the weather. To insure its economical working, it

is best to divide the Potato ground into three parts, two-thirds to be bastard or half-trenched as soon as convenient—by the middle of March—as the Cabbage tribe is cleared away, and to apply the lime to the surface. The other third, which has been cropped with, say, early Potatoes and Cauliflowers, and Grange's Broccoli in the trenches, may then be thoroughly trenched during dry weather in the autumn. I well manure it in the following manner. We hear much about earth closets and house sewage, as if they were something new, but one of our sewage tanks and our earth closets here have been in use for more than twenty years. The sediment from the tanks is cleared out once a year, and mixed with road scrapings, along with the contents of the earth closets, in a large opening dug in a backyard for the purpose. To all this are added the contents of the mixen, consisting of the refuse from the garden, a decayed-leaf hotbed, and all the sweepings and refuse that are collected from a house and grounds in the country. This mixture is wheeled on to a third part of the Potato ground every autumn, and well worked-in during the trenching. I am never afraid of my ground becoming exhausted. Talk of emigration and England not being large enough for its population, why, not one-fourth of the country is cultivated as it ought to be! I prefer to apply the quicklime to the surface of this portion of the ground for its next spring dressing, at the rate of about seventy bushels per acre, to attack the stubborn, slow-decaying remnants of the refuse, and then to plant with the second-early short-topped store Potatoes.

For all light soils worked upon this principle, I recommend the flat system of planting, with this difference: plant, at the end of February or the beginning of March, quite 6 inches deep, slightly hoe the land to keep down weeds and let in air, never mould-up at all, and allow fully 3 feet 6 inches between the rows for store Potatoes.

For rich garden soils I decidedly recommend the ridge-and-trench plan, and this is how I practise it. The first week in April is time enough to plant, at least I find it so. For first early Potatoes allow 36 inches between the rows, and for store sorts quite 42 inches, and do not be afraid of these distances; premising, of course, that the ground has been trenched, and half-trenched, and that lime, old mortar, or wood ashes have been applied. Measure out the ground, stretch two garden lines where two rows of sets are to be, and then place the seed tubers upon the surface of the soil along the lines, 1 foot set from set for the early kinds, and at least 15 inches apart for the late sorts. Then readjust the lines between the two rows of sets, and an inch or two wider than the spade, so as to mark out a trench between the two rows of Potatoes. Force down the spade to its full depth rather slopingly between the lines in order to leave the sides of the trenches even, and cast out every spadeful of soil alternately to the right and left, not directly over the sets, but as far from them as the edges of the ridge will allow, so that the seed Potatoes may appear as if lying in a hollow. The crumbs that are afterwards shovelled out may take the central position upon the sets without injuring the young shoots. Now, instead of finishing-off these ridges at once (for a superincumbent weight of earth, in consequence of the ground being recently trenched and loosed, might cause a troublesome displacement of their sides), cut part of the "crumbs" only from the trenches upon the sets, and bury them merely 3 inches or so. In another fortnight, when the ridges have become settled, or the young green tops of the sets are seen just peeping up, then is the time to shovel over them the remainder of the crumbs from the trenches, forming a good 6-inch-broad apex, and the ridges may be "left to themselves," though the mind of the worker must at once think about how the trenches are to be covered with the Cabbage tribe, of which none can be better for the purpose than Brussels Sprouts or early spring Broccoli. The ground in which these are grown should be well drenched occasionally, as soon as the crop is off, with sewage from the tanks; and along the centres of the ridges, between the Brussels Sprouts, rows of Early Stone Turnips may be sown, immediately after the Potatoes are off, with a fair chance of securing some good sweet Turnips before hard frost comes.

The Brussels Sprouts, Broccoli, or other plants of the Cabbage tribe may not appear quite so stocky and even as when planted on a piece of ground specially prepared, but they soon become strong and improve in appearance. As the Broccoli grow shovel the ridges of soil to their stems, which answers the same purpose as laying them down with their heads to the north in order to protect them from the severity of the winter.

I have as yet only referred to garden cultivation, but "H. C."

requires me to take "different kinds of ground into consideration." Well, suppose a correspondent "B" said, "I intend to plant sixty acres of Potatoes on the ridge system, as I am certain it will prove the right plan. The question is, How? Your garden method is, of course, out of the question. We find the assistance of manure requisite for a good crop, and the width of the ridges must necessarily be determined by the width between cart wheels, which in most cases is 5 feet, hence 2½ feet must be the width of each ridge. This I contend is not a fair trial, as there is not a sufficient width of earth on the top to secure room for a large quantity of good tubers. Supposing, however, that it is so, or is made so by deep cultivation between the ridges, and moulding-up twice, then how would you plant the sets? On the manure would not be safe. Besides, it would be too deep if ridged-up with the plough (8 to 12 inches). Would dibbling by hand on the top of the ridge after the plough do? Again, Supposing 5 cwt. of guano per acre were sown broadcast and the ridges closed-up at once from the winter 'till,' the guano would all be there, and the ridges might be made of any width. How would the dibble do then? Is a width of 4 feet too much for field cultivation?" I answer, It is according to my judgment radically wrong to apply raw manure in the drills when planting the Potato. It must be bad practice to place a pulpy tuber in a mass of corruption. Even should the sets escape injury, when in a poor soil dung is used after the guano under the idea of making the most of it, the young plants may grow very freely at first, but as the roots lengthen they strike into barren soil, constituting in fact an abundance of machinery with a scarcity of raw material, just when the formation of young tubers and the advancing state of the growth of the plants require an extra supply of nourishment. The start they had at first secured a vigorous foliage, to become unfruitful for lack of sustaining nourishment.

But B finds "manure necessary," whereby, I presume, his land is very light. I would, therefore, advise twenty loads per acre to be spread and ploughed in, and well worked into the body of the soil in October or the beginning of November; and if 3 cwt. or so of superphosphate of lime were sown broadcast just before the land is ridged-up in February, so much the better. If the land is well drained, and would allow of the subsoil plough being used to the depth of 18 inches or 2 feet, so as to make the soil accessible to the warmth and moisture of the atmosphere, I should consider that equivalent to an application of dung if it were coupled with a top-dressing of lime or guano at planting time. Lime is especially favourable to the growth of the Potato, and in some form is generally present in plants. Light lands require it in less proportion than heavy soils, though even light soils are rendered more compact in consequence of the lime attracting moisture powerfully from the air. It cannot be otherwise than beneficial in a clay soil, for it not only destroys the myriads of insects to which moisture is congenial, but speedily converts to vegetable mould the stubborn fragments of previous crops. It also acts upon the substances brought up by the subsoil plough, and renders a large amount of inorganic substances available as food for plants. I will not believe in the earth becoming barren from the exhaustion of its vegetable mould so long as there remains a soil to be trenched, half-trenched, and trenched again—a subsoil to be brought up every few years and exposed to the action of a winter's frost, and then to the action of a dressing of lime fresh from the kiln. To a stiff clay I would apply from seventy to eighty bushels of quicklime per acre, procuring it fresh from the kiln and spreading it, not over-slacked, on the surface of the land just before ridging-up. If on a light soil ridges and guano should be decided upon, I would sow broadcast just before ridging, at the rate of 10 or 15 cwt. per acre.

The manner in which I have said I would apply the dung, &c., obviates the necessity of trundling cart wheels between the ridges, and of the plough to split the ridges again for the purpose of covering the dung. I should not like to trust to a 30-inch-wide ridge on good ground; 3 feet in that case for the field culture of medium-topped kinds of Potatoes, such as Daintree's Seedling (round), would do very well. For the very large-tubed and branching sorts, such as Paterson's Victoria, Dave's Matchless, York Regents, or Old Grammars, I should prefer a 42-inch base for my ridge to rest upon, and to have it 1 foot wide at the top, which could be eventually done by passing a light roller over the tops of the ridges. In Shropshire, where they manage these things better—at least as far as regards the cultivation of the Swede Turnip, I think—than in any other county I have seen, except, perhaps, some parts of

Forfarshire, they would put a horse to a double mould board, and finish off between ridges as straight as a gun barrel almost as fast as a man could walk.

Whether upon the ridge or on the flat, the dibble with a blunt point should be employed in planting Potatoes in a field; the sets should be placed 7 inches deep, and I would be entirely opposed to after-mouldings. By hoe and by hand I would keep down the weeds, and I would pick off the blossoms, for from them we may anticipate seed, the formation of which taxes the energies of the plant to the detriment of the tubers. Of these in due time I would guarantee a crop on the ridge system far surpassing that obtained on the old moulding-up plan, so long practised.—UPWARDS AND ONWARDS.

CRYSTAL PALACE AUTUMN SHOW.

AUGUST 25TH TO 27TH.

No one could expect that any autumn show held during this memorable season could be at all equal to those which are usually held at this time of the year; and although, if at any place, a gathering might be expected at the Crystal Palace, so liberal is their schedule, and so anxious are they to induce growers to exhibit with them; yet not even they could overcome the terribly trying nature of the season that we have had. It was not only that we have experienced a drought such as none of us who have attained middle life can remember, but that on Saturday last we were visited by such a storm of wind and rain as utterly destroyed all hopes that might have existed of making a good show. From east and west, north and south, came lamentations that Roses, Gladioli, Dahlias were so battered to pieces, that the growers could not possibly fulfil their promises; and so, many a sad blank occurred in the generally well-filled tables in the Crystal Palace. It was otherwise with the fruit, which was very fine; and I think the astonishment was not that there were so few cut flowers exhibited, but that there were so many; not that the quality was so poor, but really that it was so good. One wondered where Mr. Hawke got his Hollyhocks, or Messrs. Kelway & Son their Gladioli. Roses, of course, nothing could save, and they were nearly all so much out of character that they call for no especial remark. Some of the Gladioli shown were very fine; notably those exhibited by Messrs. Kelway and Son and Messrs. Downie, Laird, & Laing. The stand of twenty-four, exhibited by Mr. Kelway, contained Princess Frederick William, Mr. Kenshaw, Napoleon III., Fulten, very fine; Arabella Goddard, Le Poussin, Marina, Felicien David, Euridyce, very fine; Le Quintinie Molire, a grand flower; Adolphe Brogniart, magnificent; James Veitch, Norma, very fine; Etendard, splendid spike; Ulysses, very good; Meyerbeer, grand; Mathilde de Landevoisin, Cassandra, MacMahon, Le Dante, and Madame Basseville. Messrs. Downie & Co. had Seedling No. 2, Duchesse de Padoue, Princess Frederick William, Seedling No. 3, Marie Dumortier, Madame Vilnorin, Meyerbeer, very fine; Mathilde de Landevoisin, Le Dante, Molire, very good; Stella, Oscar, John Waterer, Madame Furtado, and Noemie. Some of these spikes were very long and fine. Messrs. Bunyard & Son, of Ashford, were third with some nice flowers; and Messrs. Paul & Son equal third.

The only exhibitor amongst amateurs was the Rev. H. H. Dombrain, of the Vicarage, Westwell, Ashford, to whom was awarded first prize. His box contained La Fiancee, new, a fine white; Norma, new, white, lightly tinged with lilac; Molire, new, a fine flower; Semiramis, new, lovely pink, but somewhat narrow in the lip; Stella, new; Princess Alice, beautiful shade of lavender; Mrs. Dombrain (Stanish), rich mauve-shaded flower; Madame Pereire, Eurydice, MacMahon, Meyerbeer, Lord Byron, Sir Joseph Paxton, Galilee, Thunberg, a new and fine flower; Edulia, Belle Gabrielle, &c.

The Rev. Edward Hawke's Hollyhocks, as usual, were magnificent, and, indeed, he was the only exhibitor. The individual flowers were of great size, and wonderfully clean. His class of twenty-four contained Exhibition, Charles Eyre, Octavia (seedling), Gem (seedling), Willingham Defiance, Willingham Model, seedling El Dorado, Rose d'Amour, seedling Edward Speed, seedling Ruby Queen, Mrs. Downie, and Queen of Yellows. In twelves he had Ruby Queen, Nonpareil, George Keith, Charles Eyre, Edward Speed, Willingham Defiance, seedling Queen of Yellows, Amber Queen seedling, and Willingham Model.

Mr. Perry's Verbenas fully sustained his usual character as the foremost raiser and grower in England. His stand of twenty-four contained Spot, seedling James Birbeck, Kate, Mrs. Jorleau, Mazepa, Little Clara, Leah, Starter, Foxhunter, Annie, Harry Law, Chieftain, seedling Interesting, Madame Stenger, Rose Imperial, Lord Leigh, seedling Magnificent, Apollo, Lilac King, H. Ward, Wonderful, and Grant des Batailles; and amongst his seedlings were Mrs. Pochin, fine pink, first-class certificate; Kate; Mrs. Reynolds Hole, fine white; Spot, pink with deep eye, first-class certificate; Florence Fidecan, Excellent, and Little Dove. Some of these were very fine, and nothing could exceed the purity of the white of Mrs. Reynolds Hole.

Such are the most notable features of these classes, and I can only hope that another season with more propitious weather one may see the Crystal Palace Autumn Show what it usually is. Arrangements

have been made to hold a special *Gladiolus* exhibition, which will, we feel, be full of interest, especially if I can get M. Souchet and other foreign growers to exhibit. Thus closes another season of Crystal Palace Shows. They have been successful ones, and no small share of this success is owing to the kindness and courtesy of Mr. Wilkinson; and all who have to do with the shows in any way bear testimony to the great pleasure afforded them at this delightful place of amusement.—D., *Deal*.

Of the flowers not noticed above the Dahlias are the most important in numbers, although very far from forming such a long array as in more favourable years. Still, those exhibited were remarkably good considering how long a period of heat and drought we have just passed through.

In Class I, forty-eight blooms, Mr. May, of the Hope Nurseries, Bedale, is first with five fine blooms of, Vice-President, Lord Derby, Jenny Austin, Oerloon, White Perfection, Mr. C. Waters, James Bennett, Yellow Perfection, Coronet, Polly Fawcett, James Backhouse, John Kirby, Salamander, Matilda, Lotty Atkins, Miss Henshaw, Charlotte Dorling, Foxhunter, Sir A. Smyth, Volunteer, Mrs. Boston, Golden Drop, George White, Lady L. Paulet, Lady Jane Ellis, Sam Naylor, Sir J. Douglas, Master of Arts, Albion, Rosy Circle, Yellow Boy, Favourite, Lady G. Herbert, Lady Elcho, Fair Imogene, Goldfinder, Lord Palmerston, Hero, Peri, Leah, British Triumph, Audrey Dodd, Earl Russell, W. Dodd, Criterion, Ellen Potter, and Leopard. Mr. Keynes is second; Mr. Draycott, Humberstone Nursery, third.

In the class for twenty-four, Mr. Keynes and Mr. May change positions. Mr. Keynes being first with Andrew Dodd, Yellow Boy, Purple Gem, Queen of Whites, Miss Dombtrain, Juno, Lightning, Memorandum, Seedling C., Gazelle, J. Donnington, Mrs. Brunton, Lady G. Herbert, Baron Tanaton, Lady J. Ellis, Leah, John Hunter, British Triumph, E. Spary, Caroline Tetterell, John Kirby, Sam Bartlett, John Bunn, and Lady of the Lake. Mr. Draycott is third, Messrs., Kolway fourth.

The best twelve Fancies come from Mr. May, and consist of Gem, Sam Bartlett, Mrs. Wyatt, Chang, Prospero, Queen Mab, Ebor, Prince of Wales, Mrs. Dorling, John Brown, Coquette, and Leopard. Mr. Keynes is second with J. Bunn, Sportsman, Mrs. Wickham, Attraction, Startler, Bessie Wyatt, Lightning, Sam Bartlett, Chameleon, Fanny Sturt, President, &c.

In the amateurs' classes Mr. Charles J. Perry is first, Mr. Draycott, gardener to T. Paget, Esq., M.P., Humberstone, Leicester, second, and Mr. T. Hobbs, third, for twenty-four blooms. For twelve Mr. Draycott is first, Mr. Burritt second, Mr. Hopkins, of Brentford, third, and Mr. C. J. Perry, fourth; and the last-named gentleman is first for twelve Fancies, Mr. Beck, Wimborne, Dorset, being second. Several seedlings are shown, which receive certificates. The most noteworthy are John Dix from Mr. Hobbs; and Miss Dombtrain, John Hunter, and Queen of Whites from Mr. Keynes. Mr. Hopkins had a second-class certificate for Gipsy Queen.

Among miscellaneous subjects Messrs. Downie, Laird, & Laing exhibit an excellent group of subterminal and other plants, including Cannas, Coleuses, new Caladiums, Pelargoniums, and Phloxes. For this a first prize was awarded; Mr. Tanton, of the Epsom Nursery, taking the second with a magnificent *Allamanda*, named "Hendersonii, true of Wardle," and the correct name of which has yet to be decided.

FRUIT.

The Fruit is the great feature of the Show, and although the quantity exhibited is not quite so large as usual, the quality is generally excellent, and some of it, especially the Grapes, is of the highest merit.

The first prize for a collection of fruit was taken by Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, with a Providence Pine Apple, Bailey's Green-fleshed Melon, three good bunches of Black Hamburgh Grapes weighing 9½ lbs., three of Buckland Sweetwater weighing 7½ lbs., Noblesse Peaches, Elrige Nectarines, Brown Ischia Figs, and Washington Plums, all of which were very good. Mr. Kemp, gardener to the Duke of Northumberland, Albany Park, Guildford, Surrey, is second with a small Queen Pine, good bunches of Black Hamburgh and Muscat of Alexandria Grapes, fine Brown Turkey Figs, Green Gage Plums, Royal George Peaches, Violette Hâtive Nectarines, and two Melons. Mr. Clark, gardener to Earl Cowper, Panshanger, is third. An extra prize was awarded to Mr. Miller, gardener to Lord Craven, Combe Abbey, for a splendid collection, which would have been first but for its not containing a dish of Figs, on which account it was disqualified. The schedule, after enumerating the dishes required, stated "(one dish at option of exhibitor)," and Mr. Miller understood this to mean that he might substitute one dish of any other fruit for one of those named. His collection consists of magnificent bunches of Black Hamburgh Grapes with large and beautifully ripened berries, Golden Hamburgh also very fine, Stoneleigh Abbey Pine Apple, Combe Abbey Hybrid Melon, Stirling Castle Peach very fine, excellent Violette Hâtive Nectarines, Late Duke Cherries, and Goliath Plums.

Pine Apples are not numerous, but for the most part good. In the class for three of any variety Mr. Ward, gardener to T. N. Miller, Esq., Bishop Stortford, is first with three finely grown fruit of Smooth-leaved Cayenne, very even in size, and each weighing 7 lbs. or upwards. The prize for the best Queen was awarded to a good fruit from Mr. Laing, gardener to P. W. Flower, Esq., Tooting Common, Mr. Harrow

being second. The best fruit of any variety except the Queen was Smooth-leaved Cayenne, weighing 8½ lbs., from Mr. Ward; Mr. A. Wright, gardener to C. Roberts, Esq., Regent's Park, being second with a Providence weighing no more than 6½ lbs.

Grapes, as shown by Mr. Meredith, of Garston, Liverpool, and Mr. Miller, of Combe Abbey, are the finest we have ever seen. The former took the first prize for the best basket with Black Hamburghs, which, for size of berries and beautiful colour and bloom, could not be surpassed; whilst Mr. Miller, who is second, has the same kind also in splendid condition, and with berries of the largest size. Mr. Ward is third, and Mr. Osborne, Finchley, takes an extra prize, both with excellent Black Hamburghs. The same kind, also very good, comes from Mr. Frost, of Maidstone; and among other kinds shown are Muscat of Alexandria and Buckland Sweetwater, the latter very good, from Mr. Excell, gardener to J. Hollingworth, Esq., Maidstone.

The class for the best three bunches of Black Grapes is, however, that in which the two most remarkable exhibitions are produced; indeed, we have never seen finer anywhere. The bunches of Black Hamburgh from Mr. Meredith, who is first, are the finest we have ever seen him exhibit, magnificent as were the specimens which he produced in previous years. The centre bunch is of enormous size, with large shoulders, and it is supported on each side by a large and finely-shaped bunch. The berries are immense, in size more like Plums than Grapes, and are covered with a beautiful bloom. Mr. Miller, gardener to Earl Craven, Combe Abbey, was awarded the second prize for three splendid, compact, symmetrical bunches, remarkably equal in size, and with berries of enormous size and beautifully coloured. These, too, were such as we have not seen surpassed, and are a convincing proof of Mr. Miller's skill as a Grape-grower, though his success in previous years renders proof of that fact unnecessary. Mr. Thomas, gardener to Mrs. Child, Whetstone, is third, and good bunches are also shown by Mr. Osborne, Mr. Sage, and others. Messrs. Lane have excellent bunches of Alicante, but not sufficiently ripe.

In the class for White Grapes, Mr. Osborne, of Finchley, is first with fine beautifully-ripened Muscats, and Mr. Laing, gardener to P. Flower, Esq., second, with large bunches of Canon Hall; Messrs. Lane & Son, of Berkhamstead, are third with Trebbiano, fine. Mr. Miller, Mr. Carr, and others also send good bunches of Muscat of Alexandria, and Mr. Aedy, gardener to Mr. Wright, has Buckland Sweetwater perfectly ripe, being of a deep amber colour. Mr. Keen also has good bunches of the same kind.

The first prize for the largest bunch of any variety was taken by Mr. R. Keen, gardener to J. G. Sheppard, Esq., Wickham Market, with Buckland Sweetwater, weighing 1 lbs. 12 ozs.; the second prize going to Mr. Douglas, gardener to F. Whitbourne, Esq., Loxford Hall, Hford, for Black Hamburgh weighing 3 lbs. 13½ ozs.; and the third to Mr. R. Laing for a bunch of Canon Hall of 3 lbs. 5½ ozs.

Peaches chiefly consist of Royal George, Violette Hâtive, and Barrington, but are not remarkable for size. Mr. Douglas is first with fine fruit of Exquisite, a very large yellow-fleshed American variety. Mr. Miller is second with a very fine dish of Padley's Seedling; Mr. Sage, gardener to W. Leaf, Esq., Streatham, taking a like award for Teton de Venus; and Mr. Rose, Acton, is third with Barrington.

Nectarines, with the exception of the prize dishes, are small. Mr. King, gardener to R. Loder, Esq., Slougham, is first with large and fine fruit of the Violette Hâtive. Mr. Miller is second with Murrey, large and finely coloured; and Mr. Douglas third with Pine Apple, very fine. Titusston Orange, of which the last-named is an improved variety, Downton, Hunt's Tawny, Elrige, and Imperatrice are the other kinds principally shown, and G. F. Wilson, Esq., of Weybridge, sends good-sized fruit of the Stanwick from an orchard house.

Melons are shown in considerable numbers. The first prize for green-fleshed was awarded to Mr. Richbell, Tadworth Court, Epsom, for a fruit unnamed; the second to Mr. Bailey, Shardeloes, for Bailey's Green-fleshed; and the third to Mr. Gibson, Westerham. Mr. Carson has a fruit of Carson's Nonsuch weighing 13 lbs.; and among other kinds are Golden Perfection, Bromham Hall, King's Heckfield Hybrid, and Golden Gem. In the scarlet-fleshed class Mr. Bailey is first with Scarlet Gem; Mr. Clark, Panshanger, second with Malvern Hall; and Mr. Hutley, Epsom, third with Prizetaker.

In Figs there is scarcely any competition. The best two dishes are Brown Turkey and White Marselles from Mr. Willmore, gardener to the Misses Jones, Maidstone; Mr. O. Goldsmith, gardener to Sir W. Farguhar, Bart., Polesden, is second.

Of Cherries likewise there are very few, as might be expected so far on in the season. Morello and Belle Magnifique, both very fine, from Mr. Clark, Panshanger, are first; Morello and Black Tartarian, the latter small but of the deepest black, from Mr. Sage, Ashridge Gardens, are second; and Morello and Late Duke from Mr. Goldsmith third.

Plums are very numerous and good, and consist of Kirke's, Pond's Seedling, Magnum Bonum, Denyer's Victoria, Goliath, Purple Gage, Jefferson, Washington, Coe's Golden Drop, and Mitchelson's. Mr. Jackson, gardener to G. W. Gower, Esq., Titsey Park, is first; G. F. Wilson, Esq., second with Coe's Golden Drop, Huling's Superb, and Transparent Gage. These were grown in an unheated orchard house till all danger from frost was over, and then ripened out of doors. R. Webb, Esq., Culham House, Reading, is third with Coe's Golden

Drop, Magnum Bonum, and Jefferson; Mr. Bailey, Shadeloes, being fourth with Prince of Wales, Victoria, and Washington.

Of Apples, the collections are very numerous, and some of the specimens shown are very large, although the season has been unfavourable to the attainment of large size by fruit generally. For four dishes of dessert kinds Mr. W. Holder, Springfield, Maidstone, is first with very good examples of Kerry Pippin, Pennington's Seedling, Cox's Orange Pippin, and Summer Pearmain. Mr. Webb, Reading, is second with Ribston Pippin, Cox's Orange, Newtown Pippin, and Red Quarrenden, all of which are very fine. Mr. Willmore is third with Sam Young, Red Quarrenden, Ingram's Seedling, and Red Astrachan. Dr. Cooper, Slough, is fourth; and Mr. Jones, gardener to E. Purser, Esq., Curslton, takes an extra prize.

For Kitchen Apples Mr. C. Chaff, gardener to A. Smee, Esq., Wallington, was awarded the first prize for immense fruit of Concellor, Lord Derby, Lord Suffield, and Putt's Pudding. Mr. Geirs, gardener to F. Flight, Esq., Norwood, is second with large specimens of Ribston Pippin, Alexander, Gloria Mundi, and Blenheim Pippin. Mr. Jones, gardener to E. Purser, Esq., is third; Mr. Downing, gardener to T. Grissell, Esq., Norbury Park, fourth; and Messrs. Lane, St. Mary's Cray, fourth.

The best three dishes of Pears come from Mr. Holder, and consist of excellent examples of Gratioli, Bœurré Clairgeau, and Williams's Bon Chrétien. Dr. Cooper, Slough, is second with Williams's Bon Chrétien, Bœurré d'Amanlis, and Duchessed'Angoulême; Mr. Holder, Reading, is third. G. F. Wilson, Esq., sends excellent examples of Louise Bonne of Jersey, Maréchal de la Cour, and Glon Moreau, grown in an orchard house, and placed out of doors when there was no danger from frost. All three prizes for the best flavoured dishes of Pears went to Williams's Bon Chrétien, the prizetakers being Mr. Douglas, Loxford Hall, Mr. O. Goldsmith, and Mr. Willmore. An extra prize was given to Mr. Elliot, Sydenham Hill, for the same kind.

The heaviest dish of Pears comes from Mr. Samuel, gardener to T. Lucas, Esq., Bethelworth, and is King Edward, weighing 7 lbs. 14 ozs. Mr. Rabbitt, gardener to Lord St. John, Melchbourne Park, is second with Grosse Calebasse; and Mr. O. Goldsmith third with Catillac. G. F. Wilson, Esq., exhibits remarkably fine fruit of Triomphe de Jodoigne from an orchard house, and ripened out of doors.

For Vines in pots Messrs. Lane & Son take first for fine examples of these; and Mr. Fraser, Lea Bridge Road, has a similar award for finely fruited Peach trees. Both these exhibitors also take prizes for beautiful collections of pot fruit trees. Extra prizes are awarded to several exhibitors for miscellaneous subjects. Mr. Guyett, gardener to J. Perrott, Esq., Heme Hill, receives one for seven fine bunches of Alicante Grape close together on a portion of a branch. Mr. Webb, Reading, has another for Nuts and Plums; Mr. Bailey, Shadeloes, for a very large finely-netted Melon, called Monarch; Mr. Carr, gardener to P. L. Hinds, Esq., Byfleet, for two Grandillas, two fruit of the Papaw, and Water Lemons (*Passiflora laurifolia*); Mr. Levell, Upper Clapton, and Mr. Sleat, Upper Norwood, for well-grown Cucumbers. Messrs. Lee also exhibited among miscellaneous subjects their Madresfield Court Grape.

ORNAMENTAL AND FLOWERING SHRUBS.

(Concluded from page 113.)

CULTURE OF RHODODENDRONS.—*Soil.*—The Rhododendron, and all shrubs requiring peat soil, succeed well in an open soil, porous, so as to absorb water freely, and yet permit of its speedily passing off when the quantity is excessive. It is essential that the subsoil should be well drained, and if it is naturally of a loose open nature all the better; for the idea that some have of treating the Rhododendron as a bog plant is wholly erroneous, because where there is a bog there is stagnant water, and in such the Rhododendron will not thrive. The plant, though flourishing in a moist soil, does not succeed in one where water remains in the subsoil, for the roots speedily perish in stagnant moisture. The soil most suitable is a fibrous brown peat, containing a large proportion of particles of white sand. Avoid the use of black peat from low ground, which, when wetted, either becomes a soupy mass, or when squeezed in the hand gives out ink-looking water; any soil, except chalk, is better than it. In chalky soils the Rhododendron does not grow well—indeed, they are the worst of all. Some loams, and generally those overlying a yellow clay subsoil, will grow the Rhododendron well, especially when the loam is of a friable nature, stagnant water being carried off by drainage. Light rich sandy soils are not altogether unsuitable, as they may be improved by the addition of turf and leaf mould.

In making the beds or borders, where the soil is a peat of a snitable nature, nothing further will be required than to trench it; but if the soil is unsuitable the bed should be dug out to a depth of not less than 18 inches and not exceeding 2 feet, and the subsoil should be loosened to an equal depth. If the latter is wet a drain should pass under the bed or border to take away superfluous water, and this drain should not be less than 3 feet from the surface, but it will be better if 4 feet deep. The pit thus formed is to be filled with peat, chopped up rather roughly for the bottom, and finer towards the top, making it from 6 to 9 inches above the surrounding ground level, but do not raise the bed high in the centre unless water can be given abundantly in summer, as with the bed raised the plants will be more liable to suffer from the want of a proper supply of moisture in dry periods.

If peat cannot be obtained, and the soil is unsuitable, take out the latter as above directed, loosen the bottom, and secure proper drainage, for it is useless to plant in a soil where water remains stagnant as it destroys the fibres. Then fill up with a compost of turf cut 2 inches thick from a pasture where the soil is a good friable and sandy rather than heavy loam. The first or bottom foot in depth may be turf cut 6 inches square; and the top foot may consist of turf in pieces of not less than an inch square three barrowfuls, one barrowload of leaf mould, a fifth of old cow dung, and if the loam is strong a barrowful of sand. Mix all these ingredients well together, and put the compost in the bed, making it above the surrounding level to allow for settling. A bed thus made will grow fine Rhododendrons. I made some beds in this way several years ago, and the plants are finer than those growing in peat as regards their foliage; those in the peat, however, are more profuse-blooming.

Much may be done to improve soils not unsuitable, even where peat cannot be had. A light sandy loam may be improved by a liberal dressing of turf cut into small pieces, and leaf mould, trenching 2 feet deep, and mixing the turf and leaf mould with the soil. Heavy soils may be rendered snitable for Rhododendrons by adding sharp sand and sandy loam and turf.

In extensive plantations, whether in beds or borders, where peat is obtainable, but not in quantity on account of the expense, I have found it a good plan to dig a good-sized hole, placing a little peat at the bottom, and surrounding the ball with peat soil, covering it entirely, and then filling in with the ordinary soil. When no peat can be had the compost named as a substitute for peat may be employed for placing around the balls of the plants. This plan answers admirably. I have many fine bushes which cannot be distinguished from those in beds wholly of peat, and they have been in this state upwards of four years.

Situation.—In choosing a situation select one which is moist rather than high and dry, and if shaded by trees at a distance it will be all the better. The situation must be open, not exposed to the drip of trees, and out of the reach of their roots, as these are quite as injurious as the drip from the branches. It is also desirable to secure shelter from wind, not that Rhododendrons are tender, but in bleak positions the leaves are so battered one against the other as to be browned and much disfigured, whilst in suitable places the plants have the finest foliage. They are far better away from buildings than near them, as there are always currents of air round them which affect the plants.

Propagation.—This is effected by seeds, layers, cuttings, and grafting. By sowing the seeds there is a chance of obtaining new varieties, and plants can be secured in quantity for shrubberies. Seed may be sown in April, either in pans or boxes, in a cold frame, or in a bed of sandy peat, 6 inches deep. The pans should be well drained and filled to within a little of the rim with sandy peat, a little very fine soil being placed at the top. The surface should be made even and smooth and be watered, and the seeds scattered evenly over it and gently pressed in. Cover them very lightly with silver sand. They may also be sown in February or March; in that case the pans should be placed in a frame on a gentle hotbed, and shading from the sun will render watering less necessary than would otherwise be the case. All water should be given through a very fine rose, and to save the trouble of frequent waterings a little moss may be placed on the surface of the soil, taking care to remove it when vegetation commences. If the seed is sown in April place the seed pans in a cold frame, kept close and shaded until the seedlings appear, when air must be admitted freely. When they are large enough to handle prick them out 3 inches apart in a frame, in a bed prepared as for sowing, and keep them close and shaded till they are established; then give air gradually and harden them well off. If sown in heat they must be well hardened-off previous to their being pricked-out. The soil in which they are growing should always be kept moist, but avoid saturating it. Whilst giving abundance of air protect from heavy rain, shade from powerful sun, and shelter from frost by a mat over the sashes. Finally, plant out in the open ground when the plants meet in the bed, placing them in lines a foot apart, and at 6 inches plant from plant in the row.

Layering may be performed in autumn or spring. It requires care, so as not to break the shoots, and is at the best a slow undesirable process. Plants which have plenty of branches near the ground should be chosen, and the branches must be of sufficient length to be bent down and pegged about 2 inches below the surface. The shoots ought to be securely pegged down, and to facilitate the emission of roots copious supplies of water should be given in dry weather. Some make a cut in the shoot or branch layered; others merely layer it and peg it in the soil. I think it desirable to make a cut about midway along the branch, and on the under side of the part laid in the soil. The branches should be made secure above ground, if necessary, by staking and tying them up. In the autumn following the layering the layers should be examined by turning the soil aside, and if rooted they should be cut off immediately below the roots, taken up with as much soil as possible, and replanted. If the branches are not rooted they must remain another year.

Propagation by cuttings is seldom practised, and is not, in my opinion, equal to grafting. Cuttings of the current year's wood should be taken off when the growth is complete and the wood is becoming brown. Cut them off close to the previous year's wood, and trim off

the leaves for 2 or 3 inches, pare the base of the cutting smooth, and insert it in a compost of sandy peat covered with an inch in thickness of silver sand. A moderate watering should be given, and the cuttings covered with a bell-glass, and placed in a frame, the lights of which should be kept close and shaded from the sun until roots are emitted, then gradually admit air, and remove the bell-glasses. The rooting of the cuttings will be promoted by inserting each in a 3-inch pot; and when a callus is formed remove them to a frame on a hotbed, and plunge the pots to the rim in sawdust or tan. The hotbed should then have a temperature of 70°. The young plants from cuttings should be well hardened-off, wintered in a cold frame, and planted out in spring.

Grafting is, perhaps, the best way to obtain a stock of established varieties. The best stock is *Rhododendron ponticum*. The stocks should be slightly thicker than the grafts. Grafting should be performed quite close to the ground; indeed, better below it, and just above the setting-on of the roots, as there is then less liability to produce suckers, and the graft or scion will have an opportunity of forming roots should it be disposed, and thus obtaining nourishment by its own roots.

The stocks, of whatever kind (some using the seedlings of the hybrids, which I do not like, as the growth of the named varieties upon them is tardy), ought to be planted during the autumn or spring, previous to grafting either closely together in beds, so as to allow of their being covered with a frame, or in pots, so that they can be removed to a frame when worked.

The best time to graft is towards the end of August, or early in September, when the young shoots have ripened. The head of the stock should be cut off 6 inches or more from the ground, leaving some portion of the leaves on the stock; and immediately above the setting-on of the roots put on the scion by side grafting, which is just the same as whip grafting, only the head of the stock is not entirely removed. A growing shoot of the current year should be chosen. Secure the graft with matting, and cover it with clay or grafting wax, and if convenient cover the clay or union with soil, sawdust, coco-nut refuse, or other material. Place a frame over the plants, putting on the lights, and keeping them close until the grafts have taken. Wedge grafting may also be employed, but I do not think it is so good as side grafting. In spring the head of the stock should be cut off close to the union of the stock and scion. Grafting may also be performed in spring, just before or when the stocks are commencing growth.

Inarching is an eligible mode of propagation, being best performed in May and June. Budding is sometimes practised; it is best performed in August, and is a convenient mode of propagation.

Planting.—The most suitable time to plant *Rhododendrons* is in September, but if they are removed with good balls, it may be done at almost all seasons. Transplanting immediately before flowering diminishes the duration of the bloom, and if performed after the flowering is over it has an injurious effect on the growth. Planting early in autumn or spring is preferable to late spring and summer planting. In taking up preserve as much soil as possible about the roots, for on that depends the speedy re-establishment of the plants. Chopping the ball and reducing it by beating is a practice that cannot be too highly discontenanced, for it destroys the plant's feeders, and until more are formed it remains stationary, even if it does not retrograde.

In planting, do not plant deeply, but merely cover the roots deeper by 3 inches to allow for the loose soil settling. At the same time the plant must not be elevated much, if at all, above the surrounding ground level, for that would in dry weather only tend to deprive the plant of moisture. After making the soil firm round the ball, give a good watering, and afterwards whenever water is required it must be supplied, otherwise the foliage and flowering suffer.

If the beds become overcrowded every alternate plant should be removed, or the whole of the plants must be taken up and replanted in autumn or spring. The latter period is, perhaps, the better of the two, as the plants from crowding will have become somewhat tender, and on planting in autumn at greater distances the foliage is apt to be injured by severe frosts and cutting winds. Replanting affords an excellent opportunity for renewing the soil wholly or in part, and according to my own experience this should be done every sixth year, but where there is plenty of room between the plants, the soil will not require renewal. A liberal top-dressing of equal quantities of leaf mould and cow dung not less than a year old, should, however, be applied every year in March, and in June mulch the beds with short grass mowings. Never put a spade into beds of American plants, but keep them clear of weeds, and lightly point them over with a fork, so as to prevent the surface cracking and becoming covered with moss. Never go so deeply as to disturb the roots. If seed is not wanted the trusses should be removed as the flowers fade, doing so will contribute to a vigorous growth.

When the plants are becoming unsightly any irregular growths may be cut away, and if necessary the plant itself to any extent. This is best done before growth takes place, or it may be deferred till immediately after the flowering. *Rhododendrons* bear cutting quite as well as Laurels.—G. ABBEY.

NEW ROSES.

IN answer to "ROSARIAN'S" question, in page 110, I may state that the following Roses have bloomed well this season,

and will, doubtless, prove good—viz., *Coquette des Alpes*, pure white, cupped, larger than *Baronne de Maynard*; very vigorous. *La France*, very light rosy lilac, very large and globular, free-blooming; very fine. *Impératrice Charlotte*, beautiful delicate rose; a very large and finely-formed flower. *Madame la Baronne de Rothschild*, soft delicate rose colour, very large and cupped; fine habit. *Boule de Nieve*, white, medium size; a lovely cupped flower. *Reine de Portugal* (Tea), is a flower of good form. It is medium-sized, of a bright coppery yellow, very distinct, and should be grown by everyone.

The above I am sure will be worth every Rose-grower's attention, and will prove to be standard flowers. No doubt there are others of the same date which may ultimately prove as good.—JOHN MILTON.

WORK FOR THE WEEK.

KITCHEN GARDEN.

AFTER the heavy rains which, according to all accounts, have been general throughout the country, the ground will be in a fit state for planting out winter crops. Hoe, fork, and dig among advancing crops. *Artichokes*, if any of the rows are seven years old, lose no time in cutting the plants down, and trench the ground as deeply as you find it good; not but that the plants might go on for another seven years, and still bear well enough, but it is bad management to let ground lie out of rotation so long. Gooseberry, Currant, and Raspberry bushes are often left on the ground until they cease producing through sheer exhaustion of the soil. *Cauliflower*, sow for the spring crop. *Lettuces*, if sown now or a fortnight hence in an open, airy space, will often stand the weather better than stronger plants growing in more protected situations. *Mushrooms*, attend to the beds in a bearing state, and continue to make fresh ones. *Radishes*, sow for autumn and early winter use. *Thyme*, *Sage*, *Mint*, and *Tarragon*, that were cut over last month, are now becoming quite bushy again, and in fine condition to be taken up for potting, or to be put in boxes for forcing gently in winter.

FRUIT GARDEN.

The Strawberry plants forced last spring and planted out in May, having now done bearing, should be taken up and potted; the main portion of the old roots to be cut away in October, as by that time there will be plenty of strong young roots produced immediately under the surface of the ground. The plants should then be put in a cold vinery for forcing by the end of January, and a third crop will be gathered by the end of the twelvemonth. Cutting off the leaves of Strawberries at this time is not a worse practice than digging the beds in winter, as you cut off all those fine roots formed late in the autumn near the surface of the ground. The old plan of covering the beds with a rich compost, leaving only the tops of the leaves above it, is the best winter management after all. As soon as the fruit is gathered from Raspberries, clear away all the old wood, and any very strong shoots left at the summer thinning. Tie the young shoots to stakes or rails. Fork in a coating of manure, for, like the Vine, the Raspberry delights in rich feeding. Attend to the directions previously given about Vines; thin out all useless shoots, remove leaves when they are too close together, but, while exposing the bunches to more light, be careful to leave a sufficiency of leaves to shade them from the direct influence of the sun's rays. A number of Gooseberry and Currant bushes protected by netting might now be enclosed in mats to preserve the fruit longer. One advantage of covering some now is, that the buds will be well ripened for next season. Put the fruit room in good order for the reception of fruit, and gather not only the finer wall fruit as it ripens, but also a portion of the crop of favourite Apples and Pears, so that by sweating part of them with dry sweet hay, you will be enabled to prolong their season.

FLOWER GARDEN.

The beds here will require particular attention through the autumn, and fingers and knife must be constantly at work thinning, pruning, stopping, and regulating plants, and the outlines of the beds. Every flower which offers to seed should be cut away as soon as it begins to fade. Dahlias and Hollyhocks, with other tall-growing plants, require to be well trimmed and tied-up regularly to stakes. The hybrid *Philoxes* are particularly gay at this season. *Fuchsia corymbiflora* in rows or single standards will have a fine effect from this time till frost comes. Prepare a piece of ground for sowing a general collection of hardy annuals, which, in late situations, may be sown immediately, but in favourable soils the middle of Sep-

tember will be soon enough. Wallflowers, if they are too close together, must be pricked out into nursery beds for transplanting when the borders are cleared for the winter. Now is a good time to procure any fresh varieties of *Polyanthus*, so that they may become well established before winter; if plants come from a distance, and are planted in the border, a hand-glass should be placed over them, and carefully shaded. Loam and leaf soil in equal quantities will be found a simple and good compost to grow them in. The soil for potting layers of Carnations when they are ready to take off should be loam, river sand, and decayed leaves, well turned, thoroughly examined, and run through the hand, so that no wireworm grub may escape. The flower-stalks when there is no seed may now be cut off close to the surface, and the sticks or supports removed, cleaned, and put away till next season. Planting beds of Pansies for blooming next season ought not to be delayed much longer. The following compost is excellent for securing strong healthy plants, and fine blooms. Two parts fresh maiden loam, one part decayed cow manure, one part road scrapings, one part leaf soil or decayed vegetable matter. This, if well mixed and sweetened by repeated turnings previous to forming the bed, will not disappoint the amateur's expectations. Turn over the soil of the Tulip bed, and if fresh compost is required see to it in time.

GREENHOUSE AND CONSERVATORY.

The management of the conservatory will be more uniform now than in summer. No syringing will be necessary, unless for a plant here and there which may require it for keeping down insects. Where blinds have been in use to keep off the sun, they cannot be dispensed with yet altogether, but use them as little as possible from this time. Let all the watering be done in the morning, and give no more water to stove plants which are brought into this house for their flowers than just enough to keep their leaves from drooping. The few *Lantanas* which we cultivate in this country are well suited for flowering in this house late in the summer and through the autumn. *Turnera elegans* is a very useful and gay plant; it flowers from April to October in the conservatory, and even out of doors in summer, but it requires a house rather warmer than a greenhouse in winter, and is the first to go off in damp winters. Young plants of it in small pots, well drained, and filled with sandy loam only, might now be put in a spare Melon frame to ripen them off; when they have filled the pots with roots harden them by admitting plenty of air, and in winter place them on a shelf near the glass in a cool part of the stove.

STOVE.

The beginning of September, when slight fires will be necessary in dull or cold weather, is a critical time for stove plants. The house must now be kept more close, air being given in the middle of the day only. An increase of heat by artificial means is more likely to retard the ripening of plants now than if they were left cool and dry. The thermometer, should not, however, be allowed to fall below 60° for the next six weeks, and during this time it is of much importance to keep the atmosphere of the house dry as in the dead of winter. These rules, however, do not apply to plants whose habit is to grow in winter, as is the case with many bulbs, Orchids, and a few other plants. *Clerodendron splendens* is one which grows late in the autumn, and may now be encouraged; it will flower for a long time in the winter, and established plants of it should be forced to grow in the spring or early summer. Like some other plants it requires a long period of rest after flowering.—W. KEANE.

DOINGS OF THE LAST WEEK.

"It never rains but it pours," is a saying that has held good this week, and coming after refreshing showers, the rain has done much to moisten the soil, almost to as great a depth as the drought had penetrated. Never in our experience had we known the soil to be so dried. In turning up ground after Potatoes, Peas, &c., we found no moisture for fully 18 inches in depth, the soil falling off instead of holding on to the spade, as if it had been as much sand, or burnt clay. What rather surprised us was, that the firmer and less moved the ground previously, the more moist it was when dug up. We do not allude now to cases in which merely the surface of the ground was kept loose and open, and the soil deeper down comparatively firm and unmoved, for in such cases after passing a few inches from the surface the soil was comparatively moist, but we allude chiefly to cases in which the ground had been well

broken for previous crops, and left comparatively open, so that the parching air had more access to greater depths.

In the case of ground with a rather firm surface, though there were numbers of cracks and fissures, and though there would be a free radiation of heat and a free absorption of sun heat, and thus a free evaporation of moisture, there would be no check given to the rising of moisture from greater depths to meet this constant evaporation from the surface. On setting close hand-lights on such firm, apparently dry soil, keeping them on all day, there would often be a plentiful deposition of condensed moisture inside in the morning, and that all the more if the night was starry and comparatively cool, when the air in general was so dry that even a clear starry night could not condense dew from it out of doors. One of the most memorable things connected with the hot dry weather through which we have passed, was the clear, cloudless nights, and yet no deposition of dew, owing, no doubt, to the fact that in many of these nights the thermometer ranged from 60° to 70°. In such cases, in several instances we found that the glass was a better condenser of the vapour in a confined atmosphere, than the blades or rather points of grass and other foliage, of the vapour in the general atmosphere; perhaps owing to the air under the glass becoming hotter than even the open atmosphere.

In the case of mere *surface-stirring* of the soil, we believe that whilst that arrested absorption and radiation of heat, and thus so far modified the evaporation of moisture, it did not greatly interfere with the rising of moisture from beneath; and if so, the more frequent this surface-stirring, so as to break the lines of conduction, the more effectual it would be for preventing the escape of moisture by evaporation; but when the soil was stirred to greater depths, not only would it be dried more effectually by the dry air passing through it, but such a depth—say a foot of open soil, would prevent the free rising of moisture from beneath to supply the place of that so freely absorbed by the dry air. We would be glad if some of our readers would give a better explanation of the facts. As we have endeavoured to explain them, they are in a great measure in unison with the theory and practice of watering to which we have recently alluded. If we are right, the surface-stirring of ground to keep heat out and moisture in, depends more for its effect on the frequency and the shallowness of the stirring than upon its depth; nay, it may be presumed that the greater the depth the less will be the efficiency of the practice, so far as the keeping-in of moisture is concerned. The matter is of importance, as we believe that the heat and dry air were quite as much against our keeping up a good supply of crisp green vegetables, as the want of rain or surface moisture, and for this purpose, as lately alluded to, it would be interesting to know what is the highest temperature in which green succulent Peas, Broad Beans, &c., can be had in the south of Europe and the north of Africa, and where there are no means of watering or irrigation to be resorted to.

The change produced by the rains, and the coolness accompanying them, have acted like the wand of an enchanter. Blue-coloured vegetables are reverting to their bright green. The prophesiers of bad times, who told us there would not be much green grass until about Christmas, are thoroughly astonished. The pastures that cracked under your feet and looked as brown as a highway are now green, and will soon yield abundant forage. Our lawns, brown and more than brown, are now covered with the most beautiful green, showing that the roots had never been much injured. We could scarcely manage some parts with the machine on Friday, the only dry day of the week; and now, after such a soaking day as this of the 22nd, we expect we shall be obliged to mow the longest pieces on Monday.

KITCHEN GARDEN.

Even stunted seedlings of the Cabbage and Broccoli tribes have made remarkable progress during the week. Planted these and whatever we could in open spaces; also, good breadths of Coleworts and the earliest Cabbages, planting so thickly as to move afterwards every other plant—a good plan when watering has to be resorted to.

As our Cabbage ground was not quite ready, and as, unfortunately, the grubs seemed prevalent, we have pricked out a good piece with plants about 4 inches apart in rich soil, and will lift and transplant with the trowel. Prepared also two beds 4 feet wide, and a few inches below the surface enriched almost as much as for Celery, and planted with Leeks, as they will come in when other vegetables may be scarce. Pulled up all the Onions, and will size and string them the first opportunity.

But for the drought, watering being out of the question, our Onions would have been fine; as it is they are smaller than usual, and, therefore, we are pleased with some bushels of fine large ones of last autumn's sowing. The very first planting of these are too large to keep long, but the second planting will keep through most of the winter and be very useful where large Onions cannot well be done without, and on this account we have sown Onions twice, and will sow a few more next month. Such late autumn-sown ones do very well in a moist summer, but in such a dry summer as this the large ones thus obtained are invaluable. When once established and the ground merely surface-stirred to prevent cracking, no drought will prevent these Onions attaining a large useful size. Like autumn-sown Wheat, they take hold of the ground and rather delight in the sunshine. We have traced the roots of autumn-sown Onions 3 feet down from the surface.

Our Mushroom bed in the open shed, notwithstanding all the heat, has done well. We spawned a peccoe more, and have had the Mushroom house cleared out and will smoke it well with sulphur before whitewashing for the winter, as it is well to do away with all insects and crawling enemies. Young Lettuces are greatly troubled with grubs this season. No doubt these flourished doubly on account of the dry warm weather. The fly has now almost disappeared, at least our young Turnips seem as yet free of it. In reply to a question of Mr. Abbey, we have always forgotten to say that the duty-free tobacco dust that injured our British Queen Strawberry, was applied to the fruit when fruit and foliage were dry, was brushed off after being on some days, and then all well syringed. It did little harm to a few plants of President. There were so few of them that we did not care to smoke or to syringe heavily with any liquid hurtful to the fly, but we will not care to use the powder much for Strawberries again. As a general rule nothing is so searching as smoke, though dusting and brushing are very well in some cases. The great object is to kill the first intruder seen.

This is a good time to make Mushroom spawn for those who use a vast quantity, or who wish to go through the whole process for themselves. For those who use only a bushel, or two or three bushels in the season, they will purchase their spawn much cheaper than they can make it, as after the mere work of making, there is as much looking-after required for two or three bushels as for a hundred or a thousand. Gardeners, if possible, should learn how to do everything connected with their trade; but the doing so in many cases would only be a loss to their employer, and as much behind the times and true economy, as if every family in our cities were to spin and weave, tan and curry, and make all their own clothing and boots and shoes.

FRUIT GARDEN.

Much the same as last week. Owing to the dryness there will be few autumn Raspberries this season, and the sooner the old canes and the very young ones are removed the better. Gooseberries and Currants deprived of their fruit may also be rough-pruned at least, and the shoots shortened. Wherever birds are a pest to buds, the bushes may receive all the pruning that will be necessary until the fruit is fairly set next season.

Apples are swelling well after the wet, and all dropped ones should be picked up. The earliest, as Red Quarrenden, are ready to be gathered.

Peaches and Nectarines out of doors, will in many cases be benefited by a good watering, where the rains have not gone deep enough. Plenty of the engine and clear soot water should be given where the red spider has made its appearance. We have it on two or three trees, because in the hottest weather we could not syringe.

ORNAMENTAL DEPARTMENT.

Managed to pick a good part of our flower beds on the 21st, our only dry day, removing the decayed and seeding flowers as alluded to last week, and even on this the wet day of the 22nd, the difference is very striking between the beds gone over, fresh and gay, and those unpicked, as the faded and seeding blooms look very melancholy. In the case of Pelargoniums, &c., the fading blooms when washed send their dirty colours over other blooms tolerably fresh, and thus spoil the look of those that otherwise would have stood the ordeal of a somewhat continuous rain. We have now a fair supply of water, that will make us tolerably independent for the autumn.

The mowing the now green lawn, the clearing the beds, clipping the edges, and surface-stirring, will be nearly all that will be required, with plenty of sunshine, to give a fine autumn display. Our Pelargoniums were such masses of

flower that we could scarcely obtain cuttings, but we expect to proceed on Monday with propagating for next season, and must be content with small cuttings, so as not to distress the beds. In the wet days, cut down Pelargoniums well hardened out of doors, put in cuttings, potted Cinerarias, Salvias, Ageratums, &c., for winter, potted Primulas, changed plants in houses, potted Balsams, Ferns, Pelargoniums for late blooming, and top-dressed Chrysanthemums, which hitherto we have kept in a shady place to save watering, otherwise we would have had them full in the sun. We shall be able to do so now, and give them manure water plentifully, as soon as they knot for bloom. Many of the hardier stove plants will now and for some time longer do well in the conservatory, and fine-leaved Begonias will do well in a place rather shady; and provided no leaves or other matter fall on their fine foliage, Caladiums will also do in a similar place in a greenhouse until the middle of September, when if at all cool, they will be better transferred to a warmer place to ripen their tubers. These fine-leaved plants often perish because wintered in too low a temperature, and the tubers are green instead of matured.—L. F.

COVENT GARDEN MARKET.—AUGUST 26.

SUPPLIES remain much in the same proportion to demand as last week, prices varying but little. Pears now comprise Bon Chrétien, Beurré d'Amanlis, Louise Bonne of Jersey, and Gratioli. Apples are Kerry Pippin, Strawberry Pippin, and Nonsuch. Consignments from the Continent are still favourable to the foreigner, and comprise Lettuces, Endive, Cauliflowers, and Carrots, with the usual assortment of Plums and Pears. Potatoe trade steady at last week's quotations.

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Catalogue of Bulbous Flower Roots, Plants, Seeds, &c.*

Thomas Sampson, Preston Road and Hemmstone Nurseries, Yeovil.—*Catalogue of Cheap Flower Roots.*

E. S. Williams, Victoria and Paradise Nursery, Upper Holloway, London, N.—*General Bulb Catalogue, and Catalogue of New and Rare Plants, Fruit Trees, &c.*

Smith & Simons, 1, Buchanan Street, Glasgow.—*Dutch Root List.*

TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

HORSFORTH SHOW (*Jos. Hutchinson*).—The schedule states that "no plant will be allowed in the above classes where there is a collection for;" and you were disqualified because you showed a Heath in your collection of stove and greenhouse plants; there being a class for a single specimen Heath. A single specimen cannot be a collection of Heaths, and so you have conformed to the conditions of the schedule. What the Committee evidently meant by the note we have quoted was, that no plant for which there is a separate class, will be admitted in the above classes, but they did not say so. Some competent person should always be employed to prepare such schedules as these, and particularly when prizes of the value of £3 and £40 are at stake. (*A. Z.*)—See the preceding reply.

MILDEW ON ROSES (*L. F. W.*).—"Any ironmonger can supply or pro-

cure for you Parkes's fork. Buy one for strong land with four times, and for light land with five times. Mildew, I hear, is very rife. I see the Hop leaves in my hedges are smeared with it. I hardly know what advice to give, unless I saw the Rose plants. If you have only a few Roses dissolve 2 ozs. of blue vitriol in hot water, add to it three gallons of cold water, and pour it over the affected leaves and stems. Wash out your watering pot well afterwards. Where you see only a spot or two rub it out with your finger and thumb. Cut out all inferior wood affected with it.—W. F. RADCLIFFE.

NEW ROSES (T. M. N.).—Certainly they are raised from seed in the first instance, except a few which are sports.

EXHIBITING TRICOLOR PELARGONIUMS (James Service).—They always look best without their flowers. They should therefore be exhibited flowerless.

SELECT PELARGONIUMS (R. R.).—If you apply to any of the leading nurserymen they would procure you the varieties named. We cannot depart from our rule not to recommend one dealer in preference to another.

STRAWBERRY CULTURE (J. T., Whitechurch).—"The ground having been well manured for Potatoes for several seasons, it will be good enough for young Strawberry plants. The four sorts you name are excellent. Sir J. Paxton is good as an early large Strawberry; Dr. Hogg and Frogmore Late Pine are both first-rate in all respects, and Lucas very good indeed. You will probably not be able to obtain plants of Lucas this season. I advise you by all means to have Cockcomb; the plant never burns, neither do the berries; it hangs a long time. I finished the season with it, July 13th. I think pig, horse, and cow manure are best for Strawberries, especially the last-named. Guano, blood manure, and soot are also good for them.—W. F. RADCLIFFE."

SUBSTITUTE FOR TURF IN A FERNERY (M.).—We have no faith in the *Spergula* for making paths in a fernery; but we would remove the grass and substitute gravel, say 4 or more feet in width, and then along the sides of the gravel we would plant the Moss *Saxifrage* and different Sedums. These we would allow to grow irregularly and cover pieces of the gravel, so that the walks should be anything but uniform in width. All we should want would be merely an irregular space for walking. We know this plan will be picturesque and please you.

BOILER FOR HEATING A VINEY (J. R., Dighton Green).—We have not used Riddell's slow-combustion boiler ourselves, but we have no doubt as to its answering. Do not suppose, however, that any boiler will free you from dust, and do not be led away with the idea that you can heat any boiler with almost no fuel. As to the cleanliness and freedom from smell, that is all right, and there is the improvement.

LAYERING A ROYAL MASCADINE VINE (Amateur).—You are doing quite right with the Vine, but layer it deeply enough, and water frequently. A layer is not quite so good as a cutting.

THINNING ASPARAGUS SEEDLINGS (Idem).—We would not thin the Asparagus until next spring, then leave the plants from 4 to 6 inches apart.

SOFTENING HARD WATER (Aqua).—Expose the hard water a day or two before using it, or add to it a little soda or potash, say an ounce to four gallons.

GARDENS NEAR LONDON (J. T.).—You will find a very complete list in Hogg's "Gardeners' Year-Book," and the "Horticultural Directory." The latter gives the distances from railway stations, and the names of nurserymen as well. It may be had for 2s., or free by post for 2s. 2d.

GARDNER'S PREMIER POTATO (G. A.).—You must have overlooked the fact that "UPWARDS AND ONWARDS" stated that this variety is "not yet in commerce"—in other words, that it is not yet sold by the trade.

STANDARD PLUM AND PEACH TREES (Pecago).—Plum trees as standards would bear well in the open ground in your part of the country. As for Peach trees, though we have known a few instances of their bearing out of doors near London as standards, it would be a waste of space and means to attempt to cultivate in that way the varieties at present known.

CORDON TRAINING (J. B.).—"The proper angle for diagonal cordons is 45°, which represents the nearest approach to that made by a branch with the parent stem. All experience shows this to be the best angle for trees against walls. During the first year, however, it is right to keep the leader to an angle of 70°, so as to promote equal growth on either side. When sufficient extension is obtained, then lower it to 45° for fruiting. In the "Modern Pencil-Pruner" it is recommended to plant single cordons on back walls below, say 12 feet high, and to grow a second leader (forming a double cordon), when the wall is lower than 10 feet. From 13 to 14 feet is an excellent height for the back wall of a lean-to house. Mine are 13 feet. I have always adopted, and still prefer, a diagonal wooden trellis of three-quarter-inch rods. If horizontal wires are adopted they must be tightly strained, and guiding rods used besides, to which the leaders should be lightly attached at every 10 inches. The following are some good Nestorians:—Hunt's Tawny, Elruge, Rivers's Orange, Violette Hative, Bowden, Downton, Royal Victoria, Pine Apple.—T. C. BRIHATT."

WEEKS & Co.'s HOT-WATER APPARATUS (C. L. P.).—Write to them for their "Illustrated Catalogue." They will readily send it to you gratis, and it contains, besides the information you ask for about heating, well-executed coloured drawings of conservatories, greenhouses, and other horticultural buildings. It is really a book for reference on such subjects.

CULTURE OF THE VINE IN AUSTRALIA AND CALIFORNIA (J. F.).—We know of no particular rule on this subject; but for Australia and California we should think much the same culture as we give to our Raspberry canes would answer well, allowing every stool to have its bearing wood, and the shoot or shoots for next season's bearing, as often practised in the south of Europe.

MANAGEMENT OF CUSTARD APPLE SEEDLINGS (E. B. A. Z.).—The best way to manage your Custard Apple seedlings (Anona) will be to pot them separately in 4-inch pots, and shift them into larger ones until they are in 12 or 15-inch pots. Keep them in a temperature of not less than 65°, and train the tops to a trellis about 15 inches from the glass. To obtain fruit from such seedlings, curbing the roots in a pot or a tub, and a high temperature, will be best. There are several species and varieties.

PEACHES FLAVOURLESS (E. S., Chelsea).—In such a season we can only ascribe the want of flavour in your Peaches in pits to shading or overwatering. As this is their first year of fruiting we would not report the

trees this year, but remove the surface soil in October and fresh surface. If you resolve on repotting, we would do it now.

ERECTING A SMALL GREENHOUSE (Cubitt).—Except stating the width of your proposed house, 8 feet, you hardly afford us sufficient data; but we will give the best answer we can to your questions. 1. As you have than a high wall. Except in a particular place, and to suit some particular circumstance, we would not advise you to sink your pathway, as a house will best stand lengthwise north and south, the two planes of pose would be a house with side and end walls from 1½ to 3 feet in height; ventilators in the wall; apex of the roof 7 feet high from the floor; roof all fixed to the apex and wall plate, ventilation at top being secured by an opening at each end over the doorway. If you double the length of the house, then have two sliding ventilators in the middle. A stove would heat such a house; if doubled, a due in the centre forming part of the pathway would be best.

FORMING A FRUIT ROOM (J. B. Don).—Your room will make an excellent fruit room if you have two or three graded ventilators in the wall just above the floor level, and one in the ceiling, protected by a cowl outside. Then along the walls you could have sparrow open shelves 2½ feet wide, and these 2 to 3 feet apart in height. We have received no plan of a flower garden.

MUSHROOMS IN THE FIELDS (Idem).—We have no Mushrooms yet, but we expect them after the recent rains. The dry summer would cause the spawn to run freely, whether in a field or a meadow. After such a season we have seen them on public roads.

BOILER (W. Oxford).—If, as we presume, your large cylindrical 6-foot boiler, 28 inches in diameter, contains all that width of water, then we would not advise you to use it for heating vinerias. Such a boiler would be all right could you fill up the centre, so as to have 3 inches of water all round. However, we may state that many years ago we used a large boiler, like a wash-house copper, and set in the same way, and though it did not heat very soon, it kept heat a long time.

SHOEMAKERS' AND CURRIERS' CUTTINGS FOR VINE BORDERS (Idem).—Curriers' and shoemakers' cuttings will do good to Vines if employed sparingly and well fermented in a heap previous to use.

MINIATURE PLUM TREES FOR ORNAMENTS THE DINNER TABLE (Duchella).—There is no difficulty in doing what you propose. If you procure very small young plants they may be improved by bringing them on at first in a pit or frame, but your greenhouse will be the best place for ultimately growing them in during the spring and early summer months. If you proceed from the beginning it would be desirable to have small plants of *Sho* or *Plum* sticks established in small pots, graft them early in spring, and keep them in a frame until the union took place; then as growth proceeds shift them into larger pots, but not using any larger than from 6 to 8 inches in diameter. For pots of these sizes the plants should not be more than from 18 to 24 inches in height, but furnished with bearing wood to the rim of the pots. It would be better, however, to obtain plants grafted and potted, and then growing them in small pots, and pinching in the shoots in summer, will keep them dwarf and well supplied with fruit buds. The trees should be placed in the greenhouse as soon as the fruit buds swell, and may be kept there until the fruit has been gathered, or they may be set out of doors after the middle of June, when all danger from frost is over, and be there protected from birds, &c. In such a case the pots may be half plunged. For table decoration they will generally look best when taken from under glass with a low temperature for the summer—that is, having little or no artificial heat given to them. For dessert we would prefer such kinds as the Peach Plum, Donistons's Superb, Green Gage, Purple Gage, Kirke's, Jefferson, Reine Claude de France, Coe's Golden Drop, and Coe's Late Red. If you purchase young plants, our leading nurserymen who deal in pot trees would do the very best for you. When once you have your little trees curbed and in a bearing state, which they will be in the second season from the graft, you will have little more trouble with them, except keeping them clean and summer-pruning, and frequent surface-mulching in summer, as after they are in 7 or 8-inch pots they will need no potting for years if the mulching is attended to.

SOWING GLOBE ARTICHOKE SEEDS (A Lady Subscriber).—The seed should be sown in drills 18 inches apart in good, deep, well-prepared soil early in April. The after-treatment consists in keeping the seedlings clear of weeds, and when of a size fit for thinning, single them out to 18 inches apart in the rows.

SEEDLING VINE (Idem).—The Vine should be placed in a larger pot in autumn, and be kept dry from the time leaves fall until growth recommences. It must have rest for a period of two or three months. You can hardly expect it to fruit next spring. The leaf enclosed to us is that of an Orange, or some of that tribe. With respect to the proposed exchange of plants, unless you can find some one in your neighbourhood willing to make the exchange, the only way will be to advertise.

HOLLYROCKS (Solihull).—Hollyhocks from seed sown in April will flower next year; also plants from seed sown now in gentle heat, the seedlings being potted off in 5-inch pots when they have two or three leaves, kept close and shaded until established, and then hardened-off and wintered in a cold frame, potting when necessary.

SELECT PANSIES (Idem).—*Sells*: Prince Imperial, purple; Maid of Bath, white; Cloth of Gold, Yellow Grounds; George Wilson, gold, belted with bronze-purple; William Dean, rich gold, light maroon belting; Alexander Whimond, rich yellow, bronze-purple belting; Thomas Martin, golden, belted with bronze and maroon. *White Grounds*: Queen, white, belted with purple; The Bride, white, bluish purple belting; Lady Lucy maroon. Twelve more are—*Sells*: Otchillo, velvet maroon; Miss Ramsay, white; Cherub, yellow. *Yellow Grounds*: William Austin, yellow, maroon; maroon belt; Lord J. Russell, golden yellow and velvet purple. *White Grounds*: Victoria, medium belt of very dark purple; Miss E. Cochrane, white, deep purple belting; Pladda, white and dark purple; and Attraction, cream white, purple belting.

SOIL FOR CUCUMBERS (T. H.).—We use a compost of turf from a pasture, cut 3 inches thick, placed in alternate layers with dung, putting an inch in thickness of the dung between each layer of turf. We prefer

sheep or cow dung. Our borders are narrow, hence we are obliged to employ good rich soil, otherwise we would employ the turf without any admixture of dung. Sandy peat will grow Cucumbers, and is better without manure.

PROPAGATING CYCLAMENS (M. M.).—The Cyclamen is propagated from seed, and the seedlings flower in two or three years from the time of sowing, but the varieties of *C. persicum* flower under liberal treatment in fifteen or eighteen months.

THE "MODERN PEACH PRIMER" (C. F.).—"I have received great benefit from Mr. Brabant's 'Peach Primer.' It is an admirable work, and I recommend it to all gardeners and amateurs."—W. F. RADCLIFFE."

DEFINITIONS (Subscriber).—*Perennials* are plants which live for several years. *Biennials* are plants which are produced from seed one year, bloom and perfect their seed and die the next year. *Triennial* means lasting three years. *Bicolor* is two-colored, and *Tricolor* is three-colored. *Herbaceous* plants are perennials, the stems of which die annually. *Zonal* refers to a continuous belt of a different colour from the rest of a leaf's surface.

SHEPTON MARKET HORTICULTURAL SHOW (R. Wadden).—The word "sorts" should never be used in a schedule; "varieties" or "species" should be employed, just as the Committee may intend. Under the name of "sorts" three varieties of *Lilium* and of *Eriola*, we think, were admissible.

ROTTLEBA AND BALOGHIA (F. G.).—You split the names wrongly. *Il. japonica* is a synonym of *Proton japonicum*, and is quite uninteresting to the gardener, and so is *Baloghia lucida*, a Norfolk Island tree. You will find them described in botanical works.

TROWBRIDGE HORTICULTURAL SHOW (S. H. H.).—If, as you state, an exhibitor showed only eight distinct species in Class 4, for which the schedule requires "nine distinct species," his collection ought to have been disqualified. As Rule 3 specifies that "subjects for competition can on no account be received after 10 o'clock A.M." and the same exhibitor came "about eleven o'clock, and put up his plants while the Judges were in the other tents," he ought not to have been allowed to exhibit. If the Committee informed the Judges of these facts they would, probably, reverse their decision; but we see that Rule 4 seems to reserve to the Committee a power not to disqualify an infringer of Rule 3.

GRAPES NOT COLOURING (J. Conway).—In the case of such Blue Vines and Grapes we can assign no cause for the want of colour in your Black Hamburgs, except the number of large bunches; a few less most likely would have made a difference.

POTATOES SPROUTING (N. mo).—You will find the subject of your inquiry is treated on by "UPWARDS AND ONWARDS" in this week's number, also in page 74.

SEEDLING MELON (G. Mosdale).—The fruit was rather above the average quality of yellow-fleshed Melons, but not superior to many already well known.

PELAGONISUS (H. L. B.).—We presume you wish for the large-flowered or Show varieties, of which the following are good:—Golden Hue, Charles Turner, Conqueror, Selina, William Hoyle, Nabob, Pericles, The High Admiral, Mary Hoyle, Elegans, Progress, and Artist. They are only to be had in perfection in a greenhouse. We presume your plants or cuttings are well established in pots, which are full of roots; in that case they should be repotted at the commencement of September, and be placed in a cold frame, affording full exposure day and night. Tilt the lights at back, using them only for protection from heavy rains and frost. If the cuttings have not been stopped, this must be attended to, cutting them back to three eyes. Early in October remove the plants to the greenhouse, placing them on a shelf near the glass. Give them plenty of air, and no more heat than is sufficient to keep them safe from frost. Avoid damp and watering in winter, only keep the plants gently moving. They may be shifted in December into pots a size larger, and in February they may be stopped, and at the beginning of March have their last shift into 6, 7, or 8-inch pots, according to their vigour.

PROPAGATING MANETTI ROSE SPECIES (A. Subscriber).—The readiest mode of propagating the *Manetti* Rose is by cuttings. In making cuttings take one-year-old shoots, and cut them into lengths of about 1 foot, cutting right across immediately below a bud, and not in a sloping direction. The top should be cut just above a bud, and with a sloping cut. Take out all the eyes or buds except two at the top. In planting it is well to form a ridge, and, dividing it in the centre, put in the cuttings, burying them so as to leave each but one bud above the soil. The cuttings may be put in 6 inches apart, and 2 feet row from row. Each row should represent a ridge about 8 inches high, with the cutting along the centre. The end of October or beginning of November is the best time to put in the cuttings, and by July or August in the following year they will be fit for budding. The soil must then be levelled down from the cuttings, and the bud inserted from 4 to 6 inches from the bottom. The stocks should be banded directly they are uncovered, as the bark then opens freely. The *Manetti* Rose may be distinguished by its vigorous, erect habit and red spiny appearance, otherwise it is not unlike some other Roses. Once known it is ever afterwards readily distinguished. It is not often that suckers cannot be distinguished from the Rose.

GUERNSEY LILIES (E. G.).—It is quite natural for the flowers to appear before the leaves; but these are generally produced at the same time as, or soon after the flowers. You will soon have foliage. The leaves of the plant sent appear to belong to one of the *Jasmines*, but we cannot tell the name without flowers in addition to foliage. Afford the plant a rest by keeping it dry in winter, and expose it fully to light and air so as to well ripen the wood.

PEAR LEAVES BLIGHTED (S.).—The leaves sent are destroyed by the black fungus, the appearance of which is attributable to the roots having penetrated into bad, undrained soil. There is no remedy but efficient drainage, and encouraging the production of roots near the surface by top-dressings of rich compost.

GALVANISED IRON WIRE (J. H. H.).—The cost of galvanised wires may be ascertained from any respectable ironmonger. The proper thickness is that of good stout twine or straw, and the wires may be stretched tight by common thumbscrews, the uprights, of course, being first fixed firmly.

FRUIT-TREE ESTALIERS (Hem).—The most profitable way of growing espalier trees is the good old-fashioned horizontal. If you are fond of variety you may try all the various forms of diagonals, obliques, and vertical cordon training; they are very pretty. We would not advise you, however, looking at the profitable side of the question, to experiment too largely at first before having proved the methods yourself.

BOOKS (Hortus).—Dr. Herbert's notes on various bulbous roots are in the Royal Horticultural Society's "Transactions," in the Appendix to Curtis's "Botanical Magazine," and in the "Botanical Register." He also published in one volume, in 1837, a work entitled "Amaryllidæ," your bookseller ought to obtain it for you.

SIZE OF THE COCKSCOMB STRAWBERRY (Reader).—"The Cockscomb Strawberry measured here in the presence of Dr. Parry Hodges, Vicar of Lyme Regis, and Major Digby, was exactly 12 inches. The tape had the inches marked on it. Dr. Hodges wrote to me for confirmation; as I suppose the people of Lyme did not believe it. Before this I measured one, and it was 9½ inches. The Rev. Mr. Hosegood and his wife, both of this parish, called and much admired the Strawberries. I told them of the 12-inch Cockscomb. 'That,' said Mrs. Hosegood, 'I never can believe!' So I called my right-hand man, Stephen, and told him to look for the biggest Cockscomb left. He found one, and measured it in her presence. It was exactly 10 inches. 'Now,' said she, 'I can believe!' I gave it to her, and she sent it to her sister, the wife of the Rector of Stowford, Launceston, Cornwall, Mrs. Woollocombe."—W. F. RADCLIFFE."

ROSE MARÉCHAL NIEL IN A POT (L. G. Kay).—"My Maréchal Niel are much the same as yours—luxuriant but flowerless. They will not bloom abundantly till they attain age. I have had a bloom or two per plant, but the gross shoots are blind. Do not cut your plant. It will bloom next year. Merely cut off in the spring the tops of the shoots to a good eye or hard wood, and then it will break and bloom. It is too late to practise this on such a Rose during the present season. It is a Tea-scented Noisette (by family, but not by character), and the members of this family do not like much cutting. They require at times thinning out, the tops of their shoots, when blind, taken off, and the firm side wood shortened a little. All useless spray may be removed at any time."—W. F. RADCLIFFE."

INSECTS (T. M. N.).—The Savoy leaf was covered with Cabbage aphids with lime or tobacco powder, afterwards wash the plants with the garden engine. The insects will probably for the most part disappear now that the rain has come. (K. B. M.).—They are slimy grubs, the larvæ of the Pear Sawfly, *Salandria atropis*. Dust the trees with the powder of fresh-slaked lime. (A. Constant Subscriber).—The dead caterpillar sent is that of one of the *Smerinthi*, probably the Eyed or Lime Hawk Moth. —W.

NAMES OF FRUIT (J. Douglas).—Your Peach is Bellegarde. (A. H. H.).—Apples: 1 and 2, Old English Codlin; 3, Kerry Pippin; 4, Fearn's Pippin; 5, Court-Pendu-Plat; 6, Apparently Golden Knob; 7, Probably Court of Wick; 8, Alfriston.

NAMES OF PLANTS (X. Y. Z., Blyth).—We cannot undertake to name florist's flowers. Those you sent had dropped all their petals, with the exception of the *Fuchsia*. (T. M. N.).—It was impossible to determine the name of the withered serip sent, especially as it was not accompanied with a flower. (An Old Subscriber, Hounslow).—The two specimens sent are *Oxalises*, but too withered for us to identify the species. (J. B.).—1, Undetermined, apparently a *Pentstemon*; 2, *Plumbago capensis*; 3, *Cistus incanus*. The *Begonia*s were too much crushed to be determined with certainty. No. 4 is probably *B. sinuata*; 5, *B. lucida*. (A. Constant Subscriber, Worcester).—1, *Polypodium* (*Phymatodes*) *Billardieri*; 2, *Davallia pyxidata*; 3, *Trichomanes radicans*; 4, *Mesembryanthemum imbricatum*; 5, *M. spectabile*; 6, *Pilea muscosa*; 7, *Begonia fuchsoides*; 8, *Gasteria verrucosa*; 9, *Nerium oleander* fl. pl.; 10, *Cypripedium insigne*; 11, *Kalosanthes coccinea*. (P. B. L., Hove).—*Scolopandrium vulgare*, forked variety; *Polypodium* (*Phymatodes*) *vulgaris*; *Athyrium filix-femina*. (G. Cummings).—*Mirabilis jalapa*. (G. H. E. W.). 1, *Brusavigia Josephine*; 2, *Rhamnus libanotica*; 3, *Spiraea Fortunei*. (North Norfolk).—*Saponaria officinalis*.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending August 25th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

DEWSBURY POULTRY SHOW.

(From a Correspondent.)

THIS Show was held under a covered tent on the 19th inst., unfortunately clashing with the one at Rochdale; and this, no doubt, accounts for the fact that the entries of poultry were scarcely so numerous as last year.

The *Pigeons* were numerous and of unusual excellence. In Pouter cocks Mr. Horner was first with a good Blue, Mr. Fulton being second and highly commended with a good Black and a White. In hens Mr. Hawley took first and second with excellent Blues; Mr. Fulton being highly commended with a good Black, and commended with a Red of good sound colour, but slightly deficient in length. In Carrier cocks the competition for first prize was very close between Messrs. Hawley and Fulton, the latter eventually being awarded second, as the cock was slightly wry-beaked. Both cocks were good, as were also the highly commended pens of Messrs. Fulton and Bulpin. In hens Mr. Hawley was again first with a first-class hen; Mr. Fulton second with a hen not so heavily wattled, but of beautiful style. The highly commended birds were also good. The Almond Tumblers were unusually good, Mr. Hawley being first with excellent birds well matched in head and colour; Mr. Fulton second, and very highly commended with birds which made the competition for first very keen. The highly commended and commended pens were good. In Tumblers, any other variety, Black Mottles were first and Kites second, both pairs being splendid. The highly commended pens also were very fair birds. In Turbits good Reds and Silvers were first and second respectively. Mr. Horner's highly commended Blacks did not match in crest, they were otherwise the best birds in the class. Both birds were better individually than the winners, but did not make a well-matched pair, and were consequently thrown out. In Barbs Mr. Horner was first with good Reds and second with Blacks, the cock in the second-prize pen being something extraordinary, but accompanied by an indifferent hen, which was suffering from disease. Two pens of good Yellows were highly commended. In Jacobins and Trumpeters Mr. Horner had it all his own way, though good birds in each class were highly commended. In Owls Mr. Fielding took first and second with the same ease. Mr. Hawley's Fantails were a trifle large, but this was overlooked, as they had wonderful tails and carriage. Mr. Horner's second-prize birds were small and fine, as were Mr. Bulpin's highly commended birds. The Nuns were weak as to numbers, though the prize birds were good. In Dragons Mr. Horner was first with a pair of young Blues as stylish as race horses, and which will be heard of again. A pair of nice Yellows were second. In Antwerps Red Chequers were first and second. "In any other variety" Black Swallows were first, Yellow Magpies second; Swiss Ice Pigeons and Frillbacks were highly commended. Mr. Hawley won the silver cup, value £1 1s., for the most successful exhibitor.

COCHIN-CHINA.—First, W. A. Taylor, Manchester. Second, L. H. Ricketts, Banwell. Highly Commended, C. Sidgwick, Ryddlesden Hall, Keighley. *Chickens*.—First and Second, C. Sidgwick. Commended, W. A. Turner; G. Dixon, Selby.

SPANISH.—First, J. Thresh, Bradford. Second, W. A. Taylor. *Chickens*.—First and Second, M. Farrand, Dalton, near Huddersfield. Commended, T. & E. Cornber, Warrington; M. Egginton, Wolverhampton; W. A. Taylor.

DORRINGS.—Prize, J. Stott, Healey, near Rochdale. *Chickens*.—First, J. Stott. Second, H. Pickles, jun., Early, Skipton.

BRAMA POOTRAS.—Prize, E. Leech. *Chickens*.—First, E. Leech. Second, M. Farrand.

GAME (Black Red).—First, G. Noble, Staincliffe, Batley. Second, J. Hodgson, Bowling Old Lane, near Bradford. *Chickens*.—First, G. Noble. Second, H. Jowett, Wrose Hall, Idle.

GAME (Brown Red).—Prize, J. Hodgson. *Chickens*.—First, E. Brough, Leek. Second, J. Fell, Adwalton. Commended, W. Jagger.

GAME (Duckwings, and other Greys and Blues).—First, G. Noble. Second, W. Fell, Adwalton. Commended, W. Bentley. *Chickens*.—First, W. Fell. Second, T. Dyson. Commended, H. Jowett.

GAME (Any other variety).—First, H. C. Mason. Second, F. Holt, Staincliffe. *Chickens*.—Prize, H. C. Mason.

HAMBURG (Gold or Silver-spangled).—First, H. Pickles, jun. Second, J. White. Commended, J. Laming, Spalding. *Chickens*.—First and Second, J. Senior. Commended, H. Pickles, jun.

HAMBURG (Gold or Silver-pencilled).—First, H. Pickles, jun. Second, J. Laming. *Chickens*.—First, J. Senior. Second, H. Pickles, jun. HAMERGERS (Black).—First, C. Sidgwick. Second, S. Butterfield, Keighley. *Chickens*.—First and Commended, C. Sidgwick. Second, S. Butterfield.

POLANDS (Gold or Silver-spangled).—First and Commended, J. Senior. Second, G. W. Boothby, Louth. *Chickens*.—First, J. Senior. Second, T. & E. Cornber. Commended, G. W. Boothby.

POLANDS (Any other variety).—Prize, Mrs. E. Procter, Hull.

BANTAMS (Black).—First, S. & R. Ashton, Mottram, Cheshire. Second, S. Scholefield, Heckmondwike. Commended, T. C. Harrison, Hull.

BANTAMS (White).—First, W. A. Taylor. Second, J. R. Jessop, Hull. Commended, S. & R. Ashton; T. Burton, Thirtar, near Wakefield.

GAME BANTAMS.—First, J. Senior. Second, S. Scholefield. Commended, J. J. Conins, Chapel Allerton; J. Senior.

ANY OTHER VARIETY.—First and Second, J. Senior.

GAME (Any variety).—Cock.—First, J. Mason, Worcester. Second, E. Aykroyd, Bradford. Hens.—First, E. Aykroyd. Second, J. Mason. Commended, H. Beaman, Bradford.

ANY VARIETY EXCEPT GAME.—Cock.—Prize, J. Senior. Hens.—First, J.

Thresh. Second, J. Senior. Commended, J. Marchant, Hanson Lane, Halifax; M. Farrand.

Ducks (White Aylesbury).—First, E. Leech, Rochdale. Second, M. Farrand.

Ducks (Rouen).—First, E. Leech. Second, J. White, Wakefield. Commended, J. J. Stott.

ANY OTHER VARIETY.—First, S. & R. Ashton. Second, T. C. Harrison.

PIGEONS

POTTER.—Cock.—First, C. Horner, Harewood, Leeds. Second and Highly Commended, R. Fulton, Deptford. Hen.—First and Second, J. Hawley, Bingley. Highly Commended and Commended, R. Fulton.

CARRIER.—Cock.—First, J. Hawley. Second, R. Fulton. Very Highly Commended, R. Fulton. Highly Commended, R. Fulton; C. Bulpin, Bridgewater. Hen.—First, J. Hawley. Second, R. Fulton. Very Highly Commended, R. Fulton. Highly Commended, E. Horner.

TUMBLERS (Almond).—First, J. Hawley. Second, R. Fulton. Very Highly Commended, R. Fulton. Highly Commended, J. Fielding, jun., Rochdale. Commended, T. Rule; J. Hawley.

TUMBLERS (Any other variety).—First and Very Highly Commended, J. Hawley. Second, R. Fulton. Highly Commended, T. Rule; R. Fulton; C. Bulpin.

TURBITS.—First, J. Fielding. Second, J. Hawley. Highly Commended, E. Horner.

BARBS.—First and Second, E. Horner. Highly Commended, E. Horner; J. Fielding.

JACOBS.—First and Second, E. Horner. Highly Commended, J. Hawley.

TRUMPETERS.—First and Second, E. Horner. Highly Commended, J. Hawley.

OWLS.—First and Second, J. Fielding, jun. Highly Commended, A. Dove, York.

FANTAILS.—First, J. Hawley. Second, E. Horner. Highly Commended, C. Bulpin.

NUNS.—First, C. Bulpin. Second, E. Horner.

DRAGONS.—First, E. Horner. Second, C. Bulpin. Highly Commended, H. Yardley.

ANTWERPS.—First, J. Hawley. Second, C. Bulpin.

ANY OTHER VARIETY.—First, J. Hawley. Second, E. Horner. Highly Commended, J. Hawley; H. Yardley; H. Draycott.

RABBITS.

LOP-EARED.—Duck.—First, M. Millington, York. Second, A. H. Easton, Hull. Highly Commended, H. Yardley, Birmingham; C. Gravel, Thorne, near Doncaster; J. Walker, Batley Carr. Dog.—First, M. Millington. Second, G. Jones, Market Hall, Birmingham. Very Highly Commended, C. Gravel.

ANY OTHER VARIETY.—First, A. H. Easton. Second, H. Yardley. Commended, J. R. Jessop; C. E. Marchant; R. Bins.

JUDGES.—Mr. John Martin, Claines, Worcester; and Mr. T. J. Charlton, Bradford.

WHITBY POULTRY SHOW.

UNFORTUNATELY for this Show the weather proved very unfavourable, rain falling continuously from 10 a.m. until the showyard was altogether closed, and the poultry repacked for their return journey. Although the Committee had placed the birds under canvas, the driving rain soon passed through it, and caused not a few of them to be thoroughly wetted through, and even the majority under such circumstances showed to serious disadvantage. To *Hamboroughs*, *Sch-brights*, and all such varieties as are dependant on feather this was, of course, a serious drawback, but as all experienced the same exposure, complaints were but few. Of *Game*, the chickens were far superior to the old birds, though a pen of the latter were the most grossly "trimmed" we ever remember to have witnessed. The owner pleading the rules of the Show, as his justification for so doing—viz., "Rule 12.—All pens will be disqualified, if the plumage of the birds has been trimmed, removed, or otherwise tampered with, Game excepted." It certainly as it now stands appears to countenance the very deceit it was intended to prohibit, and indeed needs alteration.

All the water fowls were good classes, and the constant rain detracted but little from their general appearance. The *Geese*, *Aylesbury Ducks*, *Buenos Ayres Ducks*, and a few of the fancy varieties, being well worthy of especial mention.

In *Pigeons*, the Whitby Show was undoubtedly a very superior one, but from the thoroughly souled state of their plumage they showed to a serious disadvantage. By some oversight, several pens of Pigeons of extraordinary good quality were exhibited of two distinct colors as a pair in the same pen, a feature for which no amount of excellence in other points can make compensation. We regret to hear that only so recently as two years ago the Committee of the Whitby Show had to contend against quite as drenching a day as this year, and we heartily hope more auspicious weather may reward their future exertions.

Subjoined is the prize list:—

DORRINGS.—First, J. White, Warlaby. Second, H. Beldon, Goitstock. Commended, S. Burn, Whitby. *Chickens*.—First, Rev. I. F. Newton. Second, G. Holmes, Driffield. Commended, S. Burn, Whitby; O. A. Young, Driffield; J. White, Warlaby.

SPANISH.—First, H. Beldon. Second, G. Holmes. Highly Commended, T. Blackburn, jun. Broughton. *Chickens*.—First, H. Beldon. Second, G. Holmes. Extra Second, Miss E. Russell. Highly Commended, R. Brown, Warr; Miss E. Russell, Lewisham. Commended, W. Clark, Pickering.

GAME.—First, T. Blackburn, jun. Second, H. Dowland, Ruston. *Chickens*.—First, T. Blackburn, jun. Second, T. Percival. Highly Commended, R. Akenhead, Otterington; T. L. Gray, Ayton. Commended, T. Lovell.

COCHIN-CHINA.—First, G. H. Procter, Durham. Second, H. Beldon. Highly Commended, H. Dowland. Commended, G. Calvert, Darlington.

Chickens.—First, R. Brown. Second and Plate, R. Stratford. Commended, T. H. Readman.

BRABIA POOTRA.—First, E. Leech, Rochdale. Second, J. Walker, Haya Park. Commended, Rev. I. F. Newton.

FRENCH.—First, H. Beldon. Second, W. Stonehouse, Whitby.

HAMBURGERS (Golden-spangled).—First, G. Garbutt, Sington. Second, G. Holmes. Highly Commended, H. Beldon. Commended, H. Pickles, Early; W. Bearpark, Ainderby.

HAMBURGERS (Silver-spangled).—First, H. Beldon. Second, H. Pickles. Highly Commended, J. Walker. Commended, C. Richardson.

HAMBURGERS (Gold or Silver-spangled).—*Chickens.*—First, H. Beldon. Second, G. Holmes. Extra Second, J. Braim. Highly Commended, J. Walker; J. Braim, Briggsdith.

HAMBURGERS (Golden-pencilled).—First, H. Beldon. Second, J. R. Jessop, Hull. Commended, J. Braim.

HAMBURGERS (Silver-pencilled).—First, H. Beldon. Second, H. Pickles. **HAMBURGERS (Gold or Silver-pencilled).**—*Chickens.*—First, Second and Plate, J. Webster. Highly Commended, J. Walker; H. Beldon.

GAME BANTAMS.—First, W. E. Entwistle, Leeds. Second, R. Brown. Third, R. Horstler, Scarborough. Commended, T. Lovell.

BANTAMS (Any other variety).—First, W. H. Tomlinson, Newark. Second, T. C. Harrison, Hull. Third, G. Richardson. Commended, G. Holmes; H. Beldon.

ANY OTHER VARIETY NOT BEFORE MENTIONED.—First, R. Loft, Beverley. Second, W. Usherwood, Whitby. Commended, O. A. Young (Polands).

DUCKS (Black East Indian).—First and Second, S. Burn. Commended, F. W. Earle, Liverpool; Rev. J. Milner.

DUCKS (Aylesbury).—First, E. Leech. Second, O. A. Young. Highly Commended, J. Braim, Pickering. *Ducklings.*—First, O. A. Young. Second, H. Beldon.

DUCKS (Rouen).—First, J. Braim. Second, G. Garbutt. Commended, W. Dowson, Thornhill; T. E. Pymon. *Ducklings.*—First, H. Beldon. Second, R. Brown.

DUCKS (Any other variety).—First, T. C. Harrison (Pintails). Second, J. Walker (Grey Calls). Highly Commended, H. Beldon (Calls).

GEESE.—First, O. A. Young. Commended, G. Holmes; J. Wilkinson. *Goats.*—First and Second, I. B. Braithwaite. Commended, J. Wilkinson.

TURKEYS.—Second, I. B. Braithwaite. *Poult.*—First, O. A. Young. Second, Mrs. W. Ward.

SELLING CLASS (Any variety).—First, R. Brown. Second, J. Conlson (Pencilled Hamburg). Third, T. H. Readman (Buff Cochins).

EXTRA STOCK.—First, J. Jowsey. Second, T. E. Pymon. Commended, W. S. Hornby, York.

PIGEONS.

POUTERS.—First, J. Hawley, Birmingham. Second, S. Burn.

TUMBLERS.—First, J. Hawley. Second, J. Mason, Rooker Hill. Highly Commended, H. Payne.

CARRIERS.—First, H. Yardley. Second, I. C. Ord, London. Highly Commended, G. Sanders, Stokesley. Commended, R. Wilson.

FANTAILS.—First, R. Wilson. Second, H. Beldon. Commended, H. Yardley.

JACOBIANS.—First, H. Yardley. Second, H. Beldon. Commended, S. Burn; R. Wilson.

TRUMPETERS.—First, J. Mason. Second, H. Yardley. Commended, S. Burn; R. Wilson; J. Hawley.

BARDS.—First, J. Hawley. Second, H. Yardley. Highly Commended, H. Beldon.

ANY OTHER VARIETY.—First, J. Mason. Second, H. Yardley. Highly Commended, H. Yardley; S. Burn (Nuns); H. Beldon.

SALE CLASS.—First, H. Beldon. Second, S. Burn. Commended, J. Mason; R. Mitchellson; C. Lythe.

Mr. Edward Hewitt, of Sparkbrook, Birmingham was the Judge.

BURNLEY POULTRY SHOW.

THE fourth annual Exhibition in connection with the Burnley Agricultural Society, took place on the 20th inst., at Burnley. In all respects the Show may be regarded as the most successful which has been held in this part of the country. The collection of poultry was fine, including a magnificent lot of *Pigeons*, exhibited by Mr. J. Hawley, of Bingley, who was awarded most of the prizes in the various classes, and consequently the special prize of a silver cup, value £5 5s., which was offered to the exhibitor who obtained the greatest number of prizes in this class.

GAME (Black or Brown Red).—*Chickens.*—Prize, J. Carlisle, Early Skipton. *Cockerel.*—Cup, J. Fletcher, Stoneclough.

GAME (Any other variety).—*Chickens.*—Prize, T. Dyson, Halifax. *Cockerel.*—Cup, R. B. Riley, Ovenden.

SPANISH.—*Chickens.*—Prize, J. Newton, Silsden.

DORKING.—*Chickens.*—Prize, H. Pickles, jun., Early Skipton.

COCHIN-CHINA.—*Chickens.*—Prize, C. Sedgwick, Keighley.

HAMBURGH (Golden-spangled).—*Chickens.*—Prize, W. Driver, Keighley.

HAMBURGH (Golden-pencilled).—*Chickens.*—Prize, S. Smith, Halifax.

HAMBURGH (Silver-spangled).—*Chickens.*—Prize, J. Fielding, Newchurch.

HAMBURGH (Silver-pencilled).—*Chickens.*—Prize, H. Pickles, jun.

BRABIA POOTRA.—*Chickens.*—Prize, E. Leach, Rochdale.

GAME BANTAM (Black or Brown Red).—*Cockerel.*—Prize, W. F. Entwistle, Leeds.

GAME BANTAMS.—Prize, V. F. Entwistle.

BANTAMS (Any variety).—Prize, R. B. Riley.

ANY OTHER VARIETY NOT NAMED.—*Chickens.*—Prize, J. Robinson, Failsforth.

DUCKS (Aylesbury).—Prize, E. Leech.

DUCKS (Rouen).—Prize, T. Houlter, Blackburn.

DUCKS (Any other variety).—Prize, C. W. Brierley, Middleton.

GESE (Any colour).—Prize, E. Leech.

TURKEYS (Any variety).—Prize, E. Leech.

SELLING CLASS.—*Turkeys (Any variety).*—Prize, J. Newton.

PIGEONS.—*Carriers.*—Prize, G. Charnley, Preston. *Pouters.*—Prize, J. Hawley, Bingley. *Tumblers (Almond).*—Prize, J. Hawley. *Tumblers (Mottled).*—Prize, J. Hawley. *Tumblers (Any variety).*—Prize, J. Hawley.

Barbs.—Prize, J. Hawley. **Oute.**—Prize, H. Yardley, Birmingham. **Trumpeters.**—Prize, J. Hawley. **Jacobins.**—Prize, J. Hawley. **Fantails.**—Prize, J. Hawley. **Turkeys.**—Prize, J. Thompson, Bingley. **Antwerps.**—Prize, W. Wilding, Burnley. **Any other Variety.**—Prize, A. Smith, Skipton. **Selling Class (Any variety).**—Prize, H. Yardley.

JUDGES.—Mr. John Martin and Mr. Tegetmeier.

WHITWORTH AND ROCHDALE POULTRY SHOW

THIS was held on the grounds of W. E. Roys, Esq., Rochdale, on the 19th inst. The following is the prize list:—

SPANISH.—First and Cup, H. Beldon, Goitstock. Second, T. C. and E. Newbitt, Epworth, near Bawtry. Highly Commended, N. Cook, Chobent. *Chickens.*—First and Second, M. Farrand, Dalton, Huddersfield.

COCHINS (Cinnamon and Buff).—First, H. Maplebeck, Moseley, Birmingham. Second, C. Sidgwick, Ryddlesden Hall, Keighley. *Chickens.*—First, Cup, and Second, C. Sidgwick.

ANY OTHER VARIETY.—First, T. Stretch, Ormskirk. Second, C. W. Brierley, Middleton. *Chickens.*—First, J. A. Taylor, Manchester. Second, C. Sidgwick.

BRABAMS.—First and Cup, W. Hargreaves, Bacup. Second, J. Rawstron. *Chickens.*—First, G. H. Roberts, Penwortham, Preston. Second, J. Sickle, Timperley.

GAME.—First, Cup, and Second, C. W. Brierley. Highly Commended, L. Biney, Manchester. *Cock.*—First and Second, C. W. Brierley. *Chickens.*—First, T. Statter, Whitefield. Second, J. Carlisle, Early, near Skipton. Highly Commended, R. B. Riley, Ovenden, near Halifax.

POLANDS.—First and Second, H. Beldon. Highly Commended, P. Unsworth, Sandy Lane. *Chickens.*—First and Second, H. Beldon. Commended, P. Unsworth.

HAMBURGERS (Golden-spangled).—First, T. Walker, jun., Denton, near Manchester. Second, E. Brierley, Heywood. Highly Commended, H. Beldon. *Chickens.*—First, H. Beldon. Second, T. Scholes, Hollingwood, Oldham. Highly Commended, T. Walker, jun.

HAMBURGERS (Silver-spangled).—First, H. Beldon. Second, H. Pickles, jun., Early, Skipton. Highly Commended, J. A. Taylor. *Chickens.*—First and Cup, H. Pickles, jun. Second, J. Fielding, Newchurch, near Manchester. Highly Commended, J. Fielding. Commended, W. H. Bentley, Hipperholme; J. Robinson, Failsforth.

HAMBURGERS (Golden-pencilled).—First, H. Beldon. Second, H. Pickles, jun. *Chickens.*—First, H. Beldon. Second, H. Pickles, jun. Highly Commended, S. Smith, Northwram, near Halifax. Commended, T. Wrigley, Tongue, near Middleton; J. Robinson.

HAMBURGERS (Silver-pencilled).—*Chickens.*—First, H. Beldon. Second, Duke of Sutherland, Trentham. Highly Commended, H. Pickles, jun.

HAMBURGERS (Black).—First, C. Sidgwick. Second, J. Robinson. *Chickens.*—First, C. Sidgwick. Second, J. Robinson. Highly Commended, T. Grafton, Castleton Moor, Bluepits; C. Sidgwick.

DORKINGS.—First and Cup, J. White, Warley. Second, Hon. W. H. W. Fitzwilliam, Wentworth Woodhouse, Rotherham. Highly Commended, Mrs. Arkwright, Etwell Hall, Derby; C. W. Brierley; W. H. King, Moss Mill, near Rochdale. *Chickens.*—First, T. Briden, Early. Second, H. Pickles.

ANY OTHER DISTINCT VARIETY EXCEPT BANTAMS.—First, Hon. W. H. W. Fitzwilliam. Second, J. K. Fowler, Aylesbury. Highly Commended, N. Cook, Chobent. Commended, J. Holroyd, Rochdale.

GAME BANTAM COCK.—First and Cup, W. F. Entwistle, Leeds. Second, T. Barker, Hill End, near Burnley.

GAME.—First, W. F. Entwistle. Second, J. Adkins, jun., Walsall.

ANY OTHER VARIETY.—First, T. Burgess, Brighouse. Second, T. C. Harrison, Hull. Highly Commended, H. Ashton, Prestwich.

DUCKS (Aylesbury).—First, Mrs. M. Seamons, Aylesbury. Second, J. K. Fowler, Aylesbury. Highly Commended, E. Leech, Rochdale.

DUCKS (Rouen).—First and Cup, E. Leech. Second, S. H. Stott, Quarry Hill, Rochdale.

ANY OTHER VARIETY.—First and Highly Commended, C. W. Brierley. Second, T. C. Harrison.

GESE.—First, T. Statter, jun. Second, J. K. Fowler. Highly Commended, S. H. Stott; E. Leech.

TURKEYS.—First, Cup, and Second, E. Leech.

SELLING CLASS.—First, W. A. Taylor. Second, E. Ryder, Harrytown, Stockport. Highly Commended, S. H. Stott; E. Leech; E. Buckley, Rochdale; W. Lamb, Rochdale. Commended, Bowman & Fearon, Whitehaven; D. Haworth.

PIGEONS.

POUTERS.—*Cock.*—Cup, F. Crossley, Elland. Second, H. Harvey. Highly Commended, R. Fulton, Deptford. *Hen.*—First, W. R. and H. O. Blenkinsop, Newcastle-on-Tyne. Second, F. Crossley.

CARRIERS.—*Cock.*—First, G. H. Roberts, Penwortham. Second, F. Crossley. Highly Commended, F. J. Wiltshire, West Croydon; G. Charnley, Preston. *Hen.*—First, R. Fulton. Second, F. Crossley. Highly Commended, J. Fielding, jun., Rochdale. Commended, W. R. and H. O. Blenkinsop.

TUMBLERS (Almond).—Cup, F. J. Wiltshire. Second, F. Key. Highly Commended, F. Crossley; R. Fulton. Commended, R. Fulton.

BALD OR BEARDS.—First, Second, and Highly Commended, J. Fielding, jun.

TUMBLERS (Any other variety).—First, R. Fulton. Second, R. Minnitt, jun., Bentley.

OWLS.—Cup and Second, J. Fielding, jun. Highly Commended and Commended, F. Crossley.

BARDS.—First, Capt. Heaton, Lower Broughton, Manchester. Second, F. J. Wiltshire. Highly Commended, Capt. Heaton; P. H. Jones. Commended, Capt. Heaton.

DRAGONS.—First, T. Charnley, Blackburn. Second, P. H. Jones. Highly Commended, B. Carlisle, Rishton, near Blackburn; F. Crossley; R. Wilson, Thirsk.

TRUMPETERS.—First and Second, E. Horner, Harewood, Leeds. Commended, E. Sheerman, Chelmsford, Essex; P. H. Jones; Jesse Thompson, Bingley.

TURBITS.—First, R. Fulton. Second, R. Wilson. Highly Commended, P. H. Jones; Jesse Thompson.
JACOBS.—Cup, E. E. M. Royds, Greenhill, Rochdale. Second, Jesse Thompson. Third, P. H. Jones. Highly Commended, T. C. & E. Newbitt. Commended, F. Elze, Bayswater.
FANTAILS.—First, C. Bulpin, Bridgewater. Second, T. C. & E. Newbitt. Commended, E. Horner, Harewood, near Leeds.
MAGPIES.—First and Commended, E. Horner. Second, P. H. Jones. Highly Commended, J. Percivall, Peckham, London.
ANY OTHER VARIETY.—First, P. H. Jones. Second, H. Yardley, Birmingham. Commended, H. Yardley; Jesse Thompson; J. Clark, Thirsk.
ANY BREED.—First, Capt. Heaton. Second, E. Horner. Commended, J. S. Skidmore, Nantwich.

JUDGES.—Mr. Richard Teebay, Fulwood, Preston, Mr. John Douglas, Clumber Park, near Workop, and Mr. J. Shorthose, Cramlington, near Newcastle-on-Tyne, for *Poultry*; Mr. W. B. Tegetmeier, Muswell Hill, London, and Mr. D. Woolstenholme, London, for *Pigeons*.

HUNSLET (LEEDS) POULTRY SHOW.

THIS Exhibition was held on the 17th and 18th inst., but the birds shown were, as a rule, very indifferent. The *Hamburg* and *Game* Bantam classes, however, were exceptions, some magnificent Golden-pencilled chickens being shown in the former, and some exquisite Black Red Bantams in the latter class. In Spangled *Hamburgs* Mr. Preston, of Allerton, took first both for Gold and Silvers, while Mr. Perrin, of Killingbeck, Leeds, took every prize in the Pencilled classes—Gold and Silver.

Pigeons and *Rabbits* were very indifferent, and nearly all the first prizes in these classes were withheld. Subjoined is the prize list:—

DORRINGS.—Prize, J. E. Brittan, Leeds Pottery.
SPANISH.—First, W. F. Pickard, Thorne. Second, J. Squire, Rothwell.

COCHINS.—First, T. Wilcock, Morley. Second, H. B. Atkin, Hunslet Game (Black-breasted and other Reds).—Prize, T. Wilcock.
GAME (White or Pile).—First, T. Wilcock. Second, — Dixon, Hunslet.
HAMBURGS (Gold-pencilled).—First and Second, F. Perrin, Killingbeck, Leeds.

HAMBURGS (Silver-pencilled).—First, F. Perrin.
HAMBURGS (Gold-spangled).—First, J. Preston, Allerton, near Bradford. Second, T. Wilcock.

HAMBURGS (Silver-spangled).—First J. Preston. Second, T. Wilcock.
POLANDS (Any variety).—Prize, F. Perrin (Golden).

GAME BANTAMS (Black-breasted and other Reds).—First, W. Cousins, Chapel Allerton. Second and Highly Commended, W. F. Entwistle.

TURKEYS.—First, W. Taylor, Osmauthorpe. Second, O. Grosvenor and Son, Hunslet.

GEES (Dark).—First, W. Taylor. Second, O. Grosvenor & Son.

GEES (Light).—Prize, J. Newton, Chapeltown.

DUCKS (Rouen).—Prize, — Nicholson, Middleton Hall.

DUCKS (Aylesbury).—Prize, W. Taylor.

GUINEA FOWL.—Prize, — Akyrold, Arncliffe, near Leeds.

Mr. H. C. Mason, of Drighlington, and Mr. J. Mitchell, of Hipperholme, were the Judges.

MEIGLE POULTRY EXHIBITION.

THE fourth annual competition of the Meigle Horticultural and Poultry Association came off in the play-ground, Meigle, on the 19th instant. The number of entries was large, and, as Admiral Popham remarked when awarding the cups, "there was not a worthless pen in the whole place." Among the competitors were persons of all conditions and ranks, from the Duke of Newcastle downward. Lord J. F. Gordon Hallyburton, P. W. Ogilvy, Esq. of Ruthven, and the Hon. the Countess of Strathmore were among the competitors, and all of them obtained prizes. The chief prize—a silver cup, value £9—was awarded to a pen of Brahmas six months and a half old, belonging to Mr. Keith Jopp, wine merchant, Aberdeen. There was no mistake in the award, although the second pen (P. W. Ogilvy's of Ruthven) was not far behind. The second cup—£3, was awarded to Mr. Andrew Bruce, Airlie, for a pen of Dorkings four months and a half old. The Game shown was of the very highest class, and a finer pair than gained the first prize in Class VI. is seldom if ever seen. In the course of his remarks in presenting the cups, Admiral Popham paid a high compliment to the Chairman, Secretary, and Committee under whose auspices the Show had been got up.

DORRINGS.—First and Second, G. Allan, Balhary. Third, L. McDonald, Durdie. Commended G. Allan, *Chickens*.—First, P. W. Ogilvy. Second, T. Raines, Stirling. Third, D. Gellatly, Meigle. Commended, A. Bowie, Carnoustie.

SPANISH.—First, M. Turnbull, Melrose. Second Mrs. Anderson, Meigle. Third, Countess of Strathmore. *Chickens*.—First, Mrs. Anderson. Second, D. Gellatly. Third, M. Turnbull. Commended, Bowman and Fearon, Whitehaven.

GAME.—First, K. Nicoll, Carnoustie. Second, P. Mitchell, Perth. Third, D. Crichton, Ruthven. Commended, D. Gellatly. *Chickens*.—First, Duke of Newcastle. Second, P. W. Ogilvy. Third, W. Meldrum, Forfar. Highly Commended, H. Goodall, Kirkcaldy. Commended, W. Meldrum.

BRAHMAS.—*Chickens*.—Cup and First, K. Jopp, Aberdeen. Second, P. W. Ogilvy. Third, K. Jopp. Commended, T. Raines.

COCHIN-CHINA.—*Chickens*.—First, Duke of Newcastle. Second, Bowman and Fearon. Third, Mrs. Hendry, Aberdeen.

HAMBURGS.—*Chickens*.—First, Mrs. Farquharson, Invercauld House. Second, W. R. Park, Melrose. Third, R. McGregor, Perth. Highly Commended, Mrs. Farquharson. Commended, Mrs. T. Kydd.

BANTAMS.—*Chickens*.—First, Bowman & Fearon. Second, P. W. Ogilvy. Third, T. Raines. Commended, P. W. Ogilvy.

ANY OTHER DISTINCT VARIETY.—First, P. W. Ogilvy (Brahmas). Second, A. Robertson (Brahmas). Third, D. Gellatly (Cochins). *Chickens*.—First, W. R. Park (Creve-Cœur). Second and Third, P. W. Ogilvy (Houdans).

ANY VARIETY.—*Chickens*.—First and Second, P. W. Ogilvy (Dorkings and Game). Third, D. Gellatly (Dorkings).

EXTRA PRIZE.—*Ducklings*.—First and Second, P. W. Ogilvy. Third, D. Gellatly. Commended, J. Sharp.

GEES.—First, Mrs. Ballingall, Cookston. Second, Mrs. Barclay, Simprin. Third, Countess of Strathmore.

TURKEYS.—First, Countess of Strathmore. Second, Miss A. Kinloch, Kinloch. Third, Lord J. F. Gordon.

SELLING.—First, P. W. Ogilvy. Second, — Anderson. Third, D. Gellatly.

DORRINGS.—First and Third, D. Gellatly. Second Mrs. White. Commended, Mrs. Duncan. *Chickens*.—Cup and First, A. Bruce, Airlie. Second and Third, D. Gellatly. Commended, G. Allan.

SPANISH.—First, Mrs. Anderson. Second, D. Gellatly. Third, Mrs. Tait, Meigle. *Chickens*.—First and Second, Mrs. Anderson. Third, D. Gellatly.

HAMBURGS.—*Chickens*.—Prize, J. Whitten, Ruthven.

ANY OTHER DISTINCT VARIETY.—First, D. Gellatly (Game). Second, G. Mustard (Game). Third, G. Cuthill, Drumkillo. *Chickens*.—First, G. Mustard (Game). Second, D. Gellatly (Cochins). Third, Miss Anderson, Meigle (Russian Dorkings).

DUCKS.—First, J. Whitten. Second, G. Cuthill. Third, G. Allan. *Ducklings*.—First, A. Bruce, Hole. Second, Mrs. Hill, Braideston. Third, G. Cuthill.

CHICKENS.—First, W. Simpson, Cardean. Second, G. Cuthill. Third, W. Simpson.

PIGEONS.—First, J. Sharp. Second, Mrs. Hendry. Third, D. Gellatly. Very Highly Commended, W. R. Park.

The Judges were Mr. Redpath, Edinburgh, and Mr. Brown, Perth.

PIGEON-JUDGING.

I HAVE read from time to time with much interest the various articles on Pigeons that have appeared in "our Journal." Many have been instructive, some abusive, and a few humorous; also there are a few of another character, that of fault-finding, and the faults seem, according to their showing, to rest with the judges of the different shows.

I shall confine myself in this instance to the article on Pigeon-Judging (page 101), by "A YOUNG FANCIER," in which at nearly the commencement he puts forth a statement of "unfairness" with regard to the Judges at the last Birmingham Show.

Now, if there was anything unfair in the matter, I consider myself solely responsible for it. No one who knows those gentlemen who compose the Birmingham Show Committee (and I have had that honour seventeen or eighteen years), but will say that they always do all that possibly lays in their power to render justice to every one without fear or favour.

"A YOUNG FANCIER" says one of the Judges was appointed at the "eleventh hour." "Was that fair?" Why not fair? Why unfair at the eleventh hour more than any other, I am at a loss to know. I should say it was better, the Judge not knowing until the eleventh hour that he was to judge. However, this was not the case. I was written to to know if I would act as Judge as usual. I replied in the affirmative. From future letters I found to my great regret my old friend and colleague, Mr. Cottle, could not attend. Some names were suggested, I suggested some. Amongst those I suggested was that of Mr. Hedley, believing him to be a good fancier of certain classes of birds, and honest in his dealings; also, Mr. Tegetmeier. Of the latter there was a doubt about his being able to come, and a few days before the Show I was told of the great increase in the entries. Seeing Mr. Hedley the night before the judging, I said I was afraid that there would be more to get through on the morrow than could be done properly, but it would depend much on the classes that were strongest; and although he had entered and paid for several pens of birds, I asked him if he would mind acting as Judge should I deem it requisite to call in the aid of another. To this he at first demurred, but finally said he would, and would look up in the morning to see if he could be of any service. I confess I was anxious, as Mr. Tegetmeier was in delicate health, and it was a heavy day's work. Mr. Hedley came, and I considered the interests of the exhibitors would be much better served by my asking the Committee for another Judge to assist by taking certain classes. Mr. Hedley did assist, forfeited his money paid on his several pens, and also his prizes, for he assuredly would have taken more than one, and for so doing he is abused. As I said before, the whole blame, if any, rests with myself, and it would be unjust in me did I not now state it after what has been said.

My reasons for acting as I did were these: I found by the

large number of entries that it would be almost impossible to get through these carefully, bird by bird, before dark, and every good fancier will, nay, must admit, that judging by the light of a lantern is scarcely judging at all, especially when the Judges have to deal with the delicate colours of many of the varieties. The very fact of my wishing to be fair to everyone has brought down the accusation of unfairness. I have always been most anxious since I have had the honour of judging that everyone should have justice done him as far as my ability as judge extended, and I did not think that on this occasion it could be rendered without help. I think instead of the case being said to be unfair, it was the most fair thing I could do.

It has been said, also, that the Judges at the various shows are incompetent, &c., and have but a slight knowledge of many of the breeds, and often more of the exhibitors—that is to say, they favour the latter. For my own part, I have kept within the last thirty years almost every variety of Pigeon (as also my friend Mr. Cottle, and I have bred them and won many prizes with birds bred by myself. Amongst my several pens are two of the Birmingham silver cups, one of them the only ten-guinea cup ever offered for Pigeons at this Show; besides which I have had the honour of acting as Judge at Birmingham and elsewhere many years, having had the pleasure of handling and comparing very many of the best birds in this country; also in my profession as an artist I have sketched many of them, thereby still more closely observing their beauties and defects. Further, I can say that when I have entered the showyard to judge, I have not known to whom any of the birds belonged, and with very few exceptions I have been in the same ignorance when I left. I go to judge the birds not the owners, and I can confidently say that I never acted unfairly in judging at any show in my life, for I consider if a judge cannot be depended on there would soon be no exhibitors. I have endeavoured, and I trust partly succeeded, both by pen and pencil to bring the domestic Pigeon and its beautiful varieties as much and as favourably before the public as possible. These endeavours commenced many many years ago, when there were but here and there a few gentlemen banded together for the purpose of keeping up certain breeds. The love of Pigeons has grown rapidly, grown even beyond my utmost expectations, which is much pleasure to me, but yet in my opinion the fancy wants heart.

In conclusion, the office of judge is a pecuniary loss to me, and I shall be very happy to resign my post, with my employers' consent, to any one whom the great body of exhibitors have more confidence in, and as for myself at some future day I may again be found at some of the shows, as heretofore, an exhibitor. But I am willing to act as judge as long as I can be of service.

Now, a word to the exhibitors. Much has been said about the Judges. As a rule, if possible, I generally stay in Bingley Hall on the Monday to give the exhibitors the reasons why their birds have often lost, &c. I am obliged to be blunt, and I have to say things frequently which hurt my feelings. To one, perhaps, it is the birds were very much trimmed; to another, ill-matched; to another, worse matched—two cocks; to another, as badly matched—two hens; to another, your birds were dyed in feather; to another, your birds were dyed around the eyes; to another, two tail feathers wanting (this, of course, was in catching the bird, quite an accident); sometimes flight feathers from the same cause. In short it falls to the lot of the Judges to find out by time and trouble the mean and paltry tricks to which their fellow men resort to obtain a few pounds that ought strictly to belong to others who show more honestly. Nor does the fraud end here, for these birds are often bought as good, and sometimes by a young beginner, who at once becomes disgusted with the fancy.

Then there is the borrowing of birds (these are not *bona fide* property), to gain a medal or a cup. Think, ye that do this.

Another word. This to the public. When you pass the pens of poultry and Pigeons, and you think the Judges have erred here and there, look well to those birds and, perhaps, like them, you will discover the reason why they obtained no reward of merit though *seemingly* they deserved it.—HARRISON WEIR, *Weirleigh, Breckley, Kent.*

DRAGOON PIGEONS.

I NOTICE in your Journal of June 4th, a letter from "WILTSHIRE RECTOR" upon the Horseman and Dragoon Pigeon. I also find in the number for June 18th, the same subject taken up

and enlarged upon by two other fanciers—viz., "A FOREIGNER" and "J. I. B.," and in a subsequent number I also find Mr. Crossland gives his experience of the Antwerp Pigeon. I, like the last-named gentleman, should have preferred writing on the subject at an earlier period, but have been unable to do so.

I have been, and still am, a great admirer of Dragoons. I have kept them for years, and at one time had few others, and having at the present time about forty show birds of this variety (various colours), my ideas may, perhaps, be deemed worthy of some notice.

In the first place, in reviewing "WILTSHIRE RECTOR's" remarks, I must say I cannot agree with him that there should be any distinction acknowledged between the Horseman and Dragoon. My opinion is, that they are one and the same (as their name signifies), and do not admit of a line being drawn between them, for it would only make more complicated the difficulty experienced in severing the Dragoon from the Carrier. Accepting "WILTSHIRE RECTOR's" quotation from Moore's work of the Latin titles of the two varieties, the Horseman, "*Columba tabellaria minor*;" the Dragoon, "*Columba tabellaria minima*," and adding the Carrier, "*Columba tabellaria major*," I think it must be quite apparent that these names intimate that they are simply various grades of one kind, and that they are so must be obvious to any one who has studied them.

Now, "WILTSHIRE RECTOR" says, "As Carriers should be always Black or Dun, so the Horseman and Dragoon should never be of those colours." Thus I gather from this and other portions of his letter, that he allows *only* of Black and Dun Carriers, and ignores Blues and Whites altogether, which I am much surprised at. That Blacks and Duns are generally the best few would deny, but to ignore the others is quite unreasonable.

I know the difficulty of procuring Carriers of a good Blue colour, and I also know the scarcity of good Whites; but there are some splendid specimens of both kinds, and that is why we should rather value them more. I have myself a pair of Blue Carriers, both good, but the hen is a perfect bird, and from the many smoky specimens exhibited, I think it would be well to encourage the fancier to endeavour to improve the Blues and raise them to the level of the others. The superiority of the two varieties I attribute to the encouragement that breeders have had to cultivate Blacks and Duns, whilst the others have been allowed to a certain extent to degenerate. I believe that if a class were formed for them at most of our shows, instead of only a few, the fancier would be stimulated to cultivate Blues and Whites, which of late have been considerably neglected. I will not dwell upon this point, but will leave it to Carrier fanciers to decide. However, I would say, that the Black Carrier, in my opinion, is certainly the variety to be preferred from its uniform raven blackness, which contrasts so beautifully with the light-coloured wattle and rich bright eye, which in the other varieties is comparatively lost. The Blacks and Duns are also more numerous, from the fact that the colour does not require the same care to produce as the Blues; for Blacks and Duns are frequently paired together for breeding, with but little fear of their progeny being spoiled, as far as colour is concerned.

Dragoons are of five acknowledged colours—Blue, Silver, White, Yellow, and Red. Pied and Mottles, as "WILTSHIRE RECTOR" mentions, are as yet not acknowledged, but are merely the result of an injudicious cross between some of the above-mentioned varieties. Dragoons are certainly the most graceful of the Pigeon tribe. There are others which ought to be much admired for their pretty gay appearance, their rich and varied colours, their compact little form, their large size, their aerial performances, or the other many qualities which the numerous kinds possess, yet, in my opinion, the Dragoon is second to none for symmetrical and graceful form and nice proportions, which should commend them to the notice of the fancier, if they had no other recommendation.

Our friend "WILTSHIRE RECTOR" suggests that neither Dragoon nor Horseman should be lost sight of, but that their characteristics should be clearly given. I wonder who will be found to give a properly-defined description of the difference between the Horseman and Dragoon. I would recommend that no one should attempt to do so, it would only make "confusion worse confounded."

The show Dragoon should partake much of the general outline of the Carrier, possessing all the beauty of form and carriage without being so coarse in appearance as the Carrier is when above two years old. I contend that Dragoons should

be Dragons from the time they are hatched until their death, whatever age they may be, and not a Horseman when young, a Dragon at middle age, and a Carrier when old. I have myself taken a prize with a young Carrier hen, shown as a Dragon at four months old, and when about fourteen months she was highly commended in the Carrier class when competing with Blacks and Duns of various ages, and I know that similar cases are numerous where time only has transformed them into another variety. I appeal to Pigeon fanciers, Should this be the case? Let us draw a distinct line, then.

Dragons should be moderate-sized birds, very much smaller than good Carriers. They should have a long, straight, black beak, narrow skull, large and bright orange-coloured eyes, rather prominent but not protruding too much. They should have but little wart or wattle either on the beak or round the eye; that upon the beak should be neatly packed on the top, and not overhanging the sides of the beak; it should also be well tilted at the back—that is, raised to the bend of the top of the head, which together with the lump at the back of the skull adds to the length of the head. This, by-the-by, should not be too long, $1\frac{1}{2}$ inch or $1\frac{1}{4}$ inch is quite long enough; that of a good Carrier should be $1\frac{1}{2}$ inch, or as much longer as you like, measuring from the centre of the eye to the end of the beak. The eye-wattle of the Dragon should be small but circular, and not pinched-in at the back; the neck should be long and thin, and nicely tapered; the shoulders or butts of wings should be wide and prominent; the body wedge-shaped; the legs and thighs long, and should show the angle distinctly; the feet large; the colour uniform with the exception of the neck, which in all is more or less beautifully resplendent with rainbow tints, which are more distinct in Blue and Black Pigeons generally than in the other colours.

With regard to the colour of Blue Dragons there is a diversity of opinion. Mr. Percivall (a Dragon fancier), and myself had a little controversy some time ago in this Journal, and I think the only difference in our opinions is, that I would admit the light-rumped and white-rumped birds to a share of favour, whilst Mr. Percivall considers any variation in colour a positive defect. This point I leave; but still I hold that what is lost in one particular is amply made up in the richness, transparency, and brilliancy of colour and contrast in the lighter-coloured birds. Blue Dragons should be of a bright colour on the sides of the wings and across the upper part of the back, but in nearly all cases and all kinds of blue Pigeons this tint will be found to soften towards the lower extremity, and whatever tint that may be a corresponding shade is to be found under the wings, belly, and thighs. The head, I should mention, ought to be rather darker than the sides of the wings, and terminating in a circular shape at the ends of the hackle. The bars upon the wings should be neat, narrow, and jet black.

Dragons should also be sprightly flying birds, and are, undoubtedly, good homing birds, as I can testify. All my birds have their liberty. They are about seventy in number, and with seven exceptions are all Dragons and Antwerps. Dragons are swifter in flight, but fly lower than the Antwerps, are not so persevering or enduring as the latter, and consequently not so safe or so good as homing birds.—J. W. LUDLOW, *Birmingham*.

REARING YOUNG CANARIES.

I THANK several correspondents for kindly answering my queries about using gas in a Canary room. I now offer a few remarks on rearing young birds.

This season I adopted, though not until the end of June, the food recommended by Mr. Blakston in his "Guide," and have only lost two young birds out of twenty, and these not from the food, but the fault of the parent birds. Every morning, to six pairs of birds with eighteen young ones, I gave two eggs chopped fine and mixed with a good table-spoonful of crushed hempseed—the seed to be measured before crushing—and three or four lettuce leaves. In the evening I gave the same, but only used one egg. The hempseed is crushed in a couple of minutes in a small box coffee-mill properly set for the seed; and I ought to say, once or twice when the eggs were very small, I used two also in the evening. Any food remaining in the egg tins I mixed with a little canary and rape seed, and gave to what I call my "weaned lot," so that nothing was wasted.

On this food I was enabled to turn out, at three weeks old, the young birds into a large aviary cage to shift for themselves; but I continued giving a little soft food. Hitherto I have sus-

tained many losses amongst young birds, which I attribute entirely to bread crumbs. The bread does not get properly cleansed, in steeping, from yeast, salt, &c., all of which are injurious to young birds and old ones. But whilst upholding eggs and hempseed, I maintain that the secret is in giving the fresh lettuce leaves. It is surprising the quantity a hen and one canary chick will manage to eat between them in a day. The rich stimulating food—egg and hempseed-meal—combined with the cooling and purifying vegetable, forms a diet unequalled. I much prefer lettuce, but ripe groundsel or chickweed must be given rather than no green food at all. Others more experienced than I am may be very successful in bringing up young birds on different food. I am only induced to make these observations in support of the food recommended in the "Guide," that others trying it may find it succeed with them. I shall be glad if any one can corroborate my statement by his own experience this season.—W. D., SKELTON, JUN., *Leeds*.

MARKED AND VARIEGATED CANARIES.

WHAT does Mr. Blakston mean by "marked birds, and marked birds?" To a novice in Canary-breeding this seems tautology.—T. C. H.

I used the expression "marked birds, and marked birds" in the same way as we say "*Il y a des femmes et des femmes*," implying that, although similar in name, they may differ widely in character. "Well-marked" was "T. C. H.'s" description of his birds, and I simply wished to call attention to the fact that birds may be marked without being *well* marked; and I meant it more in the way of a query as to the style of marking, than as conveying any idea of a doubt as to the existence of the marks themselves; only it struck me that fifteen well-marked birds from one hen were so unusual, that "T. C. H." was possibly under a misapprehension as to what good marking consists in.

The two terms in general use applied to Canaries not absolutely clean, are "Variegated," and "Marked;" but either from some ambiguity in the meaning of these words, or from their not being regarded as technicalities, mistakes are constantly occurring, and few societies issue a schedule in which the difference is clearly defined; while comparatively very few exhibitors have a clear and intelligent appreciation of the proper significance of the terms. I believe that the North of England Ornithological Association was the first to separate "Variegated" and "Marked" into two classes in the Great Show of Christmas, 1867, and was induced to take this step from the fact that up to that time it had been the custom to have but one class, called "Marked or Variegated," which expression, taken as it stands, may mean either of two things—that "Marked" and "Variegated" are synonymous terms, representing one and the same class of bird, which may be designated either way at the option of the exhibitor; or, that both Marked and Variegated birds might be exhibited in the same class. Plainer still, it might be taken to mean birds which are sometimes called Marked and sometimes called Variegated (recognising no difference between the two), or both Marked birds and Variegated birds, admitting the difference.

That either of these conclusions might be arrived at is fully evidenced by the fact that both kinds of birds were being constantly shown together, till Mr. Barnesby, of Derby, struck a direct blow at the absurdity by awarding the first prize, say in the Jonque class, to the best Variegated bird, and the second to the best Marked bird, and *vice versa* in the Mealy class, contending, and very justly too, that if both descriptions of birds were grouped in one class, each had as much right to notice as the other, much to the chagrin of exhibitors, however, as, *ceteris paribus*, a Variegated bird is of much more value than a Marked one, so far as the marking is concerned.

Then what is a Variegated bird, and what a Marked bird? I will try and explain. Any departure from being absolutely clean, however slight, will render a bird variegated, inasmuch as it varies from the original, having a diversity of colours; keeping clearly in view the idea that the word has reference solely to a plurality of colours, and not a plurality of markings. This word then becomes a comprehensive term, including every bird not positively clean, whether lightly or heavily marked. If it have as much as a single feather of a different colour from its original yellow or buff, it at once enters the list included in the parent word variegated, simply because it is not clean but has a diversity of colours. But since all markings are not of equal value, some being of everyday

occurrence, and others very difficult to obtain and consequently very rare, it becomes necessary to make some sort of distinction between them, and with this view the whole family of Variegated, or Bicolored Canaries I might call them, is divided into two classes, easily distinguished from one another. To the first class belong those birds which are marked on each wing, on each side of the head (what is known as spectacle-eye marking), and on either side of the tail. To these markings some eminent judges add an oval cap on the crown of the head, and an entirely dark tail. I shall not pause here to discuss the question as to whether this is or is not a judicious addition; much may be said on both sides, but I rather dissent from it. To such birds the term "Variegated" is applied, which now, divested of its parent or comprehensive character, is used as a technical term to designate those birds which are evenly marked, or approximate thereto by having markings which it is possible to repeat in duplicate in the position, I have pointed out. I say approximating to exactness, because either side may not correspond feather for feather with the other. Neither must a bird necessarily possess the whole of these markings; having any or all of them will constitute a Variegated bird, but evenness and regularity determine the value of the variegation.

Now since there are but two classes of Bicolored birds (I use this mode of expression for the sake of perspicuity), and I have defined what constitutes that which we technically term Variegated, a very simple process of reasoning will enable us to arrive at the conclusion that a bird possessing any other description of marking, either with or without any or all of those before referred to, belongs to the second class, and is called a "Marked" bird.

However, well variegated a bird may be (I now use the term variegated in its technical sense to signify evenly marked, according to the conditions laid down), but has any other mark, whether it be the faintest tick or a decided blotch on the neck, back, breast, rump, &c., it becomes a Marked bird; and just as the slightest step beyond the boundary line shifts the bird from the one class to the other, so the absence of any such random marking, ticks, or blotches confines it to the Variegated class, even though its eye marks, wing marks, or tail marks be reduced to one; in which case, though being strictly a Variegated bird, it is so bad a specimen as to be unable to compete with more regularly marked ones; and it is usual where the classes are separated to allow such birds to be entered in the Marked class, where marks are not taken into consideration in judging, but the valuable points—colour, quality, feather, shape, condition, decide the matter. I do not approve of such a compromise, any more than I do of adding the cap on the crown of the head to the list of markings constituting variegation proper, and think I can show both to be unsound in principle.

A bird must belong to one class or the other, and it is a manifest absurdity to show it in a class to which it can claim no legitimate pretensions, for no other reason than that it has no chance of winning in the division to which it rightly belongs. The uniting of the two classes "Variegated" and "Marked" certainly allowed of all gradations of excellence in marking being shown together, from the specimen of absolute exactness down to the bird only blotched without any approach to regularity; but it was in most instances equivalent to the exclusion of the latter, for where the terms were held to be synonymous, the true variegated bird always conquered one which was considered to be foul-marked; and these last, forming as they do a very valuable portion of a breeder's stock, must be virtually excluded from competing unless a separate class be found for them, as was first done here (Sunderland), and then at the Crystal Palace, where in the absence of any definition of terms the schedule states "Even-marked or Variegated Norwich," and "Tick'd or Unevenly-marked Norwich." At both shows the separation was an immense success.—W. A. BLAKSTON.]

ARE WAXEN SHEETS USEFUL?

Will one or more of your apianary correspondents who have made free use of the artificial wax sheets, give your readers the results of his experience? There are two points on which especially I desire information. I have been told that the Stewarton (Ayrshire) bee-keepers consider that the use of the sheets gives them three boxes of super honey, when without them they would only have had two. If this be true their use ought to be more general. Again, I have been informed that

in constructing their cells on the basis of these sheets the bees extend them, so that it is necessary to make them less than the frame into which they are introduced. Is this really the case? For one thing I am aware they are very valuable—viz., that they secure straight combs, which in the frame bar hive is of consequence; but my experience has been so limited, that I rather desire to obtain than to impart information.—APIS.

[We should be glad if such of our correspondents as have had experience in the use of impressed waxen sheets or artificial combs, would reply to the foregoing inquiries.]

PREVENTING BREEDING IN SUPERS.

Will you advise me as to the best mode of preventing breeding in supers or boxes worked over bee hives on the storifying plan? We have had a great number of boxes greatly spoiled from this cause this year, and even some of them had queen's cells formed in them. Could it result from the excessive heat of this season, or, perhaps, it may arise from something indirectly wrong in our management or arrangement of supers?

I was thinking of adopting Pettitt's system of very narrow passages from stock hives to honey boxes or supers, and which he asserts is a complete prevention of the evil of which I complain. I see, however, that his arrangement in this respect, is strongly condemned by "A DEVONSHIRE BEE-KEEPER."—SUPER.

[I am glad to have the opportunity of explaining that my reply to "E. Lecch" was intended to apply only to the case laid before me, and not to a general condemnation of Mr. Pettitt's arrangement, which I have not myself had the opportunity of trying. Had the full particulars appeared, it would have been seen that it was perfectly successful in excluding both queen and drones from the super, although it unfortunately proved fatal to an enormous number of bees. It does not follow that because a contrivance acts injuriously in a particular instance, it may not succeed perfectly in others, and it is, therefore, much to be desired that as many as possible who have tested Mr. Pettitt's mode of restricting communication between hives and supers, would report the results of their experience. I have myself been successful in excluding brood from supers, simply by adopting side communication; but I fancy that your esteemed correspondent, "A RENFREWSHIRE BEE-KEEPER," has had more experience on this point than I have, and should, therefore, be much obliged if he would kindly enlighten us on the subject.—A DEVONSHIRE BEE-KEEPER.]

BEEES IN EAST WORCESTERSHIRE— WOODBURY HIVES.

THE honey harvest here (East Worcestershire) has been wretched, and while everyone has been complaining, a friend of mine at Wolverhampton (ten miles from here) has taken three supers worked off Woodbury frame hives, which he estimates contain together not less than 100 lbs. of honey.

I use Woodbury hives only, and since living here (about eight months), no fewer than five bee-keepers in this neighbourhood have adopted them, so great is their superiority.—H. S.

UNITING BEES.

HAVING read of the great advantage of uniting bees, and having two hives that appeared deficient in strength, I determined to try the experiment. One was a Woodbury hive with a swarm of this year, and the other a Stewarton with a stock three years old. I arranged with a cottager to take some of his condemned bees, and having acted carefully according to the directions of the "DEVONSHIRE BEE-KEEPER," I was perfectly successful in securing two hives full of bees. As soon as it was dusk I removed the crown-board from the Woodbury hive, put another live on the top, shook the strange bees into it, covered them up, and left them till morning. I then raised the Stewarton hive, laid some sticks on the floor where it stood, shook the strangers between them, sprinkled them well with boiled sugar and water, replaced the hive on the sticks and left them for the night, hoping that in the morning I should find peace and harmony established. But what a melancholy sight did I behold! In the Woodbury hive there was evidently a furious fight. Thousands of bees were being turned out dead, and

others were being carried into my neighbour's garden, as if that were considered a more suitable cemetery than my own. This process went on during the whole day, till at length the number of dead bees must, I fear, have exceeded the number of the strangers, so that my hive is weakened rather than strengthened by the transaction. In the Stewarton hive there was not so much noise as in the other, but as far as I can judge from appearances, all the strange bees have been turned out, and, curiously enough, several wasps with them.

Now, I should be very much obliged to you to let me know the cause of my failure. Was it my fault or that of the bees? Was it that I made some mistake, or that they had not read the right bee-book and did not know how good bees ought to behave?—H.

[With regard to the bees which you attempted to unite to the Stewarton hive, you appear to have followed correctly enough the directions given by the late Mr. Payne, but have unfortunately realised the truth of some remarks upon his process which I published in "our Journal" in December, 1863, and wherein after quoting his words, I say—"Thus far Mr. Payne, and he may be, and probably will be found to be, right in a majority of cases; but in many instances I have known daylight reveal a sickening scene of slaughter, so extensive as to make it more than doubtful if sufficient bees survived to render the attempted union of the slightest advantage to the stock intended to be benefited thereby." Occasional catastrophes of this kind are, I believe, unavoidable where the operator has to unite bees to a stock domiciled in a hive with fixed combs, but they only occur in a minority of cases.

With Woodbury frame hives the case is, however, very different, and failures are so rare when the operation is properly managed, that I feel justified in ascribing your miscarriage to neglect of the instructions which I gave in page 320 of the last volume of "our Journal." Had you, as therein directed, first captured the queen of the frame hive, and then driven the bees upwards through the bars into the same hive with the previously driven bees, finally knocking out the conjoined cluster on the top of the frames after temporarily deepening the hive by placing an empty one on the top, success would, I think, have been nearly certain. If you will but "try again" and adhere somewhat more closely to my instructions, there is no doubt ultimately that your perseverance will be rewarded by complete success.—A DEVONSHIRE BEE-KEEPER.]

DRIVING BEES.

A NEIGHBOUR has two hives of bees, and which he purposed suffocating before taking their honey. He says he will give them to me, if I will drive them. Do you think it possible, if I unite the swarms, and put them in a Neighbour's Improved Cottage Hive, to keep them alive by the greatest amount of feeding? I only commenced bee-keeping this spring. A friend gave me a swarm (a June one). I have fed it very liberally, and it is now pretty strong. It is in a common cottage hive. Would it be better to put one or both lots to this hive?—P. G. C.

[If you drive bees into an empty hive in the manner you propose, they should at once be copiously fed by means of an inverted pickle bottle replenished regularly every evening, until the nett weight of the contents of the hive reaches at least 15 lbs. Success by this means is, perhaps, possible, but by no means certain. If, on the other hand, you adopt a frame hive, and furnish it with such otherwise useless pieces of worker comb as you may be able to obtain from the driven stocks in the manner detailed by Mr. Woodbury in his articles on "Utilising and Uniting Condemned Bees," which commenced in January, and were concluded in April of the present year, success is so probable that it may be considered tolerably certain.

You can if you please drive and unite the bees to your own stock in the manner described in the articles to which we have already referred, but the decision as to which of these two courses you may adopt, must rest with yourself.]

OUR LETTER BOX.

GAME FOWLS.—"The birds mentioned by Mr. W. H. Wheeler in an advertisement in your last number were never stated by me to be 'valuable' at all, as the price (£2 15s.) clearly shows; nor were they ever my birds at all, nor yet market birds.—NEWMARKET."

EXCHANGES (*An Amateur*).—We cannot afford either space or time to carry out the suggestion. An advertisement is the legitimate mode of effecting the purpose.

HARTLEPOOL POULTRY EXHIBITION.—"AN EXHIBITOR" writes to us:—"It is my opinion that the judges should not be appointed from the locality in which the exhibition is held. This would give general satisfaction to the exhibitors, whether they received prizes or not. Why not appoint them from the south—gentlemen who know the good qualities of the birds? For my part I am determined never to exhibit another bird unless I can ascertain who are appointed judges."

[The writer of the above is a clergyman, and took a prize. We quite agree that judges ought to be obtained from among skilled men residing at a distance from the show. Our correspondent quotes from a letter, the judgment of the writer of which would be demurred to by many.]

CHELMSFORD POULTRY SHOW.—"In pleasing contrast to the conduct of the generality of poultry committees under the circumstances of loss of specimens during an exhibition, I feel myself bound to acknowledge the receipt by cheque of two guineas, the price it cost me of a Satin Fairy Pigeon, accidentally lost at the Chelmsford Show.—HENRY YARDELEY, Market Hall, Birmingham."

ABSENCE OF FEATHERS ON PIGEONS (*Pouter*).—The feathers on your Pouters' crops will probably grow again during winter, when they will have no young to feed. Our Pouters are now in full moult, probably yours are. Hempseed in the spring tends to make them lay. Now they ought to have done breeding, as the progeny of a moulting bird is not likely to be strong.

MANAGEMENT OF GUINEA FOWLS (*Anna E.*).—The following is extracted from the "Poultry Book, which you can have free by post from our office if you enclose seven postage stamps with your address:—"They pair, therefore an equal number of each sex must be kept. It is the hen only which utters the peculiar cry of 'Come back.' The note of the cock bird is a kind of wail. To obtain a stock of them some eggs should be hatched in the yard where they are wished to remain. To buy full-grown birds is almost hopeless; for when turned down they depart, apparently in search of their old home. They should be fed regularly at stated times. They return at the same times punctually, and if one of the feedings is in the evening they then roost at home. Their roost should be high from the ground. They must be fed like other fowls, but in winter require more animal food. The hen usually lays on a dry bank, and if the eggs are taken from her nest never lays it again. They usually bring off very large broods—twenty is not an unusual number. Chicks of the Guinea fowl are so strong that they require food soon after they are hatched, and should have a constant supply by them until they are allowed to be at liberty. Their troughs should be constantly supplied, for they die if kept without food for three or four hours. Have the mother under a coop in a warm corner of the garden, and facing the south. Egg boiled hard, chopped very fine, and mixed with oatmeal is their best food. At the end of six weeks, if hatched under a Bantam or Game hen, they may be allowed to range with her, and be fed at the same time and on the same food as other chickens. May is the best month for placing Guinea fowls' eggs under a hen. Incubation requires from twenty-eight to thirty days."

RED-COLLARED PENGALIES DURING THE BREEDING SEASON (*Whitey Brown*).—Place in a large cage the outer husk of the cocoa nut with a hole at the end. They may be purchased of Mr. Hawkins, of Bear Street, Leicester Square, also a breeding-box similar to what Canaries have, with loose dry moss, and a net of the same material as Canaries have. Give them Canary seed, millet of both kinds, Indian and French, likewise green food, and when they have young give stale sponge cake.

BUTTERFLIES (*Sophia*).—Stainton's "Manual of British Butterflies and Moths." Lowe's book which you mention does not contain the descriptions you need.

SALE OF HONEY (*J. Robinson*).—Messrs. Forthum & Mason, Piccadilly, are large purchasers of honey; but if they, like Messrs. Neighbour, are full, we know not to whom to advise you to apply in London, although it is probable that many of the Italian warehousemen at the west end may be purchasers. If you visit a watering place you may possibly find a market there through some grocer or confectioner. Fine honey in the comb ought to bring at least 1s. 3d. to 1s. 6d. per lb.

HONEY CRYSTALLISING IN THE COMB (*Idem*).—When honey crystallises in clean combs, it is best treated by being melted in a water bath, which may be readily improvised by a covered jar standing in a saucer-pan of water. When cool the wax may be removed from the top in a thin cake, leaving the honey underneath beautifully liquid and pure.

HONEY IMPORTED AND ITS USES (*H. B.*).—It comes to us in large quantities from various parts of the world. The greatest amounts are from Jamaica, Cuba, and Chili. In 1862 the total importation was 7,450 cwt.; in 1863, 12,054 cwt.; in 1864, 12,083 cwt.; in 1865, 4,519 cwt.; and in 1866, 13,521 cwt. The only uses of honey that we know are in some pharmaceutical preparations, in making mead and mum, and as an article of food. We cannot tell its usual wholesale price, but you might ascertain it from Messrs. Neighbour.

HORNETS' NEST (*R. W.*).—We cannot advise how to destroy the hornets in their nest established in the wall of your house, not knowing the exact position; but any of the usual modes of destroying wasps in their nest would succeed in destroying hornets. Oil of turpentine in a bottle, and the nozzle thrust into the entrance of the nest, would probably suffocate them.

THE WEIGHT OF A CUBIC YARD OF HAY IN A STACK (*Subscriber*).—Much depends on the solidity of the stack, as we have seen some so compact from heating that a ton could be cut out of less than 6 cubic yards, while as much as 16 cubic yards would be wanted on another occasion. A cubic yard of hay may only contain 140 lbs., or it may contain nearly 400.

POULTRY MARKET.—AUGUST 26.

From observations taken near London during the last forty-one years, the average day temperature of the week is 70.0°; and its night temperature 47.4°. The greatest heat was 85°, on the 7th, 1865; and the lowest cold 28°, on the 7th, 1855. The greatest fall of rain was 1.09 inch.

BLENDING SPECIES AND VARIETIES BY GRAFTING.

HE notes and articles which have from time to time appeared in the Journal on the influence which the stock exercises on the graft, and the graft on the stock, have always seemed to me deeply interesting, as tending to throw some light upon an allied subject which has hitherto been, and to all appearance will for some time continue to be, wrapped up in no little mystery. The idea of cross-breeding by the direct intermixture of the cellular matter of different species or varieties is, I believe, generally scouted by scientific men as a chimera and a dream, seemingly supported by some curious phenomena, but altogether at variance with the laws of vegetable physiology; it is, however, an old one, and on that account, if on no other, is entitled to some consideration.

Bacon, in his "New Atlantis," makes the governor of the model community of Bensalem say, "We have also means to make divers plants rise, by mixtures of earths, without seeds; and likewise to make divers new plants differing from the vulgar, and to make one tree or plant turn into another;" and in a footnote referring to this passage, by whom I know not, is the following:—"I have nowhere seen so remarkable a proof of what may be effected in this way as in the gardens of Boghos Bey, at Alexandria, where I was shown a very extraordinary fruit tree, produced by a process highly ingenious. They take three seeds—the Citron, the Lemon, and the Orange—and carefully removing the external cuticle from both sides of one of them, and from one side of the two others, place the former between the latter, and, binding the three together with fine grass, plant them in the earth. From this mixed seed springs a tree, the fruit of which exhibits three distinct species included within one rind, the division being perfectly visible externally, and the flavour of each compartment as different as if it had grown on a separate tree. This method of producing a tripartite fruit has been introduced by Boghos Bey from Smyrna, his native city, where it is said to have been practised from time immemorial." (Bacon's "Essays." Bohn's edition, p. 299.)

Accustomed as we are to regard Egypt as a land of wonders, this is, perhaps, more than any who are acquainted with the internal conformation of these seeds will accept. I must confess to having twice attempted the first part of this experiment, and in both cases putrefaction of the middle seed, and only partial development of the seed leaves of the two outer ones, were the results. But as the cause of failure in my case may not have been the impossibility of the thing itself, to any who wish to make it, the experiment is easy, and the seeds of the Apple or Pear would seem to be as suitable for it as those named.

In the less highly organised seeds or spores of Ferns, Mosses, or Fungi, the amalgamation of two species would appear not so wonderful, as in these the rudiments of root and stem are not to be found, but it has never been proved that they have done so accidentally, and the nicety of

manipulation required to unite them as the astute Musselman did the Orange seeds precludes the possibility of its ever being accomplished artificially.

So seeds as subjects for experiments of this kind may be set altogether aside. My humble belief, however, is that with buds the case is different. If we have not already proofs that by the agency of these the distinctive marks and qualities of different plants may be blended together, we have at least received some few hints that such an end is attainable. One of these is the oft-cited instance of the Purple Laburnum, the history of which is so well known that it need not be here repeated, and though it is an exceptional case, purely accidental, and may never occur again, it yet confirms the principle that the undefinable something—call it what you will—which constitutes the individuality of a species can be broken in upon and changed by means more decided, but less natural, than those employed by the hybridist.

Every propagator knows that the emission of roots is nearly always preceded by the formation of a callosity at the base of the cutting. This is composed of soft cellular matter, and from the first seems capable of performing in some degree the functions of roots proper, absorbing moisture, and carrying nourishment to the cutting. In a few days, or weeks, according to circumstances, the development of this substance ceases, roots are thrown out, and the plant begins to grow. Now, it appears probable that if two cuttings previously joined together by incheling can be made to produce one callosity, we may reasonably expect that some of the roots emitted from it must be common to both. Some years ago, when a young man, I was impressed with this notion, and made a few experiments for the purpose of testing its correctness. To describe them all would, for the most part, be to write a chapter of failures; therefore one which was *not* entirely a failure will suffice.

Two Myrtles were selected—the Small-leaved and the Dutch—several pairs of the half-ripened shoots from each were brought together, and grafted by approach. Those pairs which united were taken off about the bottom of the splice, and inserted as cuttings. Instead of a pot a small box with a glass side was used, so that by placing the cuttings close beside it the rooting process could be easily watched. After a long time a slight callosity was formed entirely round the base of each double cutting, with no perceptible break underneath the part where the two were joined together. In the case of one to which I would more particularly refer, these were the points where the callosity first began to make its appearance, and where it was afterwards more fully developed than elsewhere. Before the roots were emitted the cutting was taken out, and the cellular matter carefully removed from each side of the base, leaving it only at those parts mentioned, the object being to procure roots only from what was supposed to be compound albumen. These were produced after another long interval, and then the Siamese-twin cutting began to grow rapidly. When well rooted it was placed in a small pot, and the collar was elevated above the rim a little more so than is generally done in potting young Heath.

Now, my idea was this: If common roots could be obtained, partaking of the nature of both Myrtles, and if these roots could be made to form adventitious buds, or, in other words, to throw up suckers, as Myrtles when potbound are very apt to do, these suckers could be nothing more nor less than what I call—for want of a better word—pure hybrids.

After growing the plant for a considerable time until the pot was full of roots, the points were stopped, and all buds picked out from the axils of the leaves, a little soil was also removed from the top of the ball so as to expose the roots; in a very short time suckers did appear, some of the small-leaved sort, some of the large, and, what clearly proved this little theory to be correct, some neither the one nor the other, but as truly hybrids as are Jackman's Clematises. The normal forms were taken off, and, twelve years ago, this plant—a little curiosity in its way—was doing duty as a greenhouse plant at Preston Grange, in East Lothian.

What led to this experiment was the repeated failures which I encountered in attempting to form a conjoint bulb from two leaves of different Gloxinias united mechanically, and inserted as cuttings. Neither this nor the formation of one bud by the conjunction of two Begonia leaves I believe to be practicable, as both experiments have been frequently tried by the curious without success.

Despite the wholesome advice given us the other week to "Beware of the Wonderful," and illustrated as it was by a somewhat ludicrous example, I have yet ventured to send you these few notes. The whole subject is one of peculiar interest. On the score of utility any information which we yet have concerning it is of no value, but, by-and-by, new facts may be elicited, and processes devised, which may prove highly serviceable to all cultivators of fruits and flowers.—*AVESHIRE GARDENER.*

NOTES ON A KENTISH ORCHARD.

THE PLUM.

So beautiful is the appearance of an orchard where the trees are healthy and in bloom, that the most careless of Nature's observers can seldom pass such an object without some expression of admiration; and as that beauty is the forerunner of that which is both beautiful and useful, we view an orchard with widely different feelings from those we experience when surveying an expanse of Gorse, Bloom, or Heath, all of which, however graceful as well as rich in colouring, leave us nothing of importance to hope for afterwards. On the contrary, a good bloom on a fruit tree is one of the precursors of a useful crop, for although every blossom does not become a fruit, yet no fruit is obtained without it. Even apart from all expectations, there is a beauty in the bloom of our later hardy fruit trees when seen in mass, and I am, therefore, not surprised that the denizens of large towns very often travel long distances to view the orchard districts, and the sight often well repays the journey. The clear white of the Cherry contrasts well with the deep rose of the unexpanded bloom of the Apple, while the hardy Plum is the first to open the spring, and the Pear, as a tree, presents greater diversity of form than any other, and its blossoms are not less beautiful than those of the other trees. Of a well-managed orchard, therefore, most people possessing one are justly proud, and the vale of the Medway presents many such orchards, differing, of course, in some respects, as the requirements of the case or the fancy of the proprietor may dictate, but all more or less beautiful.

As orchards and Hop gardens form a very considerable portion of the ground under crop in mid-Kent, and both being cultivated by hand, it may be inferred that the use of the spade is familiar enough to the tiller of the soil, but such is not the case; the spade is rarely used, but in its stead a three-pronged fork of local make, and not by any means representing in appearance, is employed in turning up the soil. As most orchards during their formation are for some years on tilled land, although the ground may be laid down in grass when the trees attain some size, yet the aid of the three-pronged fork for digging is not less necessary than the pruning knife in the early culture of an orchard. As I hope to notice more fully the formation and management of orchards, I will confine myself at present to some notes, made a few days ago, on a Plum orchard situated a very short distance from the place where I now write, and there are many scores of similar orchards within a radius of four or five miles.

The orchard, or rather series of orchards, for there were several enclosures adjoining each other that had been planted

at various times, was on land inclining to the west, a favourite direction for orchard planting in this county, on account of the greater probability of the spring frosts disappearing before the sun fairly strikes on the trees. The soil differs very much in character, varying from a light thin soil to a stiff clay, with some intermediate soil resting on a subsoil of stone shatter, and this year it was curious to observe the difference in the appearance of the trees according to the soil in which they were growing. Those on the stony soil, owing to the roots descending deeply, seemed not to suffer, while on a small portion of the ground which rests on a sort of hungry gravel, many looked almost dying.

Tillage seems also to have exercised considerable influence this year, and of a different kind from what it did in former seasons. The extreme heat and dryness of the weather had evidently reached the roots more than had been the case for many years, and where another crop competed with the trees for the little moisture and nourishment afforded by the ground, the effects were shown on the trees; so that the generally-established opinion that certain fruits succeed best in a grass orchard was reversed this season, and some that are said to do best on tilled land were found to be in better condition when growing where their roots had no chance to be disturbed—namely, with these under the turf. Some other peculiarities were pointed out to me which will be best explained in the description of the particular fruit in which they occurred.

The orchard or orchards presented a great diversity of fruits, some parts being planted with a mixture of several kinds, others with one kind only, or nearly so; some were in grass and some in tillage, some old and some young; and yet each part was distinct from the other, a promiscuous mixture being no part of the arrangement. As I went for the purpose of seeing but one kind of fruit, and that in various stages of growth, I will confine my remarks to that fruit, which was the Plum. The occupier, though his holding was not by any means extensive, was sending some fifty bushels or more daily to the London markets, and some of the fruit was of its kind as good as is usually met with, while, on the other hand, some was small in consequence of the dryness of the season, but more frequently from the heavy crop on the trees.

Of the trees of various ages which formed the orchard, some of the young ones were well loaded, and would have broken down with the weight of fruit had they not been propped up by hop poles. All the trees, however, were not so loaded, on the contrary, some had only a light crop on them. So capricious is this fruit, and so uncertain are some of the choice kinds, that I was told the crop as a whole was not so good as that of 1865, the total produce of the orchard not being likely to equal the yield of that year by several hundreds of bushels; but sufficient was visible to show what a good crop is. I should have much liked some of the advocates of miniature trees, trimmed into whatever fanciful shape they liked, to have seen these heavily-laden standards, many of which would yield half a dozen bushels of good fruit, while others not bearing so heavily were much finer, and might cope with the generality of wall fruit of its kind. The commoner varieties are the most productive, and as most fruits for market are gathered before they are ripe, quantity with a moderate show of quality is the requirement most looked after, rather than a very small crop of fruit of superior excellence. Certain conditions seem also to govern the metropolitan market, appearance being often of more consequence than quality, yet Londoners seem to understand well enough how much better a Green Gage Plum is than a Mogul, and the price ranges accordingly, but I cannot say how many other kinds of green Plums are not passed upon them as Green Gages. In the orchard here described there was not much chance of that being done, as there were but few trees of the Green Gage, and only one or two of a bastard variety resembling that favourite.

A grower of Plums has to keep several things in view. Very early fruits as well as very late are both wanted, and in the uncertainty of our seasons he usually plants several kinds, so that when it does happen that one is entirely destroyed, which has been known to be the case, he has something else to fall back upon. Various fruits are likewise grown, otherwise what would his workmen have to do if all were gathered at once? In the case of my friend the occupier of the orchard, both the Plum and all other fruits held a secondary position with him compared to Hops, and such is very generally the case where the latter are cultivated. I must also observe that the following short list of Plums does not by any means represent all

these cultivated in the neighbourhood, but simply those of one grower. Other growers have their favourites also, and experience has taught many that certain kinds do better than others on the same ground, and such are planted accordingly.

EARLY ORLEANS.—One of the most useful fruits grown. It bears well as a standard, and is always in demand. A partial thinning of the fruit when in a green state is often advantageous, those taken off being also saleable. This variety is too well known to require further comment.

ORLEANS, LATE.—This is somewhat darker in colour than the early variety, and about a fortnight later, but this season hardly so much; it bears well, and is an excellent fruit. It is, perhaps, not so much grown for market as the Early Orleans, but is superior to it in all respects as a fruit.

There are some other varieties of Orleans bearing local names which it is unnecessary to mention; but to show that either the present season is an extraordinarily early one, or that some error has crept into the fruit catalogue of an eminent London nurseryman, I may say that in the orchard here described, and which I visited on the 10th of August, all the Orleans Plums had been gathered, both Early and Late ones, while in the fruit list alluded to, the Late Orleans is said to come into use in October and November. The difference in the season of 1868 will not account for such a discrepancy as to the time of ripening, even after making allowance for the fact that the market fruit is gathered before it is ripe. There must be more varieties of Orleans than two, or when they are so very late it must be under exceptional circumstances.

DIAMOND.—This useful variety is said to have had its origin in our neighbourhood, and is not met with in all nurserymen's catalogues; but there are many who think it does not differ much from the dark Magnum Bonum. Perhaps it is a little more pointed at the ends, and it is superior to that variety for table. It is a good bearer, and is deservedly a popular fruit.

ROYAL DAUPHINE.—A long, pale, red Plum of no especial merit beyond being a good kitchen fruit, and the tree an excellent bearer. It is surprising what a quantity of fruit some young trees of this kind will bear. I believe in the trade generally it has another name. When ripe it is partly of a bright red and other parts of a clear white or pale flesh colour. It is a long and somewhat pointed Plum, of full medium size.

BUSH PLUM.—This appears to be the same as the Harvest Plum of other districts, a small black variety. The tree has smaller leaves, and the branches are more thorny than most other kinds, hence its name, the term Bush being being applied to the Thorn in many districts. It is an excellent bearer, and one of the hardiest of all Plums, but its size is against it when put in competition with Goliath, Diamond, and others.

PRINCE OF WALES.—The tree is an excellent bearer, and the fruit far from unsightly, but it is coarse and only fit for kitchen use. It is one of the most popular market Plums, filling the basket well. The tree is not at all particular as to site. I believe it is more extensively cultivated round here than any other variety except, perhaps, the Orleans and Damson. The tree arrives at a large size, and vast quantities of fruit are gathered from it in some seasons.

WASHINGTON.—A fine Plum, but the tree is a shy bearer, and, consequently, it is not such a favourite as some of the kinds mentioned above. Nevertheless, now and then there are good crops of this variety. I believe in 1865 it bore as heavily as any other variety. It is a fine yellow Plum, and the bulk of the crop had been gathered by the 10th of August, probably nearly a week before it was quite ripe. Next to the Green Gage this is regarded as the most valuable of orchard Plums, and when good it is but little inferior to that universal favourite.

MOGEL.—A small dark Plum, not by any means equal to the Diamond, to which it is giving place very fast. The tree is a good bearer, and some old trees of it are more profitable than other esteemed varieties.

GREEN GAGE.—Comparatively few trees of this were grown in the orchard I visited, but a spurious sort, yet not at all to be despised, was bearing tolerably well. It was much inferior in flavour to the genuine Green Gage, but the latter is a shy bearer, and the tree not healthy in its growth. It is no wonder, therefore, that spurious sorts are plentifully cultivated, mostly under local names, not distinguished out of the districts in which the trees are cultivated.

GOLIATH.—I did not see any of this variety in full bearing, but am told that it will succeed well as a standard; it is more

frequently met with against a wall, where the fruit reaches a large size, but it is only fit for kitchen purposes.

DELICIEUSE (COOPER'S LARGE).—Under the corrupted name of *De la Sur* this is extensively grown, and as a late Plum is very popular, being a good bearer. Some localities seem more favourable to it than others. One grower not more than two or three miles from here has nearly one thousand trees of this variety, young and old, and considers it the best Plum he has. There is much difference of opinion as to its doing well in all seasons, but in general it is regarded as being a good bearer, and the tree attains a good average size, not so large as some above described.

VICTORIA.—Popular as this variety is, I am not well acquainted with it as an orchard fruit, although I know that it is grown as such in the neighbourhood. There were but few trees of it in the garden I visited. It is here only considered a second-class fruit. I believe it is a greater favourite with fruit growers west of London than it is in Kent.

DAMSONS.—This is a most puzzling class, from the multitude of names which appear before the intending purchaser. There is the Prune Damson, the Prolific, the Shropshire, and the Cheshire, besides the common variety, and a dozen others called after the persons who grow them or the localities they come from. Of the latter that most in repute in this neighbourhood is one called Chittenden's Damson, from a grower of that name in the parish of Earleigh. This is certainly an excellent bearing kind, so much so that some growers have had their old trees of other varieties cut down and grafted with it, a proceeding not usual with so common a fruit. Most growers of late years have turned their attention as much to Damsons as to Plums, and large breadths have been planted, but most frequently they are planted in or near hedgerows or places where other trees will hardly grow, and it is wonderful to see how heavily laden with fruit they will be in some seasons. As a fruit the Damson is more esteemed than ordinary Plums; this has led to the multitude of varieties alluded to, some of them approaching the Plum in flavour, and thereby losing that peculiar tone which gives importance to the Damson. On the other hand, there are corresponding links connecting the fruit with the wild Sloe, and one of these, under the local name of Sead, is quite as large as the Damson, and resembles it in every respect except in taste, which is more that of a Sloe. Even Seeds, as they are called, differ from each other, some approaching as nearly to the Damson as that fruit does to the Plum; thus the gradation is carried upwards from the wild Sloe to the largest Plum, and the foliage and habit of the trees exhibit similar gradations, some of the Bullace and Muske class being also included in the family. The best varieties of Damson are propagated freely by suckers, and the young trees so produced are kept a year or two in a nursery in order to train them for standards or other purposes.

I must here again remark, that the above notes relate only to the varieties of Plums that were growing in the orchard visited, another orchard would doubtless furnish quite a different list of varieties, or, at least, a portion of them would be different, and they would most likely be equally deserving of notice.—J. ROSSON.

TOMATOES.

"WHAT a quantity of Tomatoes, and what large ones! How do you grow them so fine?" I never can induce any to ripen properly." So said a friend of mine who came into our garden the other day (July 23rd), and he was even more surprised when I told him that we had already gathered quantities off the same plants, and made them into jam. "What! Tomato jam! You mean sauce," "No," said I, "jam, and splendid jam they make too." In answer to his further inquiry I told him my plan of culture, which is simply this.

I always sow the seed in pans in February, about the time I start a pit for Cucumbers; into this I plant the pans. The seedlings are soon up, and when they are large enough I prick them out in pans, and pot them off singly as they become strong into 48 and 32-sized pots. They are gradually but well hardened off by the middle of May. I then dig a trench, 1 foot wide and 18 inches deep, alongside all spare walling or paling with a south, east, or west aspect, put a quantity of manure in the trench, and cover with 4 or 5 inches of soil. In this I plant the young Tomatoes 18 inches apart, nail them up at once to the fencing, and well water them. As they push into growth, I select two or three of the strongest side shoots to each plant removing all others that would be too crowded

if left, and stop one joint above the fruit as soon as some good clusters are showing.

When the fruits are about full grown I remove all leaves that hang over them, so as to let them have the full benefit of the sun to ripen them, but take care to leave enough foliage to keep the plant healthy. By the above method I always obtain good crops. I believe that many people fail through being too late with Tomatoes, the autumn rains and early frosts coming before their fruit are full-grown. This has been a splendid year for them.—LOVEAPPLE.

THE DUC DE MALAKOFF STRAWBERRY.

From his description I have no doubt that Mr. Douglas has the true Duc de Malakoff. I planted six strong plants of it some years ago in the spring, and gave the plants a year's "grace." Three plants fruited tolerably, producing large round fruit, and three had no flowers. I therefore gave it up.

Mr. Douglas wishes me to say if he keep eight sorts of Strawberries, whether I would recommend him to retain Duc de Malakoff as one of them. I say, No. He wishes me also to recommend four or five of the best Strawberries to ripen with the Frogmore Late Pine. I recommend him to have these five, all excellent—namely, Dr. Hogg, Mr. Radclyffe, Lucas, Wonderful, and Cockcomb. The last was the latest here this year. I also recommend him a fine late white Strawberry, Bicton Pine, called also Barnes's (of Bicton) Large White. It is late, and when properly ripened is amber white. It must be rotten-ripe to be good. If he add Rivers's Eliza to Frogmore Late Pine and the above six Strawberries, he will have a capital and successful lot.

If he likes Alpines (which I am now eating), I recommend the old Red and White, and especially Galande, red. It is the best of the Alpines, as Royal Hautbois is the best of its class. The Alpines and Hautbois Strawberries to be good should be rotten-ripe. I wonder people do not grow them.

The Perpetual Pine is here. I fear it is a complete failure. Except Filmore I never had a more scantily blooming sort.—W. F. RADCLYFFE.

WHAT IS A GARDENER ALLOWED TO TAKE AS VEGETABLES?

GARDENERS are often engaged to have so much wages and "vegetables." Now, they sometimes find much unpleasantness from the use of this vague term. When the term is used, has a gardener a right under it to take a Cucumber when there is plenty of them?—ONE THAT WANTS NO MORE THAN IS JUST.

[The subject is of more importance than at first may be supposed, but the difficulty in giving an answer is owing to the difference of taking a kitchen garden product, because it is "allowed," and taking it as a matter of "right." Whenever the two words "allowance" and "right," come into collision, a proof is given that the gardener will act wisely if he walk surely, even if to his apparent loss. No arrangement is more usual than for gardeners when engaged, to have allowed so much wages, a house, and "vegetables when to spare." The latter part of the sentence ought to be needless, as few gardeners would think of taking what was needed for an employer's table. Keeping this in view, the word "vegetables" would have reference to all that was grown in the garden useable for culinary purposes, except fruits. Cucumbers are no more fruits than Kidney Beans. But here, again, the importance appears of gardeners never depending nor trusting to mere use when there is the least likelihood to be any dispute in the matter, but have everything plain and settled beyond the reach of controversy. In most respectable places, then, where such a rule exists, the gardener will not only use Cabbages and Cauliflowers when plentiful, but have an occasional dish of Peas and Beans, and according to quantity have Onions, Carrots, and Potatoes, and even a Cucumber if there be enough. We have known cases where, though vegetables formed part of the agreement, the kitchen garden was so small, and the demand so great, that the gardener could never see his way to obtain more for himself than a Cabbage, or a Cauliflower too far gone for the parlour table. As to Potatoes, we have known heart-burnings because some employers would confine the term vegetable to the varieties of the Cabbage tribe, call the Potato nothing but a root, or tuber, and consider it as not coming under the title of vegetable. We have known cases, too, where Cu-

cumbers not wanted had to be taken to the house and there disposed of or dispensed. We recollect a case where vegetables formed part of the agreement; the gardener cared for nothing himself but a Potato, but no Potatoes were grown except a few early ones, and though plenty were grown in a field, he was allowed to have none unless he purchased them, it being contended that Potatoes were esculents and not vegetables.

Our advice to gardeners is, to leave nothing uncertain in these matters when making their agreements. Two conclusions, however, are perfectly clear to us.

1st, A gardener worth having will take good care that his master is well supplied with vegetables, including Cucumbers, before he would take one himself, or give one to a neighbour; and the employer will act wisely in trusting to the careful honesty of such a man, which will more subserve his interests than any paltry restrictions.

2ndly, Wherever there is much carping about the definition of a vegetable, and such pauleying occurs as—"This you may have, that you must never taste;" "this you are allowed, that you have no right to:" then, for the benefit of all parties, the sooner the connection of employer and employed is dissolved the better. There can be no comfort where there is distrust on the one hand and a sense of injustice on the other, and it is always well, even for the best of men, to avoid rather than fight through a temptation. All disputes would be avoided if employers and employed, trusting nothing to what is considered customary, had everything stated definitely.]

THE ORCHARD HOUSE DURING THE PAST SUMMER.

FOR two consecutive seasons you have honoured my communications with a place in your Journal, and I must not allow this hot season to evaporate in mist without offering something, at least, for your acceptance.

Some of your correspondents may remember the letter in which I ventured to strike a balance between the *pros* and the *cons*, as regards orchard-house culture. My summing-up was then in favour of the *pros*, and nothing has since transpired to induce me to reverse my decision. Had I done so the extraordinary success which has attended my brother's cultivation of the Peach and the Nectarine would have necessitated a prompt return to my former favourable opinion. I am now his guest, having left my own fruit to be enjoyed, as I trust, by my *locum tenens*, and, therefore, I am not in a position to predicate anything about either its quantity or quality; but without disparagement to myself, I must frankly concede to my brother the palm. I take peculiar interest in his trees, because two years ago I was instrumental in saving them from destruction. Happening to pay him a visit in the spring, I found his valuable trees terribly infested with aphides, while no measures were being taken to get rid of this pest. He tells me that it was owing to the immediate and effectual fumigatory measures which I then insisted upon that his trees were preserved. It would have been a thousand pities for lack of a little tobacco paper to have sacrificed trees which are now in such a thriving condition.

I will only speak of one of his two orchard houses, which is 55 feet in length, by 15 in width. It contains three rows of bush and pyramidal trees planted in the ground, which have yielded an abundant crop; but I wish to call particular attention to his back wall 12 feet high, because it shows results of which Mr. Bréhaunt himself might well be proud. Fastened to iron rods, placed at an angle of 45°, are sixteen triple cordons, cultivated according to directions furnished in Mr. Bréhaunt's treatise. These trees are now in their prime, and are laden with fine fruit. When our glorious chieftain, Mr. Rivers, surveyed these cordons some six weeks ago, he admired them so much that he pleasantly said, "I shall go away, and dream of those cordons." I wish he could have seen them since, for he would be fain to confess that their produce is not "such stuff as dreams are made of," but veritable flesh and blood, rich, juicy, and melting.

Those late American Peaches, which find some advocates, but which we consider more insipid than Turnips, and resembling croquet balls covered with flannel, if gifted with speech, might well cry out, "Oh, that this too too solid flesh would melt!" but my brother's Sulhampsteads have no reason to say so, being all that the most fastidious taste could desire. I can really find only one fault—too common with beginners—and that is that the crop is abundant to excess. When

taxed with this the grower admits the soft impeachment, but quaintly pleads that his "missus" objected to any more thinning-out of the fruit in the spring. Just picture to yourself sixteen triple cordons all in full bearing, and with leaves very little affected with red spider, covering the superficies of a wall 55 feet by 12 with magnificent fruit. I counted as many as seventy-six *Victoria Nectarines* on one leader alone; and although I am aware that to allow such profusion is highly reprehensible, yet it is wonderful how fine, in spite of this superabundance, the fruit had grown.

My brother and myself have given Mr. Bréchant's triple-cordon system a full and fair trial, and we concur in the opinion that it is an admirable mode of adapting to the English soil and climate the very successful French method of single cordons; also that it is well worth while to raise walls intended to be covered with glass to the necessary height of 12 or 13 feet. I have in my own case placed 4 feet of boarding on the top of an 8 feet wall.—A CONSTANT READER.

BATTERSEA PARK.

(Continued from page 132.)

RESUMING our account of the principal beds in the sub-tropical garden, and which left off somewhat abruptly at the bed containing the variegated *Vitis heterophylla*, whilst this was being examined a fine plant of *Dracena nutans* attracted attention, and Mr. Gibson remarked that *Dracenas* and plants of similar character had this year suffered less from scorching than usual. Why this should have been the case is not very clear, but possibly the almost entire absence of dew throughout the summer, and the small amount of rain which has fallen, have had some influence, for but rarely could there be any drops of moisture on the leaves to concentrate the sun's rays as through a lens. This, however, is only one of several conjectures which might be formed. On the opposite or left-hand side there is a very fine specimen of that noble Palm, *Lantania borbonica*, backed up with *Ferdinandia* eminens, surrounded with dwarf Castor-oil plants, and margined with variegated Ivy. On the right there is a long oval bed of Mrs. Pollock Pelargonium, surrounded with Blue King Lobelia, which sets off to great advantage the finely-marked foliage of the Pelargonium, and the whole is margined with Dandy, a miniature silver-variegated kind. Another pretty bed consists of Crystal Palace Gem, a golden-leaved variety, with flowers like those of Trentham Rose, *Centaurea* and Lobelia planted alternately, and the whole surrounded by a ring of *Alternanthera spatulata*.

Turning now to the left-hand side we find a very effective mixed bed of *Erythrina*s, conspicuous among which is *E. ornata*, a new continental hybrid, with large showy vermilion-coloured flowers. At the back of this in an oval bed is *Aralia papyrifera*, one of the most ornamental fine-foliated plants for sub-tropical gardens, along with *Sparmannia africana*, an old Cape plant, valuable for its early flowering under glass, and as here growing out of doors ornamental by its large healthy leaves. A very pretty and effective bed near that just referred to has a five-rayed star in the centre formed of Beauty of Calderdale Pelargonium, with golden and silver-leaved kinds for the rays, which are divided by Lobelia speciosa. The whole is enclosed by a ring of *Alternanthera paronychioides*, and studded round with the neat rosettes of *Echeveria secunda* glauca, each as like its neighbour as if all were cast in one mould. The next group we come to consists of Indianrubber plants edged with *Hedera multimaculata*, a very handsomely-blotched variety, and opposite to this is a mass of *Polymnia grandis*, followed by a group of *Canna Rendatleri*, a variety with flame orange flowers, dark stems, and semi-dark leaves. This is backed with young plants of *Ailanthus excelsa*.

On the opposite side of the walk, *Musa ensete* forms a noble object, having leaves some 10 feet in length, by about 2½ feet in breadth, with the under sides of the midribs of a fine dark red. There are several other fine examples of the same species dotted over the garden, but this is one of the largest and most effective. An oval bed having for its centre a broad band of *Coleus Verschaffelti* is one of the finest in the place, the effect of the warm, richly-coloured leaves of the *Coleus* being enhanced by the frosted appearance of *Centaurea ragusina compacta*, and the whole is surrounded by the pretty little Californian House-leek. Several small beds occur near this point, and are very interesting from their containing some of the new varieties of *Coleus* raised by Mr. Bause at Chiswick. One of these beds is a small circle in three compartments, planted

with *Coleus Scotti*, *C. Batemanni*, and *C. Ruckeri*, the last of which is the most conspicuous, *Centaurea candidissima* being employed to divide the different kinds. A similar bed contains *C. Bausei*, *C. Saundersi*, and *C. Berkleyi*, and of these the first two are those which appear to the best advantage. In this case they are divided by *C. ragusina*, and surrounded with an edging of *Alternanthera versicolor*, margined with Saxifrage. The next bed, also a circular one, has *Dracena nutans* in the centre, surrounded by four plants of *D. brasiliensis*, whilst covering the ground beneath these tall-growing plants is *Coleus Lamonti*, the leaves distinctly edged with green, then Mrs. Pollock Pelargonium, surrounded with two kinds of *Echeveria*. This is a very pretty arrangement. Another bed on the same side has *Cycas revoluta* in the centre, surrounded by *Dracena terminalis* and *ferrea*, springing from a carpeting of the pretty little *Pyrethrum Golden Feather*, which forms a very effective plant for small beds, ribbons, and edgings. The whole is surrounded with *Centaurea ragusina compacta*, which gives an excellent finish to the bed.

We now arrive at the junction of two walks, and turning to the left we find on that side a small circle with a plant of the extremely graceful *Grevillea robusta* in the centre, spreading its Fern-like foliage above a carpeting of *Alternanthera versicolor*, which is really a splendid plant at Battersea this year. If it maintain the same beauty in a cold, damp season that it has exhibited this hot, dry summer, it will certainly be extensively employed for out-door decoration. Golden Chain Pelargonium forms a neat very dwarf margin to this bed. In an oblong bed, on the opposite side of the walk, *Solanum marginatum*, with very spiny silvery leaves, is interspersed with the highly decorative *Gladiolus branchleyensis*, the whole having an edging of *Lantana*, the best being *Raphael*, yellow and rose, and Adolphe H. Wass, yellow.

Other effective beds near this spot are composed of *Nicotiana wigandioides* and Castor-oil plants; *Canna Lihorelli*, with semi-dark leaves and dark scarlet flowers, a profuse-blooming first-rate variety; and *Musa ensete*, the last being a circular group of seedlings raised this year, and in very robust health. Beneath the *Musas* the ground is covered with *Amaranthus melancholicus ruber*, surrounded by an edging of the pretty blue-flowered *Plumbago capensis*; and outside this *Artemisia Stelleriana*, with elegantly-cut frosted foliage, forms an elegant margin to the whole. A long bed on the other side of the walk is planted with *Solanum Warszewiczoides* and *Amaranthus tricolor*, the leaves of the latter most splendid in their colours; and the whole is edged with *Lantana crocea superba*, an excellent bedding variety. This arrangement is very effective, and not less so is the next in three beds, two of which are long ovals with their ends cut out, so as to correspond in sweep with the circumference of a circle between the two. The outside row in all three beds is *Sempervivum californicum*, succeeded in the two end ones by Golden Feather *Pyrethrum*, and Lady Constance Grosvenor Pelargonium in the centre. In the small central circle the *Sempervivum* is followed by Monsieur Natchet scarlet Pelargonium, and the centre is occupied with Lady Plymouth variegated Pelargonium and blue Lobelia.

Passing onwards we again come to another bed of *Erythrina*s, this one being *E. Hendersoni*, a later-blooming variety, with the showy *Amaranthus bicolor* forming the ground-covering; and on the opposite or left-hand side we perceive in a pretty nook a fine plant of *Sesforthis elegans*. Then comes a circle, in which Beauty of Calderdale Pelargonium forms a star in the centre, Lobelias being planted between the rays, and for an edging there is a ring of the lively *Alternanthera amena*. We now come to one of the most perfect and beautiful beds in the place, at once extremely rich in colour and extremely chaste in its effect. It is a circle of *Coleus Verschaffelti* edged with *Centaurea ragusina compacta*, with a ring of Golden Chain Pelargonium round the outside. For the present we shall just notice one more bed—namely, a circle, with a star of Mrs. Pollock Pelargonium in the centre, blue Lobelias dividing the rays, and an edging of Golden Christine Pelargonium. This arrangement was very pretty and effective, the blue flowers of the Lobelia and the richly variegated leaves of Mrs. Pollock offering a fine combination of colours—in fact, the prismatic colours red, blue, and yellow.

(To be continued.)

DUTCH CLOVER VERSUS GRASS FOR LAWNS.

DURING the late burning hot weather the lawns in this neighbourhood, more especially where the water supply has

been exhausted, have presented an appearance in piteous contrast to the usual summer carpeting, whilst one of my neighbours rejoices in the extreme richness of an extensive lawn of Dutch or White Clover, which has required no extra watering, and a much less frequent use of the mowing machine. I cannot but think that the substitution of this elegant and dwarf variety of *Trifolium* for even the choicest of our Grasses, would prove a decided advantage.—HOUNSLOW.

ROYAL HORTICULTURAL SOCIETY.

SEPTEMBER 1ST.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Messrs. Backhouse & Sons, York, exhibited a dish of Figs, which proved to be the White Marseilles. *Figue Panachee* came from the Society's Garden, Chiswick. It is a very beautiful variety, prettily striped with yellow and green, and of excellent flavour. Mr. Melville, gardener to the Earl of Rosebery, Dalmeny Park, Edinburgh, again sent examples of his early seedling Grape, which was exhibited at the last meeting. The Committee then could not decide upon its merits, as there was but a very small portion of a bunch sent. This time the examples were much about the same; the Committee, therefore, while commending the Grape for its earliness and peculiarly agreeable flavour, partaking somewhat of Moselle, could not come to any sound decision respecting it from the small portions of bunches exhibited. Mr. Colegrave, Sweiford Park, Euston, sent a very large and beautifully grown bunch of Buckland Sweetwater Grape; the berries were very fine, and it was an excellent example of good cultivation.

Mr. Francis Dancer, Little Sutton, Chiswick, sent some very large and fine specimens of Jersey Gratioli Pears, grown on standards; they were very juicy and of fine quality. This is an excellent Pear for market gardens, being large and a very free bearer. Mr. Dancer also sent a dish of a large seedling Apple, which was of considerable merit, very juicy, and brisk.

Messrs. Veitch & Sons, Chelsea, sent a fruit of *Ananassa Portena*, a pretty striped-leaved variety of Pine Apple, grown as an ornamental plant. The fruit proved very watery and tasteless.

Mr. Whiting, The Deepdene, near Dorking, sent three dishes of Plums—viz., Jefferson, very highly coloured and excellent; Green Gage, also rich and juicy; and Brynstone Gage, highly coloured, but wanting in richness. The exhibition was commended by the Committee. Mr. Whiting also sent some highly-coloured Royal George Peaches, which were, however, wanting in flavour. Mr. Cole, gardener, Otto House, Hammersmith, sent some good examples of Barrington and Grosse Mignonne Peaches and Kilston Pippin Apples, which were commended by the Committee.

Mr. Cox, gardener to Earl Beauchamp, Madresfield Court, sent a very fine fruit of Golden Gem Melon. It is a large, round, and beautifully netted yellow fruit, the flesh whitish green, flavour very rich and excellent. The Committee awarded it a first-class certificate. Mr. Perkins, gardener to Lord Henniker, Thorham Hall, Eye, Suffolk, sent a hybrid Cashmere Melon, a red-fleshed variety. It proved to be of very poor quality.

Mr. Rivers, Sawbridgeworth, exhibited samples of Summer Beurre d'Arenberg, a variety similar in every respect to the Beurre d'Arenberg, only ripening in summer. It is a very nice, pleasant, refreshing-flavoured Pear, with a brisk acidity. The Committee commended it very much, but required to see it in somewhat better condition before awarding it a certificate. Better specimens of this variety are noticed in another column. Mr. Rivers also exhibited Princess of Wales Peach, a seedling raised from Pavie de Pomponne. It is a large pale variety of very excellent flavour.

Mr. R. Dean, Ealing, exhibited samples of Premier Runner Bean, a variety having the same appearance and taste as the Dwarf Kidney Beans. It is, however, a runner, a continuous bearer like the Scarlet Runner, and on that account valuable. The Committee awarded it a first-class certificate. Mr. Marcham, gardener to E. Oates, Esq., Bydorp House, Hanwell, sent examples of a Dwarf Kidney Bean, named Bydorp Longpod. It was a long and rather coarse-looking Bean.

Messrs. Dry, Hayes, Middlesex, sent a seedling dark oval Plum, which proved to be of very good quality. The Committee requested that it should be sent again. It was highly commended by the Committee. They also exhibited a seedling Apple of no great merit.

Mr. Fleming, Cliveden, exhibited some fine bunches of the Frankenthal Grape. Mr. Fleming sent them, judging they might be of interest to the Committee from being the average size and quality of two hundred bunches on one Vine, which is fourteen years old, and filling one entire house. They were a very fine example, but greatly damaged before their arrival.

Mr. R. Webb, Calham House, Reading, sent some seedling Plums and Apples, which, however, arrived too late for the meeting.

From the Society's Garden, Chiswick, came Pear Beurre d'Amant's panachee, a very beautifully striped variety, well worthy of extended cultivation.

Mr. Turner, Slough, exhibited some very fine examples of White Spanish Onions, unusually so for the season. They were highly commended by the Committee.

A large collection of White Spanish Onions was exhibited from

E. G. Hartley, Esq., Hon. Secretary of the Banbury Horticultural Society. They were of unusual excellence and large size. They were highly commended by the Committee.

FLORAL COMMITTEE.—Numerous awards were made at this meeting. Messrs. Veitch received a first-class certificate for the following plants—viz., *Cattleya speciosissima*, a very beautiful kind; *Dendrobium bigibbum*, very distinct in form; *Masdevallia Veitchiana*, very curious; *Abutilon Thompsonii*, a golden-leaved plant most beautiful, a great addition to ornamental-foliaged plants; and *Begonia Clarkei*, an erect-growing plant, with bright red stems and pale rose-coloured flowers. Of its hardness nothing was said; in point of colour and habit *B. Veitchii* far surpasses it; a cut specimen of the latter was exhibited from a plant growing in the garden. A special certificate was awarded for a collection of *Odontoglossums*; a second-class certificate for *Begonia Bottonii*, a small but pretty-foliaged plant. It was requested that *Panicum plicatum nivo-vittatum* should be shown again. Of *Lapageria alba*, a very well-grown and handsome plant was awarded a special certificate, and the whole collection, consisting of many very beautiful plants, a special certificate.

Mr. Bull, Chelsea, exhibited *Ravennia elegans*, a fine-foliaged plant—second-class certificate; *Strelitzia Nicolai*—first-class certificate; a fine Palm, *Bactris maragana*—a first-class certificate; *Adiantum Seemannii*, a beautiful Fern—first-class certificate; *Geonoma imperialis*—first-class certificate; *Dioscorea alurana*, a pretty variegated-foliaged plant—second-class certificate. Mr. Bull also sent three *Coleus* seedlings, two of which had received first-class certificates.

Some seedling *Caladiums* and *Fuchsias* were sent from the Society's garden; of the latter we hope to speak again. Messrs. Smith, Dulwich, received a special certificate for a collection of Balsams, showing the difficulty of procuring seed, which can only be saved from the lateral branches, most of which produce blooms as double as the centre spike, but of course are much later in expanding their flowers. Messrs. Smith also sent three seedling Zonal Pelargoniums of promising character, and a small collection of some of their best variegated kinds.

Messrs. Lee, Hammersmith, exhibited cut specimens of eight or ten beautiful varieties of Elms, which were awarded a special certificate. *Ulmus Webbiana* was much admired; also a variegated form of *Cornus Mahaleb*. The leaves of this specimen were rather crumpled, perhaps owing to the season; the variegation was distinct and effective.

Messrs. E. G. Henderson sent a collection of plants of great interest. Among them were small specimens of *Centaurea* of several kinds, two *Cyclamens*, a singular unnamed *Lycopodium*, some good specimens of Variegated Zonal Pelargonium Lucy Grieve, a basket of small plants of *Fuchsia Garibaldi*, and other plants. A special certificate was awarded the collection.

Mr. Eckford, gardener to the Earl of Radnor, Coleshill, sent eighteen seedling Verbenas, all of considerable merit. First-class certificates were awarded to Lady Polkstone, Master Jacob, Mrs. Lefford, and Ace of Trumps. These were all distinct and good varieties. Mr. Perry, Castle Bromwich, Birmingham, exhibited a collection of seedling Verbenas. First-class certificates were awarded to Florence Fiddian, Emma Perry, and Argus. These were all fine flowers. A special certificate was awarded for a splendid box of twenty-one varieties; among them were several seedlings which had previously received first-class certificates. Mr. Eckford sent two seedling Dahlias, of which Memorial, a fine deep rose-coloured flower, was awarded a first-class certificate. Mr. Rawlings sent seedling Dahlia Indian Chief, a fine dark maroon flower of great merit. It was awarded a first-class certificate. Mr. Burgess, Chelsea, sent four seedling Dahlias, and Mr. C. Turner, Slough, seedling Dahlia Unique, one of the finest flowers yet seen, a white ground, shaded with rosy purple, of exquisite form—first-class certificate; Polly Perkins, buff, with delicate purple tips to the petals—second-class certificate; and Lady Dunmore—second-class certificate. Mr. George Smith, Edmonston, exhibited seven seedling Dahlias, but not up to the mark as distinct from others. Mr. Legge, Edmonston, also sent seedling Dahlias. Mr. Barritt exhibited scarlet seedling Dahlia Charles Lambert. Mr. Keynes sent seedling Dahlias—Mrs. Brunton, first-class certificate; Julia Wyatt, second-class certificate; Annie Neville, second-class certificate; Mr. Dix, first-class certificate; and James Hunter, first-class certificate.

Mr. Keynes had a fine collection of Dahlias, but we must venture to say that the Dahlia race must be considered as fairly run. It is seldom we see exhibited any flower new and distinct. Traces of good old flowers are visible, but no advance is to be observed upon flowers of the last five years. Not wishing to disparage the excellent flowers exhibited this day, we could not discover any advance or improvement. We should be inclined to say we are multiplying varieties, but not introducing improvements or novelties.

We must not omit to notice a Zonal Pelargonium, *Surpasse Christine*, flowers of which were brought from Chiswick from plants sent there by Mr. Chater. The marked improvement on this old favourite was most evident. It appears to be a very desirable variety.

GENERAL MEETING.—W. Wilson Saunders, Esq., F.R.S., in the chair. After the election of W. Parley Hall, Esq., F.G.S., and F. Whitburn, Esq., Loxford Hall, Hford, as new Fellows, the Committee awards were announced. The Chairman then directed attention to *Begonia Clarkei*, resembling the hardy *B. Veitchii* in flowers, and said that if it proved as hardy as the latter it would be a valuable acquisition, especially as it was of an erect habit. *Abutilon Thompsonii*, another plant exhibited, was also worthy of particular notice

on account of its diverse-coloured leaves, its hardness, and its easy cultivation. He considered it a charming addition to our greenhouse decorative plants. Mr. Wilson then pointed out a stem of *Lilium tigrinum splendens*, and said that Mr. Eyles had informed him that it was a most important new variety, taller in habit, with the flowers marked by larger spots, and altogether much finer than the common Tiger Lily.

MESSRS. RIVERS' NURSERIES. SAWBRIDGEWORTH.

To say anything in praise of this great establishment is, of course, a work of supererogation; to say that the orchard houses are as usual in splendid order, the trees healthy, and the fruit delicious, is but to repeat an oft-repeated tale. Still, "Rest and be thankful" is not our motto, neither is it that of Mr. Rivers. In this vast establishment there is always something new, and something to be learnt. New ideas and new projects are continually on trial there, so that visit Sawbridge-worth when one may, there is always a treat in store. Mr. Rivers is one of the greatest of British experimental horticulturists, and in his own particular line—fruits, he has done, and is doing, more for their improvement, and for fruit culture in this country, than any other man living. When I mention orchard houses I will have said enough.

Six thousand Peach, Nectarine, and Apricot trees in pots, are the number cultivated in this establishment this season. The quantity seems enormous, yet there they are, and all will be able to hear some fruit next year under good management. Taking the average of them at only ten fruits a-piece, we have the enormous quantity of sixty thousand fruits. Sixty thousand Peaches and Nectarines certain! Why, it makes one's teeth water. Many of them, however, will bear much more than that. I noticed some trees with several dozens of fine fruit on them.

Mr. Rivers has long been famous as a raiser of seedling fruits. For Peaches, especially, we are to him much indebted. Mr. Rivers's efforts have been mainly directed to the attainment of a better class of early and late Peaches, and in this he has succeeded with Early Beatrice, which ripened this season on the 4th of July, Early Louise on the 8th, an Early Rivers on the 14th, all of which are earlier than the Early York or Acton Scot, and equally good in quality. Of late varieties we get Lord Palmerston, a first-class Peach, and many others. The Alexandra, a seedling from the Noblesse, looked remarkably fine. It differs only from the Noblesse in having round glands on the leaves. It is of a much more vigorous constitution, and is not subject to mildew like the old variety. Some of the seedlings of this year, yet unnamed, are of exceeding great promise. One marked S. 187, noticed in this Journal, page 133, a seedling from Rivers's Orange Nectarine, is the richest-flavoured Peach I ever tasted. It partakes somewhat of the flavour of the Nectarine and Peach combined. Mr. Rivers styles this *the* Peach of the season.

Among Nectarines there are also many grand acquisitions. The old Stanwick is well known for its superior flavour, as well as for its bad habit of splitting and cracking. Mr. Rivers has long worked assiduously to overcome this evil, and with success. The extremely rich flavour of the Stanwick has been imparted to many of the new seedlings, both Peaches and Nectarines. Indeed, the Stanwick forms the groundwork of the major part. It is the "true blue blood" in Mr. Rivers's stock book. How very interesting it is to listen to Mr. Rivers, while he is pulling fruit after fruit for one to taste, to hear him detailing the pedigrees of each, with as much exactitude as is bestowed on some of our "Derby favourites;" to learn that this beautiful Peach we are now eating is a seedling, may be the "third remove," as Mr. Rivers terms it, from a yellow-fleshed Nectarine. Nectarines are raised from Peaches, and Peaches from Nectarines, without any sort of regularity. They come just as often the one way as the other. Here is a Nectarine in appearance exactly like the Stanwick, raised from the Victoria Peach. Here is another, a white Nectarine, raised from the Bellegarde Peach, and another, a white Peach, raised from Hunt's Tawny, a yellow-fleshed Nectarine. Early Peaches are raised from late Nectarines, and *vice versa*. Here I have the full pedigree of one. The Princess of Wales Peach, a splendid late kind. It was raised from the Early Silver Peach, which was again raised from seed of the old White Nectarine. Mr. Rivers has some curious theories on this subject. One is, as to whether all our present race of Peaches have not sprung from one source, and that source the White Nectarine. Judging from what has been already learned, it

seems very probable Mr. Rivers is "on the trail;" however, I leave it with him, for who but a Rivers can fathom it, or find it out? It is a regular Darwinian subject. There have been several instances observed of Peaches and Nectarines growing on the same branch of a tree. Mr. Rivers is, however, the first to have raised seedling Peaches from Nectarines, and Nectarines from Peaches.

I must not omit to notice here a very curious Peach, which I tasted for the first time—the Honey Peach. It is not a new one. It was raised at the Jardin des Plantes, Paris, from seed received from Shanghai. It is of oval shape, perfectly white; the flesh juicy, rich, and delicious, like honey, hence its name. The double-flowering Peaches of China have fruit somewhat similar in appearance, and it may have been observed there is something of this same honeyed taste in them, only it is mixed with a certain bitterness which spoils them for eating. This variety is valuable for breeding from. It will impart novelty of flavour to Peaches.

The Shanghai is another curious Chinese Peach, which was introduced by Mr. Fortune many years ago. It is always to be seen in fine order on the Peach wall in the Royal Horticultural Society's Garden, Chiswick. It is one of the largest Peaches in cultivation, and handsome. It somehow irresistibly puts me always in mind of a Chinaman's scalp. It is so big, and has such a "shaved"-like look, being of the palest of yellows. It is tempting to look at, but no better than a Turnip to eat. Something good may come from it by cross-breeding. There is still another curious Peach to be seen here—that is the Sanguinole, the flesh of which is red, like a Beet-root, but pretty good to eat. Besides these, Mr. Rivers cultivates numbers of the varieties of Pavies, or Clingstone Peaches of America, the fruit of which rarely become melting in this country, even in orchard houses. They are used for tarts, however; and one writer I recollect recommending some elaborate process of cutting them into slices and frying them, I think, after which, being very nice, they were to be pitched out of the window.

One large house 100 feet long and 24 feet wide, is almost entirely devoted to proving seedling Peaches and Nectarines this year. There are, besides, many hundreds in the open air that are not yet old enough, one and two-year-old seedlings; and the pots, too, with the seeds of some of this season are already sown. The stones are sown almost immediately after the fruit is eaten, they germinate more freely than if kept dry until spring time. The 4 and 5-feet pyramidal trees are the most handsome; they are perfect pictures. They are, however, more difficult of management than the bush trees. They require more close attention as to pinching the young growing shoots, and keeping down the vigour which is sure to appear in the highest part of the tree. Some trees that are planted out in one house, although very roughly treated, are quite pictures, being loaded with fruit. The ground in which they are growing is of a light calcareous nature, with abundance of chalk; but, oh! how hard it is, it seems as hard as one of McAdam's roadways. The soil is never stirred or loosened in the least, or if it is, it is rammed down again, so as to be as firm as before. In these large span-roof houses of Mr. Rivers, it is worthy of note how clean, healthy, and satisfactory all the trees are, and that without any top ventilation. All the ventilation there is, is at the sides and ends. One would have imagined that, especially in this hot season, the leaves and shoots would have been all scorched, yet such is not the case. It cannot be denied, however, but that it would be better to have top ventilation, excepting on the ground of expense. These houses are erected in the cheapest possible manner, and orchard houses to pay should be erected as cheaply as possible; they are not show houses. To break the roof for ventilation in a house of this sort adds considerably to the expense, and Mr. Rivers has not found it necessary to do so. Mr. Rivers places his trees along both sides of the house nearest to the ventilators, with a broad pathway in the centre. Supposing this arrangement to be reversed, and the trees placed in the centre, farthest from the outer air, or the house to be 30 feet wide instead of 24 feet, I fear the trees then would suffer, or if not the trees the fruit would certainly lose piquancy of flavour from want of sufficient ventilation. What gives flavour to ripening fruit? It is a somewhat cool and bracing air.

There is one ingenious device here which I must not omit to notice. It is a contrivance, an "orchard-house railway," in fact, for moving all the trees *en masse*, to have the benefit of the open air. There are, first of all, two lines of rails running through the house; and the stage in the centre, instead of being a fixture

as in ordinary plant houses, is upon wheels like a railway truck running on these rails. The trees in pots are standing on this stage or truck—indeed, plunged into large metal pans filled with soil. One end of the house is, of course, made to open sufficiently, and thus the whole stage, trees and all, can be moved by rail to breathe the fresh and open air. Granted that it is beneficial to the trees to have the fresh air, they

can easily be carried out, if necessary, and that at one-twentieth part of the expense. It just resolves itself into this, whether a tree is to cost 5s. a-year, or 50s. as by this plan. This is not an invention of Mr. Rivers, neither is it adopted by him, it is simply there on trial through Mr. Rivera's kindness.—ARCHAMBAUD.

(To be continued.)

A FRAGMENT OF WILTSHIRE.

THE inhabitants of each county have some ludicrous designation assigned to them, yet I never could discern that Essex men are more calvish, nor Hampshire men more swinish, nor Wiltshire men more simple than those who have their locations elsewhere; yet the natives of the first-named county are called "Calves," of the second "Hogs," and of the third "Moonrakers." The legend attached to the last is that some townsmen of Chippenham, seeing the full moon reflected in a certain pond, endeavoured to rake it out, believing it to be a cheese.

Now, I have known that town of Chippenham for about four lustrems of years, and never could discern that any of its denizens were probably descendants of "moonrakers." Let any one of your readers visit it; let him establish himself in that old-fashioned "hospitium" improved, "The Angel Hotel;" let him see with his own eyes the town's substantial bright

structures, and among them that bit of the old shambles, with its round Anglo-Saxon pillars, which may have been there when Alfred and Guthram signed their treaty of peace within the town's precincts; let him associate with the inhabitants, and, especially if he be of conservatives a conservative superlative, he will agree with me that there are no symptoms of moonraking, nor, so far as I have sought, are symptoms of such lunacy to be discerned in the vicinity. Now-a-days the visitor can journey round the town without being way-foundered, though Wilts was formerly famous for "feeble bridges and foul ways," but they are now quite reformed, and were partly so centuries since. Walter, Lord Hungerford, early in the fifteenth century, made a non-foundering road across Standerwick Marsh, between Beckington and Warminster, and, like a good husband, he recorded that it was "for the health of the

soul of Lady Katherine his wife;" and somewhat later estates were left for the repair of "causeys" and highways about Cricklade and Devizes.

Lastly, but first in merit, was Maud Heath, for she gave all her store of hard-earned savings to make and repair the "causey" extending four miles and a half from Bremhill Wick Hill to Chippenham; and on a stone, truthful though not homerical, is this record—

"From this Wick Hill begins the praise
Of Maud Heath's gift to these highways."

Midway at the bridge over the Avon is another inscription—

"To the memory of the worthy Maud Heath, of Langley Burrell, spinster, who in the year of grace 1471, for the good of travellers, did in charity bestow in land and houses about £8 a-year for ever (now yielding £110 annually), to be laid out on the highway and causey leading from Wick Hill to Chippenham Chiff."

She did this during her lifetime—sensible woman, for thus not only trotted she along the "causey" dry-shod herself, but saw and appreciated the good she had secured for others.

The local tradition is, that "worthy Maud Heath" brought eggs and butter to Chippenham, as the women-folk of farmers' families all did in her days, and that the hindering and suffering during inclement weather which she endured in passing over the swampy and often overflowed parts of the road, induced her to bestow the endowment.

A century before—namely, in 1376, Edward III. granted to the inhabitants of Chippenham permission to levy pontage—that is, a toll for the repair of their bridges; but Maud Heath's gift is sufficient evidence that the pontage failed in efficiency.

Let the visitor, over a road needing no aid from that gift, take a stroll in a north-westerly direction until he reaches the lodge of Harnage; let him pass through its gate and into the avenue beyond—notice the splendid Elms—pass by the mansion's front—if he knows the pages of Britton, let him call to memory from them who have been the owners and the guests at Harnage. They were not "the simple ones of the earth."

Hereafter I will tell of another of those guests, but at present will pause over no other than Christopher Austey, author

of the "New Bath Guide," and who from boyhood and over more than fourscore years was "a fellow of infinite jest." In him humour had by far the mastery of discretion, and I wish there was room to spare in your columns for the burlesque declamation which conferred upon him rustication instead of an M.A. degree. He even rendered his wit hereditary, for his son in "The Pleader's Guide" satirised legal proceedings by a detail of the arguments of Counsellors Botherum and Boreum in the case of John-a-Gull v. John-a-Gudgeon. Who amongst your readers, besides old spiders of literature like myself, ever read the "New Bath Guide?" Yet its wit still sparkles, and doctors, presumed Cantwells, and fashionable manners, even when out of date, are always subjects for palatable ridicule. Its author died at Harnage in 1805, and this epitaph, extracted from his volume, might have been inscribed on his monument:—

"Farewell! may the turf where thy cold reliques rest
Bear herbs, odoriferous herbs, o'er thy breast;
Their heads Thyme and Sage and Pot-Marjoram wave,
And fat be the gander that feeds on thy grave."

Passing on, still beneath noble trees and among an under-wood of evergreens, the visitor will reach a wicket, and there, in its "God's Acre," stands the church, of which the accompanying is the portrait.

Elevated, as a church should be, it crowns a hill's summit, and between some of its neighbouring trees looks out, as such beacons should, across a wide landscape, here bounded in the twenty-mile horizon by Salisbury Plain. Its architecture is simple and graceful, and the Ivy embraces and clings to it as Ivy always should to a church, if I could have my taste satisfied, for it is ever green, and thus at once savours of the loving, confiding, and everlasting. Passing to the interior, the same all-fittingness there prevails: no exclusive pews, no decorations, yet all things in the perfection of neatness.

But few commemorative tablets are on the walls; yet among them one records the resting-place of old John Thorpe, the antiquary, one of the rare exceptions of a son celebrated in the same field where his father had been his distinguished predecessor. How few clerical fathers have clerical sons? but how many of them contribute to our naval and military lists! However, John Thorpe, the antiquary, and author of the "Registrum Roffense," or Rochester Register, was the father of the John Thorpe whose remains are in this churchyard, and he, too, published a volume of Rochester antiquities, entitled "Custumale Roffense." He would deserve a record in these pages if only because a friend records that he was "skilful and curious in his garden, intelligent and communicative in his library." And he merits a record in any page that tells of where a true christian gentleman rests from his labours. The last years of his life were passed in Chippenham, and I do not wonder that he should direct his last resting-place to be here. I should have done the same, though *not* for the reason assigned, by an old lady, "It looks so healthy."

Beneath that temple-like tomb shown in the drawing was interred another "man of his time;" but his celebrity was derived from intelligent dealings with the wealth of the present, not with the old remnants of the past. There lies David Ricardo, the eminent political economist. He died in the prime of life, at his seat in Gloucestershire, yet he, too, desired to rest here, for the heart clings to the desire, even when ceasing to pulsate, to be retained near those it loves, and Ricardo's clung to his daughter, whose husband was then the master of Harnage.

It seems strange that a man who was in early life a Jew, who married a Quakeress, and then joined the Unitarians, should finally repose in a graveyard of the Trinitarians. But, whatever may have been his final creed, he was during the thirty concluding years of his life noted for his unflinching integrity, and he deserves the admiration of his countrymen for being the early advocate of the freest competition in every branch of industry, and of dealing with all nations on fair and liberal principles.

Descending from the eastern end of the church and crossing the road the visitor may pass into the rectory. It is in perfect unison with the church; so is its garden, its hen-roost, and its pigeonry. I was privileged to cross the threshold of that rectory, and I might tell of the genial welcome, the heart-lit smiles, and the firm hand-pressures that greeted me; they

were bestowed on me by "WILTSHIRE RECTOR" and his family, and this his rectory is Hardenhuish.

The parish is small, and the incumbent's emoluments no more than £90 a-year, so that "WILTSHIRE RECTOR" might reply, as did one of his brethren, "I have no living, but I have a starving near Chippenham." No one better deserves better preferment, and no one would more rejoice to hear that he had obtained it than would his friend—G.

POMOLOGICAL GLEANINGS.

SUMMER BEURRE D'AREMBERG.—We have often heard from the lips of Mr. Rivers a flattering account of this new seedling Pear of his, which fruited for the first time two or three years ago; but from the fact of it being an early Pear, and soon past, circumstances have hitherto prevented us from forming our own opinion of its merits. Fortunately this season some of the fruit have reached us in perfect condition, and from those now before us we furnish a figure and description of this new fruit. The size, as will be seen by the figure, is not large, and

the form is somewhat turbinate or short obovate, even in its outline. Skin of a lemon colour, slightly veined with cinnamon-coloured russet, with a patch of the same here and there, and particularly so round the stalk. Eye very small, frequently wanting, and set very deeply in a deep and narrow basin. Stalk upwards of an inch long, and inserted in a small round cavity. Flesh tender, melting, juicy, brisk, and with a fine, sprightly, vinous, and perfumed flavour. The fruit does not keep long, as it rots at the core shortly after being gathered; but the variety is a desirable sort at this season, and if gathered before it is perfectly ripe it will, no doubt, keep much longer after being gathered.

The Summer Beurre d'Arenberg was raised by Mr. Rivers from the old Beurre d'Arenberg, and the tree forms naturally a perfect pyramid, is hardy, and a great bearer.

ALEXANDRA OR ALEXANDRA NOBLESSE PEACH.—We have had an opportunity of seeing and eating fruit of this season, and find that all our former favourable impressions of this excellent Peach have been confirmed; and there is no doubt but that it is in respect of the fruit, one of the finest Peaches in cultivation, and as regards the tree, one of the hardiest. Unlike the Noblesse, to which the fruit bears a close similarity, the tree is not subject to mildew, and the leaves are furnished with round glands, whereas in the Noblesse they are glandless.

We have received from Mr. Rivers a seedling Plum, marked No. 7, which bears a close resemblance to the true Nectarine Plum. It is round, purple, and of good flavour. It cannot be called a dessert sort, but is a productive and early bearer, like those two valuable varieties of which Mr. Rivers sent us fruit; also, it will be valuable as a market and culinary

* The following is a translation of the inscription on the tablet:—"In the eastern part of the graveyard now rests John Thorpe, M.A. and F.A.S. Born in the parish of Saint Margaret, in the city of Rochester, in the year 1715, and died August 2nd, A.D. 1792, in the hope of a joyful resurrection only through the merits of Christ."

variety. It was raised from that beautiful sort Belle de Septembre, but is hardier than its parent. Its season when grown out of doors is the beginning of September, but the fruit now before us, being grown in an orchard house, is consequently earlier.

A year or two ago we noticed a remarkably fine specimen of a Peach received from Mr. Bréchant, under the name of EXQUISITE. It measured somewhat about or over 9 inches in circumference. This season we have had half a dozen such, and though they were somewhat decayed in consequence of delay, the flavour was rich and really delicious. From this and other evidences we have seen of this Peach, it is one we unhesitatingly recommend as one which ought to be in every collection—say one of six. Its large size, fine apricot colour, and high flavour render it truly an exquisite Peach.

THE REV. W. KINGSLEY, of South Kilvington, informs us that he has "two very big Susquehanna Peaches colouring, fully 12 inches in girth; and I want to know whether this is big for Chiswick and other big places." We would call it big for any place; but knowing as we do, and having seen Mr. Kingsley's mode of cultivation, and the result of the intelligence he brings to bear upon it, we were quite prepared for this announcement.

NOTES AND GLEANINGS.

THE total number of people who visited the ROYAL HORTICULTURAL SOCIETY'S GARDENS, at South Kensington, on the 26th of August, the Anniversary of the late Prince Consort's birthday, was 115,303.

THE Council of the Royal Horticultural Society have decided to erect an orchard house in the garden at Chiswick, which will illustrate in an effective manner this system of fruit culture. The house will be 100 feet long and 50 feet wide; and as it is to be proceeded with forthwith we may hope to see during the next season a worthy example of orchard-house cultivation carried out efficiently where horticulturists would most expect to see it.

It is again our painful duty to add another name to the long roll of botanists who have laid down their lives in hunting out the treasures of other climes wherewith to enrich our gardens. Valuable indeed they ought to be when it is seen at what a sacrifice they are obtained. Not a month has elapsed since we had to chronicle the death of Mr. Richard Pearce; now it is that of Mr. David Bowman, a young and very enterprising botanical collector. The melancholy intelligence has just been received in this country of his death at Bogota, New Grenada, on the 25th of June last, of dysentery, after a long illness. Mr. Bowman left this country nearly three years ago to collect plants and seeds for the Royal Horticultural Society, Mr. Wilson Saunders, and others. He first visited the neighbourhood of Rio de Janeiro, Brazil. Finding but few plants there, he subsequently went to the richer districts of New Grenada and from thence he sent considerable numbers of plants to this country. He had been for some time in the neighbourhood of Bogota, and had collected a fine lot of plants, with which he intended to have returned home shortly himself, when he unfortunately sustained some severe losses through robbery, which compelled him to prolong his stay in one of his excursions. After this occurrence he contracted a violent dysentery, which he at first neglected, but which ultimately carried him to his early grave. He lies buried in the British cemetery of Bogota, and leaves a wife and one child totally unprovided for to mourn his loss. He had been but a short time married previous to leaving this country. Mr. Bowman was a native of Scotland, and was born at Arniston, near Edinburgh, September 3rd, 1838, his father being gardener there. He served his apprenticeship at Arniston, and subsequently went to Dalhousie Castle and Arherfield. After having been foreman in the gardens at Dunmore Park, near Stirling, he came to the Royal Horticultural Society's gardens, Chiswick, where, as plant foreman, he was employed up to within a short period of his departure from this country. Among plants introduced by Mr. Bowman which bear his name may be mentioned *Odontoglossum Alexandrie Bowmani* and *Cyanophyllum Bowmani*, two first-class plants.

WORK FOR THE WEEK.

KITCHEN GARDEN.

WHEELING-IN rotten dung for vacant pieces of ground, digging or trenching them, tying-up Lettuces and Endive occasion-

ally, with the general routine of weeding and keeping the ground clean, constitute the principal work now in this department. Cabbages, if there are any plants left in the seed beds, there is plenty of vacant ground now for them, and they will come in useful. Celery may have a good earthing-up now when the soil is dry, and so may the Cardoons, as they have now finished the greater part of their growth. Cauliflowers should also be planted out in time where they may be protected, or prepared for planting under hand-glasses and frames. Dwarf Kidney Beans, measures should be taken for protecting the last sown out of doors in case of necessity; one night's frost warded off may insure a supply for a month later. Where hoops and mats are not applicable, a shaggy straw rope fixed upon stakes, so as to be moved obliquely or horizontally, as occasion requires, will answer the purpose. Lettuces, while the weather is fine make the last sowing for the late-spring supply before the week is out. Mushrooms, those who grow Mushrooms only at certain seasons cannot do better than procure spawn from their nurserymen, who generally obtain it from those who make it extensively for sale. Where Mushrooms are constantly wanted, the gardener can use the spawn more liberally when he makes a quantity himself. The materials are horse droppings and cow dung in about equal proportions, with a little road drift well mixed together. It may be made into bricks with a mould and put into a shed to dry, or merely spread out on any hard place under cover, about 2 inches thick, and divided into the size of bricks by cutting with a sharp edging iron. Make two holes in each brick for spawning, and getting them dry enough for that operation is all that will now be required. Tomatoes, pinch off all their lateral shoots and stop the leaders, just as you would Vines, but they like more sun than Grapes, and some of their leaves may be cut off to let the sun reach them.

FRUIT GARDEN.

Peaches and Nectarines should now be looked over every day, and the fruit gathered before it is dead ripe. Place bean-stalks among the Peach trees if there are any earwigs, and blow these troublesome insects into a pot of water in the morning; this will soon reduce their numbers. See that you know the names of all your Peaches before the fruit season is over; if you paid attention to the size of the flowers, the leaves and fruit will now generally enable one to determine the right names. It is important that everything should be correctly named. If Peaches and Nectarines are placed on shelves in the fruit room, with soft tissue or silk paper underneath them, the flavour will be better than if they are allowed to hang too long on the trees. After gathering what fruit is ripe the trees may be sprinkled with clean water in the afternoon after fine days; but, unless in extreme cases, it would not now be advisable to water any more at the roots, as the sooner growth can be stopped, and the maturing process completed, the better. If the heavy autumn rains, which may be expected before long, could be thrown off the borders by tiles puddled with clay, or by boarding, &c., we would suffer less from a severe winter. Unless the borders are particularly well drained, a second growth will take place, the vessels of the wood will be charged with a superabundance of watery fluid, and if a severe winter ensues, black and brown spotted, cankered, gummy, and dead wood in the spring will be the consequence.

FLOWER GARDEN.

That the autumn is the best time to bud Roses no one who has tried it will dispute; autumn in many cases is a better time to graft and bud many kinds of trees and shrubs than the spring or early part of summer, especially those trees that are difficult to propagate by these modes. The conclusion to be arrived at is this, the office of every leaf having a bud at its axil is to prepare proper nourishment for the full development or organisation of that bud, that the leaves of some trees possess the property of furnishing the buds in a few days, that others take some weeks to effect this, while a third will require a month or two to furnish the buds as independent members of the system. Certain it is that autumn is the safest time to bud those trees and shrubs that are considered difficult to increase in this way; and that such trees may be grafted in the autumn and unite in less time and with greater safety than at any other season, is a very important point to attend to.

GREENHOUSE AND CONSERVATORY.

From this time to the end of October there will be a considerable amount of potting for furnishing plants for the decoration of the conservatory. *Tropaeolum tricolorum* and others should now be potted, to come in during April. *Lilium longiflorum*

and eximium—the latter only a slight variety of the other—to flower early in June should now be potted. The beautiful varieties of *Lilium lancifolium* to flower next July should also now be in pots, but October is time enough to pot all these if they are not wanted before their usual time. The spring-flowering *Cyclamens* are very desirable plants; they should now be potted, and the summer ones gradually allowed to become dry, in order to be stored away for the winter. The earliest crop of *Hyalcinths*, *Narcissus*, *Tulips*, &c., should now be making roots freely in the new pots.

STOVE.

Many useful plants in that section which flower in winter and early spring in the stove, may be brought sooner into flower by checking growth about the present time; this is done by diminishing the usual quantity of water, and by keeping the house drier. Others of the same sort may be encouraged to grow as late as they will in order to succeed these. Every pot plant should be looked over one by one at any time when the weather is bad during this and the next month. It is not enough, however, that the outside of the pots and the surface of the soil are cleaned, the balls must be turned out of the pots, worms looked after, the drainage relieved from the sediment which the summer watering has washed down among the crocks, and if the pot is at all covered with green slime, do not use it, but take a dry clean pot of the same size, then add a little fresh soil to the surface, of the same nature as that already in the pot.

PITS AND FRAMES.

They should be filled with good plants for next year. As soon as the cuttings are struck let them have a few weeks out of doors if possible; it will revive them much before winter, and will also enable them to stand the confinement with greater freedom.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

HERE the work has chiefly been of a routine character—namely, planting, hoeing, and forking among young plants, and breaking the crust formed by the rains. Cauliflowers that had not a green leaf left, nor a whole one that was not riddled by the fly, are now pushing green leaves, and though fine, compact, white heads from old plants are out of the question, they are yielding nice little pieces like Sprouting Broccoli, which come in now as an agreeable change. Scarlet Runners, which at one time threatened to succumb, are now bearing heavily. We could not manage to keep on our ridge Cucumbers, as from want of water the red spider attacked them, but Vegetable Marrows withstood the drought well, and will be useful for some time longer.

The worst effect of the dry weather has been the filling the dry ground with grubs. We lately planted some hundreds of Lettuces, and there is hardly one left, the grub has seized the most of them, biting through beneath the surface; and though we have caught myriads of the depredators, we have not yet destroyed them all. We examined the ground well before planting, and even added lime when the ground was turned over, but that has not kept them away. As yet they have not troubled us with much else, as Cabbages, young plants, and Cauliflowers are as yet untouched. We examined plants, but though we found nothing at the roots one day, there would be a grub and a cut plant the next. We once tried a sprinkling of tar on the ground, but with little benefit. In fact, we know no effectual remedy, except catching and killing them. Do any of our readers know of a less tiresome remedy? On a raised bank planted with Endive, those on the south side are almost as much injured as the Lettuce, whilst those on the north and colder side are not at all touched.

Spawed a fresh piece of Mushroom bed, and prepared a piece more, which will be the last in the open shed. In a few days, or as soon as we have wet, we will smoke the Mushroom house with burning sulphur, preparatory to cleaning it out for receiving the winter beds.

Planted out strong Cucumbers in a pit, where we can give them heat, and applied a little fire heat to those in a pit still bearing. Those in frames that fruited early are now about over. The last sowings out of doors of Onions and Lettuces to stand the winter, and Turnips and Radishes, must now be made. A sowing of Radishes may be made in the middle of September, or a week later, if some protection can be given to them, and when much wanted, they should be sown under glass in the first week in October, but without any artificial

heat. Some people like them all the year round, but in general they are more prized after the New Year than for a month or two in the end of the year. When people eat cold Cucumbers all the year round, these cease to be a zest in March and onwards. All except the latest Potatoes should now be taken up, as most of the early and medium early kinds are making fresh growth, and after this the first-formed tubers will always be deficient in quality.

FRUIT GARDEN.

Raspberries.—Thinned out and roughly tied, so as to fill the spaces between with winter stuff. Much of that will be smaller than usual, and therefore we must have more of it. See previous weeks as to Gooseberries, Currants, and bush and pyramidal fruit trees, and *gathering early fruit*. All the fruit will be much earlier this season. Even the Ribston Pippin Apple, and its next-door neighbour for quality, the smaller but equally rich Margil, are becoming quite bright in appearance, and the seeds are pretty well black ripe. One fruit here, the fine-flavoured Margil, will flourish on soils where without frequent transplanting it is next to impossible to keep the wood of the Ribston Pippin from canker, and the fruit from being spotted. Let it be borne in mind that a fruit carefully gathered and placed on shelves or drawers without injury, is really as valuable as two or three that have tumbled down and been bruised. Even soft Apples keep much better and longer if gathered by hand. Hence the superiority of bush and pyramidal trees instead of lofty standards. It is such a pleasure to be able to attend to and gather most of the fruit when standing on the solid ground. With proper attention we believe, too, that the same space of ground supplied with dwarf trees will yield more fruit than the same ground covered with large lofty trees. Until tried people will not believe the quantity of fruit they can have from small, well-tended trees, when no more vigour is permitted than is sufficient to bring the fruit to perfection.

Fruit-room.—Much depends on having this place sweet and clean. Took the chance of a dull wet day to have the shelves, &c., well scrubbed with hot soap water, and would like to whitewash and wash again before the bulk of the fruit is gathered. Anything unpleasant soon exercises an influence on the fruit.

With all our care where gauze cannot be applied, the *wasps* are exercising their powers on Plums and some of the earlier Apples. Myriads have been destroyed, but still numbers are left, and the dry season has so cracked the ground as to give them wondrous facilities for baffling us. We lately noticed a large nest, and to it there were as many as a dozen entrances, and some of these as much as 10 or 12 feet from the nest. If burning paraffin oil could be made to reach them in their burrows it would soon destroy them. Tar is also good, but if the danger is guarded against nothing is more effectual for stupefying them than lighted squibs of sulphur and powder, and after burning well a piece of turf placed over the hole.

ORNAMENTAL DEPARTMENT.

If anything could show the importance of having flower-beds well picked of their fading flowers, it would have been the appearance of these beds well trimmed before the continuous rains of the 22nd, and those that were unpicked. The former stood the rains, and remained gay and bright, but it was a number of days before the others, even after picking, became at all bright. The water falling off fading flowers discolours the younger flowers that otherwise would remain bright.

Most of the time has been taken up in switching and rolling walks, and mowing and machining the lawn, and where the latter operation has been resorted to since the rains once every four days or so, a more beautiful green carpet could not be seen. The growth, owing to the heat of the ground, is remarkably rapid, and, therefore, the mowings must be frequent. Much has also been done in inserting cuttings in moveable boxes, to avoid the necessity of raising and potting, or planting afterwards; but this has been done in the manner several times averted to.—R. F.

TRADE CATALOGUE RECEIVED.

Charles Turner, Royal Nurseries, Slough.—*Catalogue of Bulbous Flower Roots and Tulips*.

COVENT GARDEN MARKET.—SEPTEMBER 2.

THERE has been scarcely any alteration worth quoting. A trifling advance has been made in the price of Filberts and Cob Nuts, but that is

chiefly owing to the growers being so much engaged with the Hops. Peas are quite over, fully a month earlier than usual.

TO CORRESPONDENTS.

CONVERTING AN ORCHARD HOUSE INTO A GROUND VINERY (*Experiment*).—It is well to make experiments, and to form a ground vinery of your 20-feet-square span-roofed house, supposing you mean to grow the Vine as a standard. If we wanted the most return with the least trouble, we would plant the Vines and train them under the roof in the usual way. In either case you ought to have concrete and drainage beneath from 18 to 24 inches of soil in your stiff clay. Without heat the Black Hamburgh, the Esperione, and the Royal Muscadine will suit you.

ROSES (*A Beginner*).—"The best white Perpetual Rose suitable to the Manetti stock is *Baronne de Maynard*. Madame Alfred de Rougemont is also very good. The former is pure white, and as good and abundant a bloomer as Madame Plantier. I never had Mrs. Bosanquet on a Manetti stock. I bought one eighteen years ago worked on a Briar stock. It is still alive and well. It is beautiful, and the only China Rose worth preserving.—W. F. RADCLIFFE."

PALMS.—"Your correspondent, 'PA TELIN,' must have confined his search for Palms and other foliage plants to very few nurseries where these plants are grown to find the price he names—viz., three guineas as the lowest sum charged. Now, I have purchased plants of this kind at the nursery of Mr. Burley, Pembroke Place, Bayswater, at from 5s. to 10s. each, according to the size of the plants. Others also offer many kinds of Palms, &c., at about the same price. Of course for specimen plants half grown one would expect to pay three guineas; but such plants as those would scarcely be used for decorating rooms, except on the occasion of a ball being given.—WILLIAM GILES, St. James's Square, Notting Hill."

POTTING SHED CONVERTED INTO A VINERY (*G. E.*).—Plant the Vines outside in your case. Introduce them a foot at least above the hot-water pipes. Protect the stems outside with three-sided wooden boxes, the empty side placed against the wall. Fill the boxes with sawdust round the stems, and put a cover on the top to keep it dry. Then keep the Vines inside all the winter. The bedding plants will do the Vines no harm if you do not raise the temperature above from 40 to 45 with fire heat. The varieties you name will suit.

PERLAGONIUM CUTTINGS (*R. Smeed*).—In taking cuttings of Perlagoniums the bottom or middle of a large slip in general does better than the top, which is more spongy. After inserting, it is best to keep the soil rather moist, but not wet, and drier in proportion to the succulence of the cuttings. The smallest pots above thumbs do well for wintering them. We keep ours thickly in boxes and pots, say 1-inch surface to each cutting. Had we room, as you seem to have, we would place a single cutting in a small pot at once. This would save rotting, and such cuttings are sure to do well.

HEATING A SMALL GREENHOUSE BY A FLUE (*T. Sedgley*).—As you have your ashpit out of doors, why not have the furnace door out of doors too? All flues when damp and unused for a time are apt to have a back draught, and this would not signify if the furnace door were outside. In your case it would be worse but for the gradual rising of the flue. The higher the bottom of the flue is above the fire bars the better it will draw. Thus, 18 inches would be better than 10 or 12. You have increased the chance of back draught by your arrangements; first you have a deep flue, 7 inches wide, we presume inside measure; to this you add earthenware pipes 3 inches in diameter, and have a chimney 2 inches in diameter. If these diameters were more than doubled the draught would be better. It is a mistake to narrow chimnies much near the top. You may keep all the plants you mention.

FORMING STRAWBERRY BEDS (*A Regular Victim*).—We do not quite understand your case, as there are some words in your letter which we cannot decipher. We would not be discouraged about the bank planted last September. If the ground cracks, break the surface and add some mulching. We would by no means take up and divide these plants. Give them plenty of rotten dung in October as mulching, and see what next year will do. We presume your soil is very stiff, all the better if you

can work it by deep-stirring and manuring. Meanwhile for a new bed add some chalk and lime rubbish, and plenty of dung instead of ashes, and take your time to that; but as soon as possible take off your runners of approved sorts, and prick them out 4 or 5 inches apart into rich well-manured soil, with rotten dung at the surface, and shade if wanted, and water well as needed. Then, either in the beginning of October, or, as we would prefer, in the end of February, take up these plants with balls, and transplant them into the ground left rough all the winter, and merely nestly levelled and wrought before planting. This would be a good plan in your heavy soil.

RASPBERRY PLANTING (*Idem*).—In planting a row of Raspberries you may place them a foot apart if you train to a trellis, and from 30 to 38 inches apart if you mean to grow them from stools and fasten them to a stake, or bend them over like an arch. We like the regular line of trellis the best, and wires, say three, are best to tie the canes to. Of red Raspberries none are better than the Fastloff and Carter's Prolific, and of the yellows the Yellow Antwerp.

DARK CLIMBING ROSES (*Old Subscriber*).—"The only very dark lofty pole Rose is Frederick II. It is a dark crimson purple Hybrid Bourbon. It will grow 12 feet high, but it only produces one series of bloom. It is handsome. The only dark Hybrid Perpetual pole Roses are Duc de Cazes, dark crimson purple, and Prince Camille de Rohan. The first-named will, under high cultivation, grow on the Manetti stock 7 or 8 feet high, and is very hardy and a free and abundant bloomer. The second-named is very handsome, maroon-coloured, and will under the same culture, on the Manetti, grow 6 or 7 feet high.—W. F. RADCLIFFE."

COCKSCOMB STRAWBERRY (*M. N.*).—It can be obtained from any nurseryman who advertises Strawberry plants in our columns. It was raised in the Royal gardens at Windsor.

RYTON MUSCAT GRAPE (*G. S.*).—In Mr. Rivers's catalogue it is said to have been raised many years since at Ryton, near Newcastle-on-Tyne. We believe it to be a form of the Muscat of Alexandria. The large bunches may be a consequence of the vigour of the young Vines.

REMOVING ROSE TREES (*Eden Grove*).—You have no right to remove the trees; but you may have them taken up and potted, and then you can take them away. There is no danger in removing Roses after this date, only take them up carefully, and have the roots secured from the drying influences of the atmosphere by a covering of damp moss or hay, and enveloping all in a mat. The sooner they are planted after removal the better, giving a good watering to each after planting. It is quite optional on the part of the landlord or the new tenant to allow you any thing for the fruit trees and vegetables, but something in such cases is generally given.

GUANO VERSUS STABLE MANURE (*Various*).—Guano is not equal to stable manure for general purposes; it is not so lasting, otherwise it is an excellent manure, and may be applied to all descriptions of crops advantageously. It should be applied when the crops are in a growing state, or it may be put on at the same time as the crops are sown or planted. Half a hundredweight of Peruvian guano will be a good dressing for your garden. The way to apply it is to sift it through a half-inch sieve, breaking the lumps to make it fine. It may be spread broadcast over the ground, hoeing or pointing the ground afterwards; this is not necessary, however, if the surface is open and rain follow.

COMPOST FOR LILUM AERATUM (*Idem*).—Two-thirds loam from rotted turves, and one-third sandy fibrous peat, with a free admixture of sharp sand. If the loam is poor one-fourth old cow dung may be added and intermixed. To answer all your queries would take up the whole space of one Journal. You will find full instructions for the cultivation of the plants mentioned, in the "Garden Manual," which you can have free by post from our office if you enclose twenty postage stamps with your address.

ARBOR-VITE PROPAGATION (*Willson*).—The Arbor-Vite may be raised from cuttings, but best from seed. Now is a good time to put in the cuttings, taking the points of the growing shoots when they have become somewhat ripened. They may be from 3 to 6 inches in length, and should be cut below a joint. It is not necessary to trim off the spray, but this may be cleared off to the extent the cuttings are put in the soil—namely, from one-half to two-thirds of their length. They should be inserted in a cold frame in a compost of sandy loam, the surface being covered with an inch in thickness of sand. Make the soil firm about the cuttings, and after giving a gentle watering put on the lights. Keep close and shaded from bright sun. In a month admit air, and by degrees harden them well off, exposing them fully when the weather is mild, and affording protection from frost.

GRAPES CRACKING (*Idem*).—Your Vine is from some cause not healthy; the cracking is due in a great measure to the berries being so small and the late rains. We presume you allow plenty of foliage, so as to shield the bunches from the sun. The leaves now yellow must be infested with red spider, and the spotting of the wood we should attribute to mildew.

SHRUBBERIES (*E. C. H.*).—London's "Villa Gardener" may suit you; but we shall have some hints on the subject by planting time, which would, perhaps, answer your purpose.

VALUE OF CAMELLIAS (*J. P.*).—We could not say without seeing the trees what the value would be; but if good specimens and kinds, £5 each is what we have known given for plants of the size of those you name. Such things, however, have no market value; the price obtainable is solely dependant on the disposition and means of the purchaser, and the necessity of selling.

WOODLICE (*A Thankful One*).—The insects destroying your Fern fronds are woodlice. The simplest and best means known to us of destroying them is to put a boiled potato, lightly wrapped in a little hay, at the bottom of a small flower pot, and at night place the pot on its side near their haunts, and in the morning shake out the woodlice, which will remain by the potato in the bay, when they may be destroyed by staking them into a bucket of boiling water. This repeated for a time will thin their numbers considerably. If you could pour boiling water on their hiding places that would be a speedy method of destruction; but be careful not to let it reach the roots of the plants, or come in contact with the foliage.

TACSONIA VAN-VOIXEMI PRUNING (*D. M.*).—The fruit of this handsome climber we should consider eatable, but have no experience of it. It may be pruned to any extent, the best plan being to thin out the shoots, and cut back all the flowering shoots to within a few eyes of their base,

leaving enough of this year's wood to furnish flowering shoots for next. The shoots may now be thinned, and the general pruning may take place in January. Keep the plant dry at the root in winter, and diminish the supply of water now.

PRIZES FOR BRITISH FERNS (Exhibitor).—According to the wording of the schedule we should not have awarded prizes to either of the collections, for it says "distinct species," and there are varieties in both. Apart from varieties, which you do not specify, we should think B's collection the rarest, but the plants in M's, if rare varieties, ought to be placed first. B's is the best in species, and more in accordance with the schedule than M's; but M's varieties of the species named may be rare, and, if as good as the species, are better than B's.

VARIEGATED BORECOLE (J. J.).—We do not perceive in what way you have treated the plants wrong, for all that is required is to sow the seed in April in an open situation, to prick-out the plants when large enough to handle, and when of sufficient size to plant them out where they are to remain, allowing 2 feet distance between the plants every way. The kind of seed could not be right, and must have been put up by mistake, the Green or Purple being sent in place of the Variegated, which comes true from seed. Your plants ought by this time to have shown variegation.

SCARLET RUNNER ROOTS STORING versus SEED-SOWING (Idem).—Scarlet Runner roots may be taken up in autumn before frost, or after slight frosts, and be stored in dry sand in a cellar secure from frost. The roots, planted in the end of April or beginning of May, grow well, and give pods earlier than those from seed; but we find those from seed give the finest pods and longest continuance of crop, and on that account prefer sowing seed to keeping the roots of the old plants.

GATHERING EVERLASTING FLOWERS (J. A.).—They should be gathered or cut a few days after the flower is fully expanded, but not until the flower stem is rather stiff.

COMPOST FOR VINE BORDERS (Inquirer).—There are various opinions on the subject, which we shall shortly note more fully, but hope to meet your case by naming an excellent compost for the Vine. The bottom of the border must be concreted, or the roots prevented from passing below it by a floor of flagstones, or bricks or tiles run in cement. There must be a drain to carry off water that may not be required by the roots, and which would remain stagnant in the soil. It must have a proper fall and outlet. On the bottom a thickness of 9 inches of stones, brickbats, or other open material should be placed, and on this a layer of turf, grass side downwards. This may be said to be the foundation, only it is desirable to have the border quite as much above as below the surrounding ground level, and to have a wall all round to prevent the roots escaping from the border, or other roots entering. Then put in the following compost fully 2 feet 6 inches deep:—Turf from an old pasture where the soil is a good light rather than heavy loam, pared-off 2 or 3 inches thick, according to its strength of fibre, and cut into squares of about 6 inches, of fifteen barrowfuls; place it in a heap, to which add two barrowfuls of lime rubbish from an old building, taking care to pick out the pieces of timber, one barrowful of gritstone in pieces about the size of a hen's egg, one barrowful of lump charcoal, one barrowful of old dry bones, broken by beating them on a hard substance with a hammer, one bushel of calcined oyster shells, and four barrowfuls of sheep droppings from the pens, or horse droppings free of straw. Mix all the materials well together, and make the border in dry weather. Finish off with a layer of turf which has been in a heap for six months, adding to it one-tenth of half-burnt bones, and well mixed. Your Vines will astonish your neighbours.

"COTTAGE GARDENERS' DICTIONARY" (Idem).—It may be had post free from our office if you send 7s. in stamps with your address. It contains the Supplement, which includes the plants worthy of cultivation introduced down to the end of 1867.

CUTTING-BACK OLEANDERS (J. J.).—You may still cut the plant back; but it would be better to defer doing so until spring, as the plant would then make a better growth, and you will have an opportunity of forming a handsome specimen. The cuttings of the old wood will strike in water, and may afterwards be potted. They will stand the winter in a greenhouse, but not out of doors. Why not strike them in soil in small pots?

FINE APPLES (H. R.).—We should advise you to thin out the plants, removing every alternate one, and to place those you take up into pots sufficiently large to hold the roots. Perhaps you could take out every alternate row, which will answer quite as well as removing every alternate plant. We would remove all the lower leaves as far up the stem as roots

are being emitted, and give a top-dressing of rich compost, so as to cover the stems as deeply as they have roots, or rather about 1 inch deeper to allow for settling. By taking out every alternate row or plant you will afford room to those left in the pit, and they will, no doubt, bear fruit next summer, and finer than if you were to take them all up and pot them. Your compost is good.

MAMMOTH GOURD (G. G. Mucrac).—We have grown this to a weight of 120 lbs. The fruit is edible, and may be used as a Vegetable Marrow, or for custards, and when ripe is fully as good in flavour as a large coarse Melon.

CLIMBERS FOR WEST AND NORTH-WEST WALLS (W. B. R.).—West aspect: Clematis Jackmanni, C. Fortini, Aristolochia siphon, and Jasminum officinale grandiflorum. North-west aspect: Jasminum nudiflorum, Crataegus pyracantha, Berberis Darwini, and Cotonaster Simmonsii.

ALTERNANTHERA AMONGA PROPAGATION (Idem).—It is readily increased by cuttings, which may be put in now in sandy soil, with an inch of sand at the top of the pots or pans. The cuttings should be inserted about an inch apart. Select those with three joints and the growing point, and insert them two-thirds their length in the soil. A gentle heat is necessary, or a hotbed of from 70 to 75°. You may take up some of the old plants and winter them in a house having a temperature of 45°, and these will afford you plenty of cuttings in spring, which will answer for bedding out the same season, if growth is encouraged and they are hardened-off well before planting out.

STRAWBERRY CULTURE (H. W. R.).—"The blackbirds and thrushes here are so numerous that I am obliged to plant Strawberries closer than I should otherwise do, to save netting. All mine were netted, or the birds would have eaten them up, as they did my Raspberries and Gooseberries. The Strawberries will be netted next year, for it is of no use arguing with hungry stomachs. I suppose my Strawberry plants are on an average 18 inches apart every way. If runners are planted very late I put them in 9 inches apart for the first year, and cut out every alternate plant and row after cropping, which leaves them 18 inches apart every way. In wet cold summers they cannot be too far apart, and in such a summer as we have had they can scarcely be too close. Dr. Hogg is a splendid grower, and fine in every way. No Strawberry plants could withstand the sun more triumphantly than Dr. Hogg, Lucas, Rivers's Eliza, and Cockscumb. I should not consider 18 inches of loam a shallow soil. Strawberries like free drainage, plenty of sun, manure, and water. The same may be said of Roses. The horse, cow, or pig manure may be either dug in and well mixed with the soil some time before planting, or they may be put on as a top-dressing. The crowns of the plants should never be covered with anything. The manure must be kept level with the base of the plant, or the crowns will be bleached and softened. I dress my worked plants closely after cropping, as they must make new roots to supply the old ones, which die away wholly or in part. This causes them to make new deep roots at once, which greatly assist them to withstand severe winters. Some people do not dress the beds till March, when the mischief is done. Hence they have an abundance of flowers, but an abortive crop. Dress closely after cropping, and cut off the runners. Never break your ground (you may weed with a Dutch hoe), from the time the Strawberries are planted till you break them up. Mine are now dressed with calcareous loam. Put on guano, soot, or blood manure in showery weather in the spring. Be careful not to put guano over the plants; they will in that case turn as yellow as a cock canary bird. My runners were mainly planted in July, and are strong. You may have round fresh-planted Strawberry plants. It will promote growth. Do not hoe deeply."—W. F. RADCLIFFE."

BRITISH FERNS (J. B.).—It is impossible to answer your question in a satisfactory manner without knowing what are their names.

NAMES OF FRUITS (J. L.).—Apples: 1, Alexander; 2, Autumn Pearmain; 3, Manks Codlin; 4, Keswick Codlin; 5, Flat Nonpareil. (W. M. Darby.)—Plums: 1, Washington; 15, Goliath; 6 and 16, Victoria. Pears: 7, Baronne de Mello; 8, Autumn Bergamot; 9, Marie Louise. It is too early in the season to name Apples and Pears. (J. H. Haddington).—Where did you obtain the Vine? The Grapes are very much like those of Forbes's Seedling, so far as we can judge from so small a portion of a bunch.

NAMES OF PLANTS (Clermont).—The specimen has never reached us. If you will send another we will name it if it is determinable. (H. B.). Tritonia aurea. (J. R.). Lotus corniculatus. (J. W. K.). Cystopteris bulbifera. (R. M.). Diplazis glutinosus. (J. W. Strangford).—Rocha falcata; propagated by means of its leaves.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

BATH AND WEST OF ENGLAND SOCIETY AND SOUTHERN COUNTIES ASSOCIATION.

AN amalgamation having been effected between the Bath and West of England Society and the Southern Counties

Association, a special general meeting of members was held on the 25th ult. at the Three Cloughs Hotel, Yeovil.

Sir J. T. B. Duckworth, Bart., as Chairman of the Amalgamation Committee appointed by the annual meeting of members of the Bath and West of England Society, held at Falmouth on the 3rd of June last, moved that the title of the Amalgamated Societies be "The Bath and West of England Society (established 1777), and Southern Counties Association, for the

Encouragement of Agriculture, Arts, Manufactures, and Commerce." A code of laws for regulating the affairs of the Society was accepted; and at a meeting of the Council held on the same day the Stewards and officers for the current year were nominated; and a letter by Mr. Calch H. Gater, the local Honorary Secretary, having reference to the Society's Meeting at Southampton in 1869, was read, from which it appeared that the authorities of the London and South-Western Railway have promised the Mayor of Southampton to give the fullest railway accommodation during the time of the Meeting.

HALIFAX AND CALDER VALE POULTRY SHOW.

THIS year's Show was held August 28th and 29th, in the Riding School, Halifax, a building most admirably suited for the purpose, and the general arrangements were most satisfactory. The Show of this year ranks among the best that have been held in the northern counties. The entries of poultry alone were upwards of 500, and of Pigeons there were above 200 pens. Every attention that could be given by the managers was efficiently rendered, and we may justly say, they well merited the success they have attained. The attendance of visitors was remarkably good, and the Show seemed more attractive than customary. Every class was well filled with birds from the first breeders in the kingdom. The Pigeons, too, were superior to any yet entered in the district. It is much in favour of this Show, that the offer of silver cups was unusually great, which, considering the great number of poultry shows now taking place, may perhaps account for the entries being so numerous. The weather proved very favourable.

SPANISH.—First, H. Beldon. Second, J. Thresh, Bradford. Third and Highly Commended, J. Marchant, Halifax. *Chickens*.—First, J. Smith, Keighley. Second, Miss L. M. York, Tadcaster. Third, H. Beldon. Highly Commended, J. S. Senior, Dewsbury; W. A. Taylor, Manchester; P. H. Jones, Fulham.

COCHIN-CHINA (Any other variety).—First, G. & C. Furness, Accrington. Second, L. Biney, Manchester. Third, A. O. Worthington, Burton-on-Trent. *Chickens*.—First and Second, W. A. Taylor. Third, A. O. Worthington.

BRAHMA-POOTRA (Light).—First, A. O. Worthington. Second and Third, H. Downst. *Chickens*.—First and Second, H. M. Maynard, Ryde, Isle of Wight. Third, H. Downst. Highly Commended, H. Laey, Helden Bridge; W. Whiteley, Sheffield. Commended, H. Saville; H. M. Maynard; D. Conser, Frinton.

BRAHMA-POOTRA (Dark).—First, W. Hargreaves, Bacup. Second, E. Leech, Bichlade. Third, K. Jopp, Aberdeen. Highly Commended, A. O. Worthington. *Chickens*.—First, H. Langwood. Second, G. Dixon, jun., Whitehaven. Third, K. Jopp. Highly Commended, K. Jopp; Rev. J. F. Newton; Mrs. Seamons, Hartwell, Aylesbury; H. Beldon. Commended, H. Saville.

CREVÉ-CŒUR.—First, H. Beldon. Second, J. K. Fowler. Third, J. C. Cooper, Limerick. *Chickens*.—First, Hon. H. W. Fitzwilliam. Second, J. K. Fowler. Third, W. R. Park, Abbot-in-Clay.

BEARS.—First, H. M. Maynard. Second, W. O. Quibell, Newark. Third, F. B. Hald, Whitton. *Chickens*.—First and Second, F. B. Hald. Third, H. M. Maynard. Highly Commended, J. C. Cooper; H. M. Maynard. Commended, J. C. Cooper; L. Biney.

LA FLECHE.—First and Second, J. & C. Cooper. Third, J. K. Fowler. *Chickens*.—First and Second, J. C. Cooper. Third, W. A. Burnell. Highly Commended, J. K. Fowler.

GAME (Any colour).—*Cock*.—First, Cup, and Second, C. W. Brierley. Third, J. Fletcher, Stoneclough, near Manchester. Fourth, V. Boyes, Beverley. *Hen*.—First and Cup, J. Barrow, jun., Lradley Field, near Kendal. Second, J. Pickles, Banks, Mytholmroyd. Third, S. Matthew, Stowmarket. Fourth, L. Biney. Highly Commended, C. W. Brierley. Commended, J. Fletcher. *Chickens*.—First, T. Bottomley, Shelf. Second, S. Greenwood, Stowmarket. Third, C. W. Brierley. *Pullet*.—First, S. Matthew, Stowmarket. Second, T. Dyson, Halifax. Third, J. Hodgson, Whitlington, Earton. Highly Commended, G. Dingley, Shustoke, near Coleshill; Fittin & Redman, Holmfirth, Ovenden. Commended, J. Bonness, Newchurch.

GAME BANTAMS (Black-breasted Red).—First, W. Brierley. Second, L. Biney. Third, R. Booth, Halifax. *Chickens*.—First, H. Jennings, Allerton. Second, H. Warner, Loughborough. Third, S. Greenwood, Southwram. Highly Commended, E. Toder, Little Carlton, near Newark. Commended, G. Ponder, Kirby Moorside.

GAME (Brown-breasted or other Red).—First, T. Bottomley. Second,

Green & Sutcliffe, Queensbury. Third, J. Fletcher. *Chickens*.—First and Second, J. Spencer, Queensbury. Third, J. Cartle, Early.

GAME (Duckwings, Greys, and Blues).—First, W. Boyes. Second, J. Ackroyd. Third, J. Pickles. *Chickens*.—First, R. B. Riley. Second, J. Barrow, jun., Kendal. Third, T. Dyson, Halifax. Highly Commended, W. Bailey, Scholes; W. Chadwick, Halifax.

GAME (White and Pile).—First, C. W. Brierley. Second, R. Butcher, Cresswell. Third, G. & C. Furness, Accrington. *Chickens*.—First, H. C. Mason, Brighlington. Second, E. Noble, Halifax. Third, G. & C. Furness, Accrington. Commended, S. Matthew, Stowmarket.

POLANDS.—First and Third, H. Beldon. Second, J. S. Senior, Dewsbury. Highly Commended, P. Unsworth, Lowton; J. Batty, Holmfirth. *Chickens*.—First, J. S. Senior. Second and Third, H. Beldon. Highly Commended, J. A. Taylor; J. Batty.

HAMBURGHS (Golden-pencilled).—First, J. R. Jessop, Hull. Second and Third, H. Beldon. Highly Commended, J. C. Cooper. *Chickens*.—First, H. Beldon. Second, F. Pitts, jun. Third, Bowman & Fearon, Whitehaven. Highly Commended, W. R. Park; S. Smith.

HAMBURGHS (Silver-pencilled).—First and Second, H. Beldon. *Chickens*.—First and Second, H. Beldon. Third, J. S. Senior. Highly Commended, W. & J. Baird, Low.

HAMBURGHS (Golden-spangled).—First, J. White, Whiteley, Netherton. Second, E. Brierley, Heywood. Third, H. Beldon. Highly Commended, A. Bray, Holey, Huddersfield. *Chickens*.—First and Cup, offered by J. Tonge, Esq., for best pen of Hamburg fowl, H. Beldon. Second, J. Leaming, Cowburn. Third, S. R. Ashton, Mottram. Highly Commended, J. Walker, Knaresborough. Commended, J. S. Senior; S. Smith.

HAMBURGHS (Silver-spangled).—First and Second, H. Beldon. *Chickens*.—First, W. H. Bentley. Second, J. Leaming. Third, T. Robinson. Highly Commended, J. Walker; J. S. Senior; H. Beldon.

HAMBURGHS (Black, White, or any other variety).—First, C. Sidgwick. Second, S. Shaw, Stainland. Third, H. Beldon. *Chickens*.—First and Third, C. Sidgwick. Second, H. Beldon.

ANY OTHER DISTINCT BREED FACET BANTAMS.—First, J. C. Cooper (Sultans). Second, J. R. Jessop, Hull (Sultans). Third, R. Loft, Woodmansey (Sultans). *Chickens*.—First, J. K. Fowler (Silkies). Second, R. Loft (Sultans). Third, T. Ashworth, Stansfield (Sultans). Highly Commended, R. Loft (Sultans).

GAME BANTAM COCK (Any colour).—First, W. F. Entwistle, Leeds. Second, G. Noble. Third, L. Biney. Commended, J. J. Cousins, Chapel Allerton; W. F. Entwistle.

GAME BANTAMS.—First and Cup, offered by J. Crossley, Esq., for best Bantams of any age or colour, W. F. Entwistle (Black Red Game). Second, Rev. G. Raynor, Tombridge. Third, J. R. Robinson, Sunderland. Highly Commended, J. Crossland, jun.; R. B. Riley. Commended, J. Crossland, jun.

BANTAMS (Gold or Silver-faced).—First, Ackroyd & Scott, Sunderland. Second, J. S. Senior. Third, H. Draycott, Hummerstone. Highly Commended, T. C. Harrison.

BANTAMS (Any other variety).—First, T. Burgess, Brighouse. Second, H. Draycott. Third, R. B. Riley. Highly Commended, S. & R. Ashton, Mottram. Commended, G. A. Crowe.

DUCKS (Aylesbury).—First, J. K. Fowler. Second, E. Leech. Third, Mrs. Seamons. Highly Commended, Mrs. Seamons; J. K. Fowler.

DUCKS (Rouen).—First and Cup, offered by H. A. Ridgway, Esq., for best pen of Ducks, J. J. Stott, Rochdale. Second and Third, S. Shaw, Stainland. Highly Commended, T. Dean, Keighley.

DUCKS (Any other variety).—First, R. P. Williams, Glaslawn, Clontarf, Dublin (Red Shell). Second and Third, S. Shaw (Brahma and Pintail). Highly Commended, C. W. Brierley (Teal and Pintail); H. Beldon (Grey Call); R. P. Williams (Brahma); C. N. Baker, Chelsea (Pintail). Commended, S. & R. Ashton (C. Call); T. C. Harrison (Mandarin).

GESE.—First, J. K. Fowler. Second, Mrs. Seamons. Third, E. Leech. Highly Commended, J. White, Whitley, Netherton; E. Leech; S. H. Stott; O. A. Young, Driffield. *Geese*.—First and Third, S. H. Stott. Second, J. C. Cooper. Highly Commended, E. Leech; J. K. Fowler.

TURKEYS.—First, E. Leech. Second, H. Merwin, Driffield. *Turkeys*.—First and Second, W. Sandy, Notts. Third, E. Leech. Highly Commended, S. H. Stott.

SELLING CLAS.—First, W. A. Taylor (Spanish). Second, J. Marchant, Halifax (Spanish). Third, Rev. C. Spencer (Buff Cochons). Highly Commended, H. Beldon (Spanish); L. Loft (Sultans). Commended, H. Saville (Brahma); R. P. Williams (Golden-spangled Bantams); R. B. Riley (Turkeys).

EXTRA.—Highly Commended, H. Saville.

PIGEONS.

ROUTERS OR CROPPERS.—First, F. Crossley, Elland. Second, P. H. Jones, Fulham. Third, J. Hawley, Bimley.

CARRIERS.—First and Third, F. Crossley. Second, T. Colley, Sheffield. Highly Commended, F. Crossley; J. Crossland, Huddersfield.

FOULDER OR CROPPER.—*Cock*.—First, P. H. Jones. Second and Highly Commended, F. Crossley. Commended, J. Hawley. *Hen*.—First, J. Hawley. Second, S. Shaw. Highly Commended, J. Hawley; F. Crossley; P. H. Jones.

CARRIER.—*Cock*.—First and Second, F. Crossley. Highly Commended, F. Crossley; T. Colley. *Hen*.—First, F. Crossley. Second, J. C. Ord, Pimlico, London. Highly Commended, F. Crossley; J. C. Ord.

TRIBLEMS (Almond).—First, F. Key, Beverley. Second, F. Crossley. Highly Commended, P. H. Jones. Commended, J. Hawley; F. Crossley.

TRIBLEMS (Mottled).—First, F. Crossley. Second, J. Hawley. Highly Commended, S. Shaw.

BALDS OR BEARS.—First and Second, J. Fielding.

OWLS.—First, F. Crossley. Second, P. H. Jones. Highly Commended, J. Fielding, jun.

TRETTIS.—First, S. Shaw. Second, J. Hawley. Highly Commended, H. Yardley, Birmingham.

JACOBINS.—First, J. Hawley. Second, S. Shaw.

FANTAILS.—First, S. Shaw. Second, G. S. Hall, Ely. Highly Commended, F. Crossley.

BAKES.—First, Capt. Heaton, Manchester. Second, P. H. Jones. Highly Commended, J. Hawley.

DRAGOONS.—First, J. Hawley. Second, F. Graham, Birkenhead. Highly Commended, F. Crossley; R. M. Maynard; P. H. Jones; S. Whitaw; T. Gaulroger, Halifax.

TRUMPETERS.—First, P. H. Jones. Second, J. Hawley. Highly Commended, J. Hawley; F. Crossley.
MAGPIES.—First, P. H. Jones. Second, J. Hawley. Commended, H. Beldon.
 ANY OTHER BREED.—First, S. Shaw. Second, H. Draycott. Highly Commended, J. Hawley; H. Yardley.
SELLING CLASS.—First, J. Hawley. Second, P. H. Jones. Highly Commended, H. Beldon; F. Crossley; H. M. Maynard; P. H. Jones.
EXTRA.—Highly Commended, J. Hawley (Trumpeter and Tumblers); J. Fielding, jun. (African Owls).

Mr. Hewitt, of Birmingham, and Mr. R. Teebay, of Fullwood, were the Judges for *Poultry*; and Mr. W. B. Tegetmeier, of London, for *Pigeons*.

CLITHEROE POULTRY SHOW.

NOT a doubt can exist on the mind of any reflective amateur that poultry exhibitions are much injured in the present day by so many being held simultaneously, or at best, on consecutive days. This materially lessens the number of entries, and where valuable birds are shown day after day without rest, and with all the excitement of long railway journeys they are much injured, and not unfrequently the result is their complete destruction. Highly bred birds cannot endure this continuous fatigue, without almost their entire value being lost as breeding stock, and, as a rule, no birds if they are to retain a first-rate condition should be exhibited oftener than once a fortnight.

The Clitheroe Show, held August 27th, was undoubtedly a good one, and every attention was given to the management, the only drawback being heavy squalling showers of rain, which annoyed the sight-seers. The Show on the whole went off very well, though a half-dozen similar meetings held the same week could not do otherwise than limit the entries.

GAME (Black and other Reds).—First, C. W. Drierley, Middleton. Second, J. Cowgill, Thornton, Skipton.
GAME (Any other variety).—First, H. M. Julian, Hull.
DORRINGS.—First, E. G. Norris, Cobham, Surrey.
COCHINS (Any variety).—First, W. A. Taylor Manchester. Second, C. W. Brierley. *Chickens*.—First Second, and Cup, for the best pen of Chickens in the Show, W. A. Taylor.

SPANISH.—First, W. R. Bull, Newport Pagnell. Second, J. Thresh. Bradford. Highly Commended, W. A. Taylor. Commended, J. C. Wilson. Annan.

BRAHMAS (Dark).—First, W. Hargreaves, Bacup. Second, E. Leach, Rochdale.

HAMBURGHS (Gold or Silver-pencilled).—First, H. Beldon, Goitstock. *Chickens*.—First, B. Bee, Bulls-nape Hall, Gosmargh. Second, H. Beldon.

HAMBURGHS (Gold or Silver-spangled).—First, H. Beldon. Second, J. A. Taylor. *Chickens*.—First, H. Beldon. Second, J. Berry, Shaley Wood, near Holmfirth.

POLANDS (Any colour).—First and Cup, for best cock and hen of any variety, H. Beldon. Second, Mrs. E. Procter, Hull.

GAME BANTAMS (Any colour).—First, W. F. Entwistle, Leeds. Second, J. R. Robinson, Sunderland. Highly Commended, L. Biney, Manchester.
BANTAMS (Any other variety).—First, W. A. Taylor. Second, H. Saville, Rufford Abbey, near Orleton (White Japanese Silkies). Commended, T. C. Harrison, Hull.

ANY OTHER VARIETY.—First, H. Dowsett, Plehey, Chelmsford (Light Brahmas). Second, H. Saville (Andalusians). Highly Commended, L. Biney (Houdans).

SELLING CLASS (Any variety).—First, Rev. W. Callis, Slaidburn, near Clitheroe (Dark Brahmas). Second, J. Preston, Clitheroe (Brown Red Game). Highly Commended, W. A. Taylor. Commended, Rev. W. Callis (Dark Brahmas).

GAME.—*Cockerel*.—Cup and First, for best single cockerel, T. Sunderland Coley Hall, Halifax. Second, W. Roberts, Thornyholme, near Burnley.

GAME BANTAMS.—*Cockerel*.—First, W. F. Entwistle, Leeds. Second, J. J. Cousins, Allerton Park, near Leeds.

ANY OTHER VARIETY.—*Cockerel*.—First, C. Layland, Grappenhall, near Warrington (Dark Brahmas). Second, W. A. Taylor. Highly Commended, H. Beldon.

TURKEYS.—First, J. Cunningham, Blackburn. Second, E. Leech, Rochdale.

GESE.—First, J. H. Hubbers'ey, Longridge. Second, E. Leech. Highly Commended, S. H. Stott, Rochdale; J. H. Hubberstey.

DUCKS (Aylesbury).—First, E. Leech. Second, J. Dean, Nethertown, Whalley.

DUCKS (Rouen).—First, E. Leech. Second, T. Waring, Preston. Commended, J. J. Stott; T. Houlker, Revidge, Blackburn.

DUCKS (Any other variety).—First and Second, C. W. Inverley (Pintails and Teals). Highly Commended, W. Yates, Downham, near Clitheroe (Muscovy; T. C. Harrison, Carolina).

PIGEONS.

CARRIERS.—First, J. Hawley, Bingley. Second, H. Yardley, Birmingham.

TUMBLERS.—First and Second, J. Hawley. Highly Commended, E. Brown, Sheffield; H. Yardley.

BARDS.—First, G. Charney, Preston. Second, E. Brown. Commended, H. Yardley.

OWLS.—First, T. Newell, Ashton-under-Lyne. Second, E. Brown.

POUTERS OR CROPPERS.—First, E. Brown. Second, H. Yardley.

FAN-TAILS.—First, J. Hawley. Second, H. Yardley.

TURBITS.—First, H. Yardley. Second, T. Newell.

DRAGONS.—First, G. Charney. Second, J. W. Brade, Blackburn. Highly Commended, H. Yardley.

TRUMPETERS.—First and Second, J. Hawley. Commended, H. Yardley.

ANY OTHER VARIETY.—First and Second, J. Hawley. Highly Commended, H. Yardley.

RABBITS.—*Spanish*.—First, A. H. Easton, Hull. Second, W. S. Hornby, Clifton Garth, York. Highly Commended and Commended, G. Brown.

Any other Variety.—First and Second, W. S. Hornby (Himalaya Doe, and Silver Grey Buck).

The Judges were E. Hewitt, Esq., of Birmingham, and R. Teebay, Esq., of Preston.

ESTON AND NORMANBY CANARY AND PIGEON SHOW.

The seventh annual Show was held in Normanby Park, on the 25th ult., by permission of the Rev. W. Ward Jackson.

CANARIES.

BELGIAN (Clear Yellow).—First, W. Bulmer, Stockton. Second, R. Robson, Middlesbrough.

BELGIAN (Buff).—First, R. Hawman, Middlesbrough. Second, W. Bulmer.

BELGIAN (Variegated).—First, W. Bulmer. Second, R. Hawman.

GOLDFINCH MULE.—Second, J. Driver, Eston Mines.

GOLDFINCH MULE (Variegated).—First, R. Hawman. Second, J. Robinson, Middlesbrough.

LINNET MULE (Brown).—Prize, J. Munroe, North Ormesby.

JONQUE (Norwich).—First, T. Armstrong, Eroughton. Second, J. Stevens, Middlesbrough.

NORWICH (Mealy).—First, J. Stevens. Second, R. Hawman.

LIZARD (Gold).—First, R. Hawman. Second, W. Lowes, South Eston.

LIZARD (Silver).—First and Second, R. Hawman.

CRESTED (Buff).—First, W. Bulmer. Second, J. Munroe.

DUN (Cinnamon).—Prize, W. Bulmer.

DUN (Buff).—Prize, C. Burnister, Tunstall.

DUN (Variegated).—Prize, J. Stevens.

COMMON (Yellow).—Prize, J. Stevens.

COMMON (Buff).—First, J. Wood, South Eston. Second, J. Barker, Normanby.

COMMON (Variegated).—First, R. Hawman. Second, W. Bulmer.

GOLDFINCH (Mottled).—Prize, F. Leach, Middlesbrough.

LINNET (Mottled Brown).—First, W. Burnister. Second, W. Bulmer.

THRUSH.—Prize, C. Burnister.

BEST CAGE OF TWELVE BIRDS.—First, R. Hawman. Second, G. Fawcett, California.

BEST CAGE OF SIX BIRDS.—First, G. Fawcett. Second, R. Leng, Gainsborough.

COMMON (Green).—Prize, W. Smith, Normanby.

SPECIAL PRIZE (Dark Goldfinch Mule).—Prize, F. Leach.

PIGEONS.

CARRIERS.—First, H. Yardley, Birmingham. Second, J. Hawley, Bingley.

FAN-TAILS.—First, H. Yardley. Second, T. C. Taylor, Middlesbrough.

TURBITS.—First and Second, F. Leach.

TUMBLERS (Short-faced).—First, H. Yardley. Second, J. Robinson.

JACOBS.—First, F. Leach. Second, W. R. & H. O. Blenkinsop, Newcastle.

BARDS.—First, J. Hawley. Second, W. Ineson, Middlesbrough.

OWLS.—First, T. C. Taylor, Middlesbrough. Second, H. Yardley.

TRUMPETERS.—First and second, J. Hawley.

ANY OTHER VARIETY.—First, W. Ineson. Second, J. Hawley.

POUTERS.—First, J. Hawley. Second, H. Yardley.

NES.—First, F. Leach. Second, T. C. Taylor.

MAGPIES.—First, F. Leach. Second, W. Ineson.

TUMBLERS (Any variety).—First, J. Hawley. Second, J. Robinson.

RABBITS.—*Lap-ears*.—First, J. Jowsey, Middlesbrough. Second, J. Bruyan, Eston Mines. *Himalayas*.—Second, A. Keith, Normanby.

The Judges were:—For *Canaries*, Mr. Calvert, York; for *Pigeons*, Mr. A. Cattle, York; for *Rabbits*, Dr. Simpson, Middlesbrough.

DRIGHLINGTON POULTRY SHOW.

THIS took place August 29th, and in some classes there was a fair amount of competition. *Spanish* and *Game* were somewhat numerous for a local Show. *Hamburgs* were few in number, but the majority got in quality. In the Silver-spangled we noticed the first prize ticket over a pen containing a hen feathered cock, which the Judge in admiring the spangling had evidently overlooked. There was a very numerous attendance of visitors during the day.

The following is the prize list:—

SPANISH.—First, T. C. Nowlitt, Epworth. Second, J. Thresh Bradford.

COCHIN-CHINA.—First, G. T. Bedford, Gildersome. Second, D. Render, Wire Hall, Adwalton.

GAME (Black-headed or other Reds).—First, W. Fell, Adwalton. Second, H. C. & W. J. Mason, Adwalton.

GREYS AND BLUES (Duckwings and others).—First, J. Hodgson, Bowling. Second, J. Fell, Adwalton.

GAME (White or Pile).—First, R. Turner, Drighlington. Second, H. C. & W. J. Mason, Adwalton. Highly Commended, W. Walker, Drab Lane, Gomersal.

GAME (Black or Brassy-winged).—Prize, J. Fell, jun., Adwalton.

HAMBURGHS (Golden-spangled).—First, D. Render. Second, T. C. & E. Nowlitt, Epworth.

HAMBURGHS (Silver-spangled).—First, G. T. Bedford. Second, J. Preston, Allerton.

HAMBURGHS (Golden-pencilled).—First and Highly Commended, F. Perrin, Leeds. Second, J. Preston.

HAMBURGHS (Silver-pencilled).—First, F. Perrin. Second, J. Preston.

PALISH.—First, J. Thresh. Second, F. Perrin.

ANY DISTINCT BREED NOT BEFORE MENTIONED.—First, J. Preston. Second, H. Snowdon, Drighlington.

GAME BANTAMS.—First, D. W. Ingham, Wortley. Second, W. E. Entwistle. Highly Commended, W. F. Entwistle; H. C. & W. J. Mason.

BANTAMS (Any other variety).—First, J. H. Wilkinson, Bradford. Second, S. Rhodes, Wyke (Black Bantams).

TURKEYS.—First, J. Saville, Oakwell Hall. Second, W. Enttrey.

GUINEA FOWLS.—Prize, W. Buttrey, Gildersome.
GEESE (Any breed).—First, J. Ward, Drighlington. Second, W. Brown, Drighlington.

DUCKS (Aylesbury).—First, J. W. Wilkinson. Second, S. Clarke, Adwalton.

DUCKS (Bouen).—First and Second, J. Ward.

ANY BREED.—First, W. Fell. Second, J. Thresh. Third, T. Suddick.

PIGEONS.

CARRIERS.—Prize, H. O. Steele, Gomersal.
POUTERS.—First, J. T. Lishman, Gillington, Bradford. Second, T. C. and E. Newbitt.

TUMBLERS (Almond).—First, T. C. & E. Newbitt. Second, J. T. Lishman.

TUMBLERS (Any other variety).—First, D. W. Ingham (Short-faced). Second, J. T. Lishman.

BARNS.—Prize, J. T. Lishman.

OWLS.—First, J. Thresh. Second, J. T. Lishman.

TURBITS.—First, J. T. Lishman. Second, B. Lister, Birkenshaw.

FANTAILS.—First and Second, T. C. & E. Newbitt.

JACOBI.—First, J. T. Lishman. Second, T. C. & E. Newbitt.

TRUMPETERS.—First, J. T. Lishman. Second, J. Thresh.

ANY OTHER VARIETY.—First, J. T. Lishman. Second, T. C. & E. Newbitt.

JUDGES.—Mr. E. Hutton, Pudsey, and J. W. Thompson, South-
 otram.

BINGLEY POULTRY SHOW.

THIS Show took place on the 26th ult., and proved most excellent. It is a remarkable fact that scarcely a single indifferent pen of either poultry or Pigeons could be found, even after the most careful inspection. Under the very able management of that well-known amateur Mr. Beldon, everything connected with the Show was conducted with the greatest regularity and order, and that gentleman declined altogether entering even a single pen, in order to give a chance to less extensive poultry breeders. The Show was unusually well attended, and the streets throughout Bingley were decorated with banners, evergreens, &c.

It is almost needless to add, that nothing could exceed the attention paid to all the birds, so long as they remained on the spot, and that they were punctually returned.

GAME COCKEREL.—First, H. Jennings, Allerton. Second, J. Carlyle, Earby, near Skipton.

GAME (Black-breasted or other Reds).—First, J. Carlyle. Second, J. Driver, Allerton. Third, W. Spencer, Haworth. Highly Commended, H. Jennings. Commended, W. Clough, Earby.

GAME (Any other variety).—First, W. Fell, Adwalton. Second, J. Hodgson, Bradford.

SPANISH.—First, J. Thresh, Bradford. Second, J. Newton, Silsden, Leeds. Third, E. Brown, Sheffield.

DORKINGS.—First, T. Bideau, Earby. Second, H. Pickles, Earby.

COCHINS.—First, R. E. Brown, Wass, Oswaldkirk. Second, C. Sidgwick, Ryddlesden Hall, Keighley. Third, Rev. C. Spencer, Attleborough. Highly Commended, C. Sidgwick.

BRAMHAS.—First, E. Leech, Rochdale. Second, M. Scott, Cote, Idle. Third, E. Ryder, Harrytown, Stockport. Highly Commended, J. Wadsworth, Keighley.

HAMBURGS (Golden-pencilled).—First, W. & J. Harker, Allerton. Second, W. Collier, Dubb, Bingley. Third, J. Smith, Northwram. Highly Commended, F. Perrin, Killingbeck, Leeds. Commended, W. Collier; H. W. Illingworth, Idle; H. Pickles; J. Anderson, Gilstead, near Bingley.

HAMBURGS (Silver-pencilled).—First, W. Pitts, Fearncliffe, near Bingley. Second, T. Hanson, Thwaites Bank, near Keighley. Third, H. Pickles. Highly Commended, T. Maude, jun. Commended, W. & T. Foulds, Bingley.

HAMBURGS (Golden-spangled).—First, W. Driver, Bank House, Keighley. Second, J. Fortune, Morton Banks. Third, A. Driver, Morton Banks.

HAMBURGS (Silver-spangled).—First, W. H. Bentley, Hipperholme. Second, H. Pickles. Third, T. Robinson, Baildon, near Leeds. Highly Commended, T. Blakey, Silsden.

HAMBURGS (Black).—First, S. Bntterfield. Second, C. Sidgwick. Third, T. Fawcett, jun., Northgate, Baildon. Highly Commended, C. Sidgwick. Commended, J. Bradley, Harden, near Bingley.

GAME BANTAMS.—First and Second, W. F. Entwistle. Third, J. Lund, Silsden. Commended, O. & J. Heaton, Height, near Bingley.

BANTAMS (Any other variety).—First, M. Tattersall, Shipley. Second, W. H. Robinson, Long Lee, Keighley. Third, W. Brotherton, Idle, near Leeds.

ANY OTHER BREED.—First, J. Bowker, Keighley. Second, L. Bincy, Manchester (Houdans). Third, R. Draper, Seaham (Malays). Commended, T. & E. Comber, Middleton Hall (Silver Poland).

SELLING CLASS.—First, J. Thresh (Black Spanish). Second, J. Berry, Silsden. Third, H. Wilkinson. Highly Commended, W. Johnson, Idle Game.

DUCKS (Aylesbury or Rouen).—First, E. Leech. Second, E. G. Norris, Cobham, Surrey. Third, W. Haigh, Bingley.

ANY OTHER VARIETY.—First and Second, Withheld. Third, T. E. Terry, Tong.

PIGEONS.

POUTER.—Cock.—First and Second, E. Horner, Harewood, near Leeds. Third, J. A. Naylor, Barwick-in-Elmet. Hen.—First and Second, E. Horner. Third, W. Cannon, Bradford.

CARRIER.—Cock.—First, E. Horner. Second, H. M. Maynard, Ryde, Isle of Wight. Third, E. Horner. Hen.—First and Third, E. Horner. Second, H. M. Maynard.

TUMBLERS (Almond).—First, E. Horner. Second, F. Key, Beverley. Third, J. Fielding, Rochdale. Highly Commended, E. Horner; T. Rule, Durham.

BALDS, BEARDS, OR MOTTLED TUMBLERS.—First and Second, E. Horner. Third, J. Lister, Keighley. Commended, W. Lund.

TUMBLERS (Any other variety).—First, E. Horner. Second, J. Fielding. Third, T. Rule (Yellow). Highly Commended, E. Horner; T. Ashburner, Dalton-in-Furness (Black).

BARBS.—First and Second, E. Horner. Third, J. Fielding. Highly Commended, E. Horner; H. M. Maynard.

JACOBI.—First and Third, E. Horner. Second, J. Wade, Ovenden.

OWLS.—First, Second, and Third, J. Fielding.

TRUMPETERS.—First, Second, and Third, E. Horner.

FANTAILS.—First and Second, E. Horner. Third, A. Croshie, Melrose.

TURBITS.—First and Third, E. Horner. Second, J. T. Lishman, Gillington, Bradford.

DRAGONS.—First, Second, and Highly Commended, E. Horner. Third, H. Stanhope, Eccleshill, near Leeds. Commended, T. Ashburner.

ANTWERPS.—First, E. Horner. Second, T. Statter, Hull. Third, R. Autherson, Stockport. Very Highly Commended, H. Yardley. Highly Commended, T. Lister. Commended, E. Horner; W. Lund.

ANY OTHER VARIETY.—First, Second, and Third, E. Horner (Red Nuns, Black Swallows, and Yellow Magpies). Highly Commended, J. T. Lishman (Helmets); H. Yardley (Main Pigeons).

SELLING CLASS.—First, E. Horner. Second, R. Autherson. Third, H. Yardley. Highly Commended, W. Lund; T. Ashburner.

The Judges were for Poultry: Edward Hewitt, Esq., of Sparkbrook, Birmingham; and H. Redpath, Esq., of Manchester, for Pigeons and Cage Birds.

UTTOXETER POULTRY SHOW.

THE Uttoxeter Poultry Society, under the care of its present energetic Committee, bids fair to become permanent and decidedly successful. At the exhibition of August 25th the entries were nearly ninety in number, and included many pens of poultry sent by well known exhibitors. Mr. Dixon, of Bradford, doubtless, found his well known abilities as Judge somewhat put to the test by the Brahma Pootra chickens, each pen being so good. We understand the Committee have great hopes of increasing their prizes for a coming year.

SPANISH.—First, J. Stephens, Walsall. Second, J. Mansell, Longton.

DORKINGS (Any variety).—First and Second, Mrs. Arkwright, Etwall Hall, Derby. *Chickens*.—First and Second, Mrs. Arkwright.

COCHIN-CHINA.—First, J. Stephens, Walsall. Second, S. Sambrooke, Warwick. Highly Commended, A. O. Worthington, Newton Park, Burton-on-Trent. *Chickens*.—First, G. A. Crewe, Etwall Hall, Derby. Second, A. O. Worthington.

GAME (Black or Brown-breasted).—First, G. Bagnall, Draycott, Cheadle (Black Red). Second, W. S. Bagshaw, Uttoxeter. Highly Commended, J. Bakewell, jun., Sudbury (Black Reds).

GAME (Any other Variety).—Prize, Duke of Sutherland, Trentham (Duckwings). *Chickens*.—First. —Walwyn, Doveridge. Second, G. Bagnall, Draycott, Cheadle (Black Reds). Highly Commended, J. Bakewell, Sudbury (Black Reds). Commended, W. S. Bagshaw (Red); E. Bell, Burton-on-Trent.

HAMBURGS (Golden or Silver-pencilled).—First, Duke of Sutherland, Second, F. D. Mort, Stafford. *Chickens*.—First, Duke of Sutherland. Second and Highly Commended, F. D. Mort.

HAMBURGS (Golden or Silver-spangled).—First, T. Bolton, Handford, near Stoke. Second, J. Laning, Cowburn, Spalding. *Chickens*.—First, Duke of Sutherland. Second, H. Bagshaw.

BRAMHA POOTRA.—First, A. O. Worthington. Second, W. B. Etches, Whitechurch, Salop. Commended, H. Chawner, jun. *Chickens*.—First, Rev. E. Alder, Derby. Extra, Mrs. Walker. Second, H. Chawner. Highly Commended, Rev. E. Alder; Mrs. Walker.

SINGLE BRAHMA POOTRA.—Highly Commended, A. Worthington.

BANTAMS (Any variety).—First, J. Adkins, jun., Walsall. Second, Mrs. Arkwright (Black). Commended, H. Bailey, Longton (Black Red).

EXTRA.—Second. —Brassington, Highwood, Uttoxeter (Black Hamburgs).

DUCKS (Aylesbury).—First, A. O. Worthington. Second, T. Waring, Sudbury, Derby. Highly Commended, T. Waring. Commended, G. A. Crewe; H. Chawner, jun.

DUCKS (Rouen).—First, G. Bagnall. Second, F. Richardson, Bramshall. Highly Commended, G. Bagnall. Commended, A. O. Worthington; H. Chawner, jun.

GEESE.—First, G. A. Crewe. Second, F. E. Richardson.

TURKEYS.—First and Second, F. E. Richardson (Cambridge).

GUINEA FOWLS.—First, Withheld. Second, H. Chawner. Extra Second. —Walwyn, Doveridge.

PIGEONS (Any colour).—*Horsman*.—First, J. Bailey, Uttoxeter. Second, W. Brassington. *Tumblers* (Any variety).—First, A. Boote, Burslem (Almond). Second, H. Chawner, jun. *Carriers*.—First, H. Chawner, jun. Second, A. Boote (White Dragoon).

RABBITS.—First, G. Smith, Uttoxeter. Second, E. Brown, Bagshaw. Highly Commended, F. Harper, Uttoxeter.

ULVERSTON POULTRY SHOW.

THIS Show, held under the auspices of the Royal North Lancashire Agricultural Society, took place on the 25th and 26th of August. There were about 220 entries. The weather, unfortunately, was very unfavourable.

DORKINGS (Grey).—First, C. W. Brierley, Middleton, near Manchester. Second, J. Robinson, Garstang. *Chickens*.—First, J. Robinson. Second, Mrs. M. Seamons. Highly Commended, Gunson and Jefferson; S. Burn. Commended, W. Fox, St. Bees, Cumberland.

DORKINGS (White).—First and Second, J. Robinson. *Chickens*.—First, J. Robinson. Second, J. Ormandy, Gleaston Castle, near Ulverston.

SINGLE DORKING COCK (any colour).—First, Hall & Parkinson, Great Eccleston (Grey). Second, H. Beldon, Goitstock, Bingley.

BRAMHA POOTRA (Any colour).—First, E. Leech, Rochdale. Second, H. Beldon.

SPANISH.—First, H. Beldon. Second, J. Thresh, Bradford. Commended, B. Bee, Goosnargh. *Chickens*.—First, H. Beldon. Second, Bowman & Fearon. Highly Commended, J. Leeming.

GAME (Any colour).—First, C. W. Brierley. Second, W. Boulton, Dalton-in-Furness. Highly Commended, J. Poole, Ulverston. *Chickens*.

—First, W. Boulton. Second, L. Casson, Ulverston (Black Red). Highly Commended, J. Poole (Black Red); W. Boulton; W. & T. Robinson (Brown Red); H. Martin, Ulverston.

SINGLE GAME COCK (Any colour).—First, C. W. Brierley. Second, W. & T. Robinson, Ulverston (Brown Red). Highly Commended, J. Fletcher, Stoneclough, near Manchester (Black Red); E. G. Melling, Preston.

COCHIN-CHINA.—First, C. Sidgwick, Riddlesden Hall, Keighley. Second, H. Beldon. Highly Commended, J. Poole (Partridge). Commended, J. Poole (Buff); E. J. Schollick, Ulverston (White). **Chickens.**—First, and Second, C. Sidgwick. Highly Commended, E. J. Schollick; J. Robinson. Commended, Bowman & Fearon (Buff).

HAMBUROS (Golden-pencilled).—First, H. Beldon. Second, J. Robinson. Highly Commended, B. Bee. Commended, Bowman & Fearon. **Chickens.**—First, H. Beldon. Second, B. Bee. Highly Commended, J. Robinson. Commended, B. Bee.

HAMBUROS (Silver-pencilled).—First, H. Beldon. Second, J. Robinson. **Chickens.**—First, H. Beldon. Second, J. Robinson.

HAMBUROS (Golden-spangled).—First, J. Robinson. Second, H. Beldon. Highly Commended, T. Wareing, Preston. **Chickens.**—First, H. Beldon. Second, J. Robinson.

HAMBUROS (Silver-spangled).—First, H. Beldon. Second, J. Robinson. Highly Commended, J. Leeming, Broughton, Preston. **Chickens.**—First, H. Beldon. Second, J. Robinson. Commended, T. Bellman, Ulverston.

POLANDS.—First and Second, H. Beldon. Highly Commended, G. W. Boothby, Louth, Lincolnshire. **Chickens.**—First and Second, H. Beldon. Highly Commended, G. W. Boothby.

BANTAMS (Any colour).—First, C. W. Brierley. Second, W. Boulton. **Chickens.**—First, B. Bee. Second, J. Poole (Duckwing Game). Highly Commended, W. F. Entwistle, Leeds (Game). Commended, W. Boulton; B. Bee.

CREEP-COCHIN.—First, M. Wilkin, Bottle Rectory, Holborn Hill, Cumberland. Second, H. Beldon. Highly Commended, W. R. Charnley, Ulverston.

HOUDANS.—First and Second, M. Wilkin.

GESE.—First, Mrs. M. Seamons, Hartwell, Aylesbury (White). Second, E. Leech. Highly Commended, T. Houliker, Blackburn. **Goslings.**—First, E. Leech, Rochdale. Second, T. Houliker (Grey). Highly Commended, Mrs. M. Seamons.

DUCKS (Aylesbury).—First, Mrs. M. Seamons. Second, E. Leech. **Ducklings.**—First, E. Leech. Second and Highly Commended, Mrs. M. Seamons.

DUCKS (Rouen).—First, E. Leech. Second, Gunson & Jefferson, Whitehaven. Highly Commended, W. & T. Robinson, Ulverston; T. Houliker. **Ducklings.**—First, J. J. Waller, Kendal. Second, J. Robinson, Garstang. Highly Commended, T. Houliker.

LABRADOR.—Prize, S. Burn, Whitley.

ANY OTHER VARIETY.—First and Second, C. W. Brierley (Teal and Pintail).

TURKEYS.—First, E. Leech. Second, T. Houliker. **Poult.**—First, E. Ryder, Hartington, Stockport (Cambridge). Second, E. Leech.

EXTRA.—Highly Commended, M. Wilkin (Padue Chamois).

The Judges were Mr. R. Teebay, and Mr. Hindson.

CRAVEN AGRICULTURAL SOCIETY'S POULTRY SHOW.

THE following is the list of the awards made to the exhibitors at this Show, held at Skipton, August 25th. We must defer remarks on the birds shown till next week.

DORKING (Any colour).—First, H. Pickles, jun. Early. Second, T. Briden, Early. Highly Commended, H. Beldon, Guntstock, Bingley. **Chickens.**—First, T. Briden. Second, H. Pickles, jun.

SPANISH (Black).—First, T. C. & E. Newbitt, Epworth, Lincolnshire. Second, J. Newton, Silsden. Highly Commended, J. Newton; J. Thresh, Bradford. **Chickens.**—First, J. Thresh. Second, H. Wilkinson, Early. Highly Commended, T. C. & E. Newbitt; J. Newton; J. Berry, Silsden.

GAME.—First, E. Aykroyd, Bradford. Second, G. Noble, Staincliffe, Batley. **Chickens.**—First, G. Noble. Second, W. Church, Early. Highly Commended, W. Spencer, Harworth. W. & J. Harker, Alkerton.

COCHIN-CHINA.—First, C. Sidgwick, Keighley. Second, T. Trees, Skipton. **Chickens.**—First and Second, C. Sidgwick. Highly Commended, J. & B. Booth, Hightold, Silsden. Commended, J. Craig, Skipton.

HAMBUROS (Golden-pencilled).—First, H. Beldon. Second, W. Clayton, Keighley. Highly Commended, H. Pickles, jun. Commended, J. Preston, Alkerton, Bradford. **Chickens.**—First, J. Preston. Second, H. Pickles, jun. Highly Commended, H. Beldon. **Chickens.**—First, H. Beldon. Second, W. Lawson, Batley.

HAMBUROS (Silver-pencilled) or CHIFF-PRATT.—First, H. Beldon. Second, H. Pickles, jun. **Chickens.**—First, J. Preston. Second, H. Pickles, jun. Highly Commended, T. Hanson, Keighley; W. & J. Barstow, Bingley.

HAMBUROS (Golden-spangled).—First, T. Trees. Second, H. Pickles, jun. Highly Commended, H. Beldon. **Chickens.**—First, H. Beldon. Second, W. Lawson, Batley.

HAMBUROS (Silver-spangled).—First, H. Beldon. Second, H. Pickles, jun. Highly Commended, C. Smith, Silsden. **Chickens.**—First, H. Beldon. Second, T. Blake, Silsden. Highly Commended, H. Pickles, jun.

HAMBUROS (Black).—First, J. Preston. Second, W. Green, Keighley. Highly Commended, C. Sidgwick. **Chickens.**—First, S. Butterfield, Keighley. Second, J. Berry, Silsden. Highly Commended, C. Sidgwick.

POLAND.—First and Second, H. Beldon. Highly Commended, J. Bowker, Keighley. **Chickens.**—First, H. Beldon. Second and Highly Commended, J. Bowker.

GAME (Any colour).—First and Second, W. F. Entwistle, Leeds. Highly Commended, G. Noble, Staincliffe, Batley. **Chickens.**—First, G. Noble. Second, A. Wilman, Deasford Moor.

BANTAMS (Any colour).—First, S. Schofield, Heckmondwike. Second, J. Rooking, Addingham. **Chickens.**—First, W. H. Robinson, Keighley. Second, H. Beldon. Highly Commended, H. Schofield.

ANY OTHER VARIETY.—First, E. Leech, Rochdale. Second, H. Beldon. Highly Commended, J. Allen (Brahma). Second, H. Beldon. Equal Second, W. S. Clapham, Uley (Houdan).

EXTRA DUCK.—First, F. Robinson, Kettlewell (Moorecock). Second, H. Walton, Fleet, Coving (Guinea).

GESE (Any colour).—First, E. Leech. Second, H. Pickles, jun.

GESE (Any colour).—First, E. Leech. Second, W. Davis, Gargrave.

Highly Commended, S. H. Scott, Rochdale.

DUCKS (Aylesbury).—First and Second, E. Leech. Highly Commended, R. Hinchinson, Cowling.

DUCKS (Rouen).—First, J. Dixon, Bradford. Second, E. Leech. Highly Commended, H. Beldon; J. Dixon.

ANY OTHER VARIETY.—First and Second, J. Dixon. Equal Second, H. Beldon. Commended, H. Walton.

TURKEYS.—First, E. Leech. Second, J. B. Beckwith, Winterbarn.

PIGEONS.

CAMBER.—Cock.—First, H. Smith, Skipton. Second, E. Horner, Harewood. Highly Commended, J. Baxendall, Sutton; E. Horner. **Hen.**—First and Second, H. Smith.

POUTER.—Cock.—First, H. Beldon. Second, J. Hawley, Bingley. Highly Commended, H. Smith; Master Dawson, Otley. **Hen.**—First, J. Hawley. Second, H. Beldon.

TUMBLERS (Almond).—First, T. C. & E. Newbitt. Second, J. Hawley. Highly Commended, R. B. Chouler, Bolton Park.

Chick.—First, H. Beldon. Second, Master Dawson. Highly Commended, H. Smith.

BAKERS.—First and Highly Commended, E. Horner. Second, H. Smith. **JACOBINS.**—First, J. Thompson, Bingley. Second, E. Horner. Highly Commended, T. C. & E. Newbitt; J. Thompson; E. Horner.

TUMBLERS (Mottled).—First, J. Hawley. Second, J. Thompson. Highly Commended, J. Hawley; W. Lund, Shipley; R. B. Chouler.

BALD PATES.—First, W. Lund. Second, J. Hawley. Highly Commended, C. Smith, J. Collier, Skipton.

RACE.—First and Second, H. Smith.

FANTAILS.—First and Third, E. Horner. Second, T. C. & E. Newbitt. Equal Second, J. Hawley. Highly Commended, T. C. & E. Newbitt; F. & R. D. Horner, Skipton.

DRAGONS.—First, E. Horner. Second, J. Baxendall, Sutton. Highly Commended, J. Baxendall; Master Dawson; J. Collier.

BEERS (Long-faced).—First, J. Hawley. Second, R. Birtwhistle, Skibeden. Highly Commended, J. Hawley; W. Lund; R. B. Chouler; E. Benson, Farfield, Addingham.

ANTWERPS (Short-faced).—First, J. Thompson. Second, F. & R. D. Horner. Highly Commended, J. Hawley.

ANY OTHER VARIETY.—First, J. Hawley. Second, J. Thompson. Equal Second, R. B. Chouler. Third, Master Dawson (Nuns). Highly Commended, J. Hawley; W. Lund (Turbits); R. B. Chouler; J. Lister, Keighley (Bearded Tumblers); J. Thompson; J. Thresh; E. Horner; T. C. & E. Newbitt.

The Judges were Mr. J. Heywood, Middleton; and Mr. E. Hutton, Padsey.

COTTINGHAM POULTRY SHOW.

ON August 26th the annual Exhibition of the Cottesingham and district Poultry Society was held in a field belonging to Mrs. Gee, which was admirably adapted for the purpose. Of the numerous shows held annually in the district, the Cottesingham Show may fairly lay claim to being the best, not only with respect to extent, but in uniformity and excellence of arrangement. In every department, the Show just past may be favourably compared with those of former years. Of poultry, there was a very fair number of entries, and the birds taken as a whole were exceedingly fine. The Canaries, although few in number, were remarkable for their purity of breed. Too much praise cannot be accorded to Mr. Joseph Brittain, the Secretary, for his untiring exertions. Annexed is the prize list:—

SPANISH.—First, R. Carling, Cheshire. Second, — Charter, Driffield. **Chickens.**—First, R. Carling. Second, T. C. & E. Newbitt, Epworth.

DORKINGS.—First, D. White, Driffield. Second, J. Thompson, Anlaby. **Chickens.**—First, S. E. White, Driffield. Second, J. Blanchard.

COCHIN-CHINA.—First, R. Carling. Second, G. Holmes, Driffield. **Chickens.**—First and Second, R. Loft, Woodmansey.

GAME (Any colour).—First, H. M. Julian. Second, W. Boyes.

GAME.—First, W. Boyes. Second, H. M. Julian.

GAME (Any variety).—First, H. M. Julian. Second, W. Boyes. **Chickens.**—First, H. M. Julian. Second, W. Boyes.

POLANDS.—First and Second, Mrs. Procter, Hull. **Chickens.**—First and Second, Mrs. Procter.

HAMBUROS (Golden-spangled).—First, — Pinder, Kirby Moorside. Second, J. Blanchard. **Chickens.**—First, G. Holmes. Second, — Carling.

HAMBUROS (Golden-pencilled).—First, J. R. Jessop, Hull. Second, A. Hawe, Harston. **Chickens.**—First, J. Holmes. Second, W. Bearpark.

HAMBUROS (Silver-spangled).—First, J. Holmes. Second, C. P. Richardson, Chesham. First and Second, G. Holmes.

HAMBUROS (Silver-pencilled).—Prize, G. Holmes. **Chickens.**—First, — Bearpark. Second, G. Holmes.

BANTAMS (Gold).—First, T. C. Harrison. Second, J. Kingrose. **Chickens.**—First and Second, T. C. Harrison.

GAME BANTAMS.—First, — Carling. Second, R. Robson. **Chickens.**—First, R. Robson. Second, G. H. Holmes.

BANTAMS (Any variety).—First and Second, T. C. Harrison. **Chickens.**—First, E. Carling. Second, T. C. Harrison.

DISTINCT VARIETY.—First and Second, R. Loft. **Chickens.**—First and Second, R. Loft.

FARMYARD CROSS.—First and Second, S. Coverdale. Third, R. Loft. **Chickens.**—First and Second, R. Loft.

SELLING CLASS.—First, C. Richardson. Second, T. C. Harrison.

GESE.—First, O. A. Young. Second, G. Holmes.

DUCKS (Aylesbury).—First, O. A. Young. Second, G. Holmes.

DUCKS (Any other variety).—First and Second, T. C. Harrison.

TURKEYS.—First, — Merkin, Driffield. Second, J. Kome, Cottesingham.

SINGLE COCKS.

SPANISH.—Prize, J. Holmes, Driffield.

DORKINGS.—Prize, S. E. White.

COCHIN-CHINA.—Prize, R. Loft.

GAME (Black-breasted).—Prize, H. M. Julian.

GAME (Any colour).—First, H. M. Julian. Second, W. Boyes.

POLAND.—Prize, Mrs. Procter.

HAMBUROS (Golden-spangled).—Prize, R. Grantham.

HAMBUROS (Golden-pencilled).—Prize, J. Hall, Wetherby.

HAMBUROS (Silver-spangled).—First, G. Holmes. Second, C. H. White.

BANTAMS (Gold).—Prize, T. C. Harrison.

BANTAMS.—Prize, G. Holmes.

BANTAMS.—Prize, T. C. Harrison.

SELLING CLASS.—Prize, R. Loft.

PIGEONS.

POUTERS.—First and Second, F. Kay, Beverley.

CANARIES.—First, H. Yardley. Second, C. Marwood.

TUMBLERS.—First, P. Palmer & Marshall. Second, F. Key.

THIMPLES.—First, — Yardley, Buntingham. Second, C. N. Lythe.

JACOBINS.—First, C. N. Lythe. Second, T. C. & E. Newbitt.

FANTAILS.—First and Second, T. C. & E. Newbitt.
 DRAGONS.—First, H. Taylor, Newland. Second, S. Norwood, Hull.
 TUMBLERS.—First and Second, C. N. Lythe.
 BARKS.—First, H. Yardley. Second, F. Key.
 NUNS.—First, C. N. Lythe. Second, Pickering & Marshall.
 ANY OTHER VARIETY.—First, H. Yardley. Second, T. C. & E. Newbitt.

RABBITS.—First, P. Ashton. Second, J. Denton.
 CANARIES.—*Belgian*.—First and Second, G. Grant. *Marked*.—First, W. W. Bielby. Second, Hobson, Hull. *Nest of Young (Clear)*.—First, J. Sanderson. Second, T. Neill. *Nest of Young (Marked)*.—First, J. Sykes. Second, G. Grant. *Mild*.—First, Capt. Horner. Second, Miss Gawan. *Redcap*.—First, Master J. Gawan. Second, Gawan.

The Judges were F. Ferguson, Esq., and H. Adams, Esq. for Poultry; Mr. J. Weddall, and Mr. C. Glover for Canaries.

IRISH ROYAL AGRICULTURAL SHOW.

This was held at Londonderry from August 26th to 28th. The awards for poultry were as follows:—

DORKINGS.—First, J. C. Cooper, Limerick. Second, R. P. Williams.
 DORKINGS (Any colour except Silver-Grays).—First and Second, R. P. Williams. *Chickens*.—First, J. C. Cooper. Second, R. P. Williams.
 SPANISH.—First and Second, J. C. Cooper. *Chickens*.—First, R. P. Williams. Second, J. C. Cooper.
 BRAHMA POOTRA.—First and Second, J. C. Cooper. *Chickens*.—First and Second, J. C. Cooper.
 COCHINS (Buff).—*Chickens*.—Prize, J. C. Cooper.
 COCHINS (Any other colour).—First and Second, J. C. Cooper. *Chickens*.—Prize, J. C. Cooper.
 TURKEYS.—First, J. C. Cooper. Second, J. S. Black, Gateside, Coleraine. Commended, J. C. Cooper. *Poult.*.—First and Second, J. C. Cooper.
 GESE.—First, J. C. Cooper. Second, R. P. Williams. Third, T. Butler. Highly Commended, J. C. Cooper. Commended, G. Craig; T. Butler.
 DUCKS (Aylesbury).—First, R. P. Williams. Second, J. C. Cooper. Highly Commended, R. P. Williams. Commended, J. C. Cooper.
 DUCKS (Rouen).—First and Second, R. P. Williams.
 JUDGES.—Messrs. C. F. Staunton and Morris.

BREEDING IN SUPERS—PETTITT'S GRATINGS.

The best method of preventing breeding in supers I believe is to keep them cool, and I have no doubt that the excessive heat of the past summer has had something to do with it; yet in spite of the heat this season I have taken two glasses and a collateral super from one of Pettitt's collateral hives. The glasses contained respectively 20 lbs. and 20½ lbs., without brood or other imperfection; and the collateral super contained 28 lbs. of pure honeycomb, making a total of 68½ lbs., and the stock hive is well supplied with food for the winter. The bees conveyed the 40½ lbs. through the narrow gratings (three-sixteenths of an inch), in the crown board of Pettitt's collateral hive; but the collateral super was not provided with the gratings, the communication to these being in the floor board, which in some respects answers the purpose, as either compartment can be ventilated without interfering with the temperature of the other.

I believe in Pettitt's gratings for keeping out the drones from the supers, which ought to be kept at a lower temperature than the stock hive, or, as Nutt would term it, the "pavilion of Nature," for it is quite certain that the drones carry nothing into supers; but their presence in them does increase the temperature, which is undesirable.

As to the bees not being able to find their way through the gratings, I have never found this to be the case except late in the season, and then very rarely; but the bee-master should see for himself that the gratings are kept clear.

Whatever hive is used, the bee-master must see to its proper working, and that all passages to supers are clear for communication. If he neglects this duty he must put up with the consequences, and certainly not denounce a system when he himself is at fault from his not having paid to his bees proper attention in this respect.—J. PREBBLE.

REARING YOUNG CANARIES.

I HAVE been a Canary breeder for a long time, and am one of the most successful exhibitors of prize Canaries, and I say emphatically that the use of lettuce leaves, hempseed, groundsel, chickweed, &c., in feeding young Canaries is all "bosh." I have lost one bird this year out of about twenty-five, and that was through the hen sitting too closely, and I never give them anything but egg and bread crumbs morning and night. I take them away at a month old, and give them hard food after three days.

More young birds are killed by being pampered than by starving. Why, if you fed high-bred London Fancies on hempseed and egg, they would "go out" altogether. Mr. Walter told me egg alone, even, was too high feeding for them.

Hempseed is, perhaps, the worst thing you can give a bird. Give young birds egg and bread, fresh, twice a-day; give old birds canary, rape, and linseed mixed, and you will rear all the young ones, and the old ones will live until you are tired of them.—HOWARTH ASHTON.

MUSHROOMS FOR WINTER USE.

CAN any of your readers give a good recipe for preserving mushrooms for winter use? This year they are so numerous that one could fill carts with them. I am afraid you will think this an exaggeration, but it is a fact. In the cookery books there are various recipes for drying them up with butter and spice, but that is of little good to the poor. What I wish is the Russian plan of keeping them in jars and barrels, dried or salted. In one field I gathered five or six quarts in less than an hour; and as September is the regular mushroom month, a recipe from you would still be in time. At present, as we have made catsup and pickles in quantities, the mushrooms are left to the cattle.—MRS. C. GALLOWAY.

[We shall be obliged by any of our readers sending us the information required by our correspondent. The only directions we have for drying mushrooms are the following:—Wipe them quite clean, take out the brown, pare off the skin of the large ones, lay them on paper, and put them in a cool oven to dry. Keep them in paper bags in a very dry place. When wanted for use simmer them in gravy, and they will swell to nearly their former size; or you may simmer them in their own liquor till it dries up in them, shaking the pan; then dry them on tin plates, with spice or not, as you think proper. Tie down with a bladder, or keep them in a dry place or in paper.]

OUR LETTER BOX.

N.B.—From want of space, several communications are unavoidably postponed till next week.

ARTIFICIAL INCUBATION (J. F.).—We know no practical book on the subject. You can obtain the information you require by applying at Baily & Son's, 113, Mount Street, W.

DARK BRAHMA POOTRAS FOR EXHIBITION (T. N.).—No. 1 seems to us from description to be the best bird in every particular. It is a great point to be well pencilled on the breast. We mistrust No. 2. We heard of a man once who in describing the most awful squint we ever saw, said, "If you stood right in front you would see his eyes were not quite straight," and just so, when you admit a projection of an inch of soft feather, we are disposed to consider No. 2 culture-hocked. As to No. 3, we object very much to the creamy ground, and should certainly advise you not to exhibit her.—B.

CHICKENS' FEATHERS CHANGING (*Idem*).—Chickens do not moult, their feathers change as they approach maturity, but it is an altogether different process from moulting. The chicken does not drop feathers like the adult. In the pullet the change takes place imperceptibly. In the cock it is only noticed by the hackle and tail. The former shows most, for it grows as the bird approaches maturity. To moult is to change, the cock chicken has no hackle till this comes. If the chicken hatched the beginning of January is to be considered a chicken till the advent of another year, then it is true chickens moult. The chicken of January has laid and hatched in July, and then in the course of nature she moults. A constant change takes place in the plumage of chickens from the time when they are hatched downy, till they have perfect plumage, but we know nothing of the process. The wing and tail feathers come first, and then a slow but certain change goes on till a perfect plumage is obtained by gradual growth and improvement, not by its exchange for another, till having passed into the state of cocks and hens, they become subject to the laws that rule adults. Moulting is one of those to which all birds are subject.

CHEAP LIGURIAN QUEENS (K.).—I shall make my last importation of these queens for the season in October, and shall then be able to supply them in any quantity at 10s. 6d. each, provided the orders reach me during the first fortnight in September.—T. W. WOODBURY, Mount Radford, Exeter.

DEPRIVING BEES OF THEIR HONEY (W. E.).—Do not attempt to deprive your bees of any honey this year. It is a fundamental principle of the depriving system to leave the stock hive intact, and take only surplus honey stored in some other receptacle. You had better let your bees swarm, putting the new colonies into hives which can be snipped; and if you see fit to unite the bees from the old stock to one of the swarms, do it by driving, and do not subject them to fumigation.

LIGURIANISING AN APIARY (*Apis*).—"I believe that Mr. Koehler's mode of propagating Ligurians may be safely practised, and that there is in point of fact little or no risk of a quarrel. Some persons have even recommended the habitual transposition of strong and weak stocks as a ready mode of equalising their forces, and although it is a plan which I have never practised or approved of, and one which I believe has often been attended with fatal results, it is undeniable that it may sometimes be adopted with success. In the case of a stock which has just thrown off a swarm the conditions are so far altered by the absence of the old queen and nearly all the adult population, that in my opinion there is practically no risk whatever.—A DEVONSHIRE BEE-KEEPER."

GREEK WINES (*Somerset Rectory*).—We do not know the names of the varieties of Grapes from which these wines are made. They are pure, unblended wines. The White Kephesia is refreshing and invigorating, well fitted for the sportsman's luncheon; and St. E le, another white wine, for his dinner; it is what sherry would be if pure.

WEEKLY CALENDAR.

Day of Month	Day of Week.	SEPTEMBER 11—13, 1868.	Average Temperature near London.			Rain in last 11 years.	Sun Rises.		Sun Sets.		Moon Rises.		Moon Sets.		Moon's Age.	Clock after Sun.	Day of Year.
			Day.	Night.	Mean.		m.	h.	m.	h.	m.	h.	m.	h.

16	W		68.4	47.1	57.8	17	33	5	12	6	12	5	25	6	5 23	260	

From observations taken near London during the last forty-one years, the average day temperature of the week is 68.3; and its night temperature 46.2. The greatest heat was 84, on the 13th, 1865; and the lowest cold 23, on the 11th and 12th, 1860. The greatest fall of rain was 1.27 inch.

PEACH CULTIVATION.—No. 1.

ERSIA is considered to be the native country of the Peach; and there is little beyond supposition in support of this fruit being taken into Egypt in the reign of Cambyzes, or carried from Egypt into Greece, but it was known in Italy before the commencement of the Christian era, and London fixes the date of its introduction into this country at 1562: so that rather more than three centuries have elapsed since it was known to the

British gardener. How it was at first cultivated may not be known, but we have it on the best authority that for a very long series of years the Peach has been successfully cultivated as an out-door fruit on walls with a south aspect. Generations of cultivators succeeding each other in successful practice, tree succeeded tree against the same wall, and wall gave place to wall, which I look upon as proof positive of the successful out-door cultivation of the Peach. Without the aid of a wall the Peach tree does not usually ripen its fruit in this country, but we have known instances. Standard trees in most cases blossom abundantly.

Not cultivable in this country as a hardy fruit, for the ground is too cold for its roots—at least, the Peach will not thrive long on its own roots, even planted against a wall—the necessity arises for budding it on a hardier kind of stock, and of affording protection by artificial means. The Peach is not suited for cultivation in every locality. To have it in perfection in some places, the shelter of a wall, and temporary protection for the blossom and young fruit, only are required; in others additional means of affording or retaining heat are needed. Mr. Thompson, in his elaborate and practical work "The Gardener's Assistant," states, at page 510, that "In localities where the mean temperature of February is 40°, and that of March 41°, the Peach will be in full flower against a south wall in the last week in March; and if the mean of April is 49°, that of May 50°, June 61°, July 64°, and August 63°, the season may be considered a favourable one. The general crop, in that case, will be ripe in the last week of August or first week in September, and the fruit will acquire a high degree of perfection." Those temperatures, however, are but rare in this country, being confined to warm spots in the southern parts of the kingdom, and the west coast, also Ireland, as will be seen from the following table of mean temperatures given by Mr. Thompson for the five months, or from the time of flowering to that of the fruit ripening, the favourable temperature not being attained at any place named.

County.	Place.	April.	May.	June.	July.	Aug.
Cornwall	Penzance	48.07	54.54	59.52	62.10	61.11
Middlesex	Chiswick	47.13	53.55	60.31	63.11	61.97
Gloucester	Stroud	45.60	51.00	58.00	60.30	60.50
Lincoln	Boston	47.52	55.52	61.63	63.01	61.29
Dublin	Dublin	48.05	54.37	60.24	61.47	61.49
Lancashire	Liverpool	48.03	55.27	60.00	61.41	62.00
Dumfries	Applethorpe	43.27	49.24	54.77	57.09	56.50
Mid-Lothian	Edinburgh	46.01	52.51	57.00	61.09	57.50
Aberdeen	Aberdeen	47.57	54.20	58.49	60.47	59.64
Orkney	Sandwick	43.44	47.88	52.79	54.93	55.08

From the foregoing table of temperatures it will be seen we have no favourable climate for the Peach; but after twenty years' experience in localities where Peaches have been grown successfully against walls with south aspects, I have no hesitation in stating that the Peach can be grown where the temperature of February is 38°, of March 42°, April 47°, May 53°, June 59°, July 62°, August 61°, and September 57°. I have grown Peaches in three different gardens in Yorkshire with these mean average temperatures, and have failed to grow them against a south wall with the usual protection in another, where, owing to the altitude, the mean temperature of March was 40°, April 46°, May 52°, June 58°, July 61°, August 59°, and September 55°. Only one year out of six were they good—viz., in 1859. During the past five years I have practised in a situation further to the west, and Peaches every season are large and fine, ripening perfectly. The mean temperature of April is 48°, of May 55°, of June 61°, of July 63°, and of August 61°, which is slightly higher than the mean for Liverpool, in the neighbourhood of which town Peaches are grown to great perfection on walls—at Knowsley for instance. Again, in some parts of Lincolnshire Peaches do exceedingly well against south walls, for instance, at Brocksby Park; indeed there is no county in England where the Peach tree against a south wall does not with careful culture ripen its fruit in perfection. But there are exceptions, owing to altitude above the sea level; for example, York, at an altitude of 50 feet above the sea level, has a temperature suited to the growth of the Peach, and there the fruit ripens, whilst at Halifax 187 feet, and Bradford from 370 to 496 feet above the level of the sea, Peaches do not succeed or ripen against a wall with a south aspect; and at the latter elevation they are not to be grown in unheated glass structures, for these, unless narrow and backed by a substantial wall, are worthless, and afford no greater warmth than a south wall. It may seem strange that a glass house should not afford any greater warmth than that of a south wall, but such is nevertheless the fact, but only true of houses less in width than 15 feet; for in houses 20 feet wide the temperature exceeds that of a south wall, or in other words, the temperature of a south wall at 3 inches distance from it, at an elevation of 196 feet, in March 43°, April 49°, May 56°, June 62°, July 65°, and August 61°. Of a narrow (13 feet) glass house the temperatures were, in April 50°, May 56°, June 62°, July 65°, and August 62°; and in a 6-feet-wide house or glass case against a south wall the temperature was, April 52°, May 59°, June 65°, July 67°, and August 66°, or the same temperatures as are afforded trees against a south wall in localities which are favourable to the full perfection of the crop, and with such the fruit in the latter house will ripen, but not in a narrow detached house, or against an open wall at the above-named altitude.

A south wall has a temperature of 1° or 5° more or less, according to the material used in the construction, stone giving less warmth than white brick, which is 1° more in temperature than red brick, fire brick being the hottest of all, above that of the atmosphere out of doors; consequently the trees against it will have with me in this locality (North

Wales), against a south wall, in April a temperature of 52°, May 59°, June 65°, July 67°, and August 65°. Here, with these temperatures, I have Peach trees on a south-east wall, also against a south-west wall; but the walls have only, calculating by time, about an hour's eastward or westward bearing, and yet there is no perceptible difference in the time of the fruit ripening as compared with trees against a wall with a due south aspect.

Now it will be seen on reference to the table of temperatures, that Liverpool has a temperature equal to that of Chiswick. I presume, therefore, the Peach is not to be cultivated in this country otherwise than against a south wall, and not then if the locality is more elevated than 250 feet in the south, 150 in the east, west, and midland districts, and 50 in the north. Exposure, however, may so reduce the temperature as to render the locality unfavourable, whilst shelter from cold winds by natural agents may so contribute to the warmth of an elevated locality as to make Peach culture practicable where without much protection it would not otherwise be.

Much as temperature contributes to success in the cultivation of the Peach, lowness, dampness, and foginess of situation are just as unfavourable as a low temperature. A low situation will be equal to a difference of 2° or 3° of temperature, on account of its being unfavourable to the ripening of the wood, whilst a dry one assists its maturation. Temperature, however, is the first and great aim of the Peach-grower; if he has not a favourable one all his efforts will be unavailing. It would, however, greatly contribute to the perfection of the tree and its produce to afford it a south wall in all localities having a suitable temperature, and to keep from the soil any excess of moisture, for the Peach is not hardy, but tender, and is often rendered more tender than need be owing to the want of a properly-made and well-drained border, for in such the heat of the soil is greater, the ripening of the fruit and wood is effected earlier in the year, and the crop is larger.

Not only is a south wall necessary for the successful cultivation of the Peach in the open air, but to afford further facilities for the ripening of the wood and fruit a stock other than the Peach must be employed, for the first evidence of a tree's hardness is afforded by its success or non-success on its own roots. In the latter case the leaves by degrees become smaller, the wood does not ripen, and then it becomes worthless; but a tree not sufficiently hardy to succeed on its own roots may be made to endure the climate by its being budded on a hardier kind of stock. The effect of budding or grafting on a different species has a tendency to cause earlier maturity, and in that respect the working of the Peach on the Plum is desirable, as without that it is very questionable whether the Peach could be cultivated against a wall without artificial heat. The Peach does not succeed on its own roots against a wall in this country. There is every reason to conclude that the soil is too cold for its roots, for on these it fails, whilst on those of the Plum it succeeds, either from that being a hardier kind of tree, or from the influence of the stock, or both. It must be admitted that the Peach is the most natural kind of stock; but in a climate unsuited to its growth we must make compensation by art for whatever our climate is deficient in, and it has been proved that budding or grafting on a stock thriving in that climate renders an otherwise uncultivable tree cultivable.

The Plum is most generally employed as a stock for the Peach, and the kind of Plum most used is that known as the Muscote. The White Pear Plum is sometimes employed; but though the Peach takes most readily upon it, the growth does not correspond with that of the Peach worked upon it. There are obstructions to the flow of the sap which induce an enfeebled state of the Peach, and it is not so long-lived as upon a freer-growing kind of stock. The Muscote Plum, being of more free growth, is well adapted as a stock; and on it the Peach generally succeeds, though all kinds do not take upon it.

The Almond, which is very near akin to the Peach, also answers as a stock, but in cold and damp soils the Peach does not succeed upon it, but in those which are warm and dry it succeeds admirably; and there is an advantage in employing the Almond stock—viz., those kinds not taking well on the Plum stock take readily upon the Almond. Except in warm soils the Almond is not desirable as a stock for the Peach; and though all the varieties of Peach take well on Peach stocks and grow freely, yet they soon become diseased; therefore the Plum stock is preferable to either Almond or Peach.

Budding is the method most practised for the propagation of the varieties of the Peach, and sometimes grafting. New varieties, of course, are raised by sowing the stones. I shall

not, however, enter on these modes of propagation, as they are rarely practised in private gardens. I will only add that budding appears to make the best trees.

The varieties of Peach best suited for cultivation against walls are of course those that are the most hardy. Those succeeding on a south wall with me, and excellent in every respect unless otherwise stated, are—

Early York, large, melting, and excellent. Ripe from the beginning to the end of August.

Grosse Mignonne, large, melting, and fine. End of August and September.

Noblesse, large and good. End of August and September.

Royal George, large, but not so large as some. End of August and September.

Bellegarde, large, melting, and excellent on account of its keeping qualities and bearing carriage well. September.

Chancellor, large, and better from a wall than under glass. September.

Barrington, large and good. Middle of September.

Late Admirable, large, melting, and juicy. End of September.

Walburton Admirable, large, valuable on account of its lateness. End of September and beginning of October.

The above will not disappoint, unless it be the Royal George, on account of its liability to mildew. I do not care for the Acton Scot now we have the Early York, the best early Peach for a wall.

A selection of six may consist of Early York, Grosse Mignonne, Noblesse, Bellegarde, Barrington, and Late Admirable; of three, Early York, Grosse Mignonne, and Barrington; of one, Grosse Mignonne.

The Malta is a fine melting sort, keeping and bearing carriage well. End of August and beginning of September.

Stirling Castle appears a desirable late Peach. Coming into use in October, it will be valuable.

Snihampstead, closely resembling Noblesse, and said to be hardier.

Of the last two I have not sufficient experience to write decidedly of their merits; but I have sufficient to enable me to state that they and the varieties named before them are a dozen of the best Peaches for walls.—G. ABNEY.

BEDDING PELARGONIUMS.

There is much truth in the remarks made by Mr. Luckhurst upon bedding Pelargoniums. I have lately had an opportunity of seeing many of those varieties which first appeared in such glowing colours, and must confess being disappointed with them, for after making allowances for the difference of opinion between buyer and seller, I found that many of them did not arrive at the standard of excellence ascribed; this was particularly remarkable in the Golden, Tricolor, and Bronze section, many of the most expensive kinds having dwindled away into miserable-looking objects, while the colours of others were so nearly approaching those of some previously sent out, that it mattered little which one had. Of course large allowances must be made for them in consequence of the parching summer and our want of a knowledge of the peculiarities in the treatment requisite to bring out the proper tints of their foliage, and which I hope will be acquired by another season.

The great demand for something new and distinct for bedding purposes is, no doubt, one of the principal causes of there being such an influx of new varieties into the market; but from their similarity to each other, I fancy the mind of even the professional gardener, to say nothing of that of the enthusiastic amateur, must become greatly confused in making a selection of varieties worthy of purchase. More especially must this be the case with persons who live in remote districts, and have no opportunity of judging of the merit of new varieties beyond the descriptions of the sellers. It is in such lists as those given by Mr. Luckhurst in our Journal that buyers will find valuable additional assistance; but in making selections it is always well first to consider whether the plants are required for massing in large or small beds, for back or front lines in ribbon borders, or as single specimens in mixed borders or vases. I will, therefore, arrange the varieties I have found worth recommending according to the positions which, according to my own experience, have proved most suitable.

Among SCARLET ZONALS I shall take my stand upon Dr. Lindley, Rebecca, Roi d'Italie, and Indian Yellow, as being distinct and remarkably effective, either in masses in large beds, or in lines in ribbon borders in a second or third row. Herald of Spring, Lord Derby, The Clipper, and Provost are very suitable as single plants for mixed borders or vases. Glw and

Little David take their places in the centres of small beds, or as edgings to large ones, &c., being dwarf and free-blooming.

Among PINKS, I have found Wiltshire Lass to be about the best for massing, either in large or small beds. Christine and Helen Lindsay I use for mixed borders and vases, where they afford abundance of cut bloom. As a salmon colour, Madame Rudersdorff is first-rate for centres of large beds, or the third row in a ribbon border. It is charming even at a distance, and its substantial flower stem and well-made trusses stand heavy rains remarkably well.

In the SCARLET NOSEGAY section I must select Cybister, Lord Palmerston, Amy Hogg, and Christine Nosegay as being the most useful of the varieties I have cultivated; but the hot dry summer has been favourable to them, for they have been of dwarf growth and freer in blooming in consequence, otherwise they have not gained popularity so fast as some varieties, being so often injured by heavy rains.

Of GOLDEN TRICOLORS I have not found one to possess such fine bedding qualities as the well-known Mrs. Pollock. Beautiful, indeed, as they all are when grown under glass, they cannot vie with this popular bedder out of doors.

In the GOLDEN-LEAVED and BRONZE section Crystal Palace Gem and Beauty of Calderdale are likely to be extensively planted next season. The former, a dwarf-growing gold-leaved kind, is a great improvement upon Cloth of Gold, having flowers after the colour of Trentham Rose. The latter is a bronze-zoned kind, having a strong and free growth, and well-expanded foliage, showing the zone to perfection. I think it one of the best of its class for centres of beds and mixed borders.

Of SILVER TRICOLORS I have only Italia Unita, which does not grow well with me.

Of SILVER VARIEGATED kinds I have discarded Flower of the Day and Alma, for Bijou and Flower of Spring. The latter is a favourite with all who see it. I have also found St. Clair well worth growing; its cerise pink flowers render it a very conspicuous object in the flower garden, but two-year-old plants flower best. Those who want the same colour of flower with a dwarf habit of growth can use Lady Coventry, which makes a pretty bed when edged with *Verbenia Maonetti coccinea*.

It will be seen that my remarks upon the newer kinds of Pelargoniums are confined to the bedding qualities of the plants, for beautiful as such varieties may be under glass, I maintain that unless they will thrive under the ordinary treatment given to Pelargoniums, both in summer and winter, their beauty is lost to the small grower, simply because he has no accommodation for them according to their requirements.—THOMAS RECORD, Lillesden Gardens, Hawkehurst.

THE FIRST IMPROVERS OF THE HOLLYHOCK.

In one of your recent Numbers there is a long article on the Hollyhock, by Mr. G. Abbey. If you will allow me a line or two, I should like to point out a few errors which I think ought to be set right.

Mr. Abbey says, "We owe all our improvements in Hollyhocks to the late Mr. Baron." I beg to state Mr. Baron never did much to improve the Hollyhock, he was only a collector; he never raised a new strain. It is to Mr. W. Chater, of Saffron Walden, that we owe the greatest improvement, even up to the present time. He was the first successful cross-breeder about twenty-three years since, when he bought Mr. Baron's stock. Mr. Chater having then been collecting and improving from twenty-five to thirty years, he had at that time some first-rate flowers, which with Mr. Baron's made the finest collection in the world.

In the year 1848 Mr. Chater crossed his own flower, Napoleon, salmon with dark red ground, with Mr. Baron's Queen, a light pink, and was successful. From the seed of the fertilised flower he raised the celebrated variety which he named Charles Baron, which was quite a new strain, and since that flower it has not been necessary to impregnate for salmons and buffs, as every year seeds saved from its progeny bring improvements which can be traced back to the old parent; for all florists ought to know that if once you get new blood into a flower you may go on seeding, and continually raising improvements on the parent flower. We have Herenues, Invincible, Lady Dacres, and several others of the same colour, which can all be traced back to Charles Baron, from Napoleon and Queen. I say that that was the first flower ever raised from

the seed of a flower cross-fertilised by the florist, and the first improvement in the Hollyhock; therefore I think Mr. Chater ought to have the credit.

I was working in the Walden Nursery when he first took Mr. Baron's flowers. I recollect going with Mr. Ward (the raiser of John Flopper and Mrs. Berners Roses), who was apprentice, and afterwards foreman to Mr. Chater, which accounts for his being so successful in cross-breeding, to Mr. Baron's garden for the stock of plants. The following year we began to impregnate their flowers with some of our own varieties, and in three years we had several new and distinct varieties, such as Comet, Walden Gem, and others equally good, and Mr. Chater still holds the position of being the most successful raiser we have. His flowers are decidedly the best sent out, they are of better form, more substance in the petal, and more decided in colour than any others, and this improvement has been going on now for more than twenty years.

I have pointed out the colour of buff and salmon merely as a specimen of what has been done. There are other colours which I can trace back in the same way. Scarlets, whites, and yellows, all from Chater's *Sulphurea perfecta*; purples from *Purpurea elegans* (Chater); lilac and peach from Chater's *Pallida*, and so on. Therefore, I say it is a mistake to give Mr. Baron the credit for improvement, as I consider him only a collector. He certainly did save seed from those which would produce any, and, of course, raised a few new varieties but could never obtain a new strain. As Mr. Baron was an eminent florist, but no botanist, he had not the least idea of cross-breeding, nor ever attempted it.

Mr. Baron had been collecting for more than twenty years before he sold his stock to Mr. Chater. The principal of his flowers he bought of an old gentleman, a lover of the Hollyhock, of the name of Johnson, in 1823. Mr. Baron had not in his collection either a pure white, a yellow, a purple, or a good scarlet. Mr. Chater had all these colours. It is to Mr. Chater we owe all our improvements in the Hollyhock. He was the first to cross-breed to perpetuate variation in colour, and to improve the shape and quality of the flower. All the very finest and best varieties now in cultivation are the results arising from those flowers impregnated in his nursery by himself and foreman, Mr. Ward, and since then by his son, now a nurseryman at Cambridge, and Mr. Speed, his present foreman. Mr. Parsons, Mr. Roake, and the Rev. E. Hawke, have also been successful cross-breeders; but they all worked from Mr. Chater's materials, having received all his new flowers as soon as sent out.

It was Mr. Chater who first perpetuated the improved varieties by cuttings, &c., not Mr. Baron, as he used to say when he wanted to increase his stock, he would take the spade and chop a side shoot off the old plant and stick it in.—A HOLLYHOCK AMATEUR.

DUTCH CLOVER VERSUS GRASS FOR LAWNS.

CONFIRMATORY of the statement of "HOUNSLOW" in last week's Journal, I have to state what I have seen at Rockhurst, West Hoathly, Sussex, the residence of Charles Hill, Esq. When Mr. Hill laid down his lawn two years ago, he was compelled, from want of anything better, to take the turf from the park surrounding the house, and this was of the ordinary character of pasture herbage, with a large admixture of Moss. As a surface-dressing, Mr. Hill used wood ashes, and this alone has had the effect of driving out the Moss, of which there is not the slightest trace, and in its stead a thick carpeting of White Dutch Clover has made its appearance, and which during the past dry summer has maintained a freshness and verdure when everything in the way of a grass lawn was burned up. A marvellous fact connected with it is, that in the original turf there was no trace of the Clover.—H.

BLANCHING CELERY—STOPPING PEA SHOOTS.

HAPPENING a few weeks since to be in the neighbourhood of Leeds, I paid a visit to the garden of Mrs. Tetly, of Armley, near that town, and saw one or two things there which seemed new to me, and which you may think worth notice.

I was struck with the Celery, a great part of which was blanched by sawdust, the latter being kept in its proper position by wooden sides. The gardener, who, I am informed, wins numerous prizes at the neighbouring shows, told me that he found this plan answer very well, provided the sawdust was

not too new. The advantage of this over the usual system is that the Celery is not so liable to rot; the blanching, too, is effected more readily. At any rate, the size of his plants seemed to prove that he made his plan succeed.

But what chiefly struck me was his method of pinching back his Peas, which enables him, as he stated, to obtain a continuous crop from the same rows from July to October. When three blossoms on each shoot are developed, he pinches back the shoot, which after a time throws out fresh blossoms, so that he thus obtains a constant supply of new pods. This system, he thinks, cannot be adopted with every kind of Pea, but succeeds, according to his experience, with Ward's Incomparable, No Plus Ultra, and other such sorts. I should add that while the Peas in my own garden had at that date (the first week in August), ceased to bear, his rows were covered with pods.—E. BARTON, *Great Berkhamstead*.

A FEW WORDS ABOUT PLUMS AND APRICOTS.

I grow in my garden a few Plums, of which I wish to give your readers my experience.

The Washington, which in ordinary seasons is said in gardening books to ripen in September, this year, being an exceptional season, ripened in the middle of August. My tree grows on a south aspect, and is remarkably healthy. Its leaves are very large. It is not an abundant bearer. The fruit is finely formed, oval, pale yellow, with a lovely pink bloom which any maiden of bashful fifteen might covet. The fruit keeps well for at least a week after being fully ripe, if not handled. It is what our esteemed friend Mr. Rivers would call a luscious melting Plum, and has this advantage over the Green Gage, the flavour of which it resembles, with more of it—namely, it does not crack after a shower of rain. On any aspect but south, it is of a pale green, and of very ordinary flavour. Much depends on the judicious selection of aspect for successful fruit culture. The Washington is not subject to the aphid, but a large brown grub is very partial to its fine foliage.

Several Plums are not considered worth growing on account of their not being afforded a proper situation with regard to the sun. Of the Orleans I have two trees, one on a south aspect, the other on the west. The latter is a luxuriant tree, and the flavour is exquisite. The fruit of that on the south is more beautiful, but far inferior in flavour. I infer, therefore, that east and west-aspect walls, more particularly the latter, are the best for the Orleans. This Plum is very subject to the aphid.

Several Plums go by the name of Coe's Golden Drop. I have a large tree on an east wall, with some boughs trained south, but it does not improve the fruit. The fruit is very large, of brilliant colour, excellent for jam, but not by any means a table Plum. For jam it is preferable to the Apricot. It is subject to the aphid.

The Nectarine Plum is not much cultivated; but grown on a south wall is a fine-flavoured fruit, well worth cultivating, but is apt to drop its fruit the instant of ripening. It is of the same shape as the Washington, pale pink in colour, and quite as large. The blossom is very beautiful. The tree is not so much subject to the aphid as the Orleans. The leaves are large and hard, like those of the Gage.

Plum trees do not require root-pruning like Pears and trees of a too luxuriant growth. If properly planted on a dry subsoil or limestone foundation, they will manage themselves with a very little assistance from a gardener who understands summer pruning à la Mr. Rivers. The high road to successful culture is defending them from the aphid in May. That season can only be passed well by daily constant watching. These garden pests call forth man's vigilance. During the season I never go out without a soft brush, a painter's tool, and as soon as I see a leaf curl I brush off the cause—the green aphid. I practise the same with my Morello Cherries for the black aphid, so that now from attention they are in splendid condition. I have a plentiful supply of Cherry brandy for my friends at Christmas. I do not recommend growing this fruit, for I find certain members of my family, who have hitherto been free from aches and pains, often fly to this brandy-made-wholesome for relief, imaginary or otherwise. I have tried every known remedy for the destruction of blight, and I find nothing like hand-labour. I am speaking only of a garden on a small scale. To the gardener Plums are a paying fruit. Orleans sold this year at

1d. each in Devizes Market, and such Plums as my Washington would have been cheap for a dessert at 3d. I have never seen any Plums worth growing in pots, the fruit being small and inferior in flavour.

A word or two about Apricots. As much doubt exists about the cause of boughs of the Moorpark suddenly dying, I have paid more than ordinary attention to the subject. After the leaves had fallen last year I unnailed a tree I have growing on a south wall, and carefully inspected with a powerful magnifying glass every bud. I observed in the fork where the blossom bud forms, close to the wall, something like a fine web, which occurred to me must be the covering of the eggs of some insect. I removed them all carefully, and out of perhaps a dozen one only appeared to have come to maturity. On a closer inspection I observed a small hole at the top of the bud, which I removed, and I found in it a small maggot three-eighths of an inch in length and about the thickness of an ordinary piece of worsted, white with a black head. This insect, I am inclined to believe, is the pioneer to the mischief which eventually follows. But I do not consider the gumming of the Apricot arises from the same cause. I believe that to arise from some injury to the tree, by which the sap is prevented from flowing in the proper channel, and then, as it cannot circulate, coagulates into gum. Where this occurs I advise removing the bough. I believe the little insect I have mentioned does its mischief in the winter; and the bough, having some vitality left, puts forth leaves and blossoms, but as the supply of sap is cut off it speedily dies. If any of your readers will give this subject attention they may be able to clear up the mystery better than I pretend to.—EXCELSIOR, *Scend Villa, Wilts*.

PLANTS IN FLOWER DURING AUGUST.

August 3. <i>Mentha viridis</i> piperita <i>Clethra alnifolia</i>	August 22. <i>Pentstemon diffusum</i> <i>Potentilla ignescens</i> <i>Linaria cymbalaria</i> <i>Statice linumtum</i> <i>Stipa pennata</i> <i>Villarsia nymphaeoides</i> <i>Stenactis speciosa</i> <i>Pyrethrum parthenium</i> plenum <i>Salvia bicolor</i> tricolor
" 7. <i>Clematis florida</i> <i>Erica tetralix</i> <i>Gaultheria procumbens</i> <i>Lonicera sempervirens</i> <i>Oxalis corniculata rubra</i> <i>Hydrangea arborea</i> <i>Dryas octopetala</i> <i>Magnolia glauca</i> <i>Jasminum officinale</i> humile <i>Cytisus leucanthus</i>	" 26. <i>Tigridia pavonia</i> conchiflora <i>Ailanthus glandulosa</i> <i>Catalpa syriacifolia</i> <i>Aster tripolium</i> <i>Aralia japonica</i> <i>Clematis vitalba</i> <i>Dracoccephalum grandiflorum</i> sibiricum <i>Ipomoea quamoclit</i> <i>Helianthus annuus</i> <i>Physalis Alkekengi</i> <i>Lythrum roseum</i> <i>Rudbeckia fulgida</i> Newmannii
" 10. <i>Erica arborea</i> <i>Rhododendron ponticum</i> <i>Sophora japonica</i> <i>Rhus cotinus</i> <i>Escallonia rubra</i> <i>Dablia</i> <i>Tropeolum</i> <i>Asters</i> <i>Balsams</i> <i>Lophospermum scandens</i>	" 28. <i>Clematis Heudersouii</i> <i>Linaria peloria</i> <i>Polygoum histertum</i> <i>Mirabilis rubra</i> <i>Commelina tuberosa</i> <i>Crucifera stylosa</i> <i>Loasa Herbertii</i> aurantiaca <i>Nicotiana virginica</i> <i>Aloysia citriodora</i> <i>Tolpis barbata</i> <i>Mesembryanthemum crystallinum</i> <i>Fabiana imbricata</i>
" 12. <i>Ipomoea hederacea</i> <i>Portulacas</i> <i>Senecio elegans</i> <i>Zinnia elegans</i>	" 31. <i>Aster chinensis</i> <i>Achillea aegyptiaca</i> ptarmica plena <i>Ammobium alatum</i> <i>Statice bellidifolia</i> <i>Impatiens glandulifera</i> <i>Helichrysum bracteatum</i> <i>Petunia grandiflora</i> <i>Anagallis grandiflora</i> <i>Lavandula spica</i>
" 17. <i>Chelone barbata</i> glabra <i>Gladiolus</i> <i>Colechicum autumnale</i> <i>Oenothera Fraseri</i> <i>Drummondii</i> macrocarpa <i>Clematis erecta</i> <i>Ceanothus azureus</i> <i>Critimum maritimum</i>	
" 20. <i>Gaillardia picta</i> <i>Liatris elegans</i> <i>Helianthus multiflorus</i> <i>Lilium lanceifolium</i> <i>Linum auricium</i> <i>Glaux maritima</i> <i>Clematis glauca</i> <i>Aristolochia siphon</i> <i>Myosotis polystachya</i> <i>Campanula pusilla</i>	
" 22. <i>Hieracium aurantiacum</i> <i>Eccremocarpus scaber</i> <i>Delphinium sibiricum</i> plenum	

—M. H., *Acklam Hall, Middlesborough-on-Tees*.

REINE DU PORTUGAL ROSE.—I see that by some this Rose is very highly recommended. It is very beautiful, but (ah! that tiresome word), I do not think that it will ever do out of doors.

The colour is charming, something like Ophirie, but the buds are very hard, like those of *Bonne d'Or*, which only open in some very favoured spots.—D., Deal.

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.

THE last Exhibition for this season was held on the 28th and 29th of August, under very favourable circumstances, both days being fine, and the Exhibition in most respects a very good one. The display of fruit was especially good; indeed, the finest ever witnessed in Manchester, and quite equal if not superior to many of the metropolitan exhibitions. Although the prizes offered by the Society were not large, exhibitors brought fine collections of fruit from far and near, influenced, no doubt, by the kind treatment accorded to them on all previous occasions by Mr. Findlay and the Society which he serves with so much ability and energy. I hear that the Society contemplates holding a fruit show on an extensive scale in the autumn of 1869, at which liberal prizes will be given—larger, indeed, than ever offered for fruit at any previous exhibition. This subject has been well considered by many practical men, and all agree in thinking the show would be successful.

I give a list of the successful exhibitors, and if I do not describe the objects exhibited by the unsuccessful competitors, it is simply because space will not admit of my doing so. One name, however, deserves particular mention as being very conspicuous above all others for the excellence of the subjects exhibited, and the number of first prizes taken. I allude to Mr. Smith, gardener to H. Littledale, Esq., of Liscard Hall, Birkenhead, who took the first prize in nearly all the fruit classes. Only in one important case was he beaten, and in this instance it required great care on the part of the Judges in awarding the prize. The two exhibitions were of such excellence that the Judges had to call in two others to assist them in awarding the prize. They both decided in favour of Mr. Woolley, one of our oldest and best Grape growers, who competed with Mr. Smith in Class 22, for two bunches of Black Hamburgh Grapes. Mr. Woolley's bunches were larger and the berries more even than were Mr. Smith's, whose berries were very much larger than those of the former, and many degrees darker and having a more perfect bloom, but the bunches were smaller and the berries very uneven in size.

In Class 1, mixed groups of Fine-foliaged and Flowering Plants, the first prize was awarded to O. O. Wrigley, Esq., who exhibited the following plants in fine condition—*Lilium lancifolium punctatum*, a fine variety and well bloomed; *Croton variegatum*; a splendid *Ixora javanica*, *Thrinax elegans*, *Allamanda grandiflora*, finely-flowered; *Dipladenia amabilis*; a splendid plant of *Croton angustifolium*, which had the appearance of a golden fountain; *Bougainvillea glabra*, finely flowered; *Calamus dealbatus*; *Allamanda Hendersoni* in fine condition; *Gleichenia hibernica*; and a noble plant of *Stevensonia sechellianum*, 5 feet high, and 3 feet or more across the widest part, completed this fine collection. The second and third prizes were awarded to Mr. J. Stevenson, of Timperley, and S. Schloss, Esq., in the order in which their names appear. Each of the above exhibitors had similar collections to that which took the first prize, the weakest point being in both instances a want of better specimens of flowering plants. According to the conditions named in the schedule, the prizes in this class were to be given for a group containing six fine-foliaged and six flowering plants. A word of caution, I think, would not be out of place to exhibitors, who are evidently too rapidly giving up the cultivation of flowering plants, and are paying more attention to plants with fine foliage. Whether this is owing to the latter being much more easily cultivated is best known to themselves, but certain it is, the beauty of our floral exhibitions is becoming impaired in consequence.

In the Class for six Exotic Orchids there was only one exhibitor. This is very unusual indeed for Manchester, which boasts of so many fine collections of Orchids. Mr. Jones, gardener, of Whalley Range, near Manchester, however, staged the following in very fair condition, and was awarded the first prize for them. They were *Oncidium obryzatum*, *Acrides nobilis*, *Vanda tricolor formosa*, *Laelia elegans*, *Cypripedium Stonei*, and *Acrides suavisima*.

In Class 3, for six Zonal Pelargoniums, there were three competitors. Messrs. G. & W. Yates, of Market Place, Manchester, and Stockport, took the first prize with well-grown and nicely-bloomed plants. The other two exhibitors who took the second and third prizes in this class were a long way behind, and would do well to imitate—aye, and there is room to improve upon the example set them by Messrs. Yates.

In Class 4, for six Gold and Bronze Pelargoniums, Mr. Watson, of the New Zealand Nursery, St. Albans, took the first prize with well-grown plants of *Model*, *Beauty of Calderdale*, *Perilla*, *Princess Alice*, *Mrs. J. Todd*, and *Countess of Kellie*. This collection was well grown, beautifully coloured, and well deserved the place of honour. In the two collections which took the second and third prizes, fine plants of *Glowworm*, *Beauty of Calderdale*, and *Beauty of Oulton*, were exhibited. Near these collections was a fine pan of cuttings of *Beauty of Oulton*, the parent of the Bronze and Gold race of Pelargoniums, cut from beds in the open air to show the usefulness of this fine variety. These were sent by Mr. Muir, gardener to Sir P. Grey Egerton, Bart.

In Class 5, for six Gold or Silver Zonals, there was a very spirited competition, Mr. Pennington being first with fine plants of *Sophia Casack*, the finest plant we have ever seen exhibited of *Italia Unita*, also a good plant of *Miss Watson*, which appeared in fine condition; *Mrs. Dix*, also good; and *Lacy Grieve*, undoubtedly one of the very finest Tricolors in cultivation. This set was completed with a badly-grown plant of *Queen's Favourite*, which was the weakest point. Messrs. G. & W. Yates took the second prize with well and neatly-grown plants of *Florence*, *Lady Callum*, *Lacy Grieve*, *Countess of Craven*, *Italia Unita*, and *L. Elegante*, a nice Silver-variegated Ivy-leaved variety. Mr. Watson took the third prize with a neat collection, but not so good in point of colour and cultivation as the two preceding exhibitions.

In Class 6, for four Fuchsias, there was only one exhibitor. His plants were well grown and splendidly bloomed, and the first prize was awarded to Mr. Wrigley for them. The same exhibitor also took the first prize for four pots of Japanese Lilies. These were nicely grown, well bloomed, and far surpassed those from the other two exhibitors who competed with him in this class. Some very fine Dahlias were shown, and Messrs. G. & W. Yates exhibited a remarkably fine collection of *Gladiolus*, eighteen in number, and were deservedly awarded the first prize. It was well staged, and contained some very fine varieties. Messrs. Yates are celebrated for their successful cultivation of this handsome flower.

Special certificates were awarded to Mr. J. W. Wimsell, of the Ashburnham Park Nursery, King's Road, Chelsea, London, for a very fine collection of new Coleuses; also to Messrs. Dickson & Brown, of Manchester, for a very fine collection of cent Roses. These were wonderfully fine for such a trying season as we have had; they were also exhibited in that neat style peculiar to this celebrated establishment.

FRUIT.

In this department there was, as already stated, a very spirited competition. In Class 20, for six dishes of fruit, distinct, there were six entries. Mr. G. Smith, of Liscard Hall, Birkenhead, was first with a nice collection, containing splendid Muscat of Alexandria and Black Hamburgh Grapes, two bunches of each, a good Hybrid Cashmere Melon, Jefferson Plums, Elrage Nectarines, and Walborton Admirable Peaches. Both of the latter were exceedingly fine. The second and third prizes in this class were respectively awarded to Mr. Simpson and Mr. D. Davies for very fine collections, which contained many fruits of first-rate quality.

In Class 21, for four kinds of Grapes, there was also a very spirited competition, Mr. G. Smith taking the lead with a collection containing good examples of well-coloured Muscat of Alexandria, Black Hamburgh, Bowood Muscat, and Black Alicante (Meredith's), as black as Sloes, and beautifully grown and finished. Second, Mr. W. Cardwell, gardener to T. Hobson, Esq., Wimslow, who had good Muscat of Alexandria, Lady Downe's, Black Hamburgh, and Black Alicante. Mr. W. McMillan was third with a similar collection.

Class 22, for two bunches of Black Hamburgh, was also well contested. Mr. Woolley, gardener to W. Jackson, Esq., of Birkenhead, took the first prize with two finely finished bunches. Mr. Smith was second, and extra prizes were awarded to the Earl of Crawford's gardener and to Mr. Meredith, who had two splendid bunches, each weighing 4 lbs., and so much alike that they might to all appearance have been cast in one mould. Unfortunately, however, one of the bunches was very much spoilt in appearance owing to a light just above where it grew having been accidentally left unfastened. The berries, however, in each bunch were very even and finely coloured.

Class 23. In this class, for any other kind of Black Grape, Mr. Smith again took the first prize with two fine bunches of Lady Downe's, beautifully finished; and Mr. D. White, gardener to Mrs. Smith Barry, of Northwich, Cheshire, was second with fine bunches of Black Alicante, the bloom of which had been spoilt by syringing, or some other cause. The third prize in this class was awarded for two bunches of badly-grown Trentham Black.

In Class 24, for two bunches of Muscat of Alexandria, the first prize went to Mr. G. Smith, the second to Mr. W. Cardwell, the third to Mr. W. Milford. In Class 25, for any other kind of white Grape, the first prize was awarded to Mr. G. Smith, the second to Mr. R. Jason, gardener to F. Staller, Esq., who had two bunches of Canon Hall Muscat, which were some of the finest I have ever seen for size of berries, for these being well set, and for compactness of bunch. The third prize was taken by Mr. G. Whitefield, gardener to G. Galloway, Esq., who had two fine bunches of Beckland Sweetwater.

Class 26 was for one Queen Pine Apple. Mr. J. Wallace, gardener to J. Dixon, Esq., was first; Mr. Simpson, gardener to Lord Wharncliffe, second. In Class 28, for any other kind, the first prize was awarded to Mr. G. Warde for the handsomest Smooth-leaved Cayenne I have ever seen, weighing 7½ lbs. Second, Mr. A. Williams, for Smooth-leaved Cayenne. Third, Mr. W. Allen, with a nice fruit of the same variety.

In Class 29, for six Peaches, Mr. McMillan, gardener to G. Gortschalk, Esq., was first with a very handsome dish of Chancellor Peach; R. O. Leicester, Esq., second; Mr. G. Silcock, gardener to Sir Charles Shakerley, of Somerton, near Congleton, third.

Class 30 was for the best dish of Nectarines. In this Mr. Silcock took the first prize with a splendid dish of Elrage; Mr. G. W. Ferney,

leough, being second with a very good dish of Pitmaston Orange; third, Mr. G. Smith.

In Class 31, for the best dish of Apricots, Mr. J. Blears, Congleton, was first, Mr. J. Simpson, second. Class 32, for the best Green-fleshed Melon, Mr. W. Fallowfield was first; Mr. James, second; Mr. G. Smith, third. Class 33, any Scarlet-fleshed:—First, Mr. W. Woolley; second, Mr. W. Garner; third, Mrs. Smith Barry.

Class 34 was for ten dessert Apples:—First, Mr. Dean, Sale Lodge; second, Mr. W. Renshaw; third, S. Barrett, Esq. Class 35 was for baking Apples. In this there was a large number of competitors, and as many as seventeen dishes of the variety known as Lord Saffield were exhibited. All three prizes were awarded to this variety, Mr. J. Waltham being first; Mr. W. Brockwell, second; and P. Speed, Esq., third.

Class 36, for ten Pears. In this class there were seventeen exhibitors, the first prize being awarded to B. Whitworth, Esq., for a very fine dish of Jargonelle; the second to Mr. G. Smith; the third to Mr. W. Renshaw.

Class 37, for twelve Plams (dark):—First, Mr. G. Smith; second, Mr. W. Allen, gardener to Lord Hatherton, who exhibited a fine dish of Royale Hative. Class 38, for the best dish of light Plams:—First, J. Dixon, Esq., for a fine dish of Jefferson; second, Mr. King; third, Mr. Leigh. Class 39, for the best dish of Cherries:—First, A. Jackson, Esq.; second, Mr. J. Blears; third, Mr. A. Mickle. Class 40, two Vines in pots:—First, Mr. Wrigley, for well-grown and finely-fruited Vines of Black Alicante.

VEGETABLES.

This was also a fine portion of the Exhibition, and showed what an amount of patience and skill must have been bestowed during the late trying weather on the cultivation of all the objects exhibited. The exhibition was highly creditable both to the professional gardener and to the humble cottager, for a table running the whole length of the exhibition house was covered with a very excellent collection, and some very fine Peas were shown. The Potatoes, Carrots, Dwarf Kidney Beans and Scarlet Runners were also of first-class quality, and the Tomatoes were remarkably fine.

In Class 41, for six dishes of Vegetables, there were twelve competitors. The first-prize collection came from the gardens of G. Whitworth, Esq., Lyynn. It contained a fine dish of Tomatoes, two fine heads of Celery, nice dishes of Peas, of Dwarf Kidney Beans, Potatoes, and Mushrooms. The second prize was taken by Mr. A. Mickle, Read Hall, near Burnley, who exhibited a similar collection to the above, and in very good condition.

Class 42, for three dishes:—First, T. Aekon, Esq.; second, T. Hobson, Esq.; third, T. Mickle. Class 43, for ten Kidney Potatoes:—First, T. Statter, Esq.; second, B. Whitworth, Esq.; third, Mr. W. Renshaw. Class 44, for Round Potatoes:—First, Mr. W. Brown-hall, Sale; second, Mr. J. McIntyre; third, Mr. A. Mickle. Class 45, for Onions, spring-sown:—First, Mr. R. Faulkner; second, G. Oliver, Esq.; third, T. Aitkin, Esq. Class 46, for two heads of Cauliflower:—In this class there was but one exhibitor, whose exhibition was only considered worthy of a third prize; but it is very likely more care had been taken with this, poor though it was, than would have been bestowed on a thousand in any ordinary season. Class 47 was for two White Cabbages. In this only one lot was staged, which was awarded a third prize. Class 48, for two Red Cabbages:—Several competitors exhibited in this class, and some very firm heads were shown. Classes 49 and 50 were for Cucumbers and Tomatoes. In each class there were some very fine exhibitions; the Tomatoes were wonderfully fine.

The display of fruit and vegetables furnished by the cottagers was of a very high character, and was about equal in extent to that which came from the gardeners. Amongst the cottagers' collections were some splendid dishes of Red Currants, and the Celery and Potatoes were also remarkably good; there was also a very good display of flowers, consisting of Roses, Phloxes, Asters, Verbenas, and Dahlias; and lastly, two plants of Mrs. Pollock Pelargonium, grown by a cottager, were well worthy the prize they gained, being large plants with the foliage beautifully coloured. Leaves of them were compared with those of the newer varieties, and certainly the result was in favour of Mrs. Pollock.—J. WILLS, F.R.H.S.

PALMS.

Your correspondent "PATELIN" complains of the difficulty of procuring these at a moderate price. Many nurserymen could no doubt supply small plants at a low figure; but as it usually takes from four to seven years from the sowing to obtain them of such a size as would be considered "decorative," the apparently high price they are commonly sold at is accounted for. The only way of obtaining them cheaply would be to buy small seedlings, and, being not difficult to manage, they will amply repay the care bestowed.—N. R.

I HAVE to thank your correspondent for his reply to my query. I shall not fail to inquire where he directs me for what I am in search of. But, what a discontented fellow he will think me! Even at the prices quoted, at my own figure of three for a guinea, I am inclined to grumble. This may be un-

reasonable, but I cannot forget the beautiful Palms I have seen at 4s. and 5s. a-plant, and this too in an inclement climate. It is true that there the custom of hiring plants for so many months is almost universal, and for this reason they come cheaper to the purchaser. It works in this way: a florist lends out plants by the dozen at, say, 2s. 6d. each, this done two or three times brings in the value of the plant, and he can well afford to sell his plants at the sum above mentioned.

I have already detailed in the pages of "our Journal" the way in which these plants are used in ornamenting rooms, in filling blank corners and decorating alcoves. I hope to be able shortly to say a word or two on the subject of the arrangement of conservatories, on the comparative merits of our system shown in contrast with the greenhouses and orangeries of our continental friends.

Before closing let me add how useful a list of hardy Palms suitable for in-door decoration would be to amateurs. It should especially be made with respect to the strength of the plants to resist the noxious effects of long confinement in dry air, though I fear not many can give such a list verified by experience.—PATELIN.

[When in Belgium in 1865, we were informed that the Palms there found best suited for room decoration are *Chamærops staurocarantha*, *Ceroxylon andicola*, *Thrinax elegans*, *Phoenixophorium sechellarum*, and *Chamædorea Ernesti-Augusti*. Several species of *Pandanus* are also used.—Ens.]

BENTLEY PRIORY.

(Continued from page 133.)

THE home kitchen garden, in which are the plant and fruit houses, &c., slopes gently to the south, and is efficiently sheltered on every side by large masses of trees and shrubs. It is most admirably placed for all cultural purposes and for convenient access from the mansion. On entering the garden from the north side a long range of lean-to houses is seen on the right-hand side of the entrance. These are the original forcing houses erected many years ago, and in which I have seen many fine crops of Grapes, Peaches, and other fruits. They were the only horticultural structures of any moment on the place when it came into Mr. Kelk's hands; all those which I shall presently describe have been erected by Mr. Kelk.

The first house I entered in the range above mentioned was a Peach house; here the trees were looking vigorous and healthy, and bore evidence of having produced splendid crops judging from a few of the fruits still left. Passing through this house I came to the next compartment in the range, used as an early Strawberry house; and well suited for the purpose it is, as the plants are placed on shelves near the glass, and abundance of air can be admitted at all times when necessary, and be made to circulate freely amongst the foliage of the plants. When they are in bloom this is no doubt one of the points most particularly to be attended to. Where a proper amount of artificial heat can be obtained, and proper provision is made for ventilation, as is the case in this house, the crop may at all times be considered tolerably certain, if the plants have previously undergone a proper course of treatment.

I next passed through two more Peach houses. Here the crop was all gathered, and the trees, though in some cases very old, still looked healthy, and well able to bear many more fine crops of fruit. The next house is an early vinery. The borders had very recently been renewed, and young Vines planted, which gave promise of making fine canes. These Mr. Rutland intends to keep growing as long as he can through the winter, in order to have them as strong as possible in the shortest time. They may also in this way be brought into a condition in which they will be naturally adapted for early-winter forcing. In the next two houses, which complete the range, fine examples of early Muscat and Black Hamburg Grapes were still to be seen, the latter as black as Sloes, with fine well-formed bunches of regular-sized berries, having that beautiful bloom and finish by which a good Grape-grower can always estimate the quality of the fruit without tasting it.

In front of this range of houses there are several ranges of pits heated with hot water, and used for forcing early Potatoes, Cucumbers, and Melons; and to the east of these there is a span-roofed plant stove in two divisions, in which is kept a general collection of the smaller-growing stove plants, and Orchids, all looking well, and remarkably clean and free from insects. Retracing our steps we enter, a little farther down the slope, a fine range of houses; and parallel with these and

on the south front of them, is a broad walk about 10 feet wide running from one end of the garden to the other. The houses are all on the upper or north side of this fine walk, and on the south side is a border, in which is planted a row of pyramidal fruit trees, consisting of Pears, Apples, Plums, and Cherries. In front of these is planted a miscellaneous collection of sweet-smelling plants and ordinary bedding plants, with numerous hardy and half-hardy herbaceous plants.

The first house I entered, on the west side of the garden and just opposite Mr. Rutland's dwelling-house, is a noble span-roof, about 30 feet long by 22 feet wide, having a bed in the centre, and also a bed back and front. This house is filled with a choice collection of Tea-scented, Noisette, and other Roses suitable for winter-flowering. Here the plants looked remarkably healthy, and gave promise of producing a fine display of Roses during the coming winter and spring. The house is well heated, and I should think very suitable for the purpose. From a house of this description a large quantity of Roses may be gathered at a time when even the commonest flowers are scarce, and at a trifling cost, for very little fuel will be required to produce the amount of artificial heat required by the queen of flowers during the winter months. This house must therefore prove a greater source of pleasure to Mr. and Mrs. Kelk than any other on the place.

Leaving the Rose house I entered a large greenhouse, in which there is a general collection of New Holland and other plants, all in a good state of cultivation. Between this and the extensive range of vineries, Fig, Plum, and Cherry houses, are two fine ranges of Pine stoves, in which I noticed splendid examples of Pine-growing. Here were to be seen as fine a stock as any in the country, in various stages of growth and fruit, from the fresh-planted sucker to the largest Queen and Providence. I noticed some handsome Queens in various stages, with the tiers of pips one above the other as regular as if they had all been cast in a mould, and one or two fruit which I saw cut could not weigh less than 7 lbs. These ranges are three-quarter-span, with the walk at the back under the short light; but in one of them the visitor is obliged to put himself into a very uncomfortable position in order to get along, for overhead the whole space is covered with Cucumbers in great quantities, which during the hot weather looked remarkably cool and inviting. These houses are a very interesting and instructive sight, and they proved conclusively that Mr. Rutland is a perfect master of the art of Pine-growing.

After passing through the pineries I came out on the walk leading to the door by which I first gained access to the garden. Crossing this towards the east we enter the largest and most important horticultural structure in the garden. It was built as nearly as I can recollect about twelve years ago, and is one of the finest ranges of glass in the country. It is span-roofed, 151 feet long, and about 18 feet wide, and is built parallel with the walk which extends from east to west. It is in five divisions; straight through the centre of four of these the walk passes, and there is a border on each side, in which are planted the Vines, Fig trees, &c. The Vines would, doubtless, by this time have been some of the finest in the country but for a slight mistake in their management a few years after they were planted. This arose from overfeeding, one of the worst evils that can happen to the Vine. The borders were made with every care, and regardless of expense. They were made in accordance with instructions furnished by my friend Mr. J. Drewett, whose magnificent bunches of Muscat of Alexandria, Canon Hall Muscat, and Trebbiano caused such a sensation when they were exhibited at St. James's Hall, about the time, or a year or so after, this fine range was built, and I am certain that no Grapes of these varieties so well grown and in such condition were ever exhibited before or have been since. I well remember poor Mr. Beaton throwing up his hands and exclaiming, "No man ever grew such Grapes before, nor will the like be seen again." Living near the Priory at the time, I had frequent opportunities of seeing the borders during their formation, and I am quite sure Mr. Drewett's instructions were carried out to the letter. A work of this description, in which I always took so much interest, was likely to be visited on every occasion which presented itself, and these thoughts occurred to my mind on seeing the kind of material the borders were made of, the preparations and precautions taken for draining the borders, the style the house was built in, and the excellent mode adopted for ventilating it—surely with a moderate amount of skill Grapes equal to those exhibited by Mr. Drewett will some day be grown in these houses. (Many of the Vines planted in them were raised from

Mr. Drewett's stock). How I wished at the time that the management of such a splendid range of vineries had fallen to my lot, for the greatest ambition I then had was to produce Grapes equal to those shown by Mr. Drewett. The mistake which I mentioned occurred, and although very fine Grapes have been grown, and are still to be seen in these houses, the standard of perfection has never been reached, for the constitution of the Vines has been seriously impaired, and now, when they should be just at their best, they are showing signs of weakness. I may be pardoned, perhaps, for digressing a little from my description of these gardens, for I could not help recounting a little of the past history of this noble structure and its occupants.

The first division of the house is devoted to the growth of the Fig. It is completely filled with the best varieties in cultivation, and a perfect thicket they are. Their branches are laden with quantities of fruit in all stages of development. The second division is planted with Muscat Vines. They are bearing a very even crop, which at the time of my visit was looking very promising. The third division is planted principally with Black Hamburgh Vines. These also looked promising, and were likely to bear a very useful crop. In the fourth, or West's St. Peter's division, the Vines were better than in either of the preceding houses. The bunches were large, handsome in shape, and the crop a very even one all over the house. The Grapes in the last three divisions will come in at a very useful time to furnish the winter and spring supply until new Grapes shall be produced.

What I consider would wonderfully alter the condition of the Vines, and what I should do if they were mine, would be to raise the pipes in the inside borders to the level of the wall plate; I should also cut the arches away close to the wall plate, leaving only the buttresses or pillars between the arches to support the house; I should then raise the border both outside and in. This would add about 2 feet in depth to the border, would be the means of throwing life and vigour into the Vines, and would cause them to bear finer fruit than they have ever yet produced. It would also add a long period to their lifetime, and increase the pleasure and interest which they would afford both to the gardener and to their owner.

The fifth and last division is filled with Plum trees, and a magnificent sight they were, being literally covered with fruit of first-rate quality. There is certainly no more useful house in any establishment than a Plum house, for if care and forethought are exercised to plant varieties which will do well under glass and produce a good succession, the supply of fruit both for culinary purposes and dessert may be continued for a long time.

On leaving the Plum house we enter a large stove, in which a magnificent lot of plants are grown for the decoration of the large conservatory, the description of which I must leave to my next paper. After casting a hurried glance over the fine collection of plants which this house contains, for time would not permit me to linger so long as I wished, I passed through into the corridor which leads to the conservatory. In this, fine plants of Camellias were trained against the wall, and in front of these were placed specimen Camellias and other plants. This corridor forms a convenient and pretty connecting length between the conservatory and the stove, and from thence into the large range of houses described above, and so on through the whole series of houses, enabling the family to walk through them without inconvenience in bad weather.

I must here retrace my steps into that portion of the garden lying below the long walk, in order to describe the appearance of a fine lot of Azaleas, which owe their present healthy state to the application of Standen's Gardeners' and Amateurs' Friend—a manure which on a former occasion I strongly recommended for Azaleas and other plants. I was naturally anxious to see the plants when Mr. Rutland told me he had been using it, and the result was highly satisfactory. They were on a north border at the bottom of the garden, models of beauty and pictures of health. I am sorry this most valuable manure is not more appreciated than it is. The effect which it produces on some kinds of plants may be seen at the Ashburnham Park Nursery.—J. WILLS, F.R.H.S.

(To be continued.)

LEEDS HORTICULTURAL SOCIETY.

SUNLEY V. BIRBECK (SECRETARY).

In the Leeds County Court, Mr. Ferns, who was for the plaintiff, stated that at the Show held in the Mayor's grounds, last

June, the Society offered prizes for bouquets of wild flowers. One of these prizes was awarded to the plaintiff by a jury of ladies, but the Society refused to pay the amount (9s. 6d.). His Honour said the plaintiff had no action at law; the prizes were presents from the Committee, and there was no law to enforce a present. He did not sit as a Judge of Appeal between the Committee and the exhibitors. The Committee consisted of a number of gentlemen who knew their business in these matters better than he did, and he should not interfere. Mr. Ferns remarked that he held in his hand the certificate of the award, signed by the Secretary, when his Honour said he might be called and give them some explanation. Mr. Ferns proceeded to question the Secretary respecting the rule of the Society which states the decision of the Judges as final, when he pointed out to him that a part of the same rule states that "any prize fraudulently obtained shall be forfeited, and the exhibitor excluded from future shows." He stated that when the Judges came, prize cards were given to them, and they placed them (without any interference) in the order of merit. At all shows it was found exhibitors carefully looked after their own interests, and after these cards had been placed, if an exhibitor thought a prize had been obtained unjustly, he would lodge a protest, and the Committee of the Society would have to decide. It was so in this instance: a written protest from another exhibitor, against the prize being given, was sent in—the first and only one in the five years. A number of the Committee, accompanied by the Secretary, inspected the bouquets, and found the protest held good, for this reason—garden flowers were mixed with wild flowers, which was decidedly unfair to the other honest competitors, and against the spirit of the schedule; the plaintiff was told the prize was protested, and the Committee would have to consider about it.

At their first meeting, held nearly two months after the show, it was decided to set aside the award—it was entirely a question of principle.

His Honour remarked, it only confirmed what he had said, the plaintiff must be nonsuited.

[We have been asked to give an opinion on this case; and that opinion quite agrees with the decision of the Judge, supposing it to be true that garden flowers were mixed with wild flowers in a bouquet required and purporting to be wild flowers. For, in legal phrase, the prize awarded to the bouquet containing some garden flowers was "fraudulently obtained," and consequently within the proviso at the conclusion of the Society's 4th rule.—Eds.]

VISITS TO GARDENS PUBLIC AND PRIVATE.

MESSRS. JACKMAN & SON'S, WOKING.

ALTHOUGH this nursery has been established and well known for a great many years, it has been brought more prominently before the public of late by the success which has attended Mr. George Jackman's hybridising of the Clematis; and it was mainly for the purpose of seeing the varieties he has raised, that on my return from Dorsetshire lately I turned aside somewhat in my way. I was very glad that I was enabled to examine them in their own home; and although this year they suffered in common with other things, yet they were a sight not easily forgotten. On approaching the nursery from Woking you are

at once struck with the mass of blue colour in all directions. In front of the house were long beds radiant with Clematis; there were plants in festoons, and showers of blooms hung from the poles against which other plants were trained. Others, again, in pots exhibited their capabilities as specimen plants; and others had been allowed to run over large roots of trees, covering them with their beautiful blossoms; while in the houses Clematis plants were in process of increase by tens of thousands, so as to supply the immense demand which has arisen for them. Last autumn Messrs. Jackman were unable to execute all their orders; and now that the capability of the Clematis as a bedding plant has been sufficiently tested the demand will doubtless very much increase.

The varieties Jackmanni and Rubro-violacea are well known. Since then we have had Rubella and Prince of Wales, and now other varieties are coming forward to claim our admiration. Amongst those which I especially admired were the following:—Lady Bovill, a flower of great size and peculiar form; the colour is a pale lavender blue, and the petals being slightly cupped, almost like an expanded Tulip, give the flower a very peculiar appearance. Thomas Moore, very large, several blooms being 8 inches across; nearly all the flowers had five or six petals, the latter number predominating—this is sure to be a favourite. Mrs. Bateman, a light lavender, barred with a deeper shade of colour. Sir Robert Napier, a rich dark purple, with a reddish tint, light centre. Beauty of Surrey, light grey mauve, and fine in character. Magnifica, reddish purple barred with red. Velutina purpurea, fine dark violet purple. These are all seedlings, which exhibit very strongly the Languiosa blood in them. There is another class which Mr. Jackman is making progress with, in which the Viticella blood predominates, and in these some striking colours will contrast finely with the lavender and blue already produced. As bedding plants they are very useful; pegged down, cut back closely, and covered with manure, they then shoot out vigorously in the spring, and soon cover the ground. After the first bloom is over the young shoots, which are being continually produced, come into bloom, so that a succession of flowers is constantly enlivening the bed, and the colours of these varieties of Clematis are so unusual in bedding plants that they become doubly valuable. To light up dark foliage, what can be more beautiful than these plants fixed to stakes about 6 feet high, round which cluster on all sides hundreds of the beautiful flowers, varying in colour from light lavender to dark maroon? And how beautiful, too, when they are made to cluster over rustic porticoes or verandahs!

This establishment has long been noted for its collection of hardy plants, especially Coniferae; and on the lawn in the front of Mr. Jackman's new and handsome residence are to be seen many fine specimen plants; beautiful examples of Wellingtonia, Thuja aurea, Cedrus deodara, Taxodium distichum—a drooping form of it, very beautiful, Cupressus macrocarpa, and Abies Nordmanniana, one of the most beautiful of our really hardy Conifers. One of the most curious and beautiful trees to be seen here is a Waterer's Holly. After a heavy fall of snow the branches were broken down, and it suggested itself to Mr. Jackman to leave them thus. They soon began to accommodate themselves to their new position, and now, while the tree itself is about 12 feet high, it measures quite 40 feet round, resting on the ground, and being a dense mass of beautiful variegated foliage. There were many flowering shrubs here, which one does not see so often as they deserve, as Koeleruteria paniculata, with its heads of yellow flowers. The Hibiscus (Althæa frutex), in many fine varieties is here cultivated largely, and this dry season has been peculiarly favourable for the development of its flowers. Some variegated-foliaged plants, such as Acer negundo variegata, are largely grown. By the broad walk leading down from the back of Mr. Jackman's dwelling house to the main road there is a very fine collection of Coniferae, amongst which some of the Irish Yews, on the top of which had been grafted the Golden Yew, had a very beautiful and striking appearance.

Close to the nursery stands the district church of St. John with its neat parsonage; and it added not a little to the interest of my visit to recall that, some years ago, I was a visitor at this little parsonage with a valued friend who is now labouring in a densely populated manufacturing town, and I little thought then that I was so near to the nursery where I was a visitor to-day. Like many of our leading nurserymen Mr. Jackman is foremost in good deeds, and as churchwarden of this rural parish has thrown his energies into the cause. I left the nursery with many pleasing thoughts, and I am sure that any

one desirous of seeing Mr. Jackman's collection of Clematis will meet with the same courtesy that I experienced.—D., Deal.

NOTES AND GLEANINGS.

We are informed that at the meeting of the Royal Horticultural Society's Fruit Committee, on the 6th of October, two prizes, £3 and £2, will be offered for the first and second best collections of Edible Fungi.

—FROM Dr. Hooker's admirable opening address at the meeting of the BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE we extract the following:—

"The greatest botanical discoveries made during the last ten years have been physiological, and I here allude especially to the series of papers on the fertilisation of plants which we owe to Mr. Darwin. You are aware that this distinguished naturalist, after accumulating stores of specimens in geology and zoology during his circumnavigation of the globe with Captain Fitzroy, espoused the doctrine of the continuous evolution of life, and by applying to it the principles of natural selection, evolved his theory of the origin of species. Instead of publishing these views as soon as conceived, he devoted twenty more years to further observation, study, and experiment, with the view of maturing or subverting them. Among the subjects requiring elucidation or verification were many that appertained to botany, but which had been overlooked or misunderstood by botanical writers, and these he set himself to examine vigorously. The first-fruits of his labours was his volume on the 'Fertilisation of Orchids,' undertaken to show that the same plant is never continuously fertilised by its own pollen, and that there are special provisions to favour the crossing of individuals. As his study of the British species advanced, he became so interested in the number, variety, and complexity of the contrivances he met with, that he extended his survey to the whole family; and the result is a work of which it is not too much to say that it has thrown more light upon the structure and functions of the floral organs of this immense and anomalous family of plants than had been shed by the labours of all previous botanical writers. It has, further, opened up entirely new fields of research, and discovered new and important principles that apply to the whole vegetable kingdom. This was followed by his paper on the two well-known forms of the Primrose and Cowslip (*Journal of the Linnean Society of London*, vi., p. 77), popularly known as the pin-eyed and thrum-eyed; these forms he showed to be sexual and complementary; their divers functions being to secure by their mutual action full fertilisation, which he proved could only occur through insect agency. In this paper he established the existence of homomorphic, or legitimate, and heteromorphic, or illegitimate, unions among plants, and details some curious observations in the structure of the pollen. The results of this, perhaps, more than any other of Mr. Darwin's papers, took botanists by surprise, the plants being so familiar, their two forms of flower so well known to every intelligent observer, and his explanation so simple. In myself I felt that my botanical knowledge of these homely plants had been but little deeper than Peter Bell's, to whom

" 'A Primrose by the river's brim
A yellow Primrose was to him,
And,—it was nothing more.'

"Analogous observations on the dimorphism of Flax flowers and their allies (*Journal of the Linnean Society*, vii., 63), formed the subsequent paper, during which he made the wonderful discovery that in the common Flax, the pollen of one form of flower is absolutely impotent when applied to its own stigma, but invariably potent when applied to the stigma of the other form of flower; and yet both pollens and stigmas of the two kinds are utterly undistinguishable under the highest powers of the microscope.

"His third investigation is a very long and laborious one (*Journal of the Linnean Society*, viii., 169), on the common Loosestife (*Lythrum salicaria*), which he showed to be trimorphic; this one species having three kinds of flowers, all annually abundantly produced, and as different as if they belonged to different species; each flower has, further, three kinds of stamen, differing in form and function. We have in this plant, then, six kinds of pollen, of which five at least are essential to complete fertility, and three distinct forms of style. To prove these various differences, and that the co-adaptation of all these stamens and pistils was essential to complete fertility, Mr. Darwin had to institute 18 sets of observations, each consisting of 12 experiments—216 in all. Of the labour, care, and delicacy required to guard such experiments against the possibility of error, those alone can tell who know experimentally how difficult it is to hybridise a large-flowered plant of simple form and structure. The result in this case, and in those of a number of allied plants experimented on at the same time, is what the author's sagacity predicted; the rationale of the whole was demonstrated, and he finally showed, not only how Nature might operate in bringing these complicated modifications into harmonious operation, but how through insect agency she does do this, and why she does it too.

"It is impossible ever to enumerate the many important generalisations that have flowed from these and other papers of Mr. Darwin's on the fertilisation of plants; some that appear to be commonplace at first sight are really the most subtle, and, like many other apparent commonplaces, are what, somehow, never occur to commonplace minds;

as, for instance, that plants with conspicuously coloured flowers, or powerful odours, or honeyed secretions, are fertilised by insects; all with inconspicuous flowers, and especially such as have pendulous anthers, or incoherent pollen, are fertilised by the wind; whence he infers that, before honey-feeding insects existed, the vegetation of our globe could not have been ornamented with bright-coloured flowers, but consisted of such plants as Pines, Oaks, Grapes, Nettles, &c.

"The only other botanical paper of Mr. Darwin's to which I can especially allude is that 'On the Habits and Movements of Climbing Plants' (*Journal of the Linnean Society*, vol. ix., p. 1), which is a most elaborate investigation into the structure, modification, and functions of the various organs by which plants climb, twine, and attach themselves to foreign objects. In this he reviews every family in the vegetable kingdom, and every organ used by any plant for the above purpose. The result places the whole subject in a totally new light before us. The guesses, crude observations, and abortive experiments that had disgraced the writings of previous observers are swept away; organs, structures, and functions of which botanists had no previous knowledge are revealed to them, and the whole investigation is made as clear as it is interesting and instructive.

"The value of these discoveries, which add whole chapters to the principles of botany, is not theoretical only; already the horticulturist and agriculturist have begun to ponder over them, and to recognise in the failure of certain crops the operation of laws that Mr. Darwin first laid down. What Faraday's discoveries are to telegraphy, Mr. Darwin's will assuredly prove to rural economy in its widest sense and most extended application.

"Another instance of successful experiment in Physiological Botany is Mr. Herbert Spencer's observations on the circulation of the sap and formation of wood in plants (*Linnean Transactions*, vol. xxv., p. 405). As is well known, the tissues of our herbs, shrubs, and trees, from the tips of their roots to those of their petals and pistils, are permeated by tubular vessels. The functions of these have been hotly disputed, some physiologists affirming that they convey air, others fluids, others gases, and still others assigning to them far-fetched uses, of a wholly different nature. By a series of admirably-contrived and conducted experiments, Mr. Spencer has not only shown that these vessels are charged at certain seasons of the year with fluid, but that they are intimately connected with the formation of wood. He further investigates the nature of the special tissues concerned in this operation, and shows not merely how they may act, but, to a great extent, how they do act. As this paper will, I believe, be especially alluded to by the President of the Biological Section, I need dwell no further on it here than to quote it as an example of what may be done by an acute observer and experimentalist, versed in physics and chemistry, but, above all, thoroughly instructed in scientific methods.

"Mr. Darwin's recent two volumes 'On Animals and Plants under Domestication,' are a catacomb of data, observations, and experiments, such as assuredly no one but himself could produce. It is hard to say whether it is most remarkable for the number and value of the new facts it discloses, or for its array of small, forgotten, or overlooked observations, neglected by some naturalists, and discarded by others, which, under his mind and eye, prove to be of first-rate scientific importance. An eminent surgeon and physiologist (Mr. James Paget), has remarked to me, *apropos* of these volumes, that they exemplify in a most remarkable manner that power of utilising the waste materials of other scientific men's laboratories, which is a very characteristic feature of their author. As one of those *pieces justificatives* of his previous work, 'The Origin of Species,' which have been waited for so long and impatiently, these volumes will probably have more than their due influence; for the serried ranks of facts in support of his theories which they present may well awe many a timid naturalist into bolting more obnoxious doctrines than that of natural selection.

"It is in this work that Mr. Darwin expounds his new hypothesis of Pangenesis, which certainly correlates, and may prove to contain the rationale of all the phenomena of reproduction and of inheritance. You are aware that every plant or animal commences its more or less independent life as a single cell, from which is developed an organism more or less closely similar to its parent's. One of the most striking examples I can think of is afforded by a species of Begonia, the stalks, leaves, and other parts of which are superficially studded with loosely-attached cells. Any one of those cells, if referred to favourable conditions, will produce a perfect plant, similar to its parent. You may say that these cells have inherited the potentiality to do so; but this is not all, for every plant thus produced in like manner develops on its stalks and leaves myriads of similar cells, endowed with the same property of becoming such in new plants; and so on, apparently interminably. Therefore, the original cell that left the grandparent not only carried with it this so-called potentiality, but multiplied it and distributed it with undiminished power through the other cells the plant itself produced; and so on, for countless generations. What is this potentiality, and how is this power to reproduce thus propagated, so that an organism can, by single cells, multiply itself so rapidly and, within very narrow limits, so surely and so interminably? Mr. Darwin suggests an explanation by assuming that each cell or fragment of a plant (or animal), contains myriads of atoms or gemmules, each of which gemmules he supposes to have been thrown off from the separate cells of the mother plant, the gemmules having the power of multiplication and of circulating throughout the plant; their future development he supposes to depend on their affinity for other partially de-

veloped cells in due order of succession. Gemmules which do not become developed may, according to his hypothesis, be transmitted through many succeeding generations, thus enabling us to understand many remarkable cases of reversion or ataxism. Thus, according to this hypothesis, not only have the normal organs of the body the representative elements of which they consist diffused through all the other parts of the body, but the morbid states of these—as hereditary diseases, malformations, &c.—all actually circulate in the body as morbid gemmules. As with other hypotheses based on the assumed existence of structures and elements that escape our senses, by reason of their minuteness or subtlety, this of Pangenesis will approve itself to some minds and not to others. To some these inconceivably minute circulating gemmules will be as apparent to the mind's eye as the stars of which the Milky Way is composed; others will prefer embodying the idea in such terms as potentiality, a term which conveys no definite impression whatever, and they will like it none the less on this account. Whatever be the scientific value of these gemmules, there is no question but that to Mr. Darwin's enunciation of the doctrine of Pangenesis we owe it, that we have the clearest and most systematic *résumé* of the many wonderful phenomena of reproduction and inheritance that has yet appeared; and against the guarded entertainment of the hypothesis, or speculation if you will, as a means of correlating these phenomena, nothing can be urged in the present state of science. The President of the Linnean Society, a proverbially cautious naturalist, thus well expresses his own ideas of Pangenesis:—"If," he says, "we take into consideration how familiar mathematical signs and symbols make us with numbers and combinations, the actual realisation of which is beyond all human capacity; how inconceivably minute must be those emanations which most powerfully affect our sense of smell and our constitutions; and if, disarding all precautions, we follow Mr. Darwin step by step in applying his suppositions to the facts set before us, we must, I think, admit that they may explain some, and are incompatible with others; and it appears to me that Pangenesis will be admitted by many as a provisional hypothesis, to be further tested, and to be discarded only when a more plausible one shall be brought forward."

POMOLOGICAL GLEANINGS.

THERE is a new Nectarine raised by Mr. Rivers, called ALBERT VICTOR, which belongs to the Stanwick race, and has some resemblance to Victoria, another of his seedlings. We have had fruit of both of these, and the Stanwick flavour is distinctly traceable in both, but the faults of that variety are wanting; there is no cracking of the fruit, or of the stone.

— MESSRS. BUNYARD & SONS, of Maidstone, have sent us a marvellous little Apple, of which they say, "We beg to enclose four specimens of a seedling dessert Apple, which has been in use about a month, and those sent have been gathered three weeks." The flavour is rich and sweet, with the fine high

aroma of a Nonpareil. Such an Apple so early in the season is a great acquisition. The fruit is small, roundish, and russety, with a flush of orange on one side. The flesh tender, very juicy, and richly flavoured. We hope to hear more of this fruit.

— KEEPING FRUIT.—To secure the long-keeping of fruit, a cool and dry atmosphere is indispensable; not so cold as to freeze, nor so dry that the fruit will shrivel. When winter Pears are wanted for the table, they should be brought into a warm place, where, after a few days, they will become fit for eating. Apples will ripen well enough in the cellar. Grapes will keep well where the temperature is favourable to the long-keeping of other fruits. A cool, dry temperature is the

special merit of the patent fruit houses.—(*American Journal of Horticulture*.)

WORK FOR THE WEEK.

KITCHEN GARDEN.

Cauliflowers, examine the plants for next year—namely, those still in the seed beds, those pricked out, and especially the plants from the last sowing. *Kidney Beans*, a quantity of the Early Dun, Cream-coloured, or Speckled Dwarf China, may be sown in pots in a warm place to perfect their produce under the protection of a frame or pit. No more need be sown where the plants cannot have the advantage of fire heat. *Onions* should now be dried and cleared off the ground as soon as possible. The ground should then be well dug, and with the addition of a little dung it will be suitable for the main plantation of spring Cabbages, which had better be put in without much further delay. The last crop of autumn-sown *Onions* may now be put in. *Lettuces*, the last sowing of Brown Dutch is generally made by the middle of this month. They generally keep well through the winter, because they come up slowly, and become stocky during the cool of the autumn. *Mushrooms*, there is little difficulty in procuring *Mushrooms* from this time till May, in houses where a sufficient heat can be commanded, either by a thick covering of fermenting material inside the house, or by flues or hot-water pipes. If in a house with shelves upon the Oldaker system, the depth of the bed must be regulated by the quantity of materials at command, and the period at which the produce is expected. A dung bed of 5 or 6 inches in thickness may be expected to produce for six weeks, and if scarce of material, as soon as the bed has ceased bearing profusely, the top part is removed, fresh droppings added to the depth of 2 or 3 inches, the old and the new mixed together, and the bed spawned, and earthed at the proper time, the same as a fresh bed. It is not of much consequence whether the material of the bed is rather dry or rather wet, only in the first case, after spawning, a covering of wet cow or horse dung is added, and in the second case, the spawn should be wrapped in a handful of dry litter before being inserted. In all shallow beds the earth should be put on after spawning, or as soon as the state of the bed will permit, making the thickness of the earth from 1 to 2½ inches, according to the thickness of the bed, and the time at which it is to produce, as the thinner the covering of earth, the sooner the *Mushrooms* will appear, at the expense, in general, of the solidity of the *Mushroom*, and the permanence of the crop. Both with the in-door and out-door beds the heat should be rather on the decline, and just about milkwarm before spawning, and then, if after earthing-up, the heat should not be sufficient, you may throw what heat you wish into the bed by covering. Before you can remedy too much heat the spawn is worthless. *Spinach*, the Winter *Spinach*, *Onions*, and *Carrots*, sown in rows, should have the ground well stirred between the rows as soon as the surface is dry, after every rain. *Tomatoes* will now require considerable attention in order to ripen the fruit well. Stop the shoots, and cut off the leaves very liberally, so as to expose the fruit fully to the sun. *Watercresses*, these will grow just as well on a damp, shaded border in the kitchen garden as along the brook side, and will be safer for use from such a place than in the natural way, where they are always more or less sown over with the eggs of insects frequenting pools or running streams. Now is the best time to plant slips.

FRUIT GARDEN.

In paying attention to the fruit at this season do not let the trees be forgotten, but take every opportunity of hastening the maturing of the wood. The points of the shoots of *Peach* trees might now be shortened. The shortening of the shoots will cause the buds left to swell better, and unless the trees receive too much assistance at the roots, there will be no danger of the buds then bursting. In extreme cases of luxuriance the stronger roots might be pruned with advantage. The principal operations to which attention is now to be directed, are the protection of *Grapes* and the gathering of fruit. The *Grapes*, which should now be swelling fast, had better be put into small gauze bags to preserve them from the attacks of wasps, which are now troublesome. With regard to the gathering of such fruit as Apples and Pears, great care is necessary to keep them from being bruised. They ought to be handled like eggs, in order to insure their keeping. The time when the fruit is ready for gathering is indicated by its beginning to drop of its own accord from the trees, by its parting freely from the stem on being slightly moved, or if, on cutting open one of the fruits,

the seeds are of a dark brown colour, it is fit for gathering. In performing the operation, however, the fruits should never be shaken from the tree, as is often done, but should be all hand-picked on a dry day. In storing, let them be taken with great care from the basket, and placed where they are to remain, and if possible, let them be arranged side by side, and not placed one upon another.

FLOWER GARDEN.

Having a little room under this head, I shall say something more on *budding and grafting*. Buds of the Rhododendron in the autumn will take as freely as those of the Rose, and it grafts in the open air as freely as the Apple. The only precaution that is necessary in this operation is to take prominent buds from the first growth of this season, as many of the family have made a second growth this year. Variegated *Hollia* may now be grafted and budded with the greatest freedom. The Rhododendron being thin-rinded, it does best by side-grafting, and buds of it also had better be inserted after the manner of side-grafting, with a portion of the soft wood retained behind the bud; all autumn buds may thus be inserted. The following observations may be useful to those little versed in these matters:—Insert autumn grafts as you would buds, leave about an inch of the graft out at the top of the incision, and use the firm part of the summer's growth for the stock. If the bark of the stock be very thin, or if it do not part very freely from the wood, you had better put in the grafts and buds as in side-grafting, cutting out a thin slice and preparing the grafts so as to fit the place; tie rather gently, as the stock is soft, for fear of bruising the bark. If the graft be put in on the north side of the stock it will be more secure from the heat of the sun. The best grafting clay is made by putting a lump of soft clay in the bottom of a small pot, with a little water over it, then stir the clay with a stick until it is rather thicker than paint, and with a small brush, made with strips of matting tied to a little stick, paint over the tying. While the paint is wet dust a little dry sand or soil over it, and when it becomes dry no rain will wash it off, and the sand will keep it from cracking.

GREENHOUSE AND CONSERVATORY.

What a luxury a nice light conservatory is, however small, when attached to part of the sitting-rooms, and what a contrast, too, with the heavy, ill-arranged, old-fashioned greenhouses, only fit to winter half-hardy shrubs for planting out in summer. There are scores of such greenhouses all over the country, which should be pulled down and converted into modern conservatories. With a little judgment the expense need not be much, and the enjoyment and luxury which may thus be obtained will repay all the trouble and expense in a very short time. The greenhouse should now be in thorough repair, and in a clean, sweet condition, as many of the more tender plants must soon be removed in-doors. If the weather continue dry, all the stronger greenhouse plants should be left out as long as possible. This is the time when the advantages of cold pits are most apparent, as the lights can be left off except in rainy or frosty weather; whereas the greenhouse has no such advantage.

STOVE.

Some years ago people used to light fires to ripen off their stove plants about this time, but a better plan prevails now: when the plants have begun growing freely in the spring the heat is increased, and every assistance given to them to make their growth early, so that by this time no ripening of wood or late growth is needed, and the plants are gradually put to rest by the natural decline of our seasons. Plants thus managed should never receive more than 55° of artificial heat in the dead of winter, yet there is no danger if a warm, dry day raises the temperature to 80° or 85°, with a little air. After the stove has been kept dry for some time, as is always done more or less from the end of August, the red spider makes its appearance in some collections in greater numbers than at other times. This is the worst time in the year to permit the ravages of this insect, for if the foliage is now disfigured it must remain an eyesore till next season's growth; therefore, on the first appearance of this evil, apply sulphur to the pipes, &c. See that *Gloxinias* are well ripened before they are set to rest. All woody plants ought now to be done growing in the stove.

PITS AND FRAMES.

Most of the cuttings of *Pelargoniums* will now be fit for potting-off, when potted to be placed in a pit or frame, and kept close and shaded until they have made fresh roots, when they

should be set out in an open situation to grow hardy and stocky before housing them for the winter.—W. KEANE.

DOINGS OF THE LAST WEEK.

We have often read and believed, and yet with all our belief felt an under-current of something like incredulity, of the wondrous transformation in northern latitudes, where the melting of the snow is immediately followed by the rapid growth of vegetation; and of that equally striking change in tropical countries, where, after a glaring cloudless sun has parched-up everything except plants that send their roots deep down after moisture, the earth after the rainy season is covered with the most luxuriant vegetation. This incredulity in the midst of belief is apt to linger in the mind until we can add to the evidence of testimony the evidence of personal observation, thus confirming the old maxim, "that seeing is believing." Perhaps never could we have had better ocular demonstration in our country of the changes effected in other lands by drought and rain, and, therefore, in this respect the faithful delineations of the reports of travellers, though these reports were so different from what we could in general perceive in our moderate and more variable climate. Where all in whole districts seemed merely a burnt-up waste, there is now, to gladden the eye, nothing to be seen but the richest luxuriance.

A fine lesson has also been afforded to us, that in the midst of discouragements and difficulties we ought never to give up, as we never know how soon a beneficial change may come. Meet whom we might for several weeks there was nothing but long faces, and dire forebodings of want and misery as to the coming winter, for even herds of cattle and flocks of sheep would have to be disposed of before then, as there would be nothing to keep them alive, and the only thing cheerful was the hope that we, the superior race, might manage to obtain bread if not much water. Now, what with plenty of sweet autumn grass, Turnips, and Coleseed, though the Turnips should be small, a fair yield of cereals, and an excellent yield of golden Wheat, and the pleasant change in our gardens, we can contemplate the future with feelings that might irradiate the countenances of those who seem to have a pleasure in looking on the dark side of the picture instead of the bright and the cheering.

Even in our ornamental grounds we may look for a fine autumn display. The rains are encouraging free growth now. There is hardly an earthly good, however, without some little alloy to remind us that in all things, though ever aiming at, we rarely reach perfection. Scarlet *Pelargoniums* that were models of splendour and loveliness looked like so many wet rags after the drenching day of the 22nd, and are only now, on this the 5th inst., as fine as they were. *Calceolarias* that stood the dry weather well, had their flowers washed off by the bushel, and it has taken a week or ten days to make them what they were. Many faded blooms having been picked off, the dry sunny days bring on all the beds plenty of fresh flowers; these, with the rich green carpet around them, which no dry weather will now change, will afford a good show for the autumn, and make us thankful that when matters seemed at the worst we did not quite despair, and leave the plants to live or die. We know in some cases where all the water supply was concentrated on the kitchen garden, that the flower gardens, but for the green grass, will be nothing but wrecks.

Even at the risk of being considered reiterative, we must add that the season will have failed to teach a useful lesson if, in places that suffered from a scarcity of water, efforts are not now made to secure a more plentiful supply. We have no doubt that much watering was given so as to yield merely a minimum of good, if not a considerable amount of harm; but still it would have been pleasant to have been able to give more where absolutely needed. For ourselves, even for plants in pots, we should have been in extremity in two or three days, if the rains had not come. Our *Celery* is now looking tolerably well, though short, but it would have been withered or bolted—of bolting it shows no signs—if several times in the hottest weather we had not covered the ground and the plants slightly all over with dry litter. We are very apt to forget these drawbacks when we feel them no more, instead of preparing to meet them. If the past season has a lesson to many gardeners, it is pre-eminently this, "Look to the means of having a good water supply." We are glad, therefore, that Mr. Wills has drawn particular attention to the securing of water, by Mr. Rutland, at Bentley Priory. There are but few places that need be deficient

in water, if means were taken to collect a good portion of that which falls from the atmosphere. On the 19th ult. we saw large streams flowing from full ponds of water, ponds on which farmers chiefly relied for their general supply, and which had been dry for months. On the 22nd we saw streams from such ponds almost sufficient to turn the wheel of a grinding mill. The water that thus ran away did little good, as it found its level, and disappeared in ditches and holes, but saved in double or treble quantity might have been invaluable. With all the benefits to cultivation of large open fields without a tree or a hedgerow, and all the benefits of a thorough drainage of these fields, we may find such work anything but an unmixed advantage, unless we save a portion at least of the drainage water.

KITCHEN GARDEN.

Earthed-up a second piece of Celery, doing it at once after cleaning and tying, as at this early season we have no faith in the bit-by-bit system of earthing-up. When long nights and damp drizzly days come, the whole rationale of the earthing-up is quite different. As already stated, owing to the dryness, our plants will not be so large as usual. Sowed the last Lettuces, Turnips, and Radishes without protection, and Onions for spring. The last will be the best to transplant if the weather be mild. We would still plant out numbers of nice young plants of Endive and Lettuce, but have not had time to fork over the ground carefully, and examine for grubs, and if that is not done it would only be labour lost. About twenty years ago we had an attack of grubs, and after well turning the ground, using tar and ammoniacal water, in winter, we have seen little of these enemies until this season, when the ground seems to be more than usually stored with them, and nothing but constant care will enable us to free it of them, according to the present range of our knowledge.

A second summer has come, the heat being very intense, though less by 10° than what we had lately; but fancy what it would be if the days were longer; and, therefore, we gave a good watering to two plantings of Coleworts, and the two first pieces of Cabbages, and will help other crops with sewage as we find an opportunity. Our piece of spring Cabbages that stood last winter, and has done good service all the summer, we will clear of all bad and yellow leaves as soon as possible, and just leave them on the ground in the way of mulching, so that even more strength may be thrown into the young shoots. These leaves in the hottest weather shaded the young growths, and such are now coming vigorously.

FRUIT GARDEN.

No better weather could be had for gathering the earliest of the fruit. Notwithstanding the dryness of the season, Williams's Bon Chrétien Pear is of large size, and good, and should be had in successions. All Pears and Apples have swelled wonderfully during the last fortnight, and if a change of weather do not come soon, we shall have to gather before they are fully ripe, in order that they may escape the ravages of the wasps. We have gathered large quantities of Plums, which we would have left for ten days, but we knew that without gauze or Nottingham netting we could not keep them. Some of our double hand-lights contain pecks of dead wasps, and when a great number accumulate in the upper glass, we put a small pan of burning sulphur beneath them. Though we may have the right to kill wasps, we have no right to torture them. They have never had a nibble in our orchard houses, owing to the gauze over the openings.

Peaches, &c., on walls are coming in too soon for us. We hope the day is not distant when we shall have orchard houses not merely for forwarding, but for retarding, Peaches and Plums. We think a sngary Coe's Golden Drop Plum might be as great a luxury in November, as a luscious Noblesse Peach in May. After the fruit is fairly set and swelling, we see no difficulty by means of plenty of air and partial shading, or even double glass and shading, in having such fruits under glass six weeks or two months after they are over in the open air on walls, in such a season as this.

Strawberries.—After referring the reader to our remarks in the number for August 20th, we may state that we have filled nearly as many pots as we shall want until the spring is well advanced, and the first potted we shall water with manure water. Treated as previously described, the sides of the ball are supplied with fine large spongioles like crow quills. These will soon divide into myriads of smaller fibres. To have fewer pots to look after we have prepared a piece of ground by digging and enriching it near the surface, and in that we will plant out a number of plants, previously pricked out as before described,

say 5 or 6 inches apart; and as runners can now be had we will most likely plant out a number of them closer together, and these, as we want them, we can raise with balls to force next spring, or to make fresh plantations out of doors where the ground is otherwise occupied or undergoing a process of preparation in winter. From plants so treated and planted with balls in spring, we have had better crops in the first season in stiff soil than from those planted in autumn, unless the latter had been prepared and turned out as good strong plants with balls before the beginning of September. In using such plants planted now for forcing (we have put the above words "next spring" in italics, not without consideration), they will do very well, say after the beginning of March; but for all plants that are to be taken into forcing houses before that time success will greatly depend on having the plants well established in pots, and the buds rather well matured before the middle of October at the latest. Such plants as above alluded to, when taken up with balls, say in the end of February or the beginning of March and onwards, will be better if they receive a little bottom heat, with the tops exposed until the roots are reaching the sides of the pots. After the end of March and the beginning of April, however, such plants with balls do admirably for planting in frames and pits at once, with or without more heat than what the sun gives; and in pits, with full exposure to light, the fruit will be better in flavour than where partially shaded in houses. For this late forcing no plant need be taken that does not show a good fruit bud breaking into a truss.

ORNAMENTAL DEPARTMENT.

As to much of the work we must refer to the remarks for previous weeks.

Amid the potting and pricking-off in-doors, and the blaze of bloom without, there is one drawback, and, perhaps, some readers will assist us in the matter. The pleasure grounds, and the park beyond, are becoming infested with myriads of the large grass mice, and a small one, brown in appearance, with a short tail. The worst of these is that they refuse to touch almost any kind of bait, but sometimes they will nibble poisoned corn, barley meal, &c. A difficulty exists as to these, as pheasants might get at them, however carefully laid down, and the mice and other animals will carry out the poisoned bait. We put the poison as near the centre as possible of small drain tiles, yet even from these it has been carried out, and here is the danger. We have also sunk vessels in the ground with a little water at the bottom, just covered with something tempting. The great difficulty, however, is that the mice confine their depredations chiefly to what is green and growing. They managed to nearly clear for us a belt of *Boule de Feu* Pelargonium, just inside of a belt of *Cineraria maritima*, where it looked well, but as the weather was very dry then, we forgave them, as we thought they would be scarce of moisture. Yesterday, however, we saw the centres of two beds filled with Madame Vaucher white Pelargonium, drooping, and on examination find there is scarcely a plant they have not eaten through just below the surface, whilst dwarf *Scarlets* outside of them are as yet left untouched. The last feather's weight may be too much for the camel's back, and the Pelargoniums thus destroyed in a conspicuous place, would prompt us to show but little mercy to the depredators could we catch or kill them without injuring other things more prized. Can any one help us in this emergency? What they have done to these few beds they may soon do to the whole, and now there is plenty of green food without going to the flower beds. It is rather annoying that these depredations occur now, when we have entered on the glories of a second summer, and when, so far as we recollect, the lawns never looked more beautiful.—R. F.

TRADE CATALOGUES RECEIVED.

Carter & Co., 237 and 238, High Holborn, London, W.C., and Crystal Palace Nursery, Perry Hill, Sydenham.—*Carter's List of Dutch Bulbs, Fruit Trees, Roses, &c.*

Archibald Henderson, Sion Nursery, White Horse Road, Croydon, and College Grounds, North End, Croydon.—*Descriptive Catalogue of Nursery Stock. Descriptive Catalogue of Bulbous and other Roots, &c.*

COVENT GARDEN MARKET.—SEPTEMBER 9.

VEGETABLES have much improved, and prices have receded in consequence of the better supply. Turnips having fallen at least 100 per cent. in a week. Large arrivals have come to hand both by coast and rail.

They chiefly consist of Apples and Pears. Plums are sufficient for the trade, which is now chiefly confined to London and the suburbs. Potatoes remain at former quotations, and are excellent in quality.

TO CORRESPONDENTS.

*. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

REMOVING MANETTI ROSE STOCKS (A. Z.).—"I have just removed Manetti plants worked last year. I bought them in dormant bud. If the wood is not ripe, or tolerably so, you must place a covering over them for a few days, removing it at night. Give them some water, but do not keep the ground in a swampy state. The Manetti roots, with heat and moderate moisture, will strike at once.—W. F. RADCLIFFE."

ORCHARD HOUSE (J. Buars).—If you enclose four postage stamps with your address, and order No. 344 of this Journal, you will find full particulars, and the name of a builder.

GROUND CHALK (Subscriber).—Common whitening pounded and spread over your Vase border will be the same as ground chalk. You can have Brabant's "Modern Peach Pruner" from our office if you enclose forty-four stamps with your address.

SEEDLING PELARGONIUM MANAGEMENT (H. C.).—Your seedlings in 3-inch pots should now be cut down to the fourth joint. They will push strongly, and when the shoots are about an inch long place the plants in 4½-inch pots, and remove them to an airy shelf in a greenhouse from which frost is excluded. Those now in 6-inch pots should also be cut down to four joints, and when they have shoots an inch long shake out the plants and repot them in pots 4½ inches in diameter, placing them on a shelf near the glass in a greenhouse, as above directed. Give an abundance of air in mild weather, and no more water than enough to keep them slowly growing. A close damp atmosphere must be avoided. When the shoots are 3 inches long their points ought to be pinched out, and in February they may be placed in their blooming-pots, 7-inch pots being quite large enough. The plants will grow well in a compost of two-thirds sandy fibrous loam, and one-third leaf mould or sandy peat, with the addition of a fourth of old cow dung or rotten manure, and one-sixth of silver sand. Good drainage is necessary. Training must be early attended to.

GOURDS UNFRUITFUL (Idem).—Your Gourds, most probably, have only produced male flowers instead of all female flowers. If they had been female, as you say, we think some fruit would have swelled, though they would not seed. We are unable to account for the plants not fruiting. Your treatment is proper. You may obtain seeds of the Mistletoe of some friend residing in the localities where it abounds; if not, visit the greengrocers' shops about Christmas, and buy a piece with berries on it.

POTTING BEDDING PELARGONIUMS (Idem).—If you have room you may shift your plants, now in 2½ or 3-inch pots, into 4½-inch pots in October, and in March transfer them to 6-inch pots. That would give you splendid plants, but you will winter them in much less room in the pots they are now in, shifting them in February or March into 4½-inch pots, and six weeks afterwards into 6-inch pots. By attending to stopping they will be fine bushy plants for planting out in May.

RHOODODENDRONS INJURED BY DRY WEATHER (S. Bright).—The Rhododendrons being old we would advise your cutting them back, and you will obtain more dwarf and compact plants, for if left as they are, and the branches are long, the plants will be straggling and irregular in growth. If they are small we would do nothing to them until next April, and then cut away any dead and straggling shoots, so as to form compact bushes.

MANURE FOR ASPARAGUS AND SEA-KALE (Idem).—No manure is equal to seaweed. It may be placed all over the bed after the haulm is cleared off, to the depth of 3 or 4 inches. Failing seaweed, a good dressing, 3 or 4 inches thick, of farmyard manure may be given, the beds being previously cleared of weeds and haulm. Point the soil over with a fork lightly, without injuring the roots or crowns, and throw a little of the old soil from the alleys over the beds. In the case of Sea-kale the above will answer as regards the manuring, but will not be necessary if the plants are forced in the ground by covering with stable manure or hot dung; that is sufficiently enriching. If any other mode of blanching is practised, the Sea-kale may be manured as above. In March the beds should be neatly forked over, the rough manure drawn off into the alleys, the beds raked fine, and the edges straightened. Be careful in forking not to disturb the roots or crowns. A sprinkling of salt should be given in March or April.

SEA-KALE PLANTING (H. T.).—The ground should have a good dressing of manure 3 inches thick, which will be sufficient if the soil is light and sandy, but if heavy it will be well to add an equal thickness of sand and leaf mould, which should be worked into the ground in the process of trenching. Trench 2 feet deep, incorporating the fertilising agents well with the soil. The best time to plant is in autumn, immediately after the foliage decays, or in February or March. Plant in rows 3 feet apart, putting in one-year, and not older than two-year, plants three together in the form of a triangle, the plants 6 inches from each other, so as to allow of their being covered with the blanching pots.

WIREWORMS (Idem).—Lime will not destroy these pests, but a dressing of lime and soot will in most cases drive them away. The best time to apply the lime is in March, and at the rate of 100 bushels per acre. Soot may be applied at the same time, and in similar quantity. It is a good manure, as well as distasteful to most grubs.

PLANTING PANSIES (J. J.).—You may remove the plants with good balls, and plant them in mild weather any time between now and April, but the earlier it is done the better. You can safely plant them from the beginning of October to the middle of November. With your soil there will be no risk in keeping them in the open ground during the winter. We presume the situation is sheltered from cold winds. We should certainly prefer to take up and pot the most choice kinds, keeping the pots plunged to the rims in coal ashes in a cold frame during the winter, and planting out in spring with the ball entire; or you may keep some in pots and grow them to produce exhibition blooms. We do not think blooms from plants in pots are finer than from those planted out, but the plants can be more easily accommodated and attended to, and on that account are by some preferred. The bed you name will answer well, adding some leaf mould and old manure, as the Calceolarias will have taken the "heart" out of the soil. You may give copious supplies of water and weak liquid manure during the blooming season, particularly in dry weather, but avoid strong doses of liquid manure at any time.

PELAGONIUM LEAVES CURLED (Subscriber).—We do not think you have Crystal Palace Gem Pelargonium. The leaves look as if the plant had been overwatered, or as if the soil were too stiff and not well drained, otherwise we cannot account for their curling up.

DESTROYING RED SPIDER (T. J. M.).—Clear soot water and clear sulphur water will be the best liquids for syringing your plants infested with red spider; but in all cases where there is no fruit to injure, you might use soft-soap water, 1 oz. to two gallons, well dissolved and put on at heat of 130°, and then follow next day with the above. The soapy water will also destroy the green fly, and so will smoking with tobacco in a close place. If Cucumbers and Melons in frames are much infested, all you can do will be to prevent them becoming worse. You can hardly extirpate red spider there, because you cannot get under the leaves.

FIRE NOT HEATING WELL (Idem).—A fire 3 feet in depth seems very deep for a house 12 feet square. We think half the depth would have been ample; but if the fire draws so well, it is hardly worth while filling it up. You can regulate the draught by having a close-fitting ashpit door, and giving very little air there after the fire is burning well.

PETUNIAS (C. Barker, Littlehampton).—Among your numerous seedlings several are very fine, both as regards size and substance of flower, and colours and markings. The bellings of several were very bold and distinct, and others were beautifully veined.

VARIETIES (Constant Reader, Summerhill).—You give us no data by which we can arrive at the causes why Pelargoniums and Fuchsias will not flourish in your greenhouse now, when they did so formerly; but as Ferns do flourish, we can only come to the conclusion that you do not give enough of air and light to the flowering plants. The sun leaving the house at 2 p.m. would not cause the flower buds to fall, provided the sun shone on it during other parts of the day, if only for a few hours. Even in Cork, we hardly suppose, mild as the climate is, that you will do much good without a little fire heat; but you could have a small moveable stove in winter, or instead of that, you could open the door from the drawing-room in cold evenings. We have a house in which Pelargoniums stood the most severe nights of the last winter merely by opening the door of the library, in which a fire was kept burning. In two or three very severe nights the door of the room was left open all night. Ferns are very pretty, but we have no doubt in the summer months the Pelargoniums, &c., will do well if duly watered, air given in plenty, and the glass kept clean and unshaded, except a little shading during a very bright forenoon. Your Yorkshire Rose on a trellis, healthy, but yielding no flowers, will most likely produce plenty of bloom next year if you let it alone, or give it the very slightest pruning, merely removing any small twigs, and leaving the most of the shoots of this year's growth at their entire length, or nearly so, just nipping off their points. We would try this before planting a Clematis; but that is good, and might go elsewhere. We would sow the Nierenbergia now if you can keep the young plants from the cold in the winter. If not, then sow in a hotbed next February or March, and harden off before turning out. For seedlings Nierenbergia gracilis is pretty; but for mixing with South Pelargoniums, N. filiculis, which grows from 15 to 18 inches in height, will be the best. Such a mixed

bed will be very pretty. Your Virginian Stock, sown three weeks ago, will bloom at the end of September, in October, and onwards. A portion of it may stand the winter and bloom in spring; but to make sure you had better sow again before the end of September.

WEED AMONG BARLEY (*North Norfolk*).—It is *Myriophyllum verticillatum*, or Whorled Water Milfoil. It demonstrates that the soil requires draining, for it will not grow where there is not excess of moisture in the soil or subsoil. Write to Mr. Rivers, Nurseries, Sawbridgeworth, about the Peach.

MELON SEED GERMINATING IN THE FRUIT (*H. N. O.*).—This is not extraordinary. The same has been observed in Peas and Oranges. There is sufficient oxygen in the juices of the Melon, and the high temperature of the season would tend to promote the sprouting. That the leaflets were green is as easily accounted for. Plants in coal mines are green because free hydrogen is in the air of mines; and the Melon seeds, when germination had commenced, would decompose the water of the Melon's juices, retain the oxygen, and set the hydrogen free.

PROPAGATING VINES BY EYES (*H. W.*).—When the proper time arrives for pruning, preserve the prunings by sticking them in the ground, or in a flower-pot filled with rather moist but not very wet soil. In January or early in February you may prepare the eyes by making on the back of the shoot, opposite the eye, a cut with a sharp knife, bringing the knife out almost three-quarters of an inch below the eye. The same proceeding is to be repeated, bringing the knife out above the eye, and you have an eye with a portion of wood above and below it, and slanting from the back to the side on which the eye is situated. The eyes when prepared are to be inserted in pots or pans filled to within an inch of the rim with turfy light loam, the eyes being placed either horizontally or vertically, about 1½ inch apart, and covered with half an inch of fine soil. They should be placed in a house or frame where there is a hotbed in which they should be plunged, the temperature being not more than 90°, nor less than 75°. The top heat may be from 60° to 65° at night, and 75° by day, and 80° or 85° with sun heat. The soil ought to be kept moist but not wet until the eyes have begun to grow, then keep it moist, affording a light syringing morning and evening. When the eyes have pushed a few inches they may be taken up carefully and potted-off singly, and if kept in a hotbed, and a moist atmosphere is preserved for a time, they will grow freely. The young vines thus produced must be repotted as often as the pots become filled with roots. Give them their last shift about June.

WATERING PEACH TREES IN POTS (*Idem*).—It is hardly possible to over-water Peach trees in pots; but that may happen if the drainage is imperfect. The watering would not cause the fruit to drop. You may pot them when the leaves begin to fall, but unless you wish for large trees, and if they are properly potted in the first instance, they may be kept in the same pots for years with the assistance of frequent top-dressings of rich compost. We presume the plant you have is *Rochea falcata*; if so, and you will state what is your treatment, we will endeavour to assist you.

HEADING-BACK A WALNUT TREE (*Amateur*).—You may head-back the Walnut tree, for that will be your only means of securing a compact head. The best time to do so will be as soon as the leaves have fallen in autumn.

STORING PEARS (*Idem*).—It is best to form the shelves of laths with the edges rounded off. They answer better than boards. There is no necessity to suspend the Beurre Pears, they ripen perfectly and keep well on the shelves. You could not have a better place for your Apples than the cellar, placing them on a thin layer of clean Wheat straw, and covering with the same. We presume frost can be excluded. The Pears should be placed in a room in the light, where there is a temperature of from 40° to 45°, for a few days previous to use. This will improve them both in flavour and appearance.

WINTERING VERBENA VENOSA (*Flora*).—*Verbena venosa* is hardy, and if left out of doors during the winter will come up again in spring, but only in sandy warm soils. It is best to take up a few plants, winter them in a frame, and propagate from them in early spring; or cuttings may be put in now and kept from frost. Young plants grow more freely than old, and make the best plants.

CERATHUS TOMENTOSUS AND VARIEGATED BALM (*Idem*).—Both are best planted in March or April, the young offsets or suckers with a small portion of root being put in about 6 inches apart.

GOLDEN FEATHER PYRETHRUM (*Idem*).—Golden Feverfew is identical. It is probably the best of golden-leaved edging plants. We think it best to sow the seed in the end of August in a frame, pricking off the seedlings, when large enough to handle, about an inch apart in pans, and wintering them in a cold frame. The pans should be plunged in coal ashes to the rim, abundance of air given, and protection from frost afforded. By sowing in spring, and treating like a half-hardy annual, good plants may be had by planting-out time. The seed has been several times advertised in this Journal.

SPEED FOR DESTROYING THISTLES (*W. S.*).—We do not remember the maker's name; but any implement maker or ironmonger dealing in implements would be able to supply you on your naming it to him, or would procure it for you.

PRUNING VINES (*Oronian*).—Do not prune them until the chief part of their leaves have fallen.

METALLIC LABELS (*T. G. S.*).—We do not know the address of the maker. They should be advertised.

FLUELESS STOVE (*H. K.*).—No stove consuming fuel of any kind can be used among plants without great risk of injuring them.

NAMES OF FRUITS (*J. F. L. Dublin*).—1, *Amande d'Été*; 2, *Brown Beurre*; 3, *Comte de Lamy*; 4, *Beurre d'Amanlis*. (*Mrs. Phelps*).—1, *Conseiller de la Cour*; 2, *Not known*. (*Rer. C. J. Marsden*).—1, *Alfriston*; 2, *Rymer*; 3, *Yellow Ingestrie*; 4, *Kerry Pippin*; 5, *Summer Red Calville*; 7, *Norfolk Beefing*; 9, *Scarlet Nonpareil*. We cannot make out the Peach.

NAMES OF PLANTS (*Clermont*).—*Empetrum nigrum*, the Crowberry.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

HARTLEPOOL POULTRY EXHIBITION.

The comment given at page 162 causes me to reply that the Judge there was a gentleman who is fully competent to undertake the duties of judge, and is considered second to none in the north of England in a knowledge of the good qualities of poultry. As I was an exhibitor I took a little interest in looking through the pens before the Judge arrived, and I and another of the fancy marked in the catalogue what we thought would be first and second. I now see in the catalogue that we have only one pen marked in the clergyman's favour, that is pen 123, Rouen Ducks, which was not noticed by the Judge.

I beg to make a few remarks on the classes that the writer showed in. "Game, any other variety." Here he was easily beaten by a splendid Duckwing cock of superior colour. The second prize was given to a Brown Red pen; hens very good, but cock inferior. The commended pen was of Duckwings much better in colour than the clergyman's. In Rouen Ducks I expected to find the clergyman had gained the first prize; but I found after a close inspection that his birds were less in size, and if I remember, their bills were not of good colour. In "Any other variety not named above," the clergyman gained a second prize with a nice pen of French fowls. The first prize went to a good pen of Houdans.

I write to show that I believe justice was done, and no favour shown to any exhibitor, for I believe the Judge had no knowledge of a single bird exhibited. The office of Judge is not pleasant, and he cannot always give satisfaction. I believe poultry are correctly judged nine times out of ten, although losers do not always see this.—R. HAWKINS, *Seaham*.

CRAVEN AGRICULTURAL SOCIETY'S POULTRY SHOW.

(From a Correspondent.)

As regards the number of entries, this was the greatest success which the Society has had. Owing to the Show clashing with that of the Halifax and Calder Vale Society, it was anticipated that the entries would suffer, and the success achieved was therefore all the more encouraging.

The adult *Spanish* and *Game* were of high merit, but the *Dorkings* poor, while the *Cochins* were of average quality. Gold and Silver-pencilled *Hamburgs* were shown in fine feather and condition for the season; but the Gold-spangled do not deserve especial mention. The Silver-spangled cock in the pen shown by Mr. Beldon was of unusual whiteness for an adult bird, and showed his remarkably rich markings to great advantage. The first-prize Black *Hamburg* cock was fine, which is uncommon in this breed, as a great amount of coarseness has crept in of late years. *Polands* were very fine. The *Game Bantams* were bad, except the prize-takers, which were good.

In chickens, the *Spanish* were very fine, and all were highly com-

mended. The winning pens of *Game* were good, but most of the rest had bad feet. Of the *Hamburgs*, several of the best pens were out of condition, probably from being shown too frequently; but the winning pens were also of great merit. Among Black Hamburgs two neat pens won the prizes. The first-prize *Polands* were very young, but beautifully marked, though the second were much larger birds. In the "variety" class *Brahmas* and *Houdans* won the prizes, and an extra second was awarded.

The *Geese*, both *Toulouse* and *White*, were birds of very large frame, fitting occupants of the pens of an agricultural meeting. *Aylesbury Ducks* were large and good, and the first-prize *Rouens* were of extraordinary size. A very perfect *Duck*, but badly matched with a drake, won the second position.

Pigeons were excellent. The Carrier cock shown by Mr. Smith was well worthy of his first position. In *Pouter* cocks a white cock of great size was first. *Pouter* hens were of average merit, both prize birds being *Blues*. *Almond Tumblers* were but poor. The first-prize *Barbs* were good birds, and the hen in the second-prize pen was a neat little bird. The *Jacobins* were of high quality, also the *Mottled Tumblers*. Of the *Rants*, the first-prize pair were fitting companions for the *Geese*. The *Fantails* formed the most extraordinary class in the Show, and four prizes were awarded; but the pens in which they were shown were, unfortunately, too small for them to be seen to advantage. *Antwerps* were next in the list, and these (as has often been suggested), had been divided into Long and Short-faced birds, and the result was that the two classes had thirty-eight entries in all, within one of the number of entries contained in six of the first classes containing *Pouters*, *Carriers*, *Tumblers*, and *Owls*, thus showing the interest taken in this very handsome and useful breed of birds. The "variety" class was well filled. The first prize went to *Trumpeters*, the second to *Turbits*, and the third to *Swallows*, while most of the birds exhibited in the class were commended.

PIGEONS AT BINGLEY POULTRY SHOW.

The entries in nearly all the *Pigeon* classes were very good, amounting to 133 pens. The first and second-prize *Pouter* cocks were very good *Blues*, and in the hen class a magnificent *Blue* hen measuring 19 inches in feather, obtained the first place. The *Carriers* were good. Of *Almonds*, the first-prize pen was remarkably well matched. In *Balds*, *Beards*, or *Mottles*, a splendid pair of *Black Mottles* took the first prize, and a good pen of *Red Mottles* the second prize. In the class for any other variety of *Tumblers*, good *Kites* were first, and *Yellows* second. In the *Barb* class a very good pair of *Reds* obtained the first prize, *Blacks* were second, and *Yellows* third. The winning pen of *Jacobins* consisted of a very fine pair of *Reds*; very rarely has a better pen been seen at any show. Mr. Fielding's three winning pairs of *Owls* were very good. *Blues* were first, and *Whites* second and third. Mr. Horner's three pairs of winning *Trumpeters* were birds of great merit. *Mottles* were first and third, *Blacks* second. The *Fantail* class contained some very fine birds. Among *Turbits*, a splendid pair of *Blacks* was first, and good *Reds* second. In the *Dragon* class a good pair of *Blue-rumps* took the first prize; and in the "Variety" class *Black Swallows* were first, *Yellow-headed Nuns* second, and *Yellow Magpies* third, all being remarkably good.

In the prize list given last week, Mr. W. Cannan should have been first, and Mr. E. Horner second and third, for *Pouter* hens. In the selling class Mr. E. Horner was first and second. Mr. Ridpath was Judge of *Pigeons* and *Rabbits*; Mr. Hartley, of *Colne*, judging *Cage Birds*. Besides Mr. Beldon, Mr. Jesse Thompson, the Secretary, did not compete for prizes.

OLDHAM POULTRY SHOW.

THE second annual Exhibition of Poultry, Pigeons, Cage Birds, and Rabbits was held in the mill of J. Robinson, Esq., North Moor, Oldham, on the 1st and 2nd inst. The following is a list of the awards:—

SPANISH (Black).—First, Messrs. J. & E. Comber, Warrington. Second, W. A. Taylor, Manchester. Third, D. Gellatly, Meikle.
DORKINGS.—First, H. Pickles, jun., Earby. Second, D. Gellatly. Third, E. Ryder, Stockport.
COCHINS (Buff and Cinnamon).—First, W. A. Taylor. Second, E. Brindley, Derby. Third, J. Lee, Middleton. Highly Commended, W. Bamford, Harpurhey; C. Sidgwick. Commended, H. Yardley.
COCHINS (Any variety).—First and Second, J. A. Taylor. Third, W. Bamford.
BRAMA POOTRA.—First, J. Sichel. Second, E. Ryder. Third, H. M. Maynard, Ryde, Isle of Wight. Highly Commended, W. B. Etches, Whitechurch. Commended, E. Leech.
GAME (Black Reds).—Prize, F. J. Astbury, Enfield, Prestwich.
GAME (Brown Reds).—Second, J. Bowness, Newchurch.
GAME (Any other variety).—First, T. Wakefield, Golburn. Second, Green & Sutcliffe, Queensbury, Halifax.
HAMBURGHS (Golden-pencilled).—First, T. Wrigley. Second, S. Lord, Rochdale. Third, R. Ogden. Highly Commended, Miss Wrigley.
HAMBURGHS (Silver-pencilled).—First, T. Sharples. Second, H. Pickles, jun. Third, J. Robinson, Failsforth. Commended, S. Newton.
HAMBURGHS (Golden-spangled).—First, E. Brierley. Second, T. Broadbeat, Delph. Third, J. Buckley, Tannton. Highly Commended, S. & R. Ashton, Mottram. Commended, T. Scholes, Hollinwood.
HAMBURGHS (Silver-spangled).—First, J. Wild, Ashton. Second, J. Fielding, Newchurch. Third, H. Pickles.

HAMBURGHS (Black).—First, C. Sidgwick. Second, Mrs. S. Lancashire, Chadderton. Third, J. Hope, Hollinwood.

POLANDS.—First and Third, P. Unsworth. Second, J. A. Taylor, Manchester.

BANTAMS (Black or Brown Red).—First, J. R. Robinson, Sunderland. Second, J. Hope, Washbrook, Hollinwood. Third, E. Ryder.

BANTAMS (Any other variety).—First and Second, S. & R. Ashton (Black and White). Third, W. A. Taylor.

ANY OTHER VARIETY.—First, C. Layland, Warrington (Honduras). Second, H. M. Maynard. Third, T. Robertshaw, Illingworth.

DUCKS (Aylesbury).—First, S. H. Stott, Rochdale. Second, E. Leech. Third, F. Platt, Oldham.

DUCKS (Rouen).—First, T. Wakefield, Golburn. Second, E. Leech. Third, J. Hope, Washbrook, Hollinwood.

DUCKS (Any other variety).—First and Second, C. W. Brierley. Third, C. N. Baker, Chelsea.

GEES (Any variety).—First, S. H. Stott. Second, E. Leech. Third, W. Golding. Highly Commended, E. Brooks. Commended, A. Broderick.

SELLING CLASS.—First, W. A. Taylor. Second, H. Wilkinson. Third, A. Bamford.

SINGLE COCKS.

SPANISH (Black).—First, W. A. Taylor, Manchester. Second, J. & E. Comber, Warrington.

DORKINGS.—Second, T. Briden, Earby. Third, H. Pickles, jun., Earby.

COCHINS (Buff and Cinnamon).—First, W. A. Taylor. Second, C. Sidgwick, Keighley.

BRAMA POOTRA.—First, E. Leech, Rochdale. Second, J. Sichel, Timperley. Third, H. Maynard, Ryde, Isle of Wight.

GAME (Black Reds).—Prize, C. W. Brierley.

GAME (Brown Reds).—Prize, J. Green & Sutcliffe, Queensbury.

GAME (Any other variety).—Second, T. Robertshaw, Illingworth, Halifax.

HAMBURGHS (Golden-pencilled).—First, Miss Wrigley, Tonge. Second, H. Pickles. Third, T. Wrigley.

HAMBURGHS (Silver-pencilled).—First, T. Sharples, Crawshaw Booth, near Manchester. Second, H. Pickles, jun.

HAMBURGHS (Golden-spangled).—First, J. T. Broadbent, Woodbrow, Delph. Second, R. Simpson, Chadderton. Third, E. Brierley, Heywood. Highly Commended, E. Brierley.

HAMBURGHS (Silver-spangled).—First, H. Pickles, jun. Second, J. A. Taylor. Third, J. Lancashire, Chadderton.

HAMBURGHS (Black).—First, C. Sidgwick. Second, S. Lancashire, Chadderton. Third, J. Robinson.

POLANDS.—First and Second, P. Unsworth, Lewton, Newton-le-Willows.

BANTAMS (Black or Brown Reds).—First, withheld. Second, W. T. Entwistle, Leeds. Third, E. Ryder.

BANTAMS (Any other variety).—First and Third, T. Burgess, Brighonso (Pekin). Second, S. & R. Ashton.

ANY OTHER VARIETY.—First, J. Sichel (Crève-Cœur). Second, H. M. Maynard (Houdan).

PIGEONS.

CARRIERS.—First, H. Yardley, Birmingham. Second, L. Brierley, Manchester.

TUMBLERS.—First and Second, J. Fielding, Rochdale. Third, J. Hawley, Brighouse. Highly Commended, J. Hawley; H. Yardley.

FANTAILS.—First, J. Hawley. Second, H. Yardley. Third, H. M. Maynard.

OWLS.—First and Second, J. Fielding, Rochdale.

BARBS.—First, H. M. Maynard. Second, J. Fielding. Third, H. Yardley.

DRAGONS.—First, J. Robinson, Newton Heath. Second, S. Dronsfield, Oldham. Third, H. Whittle, Newton Heath. Highly Commended, H. Yardley; A. Boote, Crewe.

ANY VARIETY.—First, J. Hawley. Second and Third, H. Yardley.

CANARIES.

BEST CRESTED BREED (Not crested).—First, L. Shaw, Oldham. Second, S. Knight, Oldham. Third, J. Tattersall, Oldham.

LIZARD (Golden-spangled).—First, J. Tattersall. Second, A. Hamer, Oldham. Commended, S. Knight.

LIZARD (Silver-spangled).—First, J. Tattersall. Second, E. Shaw.

CRESTED (Buff).—First, S. Knight. Second, J. Allen, Oldham. Third, E. Shaw. Highly Commended, A. Hamer. Commended, J. Tattersall.

CRESTED (Yellow).—Second, L. Shaw. Third, J. Barlow, Lees.

BELGIAN (Clear Yellow).—First, J. Lees, Hollinwood, near Manchester. Second, Mrs. Lees, Hollinwood. Third, S. Pollitt, Failsforth.

BELGIAN (Clear Buff).—First, J. Lees. Second, Mrs. Lees. Third, E. Crossley, Rochdale. Highly Commended, S. Pollitt.

BELGIAN (Variegated).—Second and Third, J. Tattersall, Oldham.

BRITISH BIRDS.—First, Mrs. Allen, Oldham. Third, J. Tattersall. Commended, J. Kershaw, Oldham. *Larks.*—First, J. Moss, Ansterlands, near Oldham. Second, A. Holden, Oldham. Third, S. Taylor, Saddleworth. Highly Commended, J. Dowson, Hollinwood.

RABBITS.

LOP-EARED.—First, A. H. Easten, Whitby. Second, T. Schofield, jun., Rochdale. Highly Commended, S. Lloyd, Grimby, Oldham; J. Lee, Ashton-under-Lyne.

SILVER-GREY.—First, A. H. Easten. Second, T. Schofield, jun.

ANY OTHER BREED.—First, S. Lloyd (Angula). Second, T. Schofield, jun. Highly Commended, J. Warrington (Angula).

James Dixon, Esq., North Park, Bradford, and Richard Teebay, Esq., Fulwood, Preston, were Judges for *Poultry*; and W. Walker, Esq., Droylesden, for *Cage Birds*.

SOUTHPORT POULTRY SHOW.

THE prize schedule issued by the Manchester and Liverpool Agricultural Society was most liberal, and we should certainly have expected to have found a far greater number of entries for the Show of the 2nd and 3rd inst. than there were. There is, however, just now so large a number of poultry shows taking place within so brief a space of each other, and not unfrequently on the same days, that it is astonishing nearly all continue successful. The birds entered for South-

port were, as a rule, of the highest order, and the condition of the generality of them was exceedingly good. The Duke of Newcastle exhibited half a dozen pens, which were especially remarkable for first-rate condition. The *Cochins* were very excellent, and the competition in the *Brahma* classes was severe. The *Hamburgh* classes proved to be a chief feature of the Exhibition; and for *Turkeys*, *Geese*, and *Ducks* few shows can bear favourable comparison with that held at Southport. The whole show of *Pigeons* was excellent; and its popularity was evidenced by the crowded state of this portion of the showyard immediately it was opened to the public, and the attendance never flagged throughout the whole time the birds were on view. The weather was most favourable.

CHICKENS.

DORKING.—First, J. Stott, Healey, near Rochdale. Second, The Hon. H. W. Fitzwilliam, Wentworth Woodhouse, Rotherham. Third, Duke of Newcastle, Clumber. Highly Commended, Mrs. M. Seamons, Aylesbury. Commended, W. Cople, Eccleston, Pre-est; The Hon. H. W. Fitzwilliam. *Cockerel*.—First and Second, Hon. H. W. Fitzwilliam.

SPANISH—First and Second, M. Farrand, Dalton, near Huddersfield. Third, T. Comber, Myddleton Hall, near Warrington. Highly Commended, T. Comber; W. Paterson, Langholme. Commended, H. Beldon, Goitstock, Bingley. *Cockerel*.—First, T. Comber. Second, M. Farrand. Highly Commended, T. Comber.

COCHIN-CHINA (Buff or Cinnamon).—First and Second, W. A. Taylor, Manchester. Third, C. Sidgwick, Ryddlesden Hall, Keighley. Highly Commended, G. Fell, Springfield, Warrington. *Cockerel*.—First, W. A. Taylor. Second, C. Sidgwick.

COCHIN-CHINA (Brown and Partridge-feathered).—First and Second, W. A. Taylor, Third, E. Tudman, Ash Grove, Whitechurch. Highly Commended, J. K. Fowler, Aylesbury. *Cockerel*.—First, W. A. Taylor. Second, E. A. Tudman. Commended, E. Shaw, Pass Wilmot, Oswestry.

BRAHMA POOTRA.—First, J. Siebel, Lark Hill, Timperley. Second, Duke of Newcastle. Third, J. K. Fowler, Highly Commended, J. H. Pickles, Southport. *Cockerel*.—First, J. K. Fowler. Second, G. H. Roberts, Penwortham, near Preston. Highly Commended, J. Siebel.

GAME (Black-breasted Reds).—First, Duke of Newcastle. Second, J. Halsall, Ince, near Wigan. Third, W. Bonne, Heaviley, Stockport. Highly Commended, J. Holland, Manchester. *Cockerel*.—First, C. Chaloner, Whitwell, Chesterfield. Second, J. Holland.

GAME (Brown and other Reds, except Black-breasted).—First and Second, J. Wood, Wigan. Third, T. Dyson, Halifax. Highly Commended, A. Haslam, Hindley, near Wigan. Commended, J. Holme, Knowsley, Preston. *Cockerel*.—First, W. Bonne. Second, J. Wood. Commended, A. Haslam.

GAME (Any variety except Black-breasted and other Reds).—First, J. Halsall (Duckwing). Second, J. Holland. Third, C. Chaloner. Highly Commended, Duke of Newcastle; J. Halsall. *Cockerel*.—First, C. Chaloner. Second, J. Halsall.

HAMBURGH (Golden-pencilled).—First, H. Beldon. Second, W. Parr, Patricroft, near Manchester. Third, Duke of Sutherland, Truntham. Highly Commended, J. Robinson, Failsworth, near Manchester. *Cockerel*.—First, H. Beldon. Second, W. Parr.

HAMBURGH (Silver-pencilled).—First, H. Beldon. Second, Duke of Sutherland. Third, T. Hanson, Keighley, Yorkshire. Commended, J. Preston, Allerton, near Bradford. *Cockerel*.—First, H. Beldon. Second, T. Hanson.

HAMBURGH (Golden-spangled).—First, J. Chadderton, Hollinwood, near Manchester. Second, T. Scholes, Hollinwood, near Manchester. Third, H. Beldon. Highly Commended, N. Marlor, Denton, near Manchester. *Cockerel*.—First, H. Beldon. Second, N. Marlor. Commended, R. Ellis.

HAMBURGH (Silver-spangled).—First, J. Fielding, Newchurch, Manchester. Second, W. M. Nelson, Glossop. Third, J. Robinson. Commended, H. Beldon. *Cockerel*.—First, M. A. Fielding. Second, H. Beldon.

HAMBURGH (Black).—First, G. Fielding, Newchurch, near Manchester. Second and Third, C. Sidgwick. *Cockerel*.—First, C. Sidgwick. Second, W. Parr.

POLISH (Any variety).—First, H. Beldon. Second, T. Comber. *Cockerel*.—First, H. Beldon. Second, W. A. Taylor.

ANY VARIETY NOT INCLUDED IN THE FOREGOING CLASSES.—First, Hon. H. W. Fitzwilliam (Crève-Cœur). Second, Duke of Newcastle (Hondans). Third, W. A. Taylor (White Cochins). Highly Commended, L. Biney, Manchester (Hondans); J. K. Fowler (Crève-Cœur).

GAME BANTAMS (Black-breasted Reds).—First, W. F. Entwistle, Leeds. Second, J. Crossland, jun., Wakefield, Yorkshire. Third, J. W. Morris, Rochdale. Highly Commended, J. Crossland, jun.; J. W. Morris. Commended, W. F. Entwistle. *Cockerel*.—First and Second, J. W. Morris. Highly Commended, W. F. Entwistle.

GAME BANTAM (Any variety except Black-breasted Reds).—First, T. Dyson (Brown Reds). Second, J. W. Morris (Duckwings). Third, G. Birtwistle, Haslingden (Brown Reds). Commended, J. Holme (Duckwings). *Cockerel*.—First, J. W. Morris. Second, T. Berry, Merridale, Ormskirk (Duckwing).

BANTAM (Any variety except Game).—First, W. H. Tomlinson, Newark-on-Trent (Black). Second, N. Marlor (Black). Third, T. C. Harrison, Hull (Silver-laced). Highly Commended, W. A. Taylor (Black); S. & R. Ashton, Mottram (White).

DUCKINGS (Rouen).—First, T. Wakefield, Golborne, near Newton-le-Willows. Second, J. Wood, Wigan. Third, J. J. Stott. Highly Commended, E. Leech; J. Halsall.

DUCKINGS (White Aylesbury).—First and Third, E. Leech. Second, J. K. Fowler. Highly Commended, E. Leech; M. Seamons.

ANY OTHER VARIETY.—First, T. Wakefield (Brown Call). Second, T. Higby, Winsford, (Black East Indian).

GOSSINGS.—First, E. Blundell, Southport. Second, J. K. Fowler. Third, J. Bryers, Ormskirk. Highly Commended, E. Leech; Rev. J. C. Macdonald, Sefton Rectory, Liverpool; S. H. Stott.

TURKEYS.—First and Second, E. Leech. Third, F. E. Richardson, Framshall, Uttrocher. Highly Commended, M. Kew, Market Overton, Oakham.

PIGEONS.

POUTERS (Any colour).—First and Second, R. Fulton, Deptford.

CARRIERS (Black).—*Cock*.—First and Second, R. Fulton. *Hen*.—First and Second, R. Fulton.

CARRIERS (Any other colour).—*Cock*.—First and Second, R. Fulton. *Hen*.—First and Second, R. Fulton.

CARRIERS (Any colour).—First, R. Fulton. Second, H. Yardley.

DRAGONS.—First, J. Hawley. Second, H. Yardley.

ANTWERPS.—First, H. Yardley. Second, J. Crossland, jun.

JACOBINS (Any colour).—First, J. Thompson, Bingley. Second, T. H. Rildeth, Kisholme, near Manchester.

NUNS.—First, F. Graham, Birkenhead. Second, H. Yardley.

PARES.—First and Second, Capt. H. Heaton, Lower Brington.

TURBITS.—First, J. Fielding, jun. Second, J. Thompson.

OWLS.—First, J. Fielding, jun. Second, F. Graham, Birkenhead.

TRUMPETERS.—First and Second, J. Hawley.

FANTAILS.—First, F. Graham. Second, H. Yardley.

TUMBLERS (Almond).—First, J. Fielding jun. Second, R. Fulton.

BEARDS.—First, J. Fielding, jun. Second, H. Yardley.

BALDS.—First and Second, J. Fielding, jun.

TUMBLERS (Any other variety).—First and Second, R. Fulton.

ANY VARIETY.—First, J. Hawley. Second, H. Yardley.

JUDGES.—*Poultry*: Mr. Edward Hewitt, Sparkbrook, near Birmingham; Mr. Richard Teebay, Fulwood, near Preston; Mr. Joseph Hindson, Barton House, Everton, Liverpool. *Pigeons*: Mr. F. Esquilant, Effra Road, Brixton, London.

WAKEFIELD POULTRY SHOW.

THE West Riding Society's fourth annual Show was held in the Belle Isle Fields, Sandal Road, Wakefield, on the 5th inst. There were upwards of 250 entries of Poultry, Pigeons, and Rabbits, and altogether it was the most successful Show the Society has held.

Game and *Game Bantams* mustered in good force, and both contested stoutly for the cups offered in their respective classes. The *Hamburgh* class contained some excellent birds, the Spangled varieties being far more numerous than the Pencilled. In Gold-pencilled, although Mr. Beldon and Mr. Pickles competed, the first prize for chickens was not awarded.

Pigeons were a good show, Mr. J. Hawley, of Bingley, taking the silver cup for the best pen on the ground.

GAME (Black-breasted or other Reds).—First and Cup, C. W. Brierley, Middleton. Second, E. Aykroyd, Bradford. Highly Commended, H. M. Julian, Hull. *Chickens*.—First, Master G. Crossland, Wakefield. Second, G. Noble, Staincliffe, Batley. Highly Commended, H. Jowett, Idle.

GAME (Brown-breasted Red).—*Chickens*.—First, J. Preston, Allerton, Bradford. Second, H. M. Julian.

GAME (Duckwings, Blues or Greys).—First H. Jowett. Second, H. M. Julian. *Chickens*.—First, W. Fell, Adwalton. Second, R. B. Eiley, Ovenden. Highly Commended, J. Hodgson, Bradford. Commended, F. Sales, Crowle.

ANY OTHER VARIETY.—First, C. W. Brierley. Second, J. Sunderland, Halifax. Highly Commended, E. Noble, Halifax. *Chickens*.—First, H. C. Mason, Drighlington. Second, E. Noble.

GAME BANTAMS.—Cup, Master J. Crossland. Second, G. Noble. Highly Commended, Master J. Crossland; R. Swift, Southwell. Commended, J. J. Cousins, Chapel Allerton; W. F. Entwistle, Leeds.

ANY OTHER VARIETY.—First and Second, Master G. Crossland. Highly Commended, R. Swift, Southwell; G. Noble; R. B. Eiley.

ANY VARIETY EXCEPT GAME.—First, T. Burgess, Brighouse (Pekin). Second, B. Eiley. Commended, Ackroyd & Scott, Sunderland; J. S. Senior, Dewsbury.

HAMBURGHS (Golden-spangled).—First, J. White, Whitley, Netherthorn, Wakefield. Second, H. Beldon, Goitstock, Bingley. Highly Commended, H. Pickles, jun., Early, Skipton; J. White; J. Walker, Knaresborough. *Chickens*.—First, Master E. Crossland. Second, J. White. Commended, J. Walker.

HAMBURGHS Silver-spangled.—First and Cup, H. Beldon. Second, H. Pickles, jun. *Chickens*.—First, J. S. Senior. Second, H. Pickles. Commended, H. Beldon; J. Walker.

HAMBURGHS (Golden-pencilled).—First, H. Beldon. Second, H. Pickles. *Chickens*.—First, Withheld. Second, H. Pickles.

HAMBURGHS (Silver-pencilled).—First, H. Beldon. Second, H. Pickles. *Chickens*.—First, H. Pickles. Second, J. S. Senior. Highly Commended, H. Beldon.

SPANISH.—First, H. Beldon. Second, J. Thresh, Bradford. *Chickens*.—First and Second, M. Farrand, Dalton.

PORKINGS (Any variety).—First, C. W. Brierley, Middleton. Second, J. White, Warlahy, Northallerton. *Chickens*.—First, T. E. Kell, Wetherby. Second, J. Anderson, Meikle.

COCHIN-CHINA (Any variety).—First, C. Sidgwick, Keighley. Second, H. Crossley, Halifax. *Chickens*.—First and Cup, R. E. Brown, Waas, Oswaldkirk. Second, W. A. Taylor, Manchester.

BRAHMA POOTRA (Any variety).—First, E. Leech, Rochdale. Second, J. Walker, Haya Park, Knaresborough. *Chickens*.—First, G. H. Roberts, Preston. Second, E. Leech, Rochdale.

ANY OTHER VARIETY.—First, H. Beldon. Second, H. Pickles.

DUCKS (Aylesbury).—First, E. Leech. Second, H. Crossley.

DUCKS (Rouen).—First, E. Leech. Second, J. White.

GESE.—First, E. Leech. Second, J. White.

EXTRA (Any variety of Poultry).—First, C. W. Brierley, Middleton. Second, C. N. Baker, Chelsea (Gold Pheasants).

PIGEONS.

CARRIERS.—First and Cup, J. Hawley, Bingley. Second, G. H. Roberts. Highly Commended, J. Crossland, Huddersfield; E. Horner, Harewood, Leeds.

DRAGONS.—First, H. Yardley, Birmingham. Second, E. Horner.

POUTERS.—First, E. Horner. Second, J. Hawley.

TRUMPETERS.—First and Second, E. Horner.

BARES.—First, J. Crossland. Second, J. Hawley.

OWLS.—First and Second, J. Fielding, jun., Rochdale.

TURBITS.—First, E. Horner. Second, J. Thompson, Bingley. Highly Commended, J. Thompson; H. Wilson, Thirsk.

FANTAILS.—First, J. Hawley. Second, E. Horner.

JACOBINS.—First, E. Horner. Second, J. Thompson.

NUSS.—First, J. Thompson. Second, E. Horner.
TUMBLERS.—First, J. Fielding, jun. Second, J. Hawley.
ANTWERPS.—First, Master E. Crossland. Second, J. Thompson. Highly Commended, Master E. Crossland; J. Hawley.
ANY OTHER VARIETY.—First, E. Horner. Second, H. Yardley. Highly Commended, E. Horner; J. Thompson.
RABBITS (Any variety).—First and Second, A. H. Easton, Hull (Lop-eared fawns, and Silver Greys). Third, C. Rayson, Prestwich.
JUNGES.—*Poultry:* Mr. J. Douglas, Clumber, and Mr. E. Hutton, Pudsey; *Pigeons:* Mr. T. J. Charlton, Bradford, and Mr. J. Dixon, North Park, Bradford.

KNARESBOROUGH POULTRY SHOW.

This Show improves from year to year, and the Committee seem to be determined to spare no effort to command success. The day on which the Show was held—namely, the 1st inst., was fine throughout, though at intervals the sky threatened heavy rain. The Show eventually proved more successful than any of its predecessors. It was remarkable for the excellence of the Hamburgh classes.

COCHIN-CHINAS.—First, G. Holmes, Great Driffield. Second, W. Lord Starbeck. *Chickens.*—First and Second, W. Lord.

DORRINGS.—First, G. Holmes. Second, C. Triffitt, Cattal. *Chickens.*—First, G. Holmes. Second, A. C. Thompson, Kirby Hall. Highly Commended, C. Triffitt.

SPANISH—First and Second, W. & F. Pickard, Thorne. Highly Commended, W. Bearpark, Ainderby Steeple; G. Holmes. *Chickens.*—First, W. & F. Pickard. Second, G. Holmes. Commended, W. Bearpark; F. Powell, Knareborough.

GAME (Any Description).—First and Highly Commended, J. Watson, Knareborough. Second, G. Holmes. *Chickens.*—First, W. Bearpark. Second, J. Watson. Commended, A. C. Thompson; J. Watson.

HAMBURGHS (Golden-spangled or Pheasant).—First, J. Walker. Second, B. Marshall. Highly Commended, G. Holmes. Commended, C. Triffitt. *Chickens.*—First, J. Walker. Second, B. Marshall. Commended, G. Holmes.

HAMBURGHS (Golden-pencilled).—First, F. Horsman. Second, G. Holmes. *Chickens.*—First, J. Walker. Second, F. Horsman. Commended, A. C. Thompson; G. Holmes.

HAMBURGHS (Silver-spangled or Pheasant).—First, G. Holmes. Second, J. Walker. *Chickens.*—First, G. Holmes. Second, J. Walker. Commended, W. Bearpark.

HAMBURGHS (Silver-pencilled or Chittipratt).—First, H. S. Hardestale. Second, G. Holmes. Highly Commended, J. Walker. *Chickens.*—First, J. Walker. Second, W. Bearpark.

BRAMA POOTRA—First and Commended, F. Powell. Second, J. Walker. *Chickens.*—First and Highly Commended, F. Powell. Second, J. Walker. Commended, F. Powell; J. Walker; S. Rhodes.

GAME BANTAMS (Any variety).—First, G. Holmes. Second, C. Triffitt. Highly Commended, F. Powell; J. Watson. Commended, J. Watson.

BANTAMS (Any variety not before mentioned).—First, G. Holmes. Second, T. Wheatley, York.

GEES—First, J. Walker. Second, G. Holmes.
DUCKS (Aylesbury).—First and Second, C. Triffitt. Highly Commended, G. Holmes.

DUCKS (Any other breed).—First, C. Graham, Boroughbridge. Second, H. S. Hardestale. Highly Commended, J. Walton; G. Sadler.

TURKEYS.—First, J. Walker. Second, C. Triffitt.

GUINEA FOWLS.—First, G. Holmes. Second, M. & R. Gray.

BARNDOR FOWLS.—First, G. Holmes. Second, M. & R. Gray.

EXTRA STOCK.—Commended, J. Walker.

PIGEONS.—*Tumblers.*—First, M. & R. Gray. Second, G. Holmes. Commended, G. Sadler. *Fantails.*—First, M. & R. Gray. Second and Highly Commended, G. Sadler. *Croppers.*—First, G. Sadler. Second, J. Walker. *Jacobins.*—First and Second, G. Sadler. *Carriers.*—First and Second, G. Sadler.

Edward Hewitt, Esq., of Sparkbrook, Birmingham, officiated as Judge.

PIGEON-JUDGING.

I BELIEVE I express the opinion of every fancier, and in general of every exhibitor, when I say that we cannot possibly afford to lose the most valuable services of the greatest of English Pigeon judges, Mr. Harrison Weir, nor those of Dr. Cottle, whose absence from the greatest of English shows last year has been severely felt.

I respectfully suggest to Mr. H. Weir the following plan for judging. In my opinion there is no judge or fancier in existence who admires every variety of Pigeons; we all have our likes and dislikes: therefore I consider it injudicious for any judge to undertake the judging of any variety which he dislikes, as in such a case, never having kept birds of the variety, he would not be sufficiently acquainted with their merits. For example, the author of "Pigeons" is not the judge for Antwerps. What he has written about them proves that he has not discovered their merits, which are invaluable to every fancier, as lately proved in this Journal. I consider that a judge must only judge the varieties he admires, as this being the case, he must have studied them, consequently must know their merits, and can do them justice.

From careful observations I have discovered that in some cases there is too much attention paid to "ill-matched," "worse matched," and "badly matched" pairs, for in certain classes it is impossible to match the birds exactly in colour,

and this being the case, birds of a superior quality have been passed over for those which are inferior, but well matched. In the varieties I allude to quality is a much more valuable property than colour, and should not be sacrificed because there is just a shade of difference between the cock and hen.

I know well that a certain judge says that a certain variety has had enough prizes yearly, and his opinion is that others must have a turn, which is anything but just; and I know that certain judges do not like to patronise too much one variety, otherwise they will be told that they are too partial to it.—A FOREIGNER.

[We have a communication from "A YOUNG FANCIER," from which we extract what follows. We have omitted all he repeats about Mr. Hedley being appointed a third judge of Pigeons "at the eleventh hour" at Birmingham. He was appointed as soon as it was evident that a third judge would be required, and there could be nothing unfair in the proceeding.—Ens.]

"I am well aware that the office of judge is anything but a pleasant one, for two reasons—first, I consider it almost impossible for any man to go through two hundred pens of birds, consisting of nearly all varieties, without making some mistakes; and secondly, that exhibitors' views as to what constitutes a good bird differ in many cases. However good a judge the gentleman may be who is adjudicating, and whatever birds he may have bred, or compared, he cannot please everyone. I hope for the future my own and fellow-fanciers' birds will never meet with worse judgment than they will receive at the hands of Harrison Weir.

"Now, a word to exhibitors. I should be pleased to see judges disqualify all birds either trimmed or dyed, or in which the tail or wing feathers are wanting, and likewise when two cocks or two hens are shown as a pair. Trimming and dyeing are the most paltry tricks a man can practise. An intimate friend of mine purchased about nine months ago two pairs of birds exhibited in the selling class by one of the largest prize-takers of the present day, and, to his utter disgust, when they had been at home about a fortnight they were worthless, so badly had their feathers come up.—A YOUNG FANCIER."

DRAGOONS AND ANTWERPS.

The Dragoons have for many years been kept by English fanciers, with little improvement in them in any way, until Mr. Percivall brought out his matchless Blue-rumps. Most of your readers will remember the handsome pairs of Blue-rumped Dragoons exhibited by him at the Birmingham Show, and deservedly admired by all. Mr. Percivall's strain has not been equalled by any fancier as yet. No show would he complete without a Dragoon class.

Antwerps, as they are called, are useless for exhibition purposes; they are about equal to other mongrels of the Skinnun tribe, and do very well to feed the young of valuable sorts, but I find any other half-bred Pigeon does as well.

To prohibit dealers exhibiting would prevent many good birds from being shown, especially by the wealthy fanciers, who generally buy the prize pens at our shows. Those who cannot afford to compete with the dealer should not try to deprive him of bread.

Mr. Ludlow gives a good description of what a Dragoon should be, but cannot help touching upon the worn-out crotchets that White-rumps are equal to Blue-rumps. Three of the best judges in England have decided that Blue-rumps have the palm, and I believe it is the opinion of most good fanciers.—AN OLD FANCIER, Birmingham.

LEAVE WELL ALONE—ARE BEES CARNIVOROUS?

I HAVE three hives of bees; now, if I thought it advisable, for the sake of better stocks, not for the honey, I would unite some two of the three. I say "not for the honey," because maiden honey in the comb is being offered for sale in Galway at 5d. per lb. I am sure you will agree with me, that whilst I can obtain honey at that price it would be foolish to risk the bees, except for the sake of making the stocks stronger. As they are, they appear healthy and strong. Would you advise me to drive any of the bees?

It is customary with bee-keepers in this and other parts of Ireland to give their bees in winter chickens or birds for food. They pluck the feathers off the fowl; some give it to them

cooked, others raw. All I have spoken to about the matter state that the bees leave nothing but a perfect skeleton. Do you approve of this?—H. C.

[If your three stocks are, as you state, healthy and strong, and you neither wish for their honey nor desire to diminish their number, we should by no means advise you to risk the bees of either of them for the sake of attempting to strengthen one of the others.]

A discussion on the supposed carnivorous propensities of bees took place in our columns during the autumn of 1861. It ended by one of our most valued contributors submitting the alleged fact to the test of actual experiment in a variety of ways, and reporting the result, which was, as might have been expected, that bees can make no use whatever of animal food in any shape or form.]

UNITING BEES.

THE two failures related by "H.," in page 162 of "our Journal," lead me to believe that an article enunciating what I conceive to be the true principles to be observed in order to effect peaceful unions of adult bees, and also describing some of the various modes in which these principles may be put into practice, will not be without interest to apian readers.

In the first place, then, I am so convinced by experience that I think we may lay it down as an axiom, that bees are never more likely to unite peaceably than just after they have been subdued by the operation of being expelled from their hives by driving.

Secondly, That a number of bees presenting themselves peaceably at the entrance of a hive, and, as it were, asking for admittance with vibrating wings are very frequently received without demur, and that the chances of peaceful fraternisation if sought in this manner are much increased when the supplicants present themselves with well-distended honey-bags.

It will be perceived, therefore, that both these conditions were most perfectly fulfilled by the Rev. P. V. M. Filleul, better known, perhaps, to the present generation of readers as "B. & W.," who when writing to the then COTTAGE GARDENER, about eighteen years ago, under the *nom de plume* of "A COUNTRY CURATE," declared that he had found that if the inhabitants of two or more stocks of bees were driven in succession into the same empty hive a peaceful union would be the result. I may, indeed, at once confess that I do not believe that this simple process can be improved upon, and that it is the one which I should myself adopt if I were desirous of uniting the inhabitants of two common hives situated in the same apiary or within a short distance of each other.

Mr. Payne's process, on the other hand, is based entirely on the second of my two propositions. He advises that the bees which have been expelled from a hive by driving should in the evening of the same day be knocked out on a cloth spread on the ground, and the stock to which they are to be united having been placed over them supported on a couple of sticks, it is expected that a peaceful union will be effected by the morning. In this case the houseless bees are just in such a state as to render it likely that they will be favourably received: they are well filled with honey, and we may be very sure that they make their ascent into the inhabited hive with uplifted tails and vibrating wings. I believe that in the majority of cases their advances are well received, the urgently-required shelter being unhesitatingly and ungrudgingly granted to them, and in this case, as Mr. Payne says, "all will be peace and harmony." But unfortunately there is a reverse to this delightful picture, and in far too many instances, as was experienced by "H.," daylight reveals, as I have before stated, a sickening scene of slaughter so extensive as to make it more than doubtful if sufficient bees survive to render the attempted union of the slightest advantage to the stock intended to be benefited thereby.

Some of the various modes in which the principles which I have enunciated may be reduced to practice, will, I think, be best illustrated by describing my proceedings after a bee-driving expedition, which took place on the 27th ult., and which resulted in my bringing home three lots of bees. The first was a large mass of bees, being the entire population of a very strong stock, the second a comparatively small cluster from a weaker colony, and the third the combs and bees of an unfortunate swarm the whole of the combs of which had by some accident been detached from their foundations, and remained when the hive was lifted in a confused heap on the floor-board.

I commenced proceedings the following morning by looking over a frame-hive containing a colony of black bees, the queen of which I captured and placed in a cage which I secured inside an empty box in contact with the crown-board. Putting this box on the old stand, I fixed immediately in front and in close contact with its entrance, a platform consisting of a half-inch plank some 4 feet long by 16 inches wide, upon which I shook and brushed off the bees from the combs of the frame-hive, which as fast as they were cleared I conveyed in-doors out of the reach of robbers, whilst their rightful owners skeddaddled in profound dismay to avail themselves of the cheerless shelter afforded by the empty box, and solace by their presence the captivity of their queen. When all the combs were cleared they were again arranged in their own hive, which was once more replaced on its stand and deepened by a square frame about 2 inches in depth being added above the frames. The cage containing the queen having been transferred to the crown-board of her own hive, all her bees were knocked or brushed out of their temporary refuge on the top of the exposed bars, and the crown-board put in its place. Whilst the confusion thus produced was at its height, I brought out the mass of fallen combs, and separating layer after layer brushed off the bees upon the platform, keeping a bright look-out for the queen. All these houseless strangers rushed with vibrating wings to the nearest shelter, which was, of course, the disturbed hive, where, as I had expected, they were received without opposition, but no queen could I find, and I am disposed to believe that none was present. As soon as this was finished, and the denuded and fragmentary combs conveyed in-doors, I brought out the hive containing the bees from the weak stock, and whilst the rear-guard of their predecessors was still buzzing forth what the Germans call the "swarm-tune," the entire cluster was knocked out amongst them on the platform; the same result partially followed, and the bulk of this second immigration of strangers speedily found their way inside. Still in this case success was evidently not perfectly complete, and finding after some time that a good deal of confusion continued to exist at the entrance whilst many bees obstinately clustered and hung about the platform, I raised the latter and keenly scrutinised the recusants, whose stubborn obstinacy I was inclined to attribute to the presence of a queen. Nor were my anticipations unfounded, for her majesty was almost the first bee that met my view. Attempting to seize her, she eluded my grasp, and taking wing was in an instant out of sight. Her absence under the circumstances was, of course, no loss, and I replaced the platform in the full belief that the truants would speedily betake themselves to the proffered shelter. In this expectation I was, however, doomed to be disappointed, for things remained as before, and finding that no change for the better had taken place, I again lifted and examined the platform and with the like result, for there once more I speedily espied the errant queen. I did not bungle this time, but at once seized her and popped her in at the top of the hive. The change that ensued was almost instantaneous—confusion was at an end, and the platform being replaced the former recusants at once set up the "swarm-tune," and in joyful procession marched directly into their new home. Next morning I examined the hive and finding a fine queen at liberty therein, I removed the captive but rightful monarch and left the usurper in the enjoyment of the sovereignty which she had won. I should add, that this union of the inhabitants of three colonies was most successful, not more than a score or two of bees being lost in effecting it.

The large body of bees which I had secured from the strong stock were manipulated in a somewhat different manner. In this case the queen had been removed some days previously from the stock to which they were to be united, and I commenced proceedings by standing the straw hive containing the new comers in the place of the queenless colony, erecting the platform which I have before described immediately in front of it. Upon this I shook and brushed off all the bees from the combs of the removed stock, eradicating every royal cell during the operation, and conveying the combs in-doors. Having then replaced them in their hive and deepened the latter by the addition of an empty box above the bars, I returned it to its place and knocked down into it the now conjoined cluster of bees, putting on the crown-board immediately, and leaving it undisturbed for the rest of the day. Next morning I lifted off the upper box and was rather surprised to find that it contained the great bulk of the bees, comparatively few having congregated among the combs in the lower hive. Having put a shallow wooden frame on the top of the latter, I cautiously

lifted the crown-board from the box, thinking to transfer it with the adhering cluster of bees to the hive itself; when lo, just as I had raised it a few inches the entire cluster became detached and fell in a mass to the ground! Many would, doubtless, be somewhat nonplussed at such an accident, but I was too old a hand to be much disconcerted, so after putting on the crown-board with such bees as still adhered to it, I merely covered the cluster on the ground with an empty box propped up on one side, and turned my attention to other matters. Numbers of bees at once took wing and flew to the mouth of the hive, and on returning in about half an hour I found that the remainder had sought refuge within the empty box whence they were speedily shaken into their own hive on the top of the bars, and the crown-board being replaced this apparently formidable mishap was rectified with but little trouble and no appreciable loss of life. The entire operation was indeed very successful, although there was rather more quarrelling than in the former case, and in the whole from one hundred to two hundred bees might probably have been killed.—A DEVONSHIRE BEE-KEEPER.

IMPRESSED WAXEN SHEETS.

In reply to the inquiries of "Apis," in page 161, I last year used embossed wax sheets in frames largely, and with uniform success when care was taken to hang them by their thickest edge, failing which they are apt to break down, especially with a new swarm. The combs are built much more rapidly, and on several occasions queenless stocks were compelled to build worker comb instead of drone. In supers partly fitted with sheets and partly with guide comb, I found the bees, however, pertinaciously reject the sheets and build from the comb, causing much irregularity and delay. I therefore this year used nothing but guide comb in the top supers; but when they were well advanced introduced intermediate supers fitted with wax sheets, on which the bees at once fastened, and filled the supers very rapidly.

The expense is, however, a great objection, the makers charging 6d. a-piece for the sheets; considering which, and the fact that the bees always reduce the thickness of the sheet very greatly as they build, it struck me that the embossing was a superfluity, and I therefore resolved to try the effect of plain unstamped sheets. This I have done all the present season, using plain and stamped sheets in the same hives, and I find that the latter are in no respect superior to the former, whilst the plain sheets have the advantage of considerably greater strength, as the embossed ones are apt to crack if not very carefully handled. They are easily made as follows:—Procure a tin kettle without a lid, like a narrow fish kettle; mine, larger than necessary, is 2 inches wide at the top, 4 inches wide at the bottom, 16 inches long, and 12 inches deep. Fill it with water to within 3 inches of the top, and melt a pound or two of wax in it. Have a piece of thin smooth board, mine is 20 inches by 12, and three-eighths of an inch thick; soak it in a flat-bottomed sponge bath for half an hour, dip it endwise into the kettle of wax, and withdraw it rapidly. If you wish the sheets thick (I prefer them about one-sixteenth of an inch), dip again. The wax sheets will peel off easily and unbroken. Cool the board in the bath, dip again the other end of the board, letting the first-used end cool, and so on, using either end alternately. The thickness of molten wax must not be diminished to less than one-quarter of an inch, or it will fail to adhere evenly to the board. Instead of a board, a piece of glass dusted with whitening may be used, but I prefer the board. The sheets are thus produced for the value of the wax, about 1d. each.

With respect to the use of narrowed communications between hive and super, I have adopted them this season, and find no inconvenience whatever in consequence; so that in future I shall never put on a super without such a protection. My plan is to take a common Woodbury adapter, and divide each side slit into two by a longitudinal bar about one-quarter of an inch thick, thus leaving in each slit two passages three-sixteenths wide; the adapter thus guarded, I generally place with the slits across the hive instead of at the sides.—*APICOLA, Murraythwaite, N.B.*

MANAGEMENT OF FERRETS.—No. 3.

THE Ferrets may be taken from the mother at any time after they are two months old, as they will then be able to take care of themselves. I have one Ferret that was most amusing with her family. She is now too old to breed. Her anxiety

consisted in keeping her family in the nest; she would drag them in one by one, making them squeak all the time. No sooner had she put one back than out she would run and seize another. Of course they would not stay there, and I have seen her do this for a long time. The same Ferret was once taken to a neighbouring farm on a hunting expedition. I suppose she was not very closely watched, for she came home alone, walked under her hutch, and waited for some one to put her in. I find Ferrets can go back to a place where they have been kept, if not too far. Mine are very gentle, and will play with my children without ever showing a tendency to bite. They will let a child two years of age play with them. I believe they detect a stranger, for I have seen them look timid when one approaches.

After the young are removed the old one should still have milk or water. Keeping them without drink is very cruel. One of my children had one given him, because it was so spiteful. The owner never gave it drink. My boy gave it milk, petted it, and it became so gentle, that it would follow him anywhere, gambol about his feet like a playful kitten, and run all over him; it was never spiteful afterwards. So much depends on treatment.—*L. B.*

MY DOGS.

(Continued from page 69.)

OUR hearts—that is, the dog-loving part of them, a very warm part—were sore for a long time after the death of old Keeper; so sore that we could not think of a successor. It sufficed for us to talk of his good deeds, and to point to his picture, with "Poor old fellow!" or "Dear old fellow!" or similar expressions of affection. But we were not let alone in our grief. Other suitors to our favour came, or rather were brought. The old dog had been a hero; he had been pointed to in the streets as the dog who had won such and such a battle—just as, I fear, a retired pugilist has a number of admiring eyes fixed upon him by a number of very indifferent characters. So it had been with Keeper. Hence when the grand old hero with the many scars on his face was missed from the streets and lanes of the town, it was naturally thought by persons interested in the sale of dogs that we should wish for a successor of the same breed. So sundry "bankers,"—afterwards called "navvies" when the railways came to be made, but before that era employed to make and repair the embankments which kept out the Wash—sundry of these gentlemen made their appearance, and a pretty appearance they themselves had. You all remember Bill Sykes of one of Dickens's tales. The bankers were so many Bill Sykeses. They wore stout laced boots, speckled worsted stockings, corduroy breeches, and very full-pocketed fustian shooting jackets; their necks encircled by a red handkerchief, and above that decidedly unprepossessing figureheads, close-shaven, and not unfrequently a long curl on each side hanging between the ear and the eye, and the creature crowned by a flattened wideawake. Many pairs of such gentry found their way into the old surgery. Mysteriously did they shut the door—I mean with a mysterious air, leaving a couple of friends or more outside, probably in fear lest the dear lambs should come to harm. Out of the huge pockets were brought divers blind and shuddering bull pups, which the mother eyed from behind the thick boots fondly yet jealously. The one dear lamb began with the invariable "My mate Bill," here he jerked his thumb towards Bill, who acknowledged the words with an understanding grunt, "heard a chap say as he heard you was in want of a dawg." I need hardly add that we declined the "dawg." Weloathed the thought of a second edition bound in rough of our old hero; and so our favour was sought, but sought in vain.

At length time, the great healer of broken hearts, healed ours. Have you never known a widow who was wont to gaze at the likeness of her dear deceased, and talk of his merits often and long? She was besieged by suitors, but in vain. At last a handsome stranger quite unlike her late spouse comes on the stage; and the widow's parlour-maid declares in the kitchen that "she just now went suddenly (by mistake, of course), into the drawing-room," the handsome stranger being there, "and missus's face was as red as a beetroot, and her cap was the least bit on one side." This is an odd metaphor for us (I speak this once in the dignified plural), to use, as we were ever guiltless even of a nightcap.

Well, the handsome stranger who won our hearts was a young liver-and-white spaniel from "the high country," as feamen call it, though Northamptonshire is not very high either.

My young eyes glistened. I was a very young boy then, and I fell in love head over heels with the handsome stranger, and begged hard that I might have the dog; so after some bargaining the dog was ours. But what was his name? That had been forgotten by the man who brought him into the fens, but he promised he would inquire the next time he went to the high country. Meanwhile at a venture we named him "Rockwood," and Rockwood became the dog of my early boyhood, as old Keeper had been of my little childhood. Have you ever marked carefully, gentle reader, those nice minute gradations in life? First the unknowing infant; but how soon it begins "to take notice," to use a common but very suitable expression. The little child learns very early to smile. As Wordsworth says—

"On its face
Smiles are beginning, like the beams of dawn,
To shoot and circulate.
Feelers of love put forth, as if to explore
This untried world, and to prepare its way
Through a strait passage intricate and dim."

After the infant, then the little child, obedient, trusting, trusting every one; but bigger children overawe it. In play with them it gets confused, upset in mind, overwrought in nerve, and leaves them for its mother's lap. It is a manifold little thing in its home and its garden, but a few hundred yards away it becomes a baby again. Then comes playful, ever-playing young boyhood. All life is a play, a very play then. Bats, balls, tops, strings littered about; doors slammed; the feet always run, for they cannot merely walk; noise, noise; rushing hither and thither pell-mell. This is the grand play-time of life, when the meals are shortened in order to get out the earlier to play; not the sprucest neatest time—far from it—nails, and hands, and face too, not over-clean; clothes torn. What boy thinks of his breeches when he sees a bird's nest?

During all my early boyhood, this playtime of life, Rockwood was my prime playfellow. Like many handsome strangers, as widows of the cap-on-one-side school often find when the cap is put quite aside, he had not much brains, but he could hunt through the hedges—there were a few, drive out the birds from their nests on the side of the fen drains; and then, more than all, he could play cricket, and, best of all, he was always on my side. This is how it came to pass: Four houses from ours (each house had a paddock at the back), lived my prime school friends, four in number, all brothers. They were sons of a Waterloo officer, and therefore smitten with a perpetual scarlet fever. Every Saturday afternoon away I and Rockwood went for a game of cricket. But home-made, stumps ditto, ball oblong—never mind, we enjoyed the game just as much as the gentlemen players at Lord's, and a great deal more than the tired professionals, who must long for the winter to begin in August. The sight of a cricket ball acted upon Rockwood as does a gun upon a pointer. I bowled, Rockwood fielded, and with the speed of a racehorse he brought the ball to my feet; so together we were a formidable pair. But when I was batting Rockwood declined to field, knowing "his side was in." He therefore rested near, seeing how the game went on, extending his handsome form on the grass until I was again on the "out" side. Oh, those Saturday afternoons! those scramblings from paddock to paddock, Rockwood galloping by my side! Oh, those jolly games of cricket! I have often played since; I stand to a wicket still; but now I have a backbone, boys have none.

Time which will go on—time which usually will also separate friends, separated me from mine. Two of the four went into the army, and, alas! both have long since slept beneath the sun-parched plains of Bengal, one of them a victim to the Indian mutiny. The third I have not seen these twenty years and more. The fourth I meet now and then, the "now" separated a long way from the "then;" but when we do meet we shake hands as only old schoolboy friends know how. When we do meet, then we talk the old talk—open, free, generous, kindly; then we bring the past years and faces before us; then among other questions he put this, "Have you forgotten Rockwood?" Oh! the pleasure of having old, old friends—friends who grew up with you, whose life's associations are blended with yours, who met you not the first time in stiff heart-freezing manhood, but in open-hearted boyhood. Yet let not this thought deter us from making new friends, for they in turn will become old friends. We must go on in the battle of life. "Forward!" is the word; then let me go on shoulder to shoulder with friends new and old, old and new. "Have you forgotten Rockwood?" How much that little question brings to my mind!—the Saturday afternoon holidays, the glee, the high spirits,

the cricket, and the old school friends who joined in the game. What! is the paper suffused with a mist? or is aught wrong with my eyes?—WILTSHIRE RECTOR.

(To be continued.)

OUR LETTER BOX.

GAME FOWLS.—"Absence from home has been the cause of my not replying to 'NEWMARKET'S' paragraph in the Journal of August 27th. In reply, what I advertised was a quotation from 'NEWMARKET'S' letter. I have also letters by me respecting the birds. The following are extracts:—"Good and handsome fowls." "Will breed the richest colours." "Are the handsomest bens in this place." "These birds are really good and are dirt cheap." Any one is welcome to see the correspondence who may be thus interested.—WILLIAM H. WHEELER." [Here this controversy must cease.—EDS.]

BRABMA POOTRAS SELF-PLUCKING (Brahma).—Fowls are prone to eat the feathers from each other's legs at this time of year if they are confined. They seldom do it when at liberty. It arises from a morbid state of appetite, and this is more benefited by an ample supply of lettuce than by anything else. If they have no grass run give them large sods of growing grass, eat with plenty of earth. Legs stripped of their feathers in any way will disqualify Brahmas and Cochins.

WHITE SPANISH AND WHITE MINORCAS (Subscriber).—White Spanish fowls should have white faces. Minorcas have red faces.

FOOD FOR MOULTING HENS—MARKS OF AGE (A. E.).—Ground oats are the best food for poultry at all times. Growing green meat is good for them when moulting. Indian corn, rice, and vegetables are all bad, except as amusements and for a change. They require better food when moulting than at other times, but it should not be of a stimulating nature. After a fowl has once passed from the chicken to the adult state there are no means of ascertaining the age with certainty. The most experienced are often deceived.

HEN'S FLESH SPOTTED (Warwick).—We cannot account for the white spots. We have seen them many times in our lives, and if the fowl were in other respects in good condition, we should consider it fit for food.

LENGTH OF LOF EARS IN RABBITS (Rabbit Fancier).—The length you speak of is a hereditary quality. The length may be increased by a judicious system of pulling, and by suspending leaden weights to the extremities. If, however, it is not in the breed to reach extreme length such as you desire, no management will effect it.

BUCKWHEAT AND APPLES FOR POULTRY (E. A. S.).—We have tried buckwheat, but our fowls neither liked it nor did well upon it. We do not consider any of the oily foods good for chickens. We think apples good for fowls, but we always give them raw. They make a change, and the birds are very partial to them.

POINTS OF HOUDEANS (Gallina Bankiva).—The few reddish brown spots are not a disqualification. They are not desirable. In all these breeds the cocks acquire colour as they increase in age. The same rule applies to the Houdan and Crève-Cœur; yellow or light straw-coloured feathers are admissible, red ones are a disqualification. The convex back is fatal to success unless it be so trifling as to escape notice. If the crest feathers are pulled out, the feathers will grow again at once; if they are broken off they will not grow till the bird moults.

REJECTED FOWLS (Fair Play).—The "person near Longton, Staffordshire" certainly treated you very unfairly. If your man turned the pullets out, and they were both then sound, he should not have brought it back, for the injury was inflicted in some way on the purchaser's premises. As it was taken back, and as you afterwards received the other pullet, we think you have no remedy. The proposing purchaser would act no more than equitably if he paid the expenses you incurred.

GOLDEN PHEASANTS ON A LAWN (E. E. K.).—It will do your Golden Pheasant good to feed always on the lawn. Pheasants never do so well as when kept on grass.

WHAT IS A PEN AND WALK OF POULTRY? (J. Smith).—The pen depends on the decision of a show committee. In some places the prize is offered for the best pen of —, containing cock and three hens; others require cock and two hens; others cock and one. There is no fixed number. A "walk" formerly consisted of a cock and four hens.

OLD AND YOUNG CANARIES TOGETHER (T. C. H.).—"I usually put all my breeding hens into a large flight-cage for the winter. My old breeding cocks I put into separate cages, and the same with those young ones which bid fair to moult into something good. When they will agree and do not show any disposition to attack each other, I put two together, but where there is plenty of cage room a separate compartment is best.—W. A. BLAISTON."

BEE HIVES (E. Pater).—You will find engravings and descriptions of hives in "Bee-keeping for the Many," which you can have free by post from our office for five postage stamps.

LECTURE ON BEE-KEEPING.—We have received a copy of a little, a very little pamphlet, which is stated to contain the substance of a lecture on this interesting subject, delivered on the 7th ultimo by the Rev. J. B. Hughes, of Tiverton, Devon, at the Cottage Garden Show held on that day, at Dulverton, in the neighbouring county of Somerset. The rev. gentleman appears to have judiciously eschewed the more recondite mysteries of bee-keeping, and to have confined himself to pointing out the advantages which every bee-keeper may realise by the use of suvers, and recommending the autumnal union of bees by means of driving, instead of pitilessly consigning them to the brimstone pit.

SWARMING FROM SUPERED HIVE (A Reader).—It may be laid down as a general rule, that if a supered stock swarms the super becomes deserted, and that no more honey will be deposited in it. Your bees, therefore, were no exception to the rule. You should weigh the hive and judge for yourself whether it requires feeding. It would, we think, be well to unite the weak swarm to the parent stock, which, if properly done, may be accomplished without much risk of a quarrel. Read Mr. Woodbury's article on "Uniting Bees," in another column.

TOMATO JAM.—"T. W. W." would be obliged if "LOVEAPPLE" would make public the receipt for making tomato jam.

WEEKLY CALENDAR.

Day of Month	Day of Week.	SEPTEMBER 17-23, 1868.	Average Temperature near London.			Rain in last 41 years.	Sun Rises.	Sun Sets.	Moon Rises.	Moon Sets.	Moon's Age.	Clock after Sun.	Day of Year

From observations taken near London during the last forty-one years, the average day temperature of the week is 67.3°; and its night temperature 45.3°. The greatest heat was 84°, on the 17th, 1813; and the lowest cold 23°, on the 17th, 1810. The greatest fall of rain was 1.21 inch.

PEACH CULTIVATION.—No. 2.

IN cold situations, but not unsuitable for the growth of the Peach on walls, it may be desirable to plant the hardiest kinds; for in the case of the Peach, as with every other kind of fruit, there are degrees of hardiness. The hardiest Peaches seem to me to be the following—viz., Mountaineer, the fruit of which is sometimes partly smooth, flesh melting, ripe about the beginning of September; Violette Hâtive, large and good, ripe in September, the hardiest of all Peaches, and which, having a good constitution, succeeds where others do not; Early York; Malta; Barrington, and Chancellor.

From the list of twelve varieties I have left out Early Grosse Mignonne, finding Early York much larger and finer; indeed it is fully as large and fine as the September Peaches, and cannot be too highly praised, as it is of a splendid colour, firm, but melting and juicy. If the Sulhampstead supersedes, as I believe it will, the Noblesse for walls, the Dymond, a large, very fine, and good-flavoured sort may be added to the first twelve in place of the Noblesse. Dymond is ripe from the middle to the end of August. The old Red Magdalen, or Madeleine de Courson, owing to its being tender, I have omitted. It is, however, one of the best-flavoured Peaches, medium-sized, and handsome. I have seen it die off against a wall where other varieties succeeded, and it appears to be of the same type as the Royal George, Royal Charlotte, and, I think, Early York; all being subject to mildew, and occasionally producing smooth-skinned fruit, though in general very downy. All are highly coloured, and roundish or globular, flattened at the base.

The NECTARINE requires the same cultivation as the Peach. The best Nectarines for walls are:—

Rivers's Orange, large, melting; the flowers are splendid, well worth growing for decorative purposes. It ripens a few days earlier than Pitmaston Orange, its parent, and is harder, and a great bearer.

Elruge, medium-sized, juicy, and of good flavour. End of August and beginning of September. It is an abundant bearer.

Violette Hâtive, medium-sized, melting, juicy, and excellent. End of August and beginning of September.

Hardwicke, large, juicy, and rich-flavoured. End of August and beginning of September.

Pitmaston Orange, large and excellent. September.

Balgowan, large, melting, and fine-flavoured. September.

All these are of good constitution, and hardy. Three of the best varieties are Rivers's Orange, Violette Hâtive, and Hardwicke. For one variety I would select Violette Hâtive.

Hunt's Tawny is evidently of bad constitution, being very subject to aphid and mildew, otherwise it is early, but mealy, and not rich in flavour.

New White is large and good, but does not succeed against a wall, except in warm situations.

Peterborough, or Vermash, is the only Nectarine ripening in October, but that is its only recommendation.

Early Newington is large, and of excellent flavour. It is a cling-stone, ripens in September, and should be left on the tree until it is slightly shrivelled. It is then very rich.

SOIL.—There is a prevailing opinion that strong soils

No. 890.—VOL. XV., NEW SERIES.

are the best for the Peach. This, I am convinced, is a mistake. Heavy clay soils are as unfavourable as poor sandy soils, if not more so. The latter can be improved by the addition of cool manure and adhesive compost, so that the liability of the tree to curl and aphid in spring, and to red spider in summer, may to a great extent be avoided; but heavy clay soils have such a tendency to cause late growth, and to encourage the production of shoots which do not become thoroughly ripened, that a Peach tree ought not to be planted in them for out-door cultivation. The best soil for the Peach against a wall is a calcareous sandy rather than heavy leam, and yellow rather than black. All soils, however, are not of that description, neither are subsoils the same. The latter must first engage our attention.

If the subsoil is wet the ground must be well and efficiently drained, so as to carry off all water that would become stagnant in the soil, otherwise the trees will make a poor growth in spring from the coldness of the soil, and the injury the roots sustain in winter; and owing to the moisture in summer, the trees will grow rapidly, but late, so that the shoots will be imperfectly ripened. They will in consequence be liable to die off at the points, and the roots drawing vitiated watery nutriment from the soil, the trees cannot be otherwise than unhealthy. Besides, it is a mistake to plant a Peach tree on the Plum stock in a wet soil, for the Plum does not thrive in such, and the stock will become unhealthy. Wet soils should not only have drains with a proper fall and outlet, but the drains should be not less than 3 feet deep, for it is not the surface water but that passing from the surface to the subsoil that requires to be taken off. If no drain can be made on account of there being no fall or outlet, then the border must be raised; it is better to take from the height of the wall than to plant in ground wholly unsuitable.

Some subsoils are extremely dry. In soils resting on a subsoil of gravel the trees are apt to be injured in hot weather. When there is an excessive evaporation from the leaves, and the roots do not supply moisture sufficient for their requirements, there is a drawing from the tree itself to supply the deficiency; mildew appears on the young shoots and fruit; if not that, red spider attacks the trees with a determination requiring the syringe to be almost constantly at work to keep it under. Draining gravelly soils is of no use unless there is water in the gravel, which is rare. Some sandy soils, however, have quite as much if not more water in the subsoil than clay soils, and must therefore be drained. If there is nothing but a dry gravelly subsoil, it will be necessary to take out the soil, or some part of it, and make a proper border 2 feet 6 inches deep. A light as well as a gravelly soil may in most cases be made excellent by putting on a dressing of heavy loam, clay, or marl in autumn, before frost, 6 inches thick, and after the first frost digging it in and mixing it with the old soil. This will make the soil more retentive of moisture, and the trees will not suffer from drought nearly so much as they would otherwise do; and in March a top-dressing of cow dung, 3 inches thick, should be given, and pointed in with a fork. When the

No. 1042.—VOL. XL., OLD SERIES.

ground becomes dry tread it firm, and give a top-dressing of cow dung or littery stable manure to the depth of 2 inches, and do not crop the border, but keep the surface firm, and enriched with good surface-dressings of rich compost. Turf taken from a pasture where the soil is a good loam, laid up for six months in alternate layers with cow dung, will form an excellent top-dressing. The deficiency of light soils in respect to openness and dryness must be counteracted by rendering them more firm, and affording top-dressings of cool composts retentive of moisture.

If the soil is naturally a good, friable, yellow or hazel loam, all that will be required will be to drain it effectually, trench it to the depth of 2½ or 3 feet, and work in a liberal quantity of manure, 3 or 4 inches in thickness being a good dressing. Almost any good fresh soil will grow the Peach, but soils that are from long cropping worn out, by adding fresh soil, turning the top soil to the bottom of the trenches, and bringing the bottom to the top, may often be made as suitable as they were before unsuitable, and the trees will become as vigorous as they were dwindling when the exhausted black soil was at top. Old borders long occupied by Peach trees are not suitable for planting fresh trees. The soil must be changed, or a considerable quantity of fresh soil should be added, and the greater part of such fresh soil ought to be turfy loam.

If the soil is wholly unsuitable—a stiff clay, or a poor, sandy gravelly soil—and excellent crops and well-covered walls are wanted, a good border must be made. The soil ought to be taken out to a depth of 3 feet next the walk, and 2 feet close to the wall, which should go as deep as the border. The border will slope to the front, and there should be a drain about a yard from the edge of the walk. If the subsoil is a stiff clay, or cold and wet, it would be advantageous to concrete the bottom with fine gravel and lime, two parts gravel and one part lime, brought to the consistency of mortar, putting on a 3-inch layer, and then ramming firm, then an inch layer, which need not be beaten, but which when it hardens must be rolled firm and left to dry. If it then crack run it with Portland cement, and make it smooth. Not a root will pass through this; it will keep out the roots of trees growing near which not unfrequently pass under walls, and encroach on their neighbour's domain. Six inches of rough gravel, stones, or brickbats, may be placed on the concrete, and then a layer of turf, grass side downwards. For the border 2 feet 6 inches of soil may be put in, consisting of the top 3 inches of pasture where the soil is a good yellow loam, neither light nor heavy, and it need not be chopped fine, but used roughly, adding to every ten loads a load of marl or chalk in pieces from the size of a walnut to that of a hen's egg, and a load of cow dung or rotten farmyard manure, adding as many bushels of half-inch bones as there are loads of loam, and well mixing and incorporating the whole. The border should be made at least 6 inches higher than the intended depth, and should slope from the wall to the front or walk; an incline of 1 foot in 12 will be sufficient. The surface ought to have a covering of 3 inches in thickness of the loamy soil without turf. This border will be quite rich enough and very durable.

The width of the border should equal the height of the wall, which may be of any height between 7 feet and 12 feet; but in the case of an artificial border being formed, part may be made at first not less than 6 feet wide, and then increase the width in a corresponding degree to the advance of the roots. Borders, especially Peach borders, are so valuable for early crops, that they rarely escape the ruinous practice of cropping with vegetables. In that case they ought to be wider than when they are not cropped, as the upper part of the border is of very little value to the roots, from the digging or disturbing of the surface. The border, therefore, may be 15 feet or 18 feet in width, according to the extent of the garden. It would be well, however, in all cases to have a border of proper extent solely devoted to the trees, and in no case to crop it or dig it; but if this cropping cannot be avoided, it will be well once the system of cropping is begun to continue it, for the alternate digging and cropping, and then not digging for an equal length of time, are injurious. I have seen splendid trees where the border was annually cropped; but I have also seen the same border go without a crop two or three years with evident improvement in the crop of Peaches, and on a return to cropping the border the trees, from the loss of roots consequent on the digging, received a check they did not recover for three years.

PLANTING.—The height of the wall, and mode of training will determine the distance between the trees. Against a 12-foot wall the trees should be 18 feet apart; on a 10-foot wall, 21 feet;

and on an 8-foot wall, 24 feet apart, if fan training, which is the best for the Peach in this country, is practised. The best time to plant is autumn, as soon as the leaves have fallen, or are falling. In selecting the trees, give preference to those which are healthy and moderately vigorous, and that have side shoots of corresponding vigour. See that they have no strong leading shoot or shoots, for if their upper shoots are more vigorous than the lower ones, no one can make good trees of them; and see that there is no appearance of gum. Avoid the vigorous plants, they never have good roots, and are sure to disappoint by their growth after planting. Do not be afraid of making too large a hole at planting, but let it be wide enough to admit of the roots being laid out straight. The hole ought not to be deep, at least the tree should not have its roots more deeply covered than 3 or 4 inches, and it would be well to place a few inches of rich soil under and over the roots. The stem should be kept 4 inches from the wall, the head slightly inclining towards it, and the root portion of the stem inclining from the wall. The ground should be mulched with littery manure as far as the roots extend, and beyond their extremities. The shoots ought to be loosely nailed to the wall. The trees should have clear, straight stems; the first pair of branches about 9 or 10 inches above the surface, but this stem ought not to be a portion of the Plum or other stock, but that of the Peach worked on it. I can perceive neither benefit nor ornament in the Plum stock being seen above ground. As it does not increase in thickness in proportion to the Peach, it is quite as well to have the Plum stock huddled so low that its stem may safely be buried, and the ugly swelling formed at the point of union will then have the appearance of being the stem.—G. ABBEY.

JERSEY FRAGMENTS.

A LITTLE girl, after reading the epitaphs in a country churchyard, all extolling the excellencies of those they commemorated, asked very naturally, "Where are the *bad* people buried?" And I had often considered mentally, until I voyaged the other day to Jersey, where disagreeable people go in their periods of holiday. I now think that they are to be found on board steamers at pitch-and-heave times in the British Channel. However, those who are then disagreeable improve wonderfully soon after they get on shore; and I think all must, for even the most disagreeable man on board the "Cygnus" steamer was actually sprightly so soon as he reached the Imperial Hotel at St. Helier's. I would not mind being sea-sick, which I never am, and I should cease from being ill-tempered, but I never am, to be at a hostelry so excellent as the Imperial. It is a palace, and has befitting gardens with long shady walks, and a Mulberry tree loaded with fruit. Think of that, ye who, like Shakespeare, love Mulberries so well that you plant Mulberry trees without even a hope to live to partake of their fruit.

Then the Fig trees—these you see all over the island—20-feet-high standards, and branches extending as far, so that people literally realise the blessing of "sitting under" their own Fig trees.

I shall say nothing about the island's Pear trees, because every one has heard of its Chaumontels, though every one does not know that if he asks a friend to send him some he asks for a present that makes his friend come down handsomely—that is, if his friend does what he is asked to do. A Pear weighing 12 ozs. costs about 9d., and one weighing 1 lb. about 1s. 6d. But I will say something about the island's Apple trees, for these are not talked about so much as they deserve.

I know of no space of similar extent that contains so many Apple trees as Jersey. You may travel far through an almost unbroken series of orchards. In 1866 were exported from the island 170,687 bushels of Apples, and this year the crop is abundant, and the exportation probably will be larger. Last year the crop was light, yet 75,275 bushels were exported. Notwithstanding these exports there were also exported in 1866 of cider 33,995 imperial gallons, and 36,662 in 1867. How many more bushels of Apples were required to produce that cider others are better judges than I am.

Of other fruits of all kinds, 15,589 bushels were exported in 1866, and 19,876 in 1867.

Of Potatoes, 4080 tons were exported in 1866, and 6251 tons in 1867. This year the crop is above an average, and quite free from disease.

The Parsnip crop this year is an average, for though the roots are rather smaller than usual, they are of superior sweetness, and the crop of Parsnip seed both here and in Guernsey

is very good. Our seedsmen in England resort for their supply of this seed to these islands.

The success of the Parsnip crop during the late protracted drought is another testimony to the good effect of deep stirring of the soil. This deep stirring for the Parsnip crop is quite an annual festival in the Channel Islands. It is called "*la grande charrue*," or, as we should say, "the great ploughing." The holdings in Jersey and Guernsey are very small, varying from four to eight acres, and all devoted to cow-keeping, at the rate of a cow per acre. The owners of such small plots keep, at the utmost, one horse or pony, and to stir the soil deep enough for the Parsnip crop, four at the very least of these animals are required for each plough. Neighbours, therefore, render aid to each other, and the farmer at whose plot of land the neighbours assemble thus to help, feasts them and their families. It is "*la grande charrue*" of the year. A customary junket on the occasion is called "a goshe." I do not know whether I spell it correctly. It is a Yorkshire pudding, containing a layer of sweetmeat, and made so rich, that it is a jocular observation that butter always rises 2d. per pound at the "charrue" season.

No more forcible evidence of the forcing power of the past summer could be adduced than that a farmer in the parish of St. John's, in this island, planted a field with Potatoes on the 20th of February, took up the crop they produced on the 3rd of June, planted Potatoes again the same day, and took up their produce in perfect condition during the second week of last month—August.

The only fruit that does not succeed either here or in Guernsey is the Filbert. It has been repeatedly planted, and as often failed. I am told that not a Filbert or Hazel Nut bush is to be found in these islands. The Spanish Chestnut and Walnut, however, thrive well.

Not long since, I remember, that the ornamental gardening of Jersey was noticed in your columns, and that a committee of the Agri-Horticultural Society of the island reported on some of the most distinguished of its gardens, so I pass them over; but I must record my protest against the prevalence of topiary work near St. Helier's. It is far more often observable than is compatible with good taste. Here are evergreens clipped into huge cones, reminding one of "Jack in the green" in the chimney-sweeper's May-day procession; others rounded into perfect globes; pyramids also are numerous; and these geometric figures are in rows, rendered more grotesque by being put in totally irregular association. One long hedge of Evergreen Oak is absolutely clipped into an uniform series of scollops, and one of Yew is cut so as to represent a battery and its embrasures. In the graveyard around that fine old Anglo-Norman church at St. Brelade, the evergreens are as tastelessly cut as are the pillars within coated over with incrustations of whitewash. Ornamental shrubs attain a size quite unknown in England, except in its most south-western counties—Magnolias 20 feet high, and Hydrangeas and Fuchsias large in circumference and half that height.

The Cow Cabbage is almost peculiar to this island, being rarely seen even in Guernsey. It is chiefly cultivated for its leaves, which are used for wrapping round the butter before conveying to market. The stems of this Cabbage are often 10 feet long and stout. The regularly-placed scars on each stem, caused by the falling-off of the leaves, produce a variation in the colour of the stems, and when these are stained and varnished and furnished with a fernle, they are admired as walking-sticks by some, with whose taste mine does not coincide. One gent near Mount Orgueil I saw with six of these Cabbage-wort truncheons under his arm!

That Mount Orgueil Castle is one of the island's "places to be seen," and that many do see it is told, after the manner of Englishmen, by the names, initials, and dates pencilled upon its fabric. These are not usually the suggestions of vanity, but are written in the hope that some friends in after days may be gladdened by this written greeting. Sometimes, however, the record is dictated by vanity, and one "J. P.," I remember, has written those initials, and his place of residence, most disfiguringly, on about twenty difficult places of Sandsfort Castle, near Weymouth; and though I do not know the scribe, I would wager a broad acre against a foot's breadth of Weymouth sand, that he never perpetrates anything more worthy of remembrance. Strange, too, is it how unworthy are the entries in the "Visitor's Book" usually kept at places of celebrity. Tennyson was at Waterloo in the August of 1866, and this note written by our Poet Laureate, I read in the album of the Hotel du Muséum, "Good fare, civility, and moderate charges." I

should have expected such a sentence in such a place from the man with the six Cabbage-stalk truncheons.

On one of the battlement stones of Orgueil Castle, I observed "W. P." inscribed, and though not by the pencil of William Prynne, yet they reminded me that that stout-hearted Reformer, but offensively bad rhymester, had there been imprisoned, and had written such lines as these—

"Mount Orgueil Castle is a lofty pile,
Within the eastern part of Jersey Isle,
Seated upon a rock, full high and high,
Close by the seashore, next to Normandie."

Prynne was not puritanical in all his ways, for one of the charges Lempiere brought against him was, that "Mr. Prynne (whilst imprisoned here) played at cards with my Lady Cartaret and her daughters till midnight, or two of the clock in the morning."

Whilst confined in Mount Orgueil Castle, he wrote, "Monnt Orgueil; or divine and profitable meditations raised from the contemplation of these three leaves of Nature's volume. 1, Rocks. 2, Seas. 3, Gardens. With a poem of the Soul's complaint against the body, and comfortable cordials against the discomforts of imprisonment. London, 1641." The third of the leaves on "Gardens," I am told, for I have not seen the volume, is rhapsodical, like Austin's meditations in his Orchard, and Hervey's in his Flower Garden.

My last fragment shall be about Pigeons. They were formerly far more highly prized than now as a dainty for the table. The interior of the upper stories of two of the towers of Hurstonceaux Castle, near Eastbourne, were devoted to Pigeons, the recesses for their nests all round those interiors still remain. So in Jersey more than one ancient farm house may be seen with its front thickly pigeon-holed. I was told that this evidence of the original proprietor's right to keep Pigeons, showed that he was closely allied to the Lord of the Manor, and that the permission had been granted by him to the proprietor. Few of your readers, probably, are aware that the law is similar in England. A Lord of a Manor may establish a Pigeon house or Dovecot upon his land that is part of his manor, but a tenant cannot there establish one without the lord's permission. Formerly it was decided that no one but the Lord of the Manor, and the Parson, might erect a Dovecot, but later decisions have established that any freeholder may erect one on his own ground.—G.

GOLDEN CHAMPION GRAPE.

FAVOURABLY impressed as I have been with this Grape from its appearances on the exhibition tables, and the flavour of the few berries I had tasted, I was quite astonished to see it in its full magnificence at Dalkeith to-day, to taste its most exquisite flavour, and judge correctly of its merits in direct comparison with other varieties growing in the same house under precisely similar conditions. Mr. Thomson has several rods of it grafted on the Muscat of Alexandria. They are thus fruiting side by side in the same house.

For size of berry, colour, and general appearance the Golden Champion is far before the Muscat, and for flavour it is superior also. Yes! berry for berry, as I had them to-day, I decidedly prefer the Golden Champion. It is more juicy, more refreshing, and equally rich, if not richer, without cloying the palate as the Muscat does. The flavour is of a particularly rich and agreeable kind, and very lasting. I tried some well-ripened Hamburgs afterwards; they seemed to have no taste at all, the powerful flavour of the Golden Champion had completely killed theirs. As a white companion to the Hamburg is its place, however, although it is far superior to it in flavour.

The Golden Champion requires exactly the same treatment as the Hamburg, and is of the same free habit of growth and vigorous constitution. If anything it grows somewhat too strongly. What a glorious Grape this will be for the early-summer months! It can be had ripe in April, May, June, and July, months when ripe, truly ripe Muscats are never seen, or very rarely so. Mr. Thomson intends devoting some entire houses to its cultivation. The Vines in one house of Hamburgs (at least the top part of the rods), are already grafted with it, and they are doing well, and so likewise are those on the Muscat, but Mr. Thomson prefers the Hamburg stock. It is doing equally well planted out on its own roots. There are canes as thick as one's thumb from plants only planted this season.

I feel I cannot say enough in praise of this splendid Grape,

although, indeed, it requires no help of mine. Its high merits will soon be universally known and appreciated.
